

CHEMICAL ABSTRACTS

Vol. 22.

JUNE 10, 1928

No. 11

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Chemical Engineering Memoranda. I. and II. Drying and calcining plant. C. H. BUTCHER. *Ind. Chemist* 3, 554 6(1927); 4, 47-8(1928).—B. gives detailed sample calcs. for a drier heated by flue gases or hot air. The calcs. are unusually complete, but no new methods are involved. W. L. BADGER

The building of containers for severe service. T. McLEAN JASPER. *Ind. Eng. Chem.* 20, 466-70(1928).—A description of the precautions to be observed in designing containers to operate under high pressure and temp. T. S. CARSWELL

A new pipet. H. NORMAN RIDYARD. *J. Chem. Soc.* 1928, 749-50.—This instrument is capable of measuring the vol. of H_2O to $\pm 0.02\%$ and that of C_6H_6 to $\pm 0.1\%$, being of 1.5-2.5-cc. capacity. The outlet of a tapering bulb, serving as the body of the pipet, is drawn out to a fine capillary. The other end merges into another fine capillary which is bent, expanding here into a small bulb and then contracting into a slightly larger capillary, and finally enters a bulb of about 2 cc. diam. This bulb has 2 outlets, 1 for emptying and the other to which to attach a vacuum line. The pipet is filled by attaching a suction and closing the other outlet with a finger. J. B.

A modified weighing pipet. GRAHAM EDGAR. *Ind. Eng. Chem.* 20, 158(1928).

E. J. C.

A micro-calorimeter. S. G. LIPSETT, F. M. G. JOHNSON AND O. MAASS. *J. Am. Chem. Soc.* 50, 1030-3(1928).—A calorimeter (of 1 cal. heat capacity) is detailed for measuring heats of soln., 4 cc. of solvent being used. The calorimeter is cylindrical, a drum contg. the solute being set inside and then surrounded with the solvent. On rotation, the solvent and solute mix and the heat change is measured. The deviation from the mean of 6 measurements of the heat of soln. of NaCl was never greater than 0.26%. J. BALOZIAN

An improved glass manometer. FARRINGTON DANIELS. *J. Am. Chem. Soc.* 50, 1115-7(1928).—The description of a glass manometer is given in which a known air pressure is balanced against an unknown gas pressure through a glass diaphragm. The point of balance is obtained electrically by a Pt contact fused to the diaphragm. Readings may be obtained accurate to 0.2 mm., the 0 point being independent of the temp., over a wide range, and pressure, until the total pressure is lower than 10 mm. Advantages are claimed over other devices. J. BALOZIAN

An improved quartz-fiber manometer. A. O. BECKMAN. *J. Optical Soc. Am.* 16, 276-7(1928). E. H.

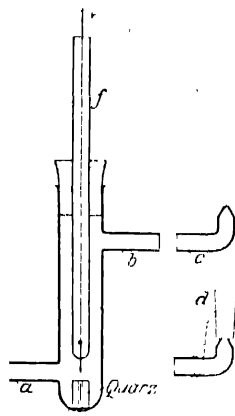

Most favorable dimensions of a resistance thermometer. A. MICHELS AND P. GEELS. *Verslag Akad. Wetenschappen Amsterdam* 36, 1342-8(1927).—For maximal wire length of a resistance thermometer the thickness d for optimal sensitivity is detd. by the condition $R = G$ for an aperiodic galvanometer and Rt_{metal} for a const. field galvanometer. (R is thermometer resistance, G total external resistance.) B. J. C. VAN DER HOEVEN

Ring-shaped capillary electrometer. G. KOMOVSKII. *Trans. Karpov Inst. Chem.* 1926, No. 5, 39-42.—K. proposes the adoption of an electrometer of his own invention which consists of a ring-shaped app. with communicating vessels turning around an immovable axis. Its sensibility is 0.01 millimeters per 1.10^{-3} v.; the sensibility of the app. can be changed to a very considerable extent either by revolving the electrometer around the axis or by inclining it. A complete description and drawings are given. BERNARD NELSON

Design of fractionating columns. D. B. KEYS, ROY SOURUP AND W. A. NICHOLS, JR. *Ind. Eng. Chem.* 20, 464-6(1928).—The no. of theoretical plates at infinite reflux is graphically detd. from the equil. curve, and is multiplied by an empirical factor of 2 or 3 to give the no. of plates practically required. T. S. CARSWELL

The fulgurator as an atomizer of salt solutions for flame spectra. Photography of its spark spectrum. WILHELM HIRSCHL. *Z. Physik* 47:147-50(1928).—The De-

lachanel-Marmet fulgurator has been modified as indicated in the figure. For spark spectroscopy it is used as the ordinary app. For flame spectroscopy, *b* is placed in front of a Bunsen burner; the spark pulverizes the soln. and the mist is pulled into the flame by the draft produced by the burner. Another method consists in passing hydrogen through *a* and burning it in *c* (which is first connected to *b*). Or, illuminating gas can be substituted for H if the quartz or hard-glass tube *d* is fitted on to *c* to act as a Bunsen burner. This app. is particularly suitable for quant. work; the amt. of salt consumed is readily obtained by weighing the fulgurator before and after its use.

A. L. HENNE

Preliminary communication on the applicability of the "acidimeter" according to Dr. Trénel. G. LAUFER. *Z. Pflanzenernähr. Dungung* B6, 486-9(1927); cf. *C. A.* 19, 927.—The claims made for the acidimeter by Trénel were tested and the results are given.

E. F. SNYDER

Apparatus for determining viscosity under varying conditions. EDWARD MASTERS and A. E. GODDARD. *Ber.* 61B, 586-91(1928).—The viscometer described consists of a 0.02-0.03-cm. capillary, 20 cm. long, with a mm. scale at the lower end. At the upper end is a pear-shaped vessel whose vol. is accurately known, and which can be replaced by vessels of different size depending upon the quantity of liquid available and its viscosity. The liquid can drain out of the vessel either under its own wt. or under pressure supplied from

a very much larger chamber. By use of Scarpa's methods of calcn., errors due to displaced air and surface tension can be ignored, and the app. makes it unnecessary to consider changes in velocity of the moving liquid.

H. S.

Electromagnetic vacuum cut-off. J. H. HUBBEN. *J. Am. Chem. Soc.* 50, 1117-8 (1928).—A Hg cut-off is described, suitable for high vacuums, in which the Hg level in an arm of a U-tube is varied by a soft Fe plug and an elec. winding, acting as a solenoid. When the Hg level is below the outlet of an inner tube the app. may be evacuated, when above, the chamber and the pump are disconnected. The vapor pressure of the Hg may be reduced by so designing the app. that it may be immersed in liquid air.

J. BALOZIAN

Light filters for the isolation of narrow spectral regions. L. A. JONES. *J. Optical Soc. Am.* 16, 259-71(1928).

R. H.

A cutting burner for cast iron. I. C. FRITZ. *Gas u. Wasserfach* 70, 1048-9(1927).—A special type of oxy-acetylene cutting burner for cast iron has been devised with a heating burner on either side of the cutting burner. This burner will cut cast iron up to 6 in. thick satisfactorily.

R. W. RYAN

Oxygen-cutting technic. ANON. *Apparatebau* 40, 80 1(1928); 4 cuts.—The Weberwerke-Siegen app. is described.

J. H. MOORE

Utilization of waste heat from large gas engines, industrial furnaces and gas generators. ANON. *Apparatebau* 40, 73-9(1928); 17 cuts.—Descriptions of app., with plans and elevations.

J. H. MOORE

Absorption of light by a reversing apparatus of the reversing type and thermostat for same (Brit. pat. 273,175) $\frac{1}{t_1} = \frac{1}{t_2}$ vacuum distillation in the laboratory (McDowell) 2.

Colorimeter. R. E. KLETT. U. S. 1,667,478, April 24.

Apparatus for comparing the color of liquids by reflected and transmitted light. H. A. ELLIS. U. S. 1,667,249, April 24.

Crucible furnace with two crucibles one above the other. J. D. PATON and A. WOOD. Brit. 273,457, June 3, 1926.

Combined furnace and gas producer suitable for use with steam boilers. T. R. WOLLASTON. Brit. 274,286, Aug. 3, 1926.

Regenerative furnaces. D. B. JONES and F. C. SWARTZ. U. S. 1,667,319, April 24.

Continuously operated tunnel furnace suitable for cementation of steel articles in boxes. BRITISH FURNACES, LTD. and E. W. SMITH. Brit. 274,003, March 23, 1927.

Holder for radiation pyrometers, etc. T. H. NORTON. U. S. 1,667,355, April 24.

Pyrometer for measuring the temperature of gases. KAISER-WILHELM-INSTITUT FÜR EISENFORSCHUNG. Brit. 274,440, July 16, 1926.

Temperature alarm operated by expansion of gases. L. J. J. B. CHENEAU. Brit. 273,764, July 3, 1926.

Electrical safety control for burners having gas-ignition pilots. F. FISCHER and A. F. VAN PELT. U. S. 1,666,331, April 17.

Removing gases from electric discharge tubes. ELECTRICITE INDUSTRIELLE ET DOMESTIQUE. Brit. 273,726, July 3, 1926. In order to remove gas from tubes and from their electrodes, a chloride such as Hg_2Cl_2 is enclosed in a receptacle communicating with the tube to be evacuated so that gas is absorbed by particles of chloride which are removed by a pump. A rare gas such as neon, for use as a filling, is admitted and purified by C produced by combustion of Landes pine or sea pine and contained in a vessel cooled by solid CO_2 and EtCl .

Gas separator suitable for separating gases from liquids. J. F. BORDEN. U. S. 1,666,139, April 24.

Heat-exchange apparatus for heating air or other gases. J. W. YOUNG and METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Brit. 273,886, June 16, 1926.

Apparatus for purifying and sterilizing water or other liquids or gases by filtration with active carbon. J. N. A. SAUER. U. S. 1,667,439, April 24.

Rotary filter. H. S. HOLE SHAW, R. C. B. STILLMAN and J. A. PICKARD. U. S. 1,666,381, April 17.

Continuous rotary vacuum filter. R. O. BOYKIN. U. S. 1,666,279, April 17.

Filter for sludges or other liquids. E. J. SWEETLAND. U. S. 1,666,515, April 17.

Apparatus for aerating and screening sewage or other liquids. F. B. CHAPPELL. U. S. 1,666,164, April 17.

Pressure filtration system for removing portions of filter cake in successive stages. J. F. WAIT. U. S. 1,667,465, April 24.

Apparatus for admixing with water proportioned quantities of substances in powdered form. W. BOBY and W. BOBY & CO., LTD. Brit. 273,442, May 10, 1926.

Bubble tower for absorptions or fractionations. C. M. ALEXANDER. U. S. 1,667,136, April 24.

Acetylene generator. R. M. EVLETH. U. S. 1,667,346, April 24.

Acetylene generator. G. WRIGHT and PENNY & PORTER (ENGINEERS), LTD. Brit. 273,784, March 30, 1926.

Apparatus for aerated milk, cream or other liquids. D. SWEENEY. Brit. 273,835, April 14, 1926.

Ring oven (with revolving hearth) for heating pulverulent or granular materials. L. HONIGMANN and F. BARTLING. U. S. 1,666,656, April 17.

Tubular coil heat-exchange apparatus. H. HILLIER. Brit. 273,450, May 26, 1926.

Device for charging material (of thick or solid character) into high-pressure reaction vessels. I. G. FARBERNIND. AKT.-GES. Brit. 274,122, July 10, 1926.

Lining iron pipes with copper for heat-exchange apparatus, etc. SILLER & RODENKIRCHEN GES. Brit. 274,015, Jan. 13, 1927. Mech. features.

Glow cathode for electron tubes. E. FRIEDERICH. U. S. 1,667,471, April 24. A cathode is formed with a metal wire such as W contg. a small proportion of C and carrying a coating contg. a carbide of a metal such as Th capable of high electron emission.

Vacuum electric discharge tubes. NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOELAMPENFABRIEKEN. Brit. 274,233, April 30, 1926. Oxide cathodes are made by coating a core of W or Mo (or other highly refractory metal or alloy not forming an alloy with alk. earth metals) with a film of Cu or other readily oxidized metal of relatively low volatilizing temp., oxidizing the film (partially or wholly), bringing it into contact with an alk. earth metal such as Ba condensed from Ba vapor, and further heating to effect oxidation of the alk. earth metal by O from the Cu oxide with or without additional supply of O. The Cu or other metal thus used is finally evapd. by addnl. heating.

Thermocouple pyrometer for measuring the temperature of flowing gas. SIEMENS & HALSKE AKT.-GES. Brit. 274,096, July 8, 1926.

Thermoelectric couple. W. A. DARRATH. U. S. 1,667,142, April 24. Two metals of granular form such as German silver and Sb, Zn or Al are interlocked with an insulating support such as asbestos or bakelite.

Thermionic valves. F. MEYER and H. J. SPANNER. Brit. 274,027, July 10, 1926. Cores or coatings for cathodes comprise a metal which yields an amphoteric oxide such as Co, Ni or their alloys with Al or Zr. Cores of noble metal such as Pt or Pt-Ir or of W or Mo may be coated by electrolytic or mech. processes or by heating in an atm. of Co or Ni carbonyl. Alk. earth metals also may be assocd. with the coatings. Cf. C. A. 22, 1710.

Thermostat. J. E. BOLLING. U. S. 1,666,192, April 17.

Thermostat. R. F. MASSA. U. S. reissue 16,940, April 24. Original pat. 1,146, 637 was issued July 13, 1915.

Bimetallic thermostat. H. J. LLOYD. Brit. 274,267, July 2, 1926.

Precision measurements in the L-series of the new element 75, rhenium. INA WENNERLOF. *Z. Physik* 47, 422-5(1928).—On a prepn. contg. 5% Re and 92% Mo, obtained in the work of I. and W. Noddack (*C. A.* 21, 1570), accurate wave-length measurements were made for the 3 strongest x-ray lines of Re with the following results: L_{α_1} 1429.88, L_{β_1} 1236.04, L_{β_2} 1204.1 x-units. These values are in good agreement with those obtained by interpolation from the $\sqrt{\nu}/R$ values of neighboring elements, and leave no doubt as to the actual presence of element 75.

A. FLEISCHER

Chemical composition of the interior of the earth and the moon. S. MOHOROVIČIĆ. *Archiv. Hem. Farm.* 1, 95-104(1927).—From seismological, petrological and astronomical-geodetic considerations it is concluded that the earth consists mainly of Fe, Mg, Si and O, while the moon contains in addn. relatively more Al and Ca. The rigidity of the earth is a little more than 3 times as great as that of the moon. Venus and Mercury probably possess a similar compn. to the earth while that of Mars is closer to that of the moon. The planetoids are similar in compn. to meteorites, while the planets more distant from the sun probably resemble the fixed stars in compn., this being unknown.

B. C. A.

Radioactivity and the temperature of the interior of the earth and the moon. S. MOHOROVIČIĆ. *Archiv. Hem. Farm.* 1, 226-36(1927).—From a consideration of the thickness of the Sial granite substratum and its radioactivity, thermal cond. and elasticity, it is concluded that at a depth of 50 km. the rocks of the moon exist only in the liquid state, while at 70 km. only the gaseous phase can exist. In the earth, a temp. high enough to liquefy rocks (2500°) is attained at a depth of 50 to 60 km. below high mountains.

B. C. A.

Determining composition by specific gravity. L. O. HOWARD. *Eng. Mining J.* 125, 617(1928).—A simple formula is derived which permits a very rapid detn. of % by wt. or by vol. by water displacement. Application is also possible to the compn. of certain alloys having quite different sp. grs. and very low mutual soly. A table shows the closeness of the calcd. results to the assumed.

W. H. BOYNTON

The ice point of the thermometer scale. A. MICHELS AND F. COETJER. *Proc. Acad. Sci. Amsterdam* 30, 1017-20(1927).—See C. A. 22, 1524. • E. H.

Fundamental frequencies, interatomic forces and molecular properties. J. R. BATES AND D. H. ANDREWS. *Proc. Nat. Acad. Sci.* 14, 124-30(1928).—From the fundamental equations for the frequency of vibration of atoms in mols., for harmonic and anharmonic oscillators from the theories of vibrational quantum states, relations are derived connecting the energy necessary to dissociate a normal mol., the force const. and the amplitudes of vibration. These relations are used in calcg. data available in the literature to a comparative basis. A great similarity of all non polar linkages is shown by the close agreement of the values for "displacement for association." It is also shown that relations do exist between the fundamental frequency and the force of binding in non-polar mols. and such properties as heats of linkage, b. ps and directive influence.

ARTHUR FLEISCHER

Valence. W. A. NOYES. *Proc. Am. Phil. Soc.* 66, 287-308(1927); cf. C. A. 22, 724.—This article contains more historical material than the previous one.

W. ALBERT NOYES, JR.

The basis of the firmness of attachment in chemical combinations. FRIEDRICH EBEL AND EGON BRETSCHNE. *Helv. Chim. Acta* 11, 281-300(1928).—A study of the relation of the firmness of attachments in chem. combination to the degree of dissociation and the reactivity of the mol.

J. S. REICHERT

Symbols for electronic bonds. J. A. CRANSTON. *Chemistry & Industry* 47, 208-11(1928).—As a remedy for the existing confusion the dotted dash— proposed by Mann Smith (C. A. 21, 3324) is recommended. "It enables all the types of electronic bonds so far recognized by chemists to be graphically represented in a consistent way" and gives much useful information readily. Examples are given. AUSTIN M. PATTERSON

Röntgenometric examination of highly polymerized organic substances. EMIL ORT. *Helv. Chim. Acta* 11, 300-23(1928).—A comprehensive study of the Debye Scherrer diagram of the *poly-oxymethylenes*. The axial ratios, a b c, are 1.72 1:1.55. The axes are: a = 7.79, b = 4.53, c = 7.02 Å. U. The elementary parallelepiped is rhombic, base-centered and pseudohexagonal. The building unit is (CH₂O)₄. The C atoms are in a straight line in the direction of the c-axis. One H atom appears after each four C atoms. The C atoms and O atoms all lie in the same plane. The remaining H atoms are located perpendicular and symmetrical to this plane. Macroscopically the crystals are rhombic-holohedric and pseudohexagonal. The röntgenometric examn. of poly-oxymethylene diacetates gave variable space lattice constns; this was due probably to mixed crystals.

J. S. REICHERT

Molecular structures of methane. J. K. MORSE. *Proc. Nat. Acad. Sci.* 14, 166-71(1928).—The cube is a convenient method of representation of the C atom in combination. The center of the cube is the C nucleus, while the corners represent "electron positions," 4 of which are occupied by the carbon 1s electrons. The remaining 4 electrons are supplied by the atoms in combination with the C. The distance from the C nucleus to an "electron position" was calcd. to be 0.77 Å. U. for the diamond structure and 0.75 Å. U. for the graphite. For CH₄, two types of mol. are possible depending upon the position of the cube about the C cube. Since there are 8 "H positions" in the outer cube and only 4 H atoms to take them, the possibility of "dynamic isomers" is present. These may be distinguished by their moments of inertia. These calcd. for the different forms agree with the moments of inertia calcd. from exptl. data on infra-red absorption bands of CH₄.

ARTHUR FLEISCHER

Inner crystal structure of some native metals. H. C. H. CARPENTER AND S. TAMURA. *Bull. Inst. Mining Met.* 282, 1-22(1928).—Preliminary investigations were made of Cu, Ag, Au, Sb, Bi, Pt and Fe, all native, to ascertain native forms, distinguishing features from ordinary manufd. forms and whether native forms were primary or metamorphic structures. Cu has a metamorphic form due to atomic rearrangement; Ag apparently was pptd. from aq. solns.; and Au possesses a secondary structure. Native Sb resembles the laminated concentric structure of electrodeposited Zn on a cathode, Bi shows a very coarse crystalline structure, many characteristic lamellae being present, resembling cast Bi plastically deformed. Pt possesses apparently a primary structure, resembling a metal or oxide crystd. very slowly from the melt. Meteoric Fe largely preserves its primary cryst. structure and shows Widmanstätten figures, cohenite crystals and Neumann bands. Metals and alloys with an irregular at. arrangement are unstable. By rearrangement of the atoms they tend to pass into a more stable condition, thus producing an internal structure similar to manufd. metals recrystd. by annealing. 34 photomicrographs are added.

S. L. B. ETHERTON

Crystal structures of the isomorphous sulfates of potassium, ammonium, rubidium

and cesium. A. Ogg. *Phil. Mag.* [7], 5, 354-67 (1928).--The structure is based on a simple orthorhombic lattice having 4 mols. per unit cell and the space-group is V_{16} . The positions of the atoms in the structures have been detd. An explanation of the characteristic twinning of these crystals is given. GEORGE CLOCKLER

Crystal measurements on a few products of Knoll A.-G. H. STEINMETZ. *Chem.-Ztg.* 52, 102 (1928). Pentamethylenetetrazole (cardiazole), monoclinic prisms, a, b, c 1.8171 1.15690, β 120°15', n_D 1.617. Pentamethylenetetrazole, monoclinic prisms, a, b, c 1.6155 1.24725, β 95°2', doubly refractive, n_D 1.59. Crystallizes from H_2O or aq. media as monohydrate, monoclinic prisms, a, b, c 0.5368 1.05043, β 95°52'. Dihydromorphinone HCl (Dilandid), rhombic, a, b, c 0.7511 0.491. F. D. S.

Apparent relation between the rate of change of the electrical resistance at fusion and the crystal lattice of metallic elements. H. PERLITZ. *Phil. Mag.* [7], 2, 1148-52 (1926). *Science Abstracts* 30A, 320. The structure and the elec. resistance undergo an abrupt change when a metallic element is heated to its m. p. Since melting of a metal means a complete collapse of the crystal lattice formed by the atoms of the metallic elements in the solid state, it was thought probable that a relationship exists between the discontinuity of the elec. resistance at fusion and the crystal lattice of metallic elements. The available data were examined and out of 49 elements, 12 elements are in favor of the statement that the rate of change of the elec. resistance at fusion is related to the crystal lattice, and 6 elements leave the question in doubt, while in one case considerable divergence was found. H. G.

Mixed crystals. II. Mixed-crystal formation of barium sulfate and potassium permanganate. H. G. GRIMM and G. WAGNER. *Z. physik. Chem.* 132, 131-48 (1928); cf. C. 19, 1511. By mixing solns. of K_2SO_4 and $Ba(NO_3)_2$ each contg. equiv. quantities of $KMnO_4$, G. and W. have pptd. mixed crystals of $BaSO_4$, $KMnO_4$ at 50° contg. up to 60 mol. % $KMnO_4$. Qual. the concn. of $KMnO_4$ in the crystals and in the soln. are directly proportional. They are prepd. for analysis by washing (1) with Me_2CO until the washings are but faintly pink, (2) 3 times with anhyd. Et_2O and then dried in a vacuum at 110-120°. Crystals contg. more than 40% $KMnO_4$ decompose spontaneously and react vigorously with Me_2CO ; those with less $KMnO_4$ are attacked by water, thus making reproduction of washed crystals very poor. Crystals which have been extensively washed with water are very inert towards HCl, HNO_3 , and H_2SO_4 . The rate of soln. in concd. H_2SO_4 increases with increase in $KMnO_4$. When exposed to light the surfaces of the crystals become coated with oxides of Mn. Qual. expts. indicate that $SrSO_4$, $BaSeO_4$, $SrSeO_4$, $BaCrO_4$ and KBF_4 form mixed crystals with $KMnO_4$; also $BaSO_4$, KIO_3 can be prepd. E. R. SCHIERZ

The supraconductive state of gray tin. W. J. DE HAAS, G. J. SIZOO and J. VOOGD. *Verslag Akad. Wetenschappen Amsterdam* 36, 1227-9 (1927).--White tin becomes supraconductive at 3.8 abs. Gray tin, pressed into rods, has a positive resistance down to 1.2° abs. No persistent currents could be induced in the metal grains by magnetic fields. From the lower d. of gray tin as compared with white tin, it appears that Kamerlingh Onnes' rule "loose at. bonds favor supraconductivity" does not generally hold. B. J. C. VAN DER HOEVEN

Viscosity of metals.-Bismuth. G. SUBRAHMANYAM. *Nature* 120, 770 (1927).--The coeff. of viscosity of Bi at 237° is computed from known data to be 13.71×10^8 poises. B. C. A.

The coefficient of expansion of bromoform. ALBERT SHERMAN and JACK SHERMAN. *J. Am. Chem. Soc.* 50, 1118-20 (1928).--The coeffs. of expansion of bromoform (m. 77.0°) were detd. from ds., at temps. ranging from 9° to 50°, by means of a Pyrex pycnometer. An empirical equation is derived for the variation of sp. vol. with temp., values calcd. from this agreeing with the exptl. to 3 units in the last place. J. B.

The fundamental pressure coefficient of helium. W. H. KERSOM and MISS H. VAN DER HORST. *Proc. Acad. Sci. Amsterdam* 30, 970-9 (1927).--See C. A. 22, 1069. E. H.

The freezing point and density of pure hydrogen peroxide. A. C. CUTHBERTSON, G. L. MATHESON and O. MAASS. *J. Am. Chem. Soc.* 50, 1120-1 (1928).--The f. p. of H_2O_2 is detd. as -0.89°; the cooling bath temp. was maintained 0.1° below the f. p. By the method described for measuring the d. at 0°, detd. as 1.4649, the decompn. occurring in the dilatometer is a min. In concd. aq. solns. contg. up to 5% H_2O , the ds. are accurately expressed by the equation $D = 0.9486 + 0.005163 A$, where A is the % by wt. of H_2O_2 . J. BALOZIAN

Molecular velocities, states of excitation and the probability of transition into a degenerate gas. I. E. PERSICO. *Atti accad. Lincei* [6], 7, 137-41 (1928).--A mathematical analysis of the way in which the law of distribution of velocities, the law of

division into various states of excitation and the laws of the probability of transition are modified in a monatomic degenerate gas as a result of their mutual dependence established by the Pauli principle. Since Fermi (*C. A.* **20**, 2265) assumed 3 degrees of freedom, and since in the present work another degree of freedom is assumed, viz., the internal condition or state of excitation of the mols., the distribution of velocities must differ from those calculated by F. Conversely the distribution of the mols. in various states of excitation and the probability of passage from one to another by the Pauli-Fermi hypothesis is influenced by the distribution of the velocities of translation. Likewise the Einstein formula for the probability of transition must be modified. C. C. D.

Gaseous solutions. MERLE RANDALL and BENJAMIN SOSNICK. *J. Am. Chem. Soc.* **50**, 967-80 (1928).—Deviations of gaseous mixts. from the generalized Raoult law are similar but smaller than those of liquids of like polarity. It is shown graphically by using A and ethylene mixts., that they increase with total pressure. Calcn. of the fugacities of pure supercooled vapors are impossible for pressures above the max. in the P - T isotherm. From considerations of gaseous solns. it is seen that Lewis and Randall's rule holds above the crit. points of vapors and for a limited range below these points. For a given pressure, values of the activity function show how the fugacity of a gas depends upon the chem. nature of the added gases, and are a means of predicting the probable effect for other temps., pressures and gases. Tables and graphs of the variation of the activity function with pressure are given for NH_3 , H_2O vapor and CO_2 in mixts. with N_2 or H_2 at various temps. J. BALOZIAN

The boundary condition "concentration equals zero" in diffusion problems. W. DE GROOT. *Physica* **8**, 23-34 (1928).—A mathematical paper. B. J. C. v. D. H.

The melting curve of helium and the heat theorem of Nernst. W. H. Keesom. *Proc. Acad. Sci. Amsterdam* **30**, 952-6 (1927).—See *C. A.* **21**, 2582. E. H.

The melting-point line of helium and Nernst's theorem of heat. J. J. VAN LAAR. *Proc. Acad. Sci. Amsterdam* **30**, 955 (1928).—See *C. A.* **22**, 1069. E. H.

Vacuum distillation in the laboratory. F. H. McDOWELL. *Chemistry & Industry* **47**, 241 (1928).—The const. vacuum app. of Wade and Merriman (cf. *C. A.* **5**, 2992) is described, a test tube inside of a filter tube being used as receiver. Following the distn. with frequent detns. of n a 3-g. fraction of ngaiol (cf. *C. A.* **20**, 186) b_{20} 191-2° was shown to contain an isomer b_{20} 188-90°. M. advocates n as of more value than the b . p. as a standard of purity on small samples. FOSTER DEE SNELL

The effect of intensive drying on the vapor pressure and vapor density of ammonium chloride. W. H. RODEBUSH and J. C. MICHALEK. *Proc. Nat. Acad. Sci.* **14**, 131-2 (1928).—Intensive drying causes no change in the vapor pressure, but complete dissociation of NH_4Cl . Smits (cf. *C. A.* **21**, 3506) found a lowering of vapor pressure and a vapor density equal to NH_4Cl or higher. Intensive drying produces an extraordinary retardation in the rate of evapn. and condensation, and several hrs. were required for equil. to be established. Thermodynamic consideration of Smits' data shows that the dissociation of dry NH_4Cl in the vapor state is an exothermic reaction. ARTHUR FLEISCHER

Vapor tensions of liquid ethylene. C. A. CROMMELIN and H. G. WATTS. *Proc. Acad. Sci. Amsterdam* **30**, 1057-8 (1927).—See *C. A.* **22**, 1509. E. H.

Preliminary isotherms of ethylene. C. A. CROMMELIN and H. G. WATTS. *Proc. Acad. Sci. Amsterdam* **30**, 1059-61 (1927).—See *C. A.* **22**, 1508. E. H.

The rectilinear diameter of ethylene. E. MATHIAS, C. A. CROMMELIN and H. G. WATTS. *Proc. Acad. Sci. Amsterdam* **30**, 1054-6 (1927).—See *C. A.* **22**, 1066. E. H.

Condensation of liquids in the vesicular state. M. PAULY. *Rev. gén. colloïdes* **5**, 745-8 (1927).—When a substance, liquid at ordinary temp., is vaporized and then diluted with a large vol. of gas, there is formed, by condensation, a finely divided residue through the gas. This residue, said to be in the vesicular state, is difficult to break up; it is possible to do so with shock app. when the particles are large, if they are very fine, use is made of their elec. charge. The condensation of H_2SO_4 is difficult to obtain; the presence of H_2O aids in breaking up the state but it is never possible to arrive at complete condensation by mech. means. The Cottrell method is very effective, giving 80 to 90% recovery. E. G. VANDEN BOSCH

Contribution to the study of the vitreous state and the expansion of glasses. MICHAEL O. SAMSOEN. *Ann. phys.* **9**, 35-127 (1928).—Measurements of linear expansion with a Chevenard dilatometer (*C. A.* **20**, 1539) and Chevenard and Portevin, (*C. A.* **19**, 3467) and of cubical expansion of various amorphous solids show that the phenomenon of "amorphous expansion" is common to all amorphous substances and that it is due to an increase in the coeff. of expansion, and not to the change of dimensions at the transition point which is characteristic of allotropic transformations. These measurements were made on the following substances in the amorphous state: Pryex and other glasses,

Na silicates, enamels composed of B_2O_3 and Na_2O and of B_2O_3 and PbO , $NaPO_3$, B_2O_3 , pitch, rosins, gum lac, cane sugar and polymerized acrolein, glycerol, and $Na_2S_2O_3 \cdot 5H_2O$. A glass which was not annealed did not show this increase of expansion. The change of sp. heat which accompanies the transformation has been measured for glycerol and B_2O_3 . The coeff. of expansion before transformation, temp. of transformation, and coeff. of expansion after transformation have been detd. and their variation as a function of the chem. compn. established for glasses composed of SiO_2 and Na_2O , SiO_2 and B_2O_3 , Na_2O and B_2O_3 , B_2O_3 and PbO , silicoborates of Na and a group of industrial glasses. Conclusion: All amorphous substances undergo a transformation characterized by a discontinuity in their phys. properties. The transformation temp. is detd. by the viscosity of the substance, and for temps. below this point, the substance is in a true solid amorphous state. In this state the mols. are immobile, and crystn. is impossible below the transformation temp.

R. J. HAVIGHURST

Capillary rise of liquids in wide tubes. C. H. BOSANQUET. *Phil. Mag.* [7], 5, 296-301 (1928). --The equation for the form of a liquid surface at rest in a circular tube under the influence of capillary forces is treated and tables are given of appropriate quantities necessary to solve it.

GEORGE GLOCKLER

Molecular orientation at surfaces of solids. II. The work of adhesion of the saturated fatty acids for water. A. H. NUTZ. *J. Phys. Chem.* 32, 620-30 (1928); cf. *C. A.* 22, 1510. --When work of adhesion of fatty acids is plotted against the no. of C atoms, the adhesional work shows a marked min. in the neighborhood of 12-14 C atoms, beyond which there is a very pronounced increase. The alternation of various phys. properties for odd and even acids is markedly illustrated in the work of adhesion. Even and β odd acids lie on a single smooth curve, the α -odd modifications showing alternating higher values. Alternation of two sets of values for α - and β -odd acids are attributed to differences in crystal structure. The general trend of the curve, for adhesional work against the no. of C atoms is considered as partly due to the general nature of the adhesional energy-temp. relations and partly to the mech. effects of the length of the C chain.

R. J. HAVIGHURST

Liquid wires and their surface films. W. B. PIETENPOL AND H. A. MILEY. *Phys. Rev.* 30, 697-704 (1927). A wire of low-m.p. metal (Pb, Sn, Zn, Bi) can be made to glow when freely suspended and heated in air or O. This has been shown to be due to the formation of an oxide film of sufficient tensile strength to permit the molten metal to be sustained even though its m. p. is much lower than the glowing temp. Wires with clean surfaces when heated in N_2 break at the m. p. of the metal. Expts. with sulfide, bromide and chloride films reveal 3 facts: if there is not a firm coat at the m. p. of the metal the wire breaks at that temp.; if the m. p. of the coat is between the m. p. of the metal and the glowing temp., then the wire breaks at the m. p. of the coat; if the m. p. of the film is above the glowing point the wire can be made to glow when freely suspended. The suspension of molten metals by their oxide films affords a unique method of measuring the temp. coeffs. of resistance of low-m.p. metals through the solid and liquid states.

BERNARD LEWIS

Studies of the surface layer. VI. Differences of potential on the border between air and solutions of some benzene derivatives. A. FRUMKIN, A. DONDOS AND R. KUL'VARSKII. *Trans. Karlov Inst. Chem.* 1926, No. 5, 17-33; (cf. *C. A.* 20, 2604-5). --The purpose of the present investigation was to find the mechanism of orientation of mols. of simple aromatic compds. on the surface of water. Since the adsorbed quantity of these compds. is almost proportional to the magnitude of the positive charge of external air, the magnitude of the lowering of surface tensions and the differences of potential on the border air-soln. of aromatic compds. of various concns. were studied. The capillary curves of these compds. can be expressed by means of Shishkovskii's reaction so modified as to take into account the existence in the surface layer of forces of mutual attraction. The adsorption of aromatic compds. is less than that of corresponding aliphatic compds. having the same no. of C atoms. As a rule, the introduction of the Me group increases the adsorption, but the effect depends on the position of the Me group. Compds. having in the kernel 1 polar group (phenol, cresols, anisole, nitrobenzene, aniline, methyl- and dimethylaniline, toluidines) communicate a positive charge to the surface of water, but the charge is less than in the aliphatic compds., and it still decreases if there is an accumulation in the kernel of several polar groups; in the latter case it even becomes negative (dihydroxybenzenes, *m*- and *p*-nitrophenols). Compds. substituted in the lateral chain (benzoic acid, Me benzoic ester, benzyl alc., benzylamine) produce effects similar to those of corresponding aliphatic compds. Compds. of which the mols. occupy in the surface layer less room than the corresponding isomeric compds. give more positive (less negative) effects; thus *p*-cresol and *p*-toluidine

give a more positive charge to the surface than the *o*-compds., and *p*-dihydroxybenzene and *p*-nitrophenol give a more negative charge to the surface than the *o*-compds. However, this difference in value of the charge is too great to be accounted by the change of the degree of orientation of mols alone.

BERNARD NELSON

Transverse electrocapillary effect. T. TAKEUCHI and H. AKASHI. *Proc. Phys.-Math. Soc. Japan* **8**, 192 4(1926); *Science Abstracts* **30A**, 541-2. (In English.)—The effective surface tension at the boundary of 2 liquids is reduced by the contact p. d. This effect can be increased, diminished or revised by an appropriate applied e. m. f. An alternating e. m. f. is applied between 2 drops of electrolytes on the surface of Hg, and the drops vibrate in the period of the alternations, expanding and contracting under the influence of the varying surface tension.

H. G.

Adsorption of iodine by calcium fluoride. J. H. DE BOER. *Verslag Akad. Wetenschappen Amsterdam* **37**, 237-45(1928).—The app. used is an elec. bulb fitted with a sealed side arm. CaF_2 is spread on the filament and vaporized. It builds a thin transparent coat on the glass wall. The side arm contg. I crystals is cooled with liquid air. By regulating the temp. of the bulb, it is possible to regulate the vapor pressure of I, and thus to det. the quantity of I adsorbed at a definite pressure. The absorption spectrum shows a max. at about 2950 Å. U., which indicates that the I adsorbed is more polarized than in KI_3 solns.

A. L. HENNE

Adsorption in concentrated solutions and adsorption of liquids. I. Shape of the adsorption curves. II. Tentative direct determination of the adsorption of a pure liquid or a solution. RAYMOND DELOY. *Bull. soc. chim. Belg.* **37**, 63-87(1928).—I. recalls the influence of the solvent adsorption and of the vol. change of the soln. on the shape of the adsorption curves of dissolved compds. and emphasizes the importance of these phenomena in the detn. of the adsorption law. He gives 2 new examples of adsorption in concd. soln., in which the apparent adsorption curve shows a falling branch (adsorption of the brown pigment of a proteic hydrolyzate by fossil SiO_2 ; AcOH and H_2O in the presence of activated vegetal carbon black). The detn. of the true adsorption law will probably be rendered possible by studying filtration through adsorbent columns, a few detns. have been carried with water through kieselguhr. A. L. H.

The adsorption of strong electrolytes on pure ash-free charcoal. I. M. KOLTHOFF. *Z. Elektrochem. angew. physik. Chem.* **33**, 497-501(1927); cf. *C. A.* **22**, 339.—Salts of the capillary active acids and inactive bases are adsorbed hydrolytically, if the acid is not oriented in the adsorption layer. The acid is adsorbed and an equiv. amt. of strong base stays in soln. If the acid is oriented then the adsorption is mol. and hydrolytic. With the salts of the active bases and active acids there is mainly a mol. adsorption, but if the base has a strongly polar group while the acid is non-polar, there is a limited hydrolytic adsorption. The capillary activity of water-air is similar to that of water-charcoal.

E. SCHRÖTTE

An examination of Patrick's theory of adsorption. S. J. GREGG. *J. Phys. Chem.* **32**, 616-9(1928); cf. *C. A.* **14**, 1776.—Based on adsorption measurements on silica gels, Patrick has proposed the formula $V = K(p\sigma)^{1/n}/p_0$, where V is the amt. of substance adsorbed expressed as vol. of liquid air per g. adsorbent; K and $1/n$ are consts. for a given adsorbent, no matter what the temp. or the substance adsorbed; σ is the surface tension, p is the equil. pressure, and p_0 the vapor pressure of the adsorbed substance. An examn. of Patrick's data shows little doubt that the Patrick formula and the theory upon which it is based are unsatisfactory. The presence in it of the surface-tension factor, β , is shown to be unjustified, even the entirely empirical quantity $1/T$, securing for the formula a closer agreement with exptl. data. Even when so amended, however, the formula can be regarded only as a purely empirical relationship, which does not provide a basis for a theory of adsorption.

R. L. DODGE

The structure of the oil drops and the mercury drops investigated by Millikan and Matlauch. S. N. RAY. *Kolloid-Z.* **44**, 186-8(1928).—Mathematical discussion. R. considers the influence of atm. pressure changes on the shape of the drops of oil or Hg.

A. L. HENNE

Formation of colloidal gold and platinum in phosphoric acid. ADOLF MÜLLER, FRANZ URBACH and FRITZ BLANK. *Kolloid-Z.* **44**, 185-6(1928).— H_3PO_4 purified by several recrystns. is heated in a Au or a Pt crucible, HPO_3 is obtained; it is colored purple or brown by colloidal Au or Pt. After 2 years, there was no tendency toward sedimentation. The preps. show a strong Tyndall effect, but no Brownian effect, because of the too high viscosity of the medium.

A. L. HENNE

Chemical method for preparing carbon hydrosol. EUGEN CHIRNOAGA. *J. Chem. Soc.* **1928**, 298-301.—*C hydrosol* is prepd. by rapidly stirring a small quantity of charcoal in NaClO soln. (concn. immaterial) at 25°. NaCl must be removed from time to time

by dialysis, and the colloidal soln. finally obtained is dialyzed until free from electrolytes. It reacts neutral to the usual reagents, and can be evapd. at 100° without change, the residue passing into colloidal solns on addn. of water. The sol particles are negatively charged (moving toward + electrode with a velocity of 70×10^{-6} cm./sec. under a gradient of 1 v./cm.), the negative charge being probably due to the adsorption of Cl⁻ and possibly OH⁻ ions. Ultramicroscopic examn. indicated an av. particle radius of 60 $\mu\mu$. H. STORTZ.

Purification of alcohol for preparation of alcoholic potassium hydroxide. SOL KICZALES. *Ind. Eng. Chem.* **20**, 485, 193 (1928).—A brief note. R. J. C.

The transformation of vanadium pentoxide sols. W. REINDERS AND G. VAN DER LEE. *Rec. trav. chim.* **47**, 193-231 (1928). The content of mol. dissolved vanadic acid in V₂O₅ sols reaches a max. a short time after prepn. and then decreases slowly. The change in cond. of the sol with time runs parallel to the content of mol. dissolved vanadic acid. An extended investigation was made of the effect on the aging of the sol of the method of prepn., the concn., and the addn. of such substances as NH₃, vanadate, vanadic acid, acetic acid, NaCl and gelatin. The aging was found to consist of a slow growth of very small crystals into larger ones. HARRY B. WEISER.

Viscosity and the cataphoretic potential of casein sols. B. J. HOFWERDA. *Rec. trav. chim.* **47**, 248-61 (1928).—Casein peptized by NaOH and Ca(OH)₂ gives sols which obey Poiseuille's law. The viscosity at 25° reaches a max. at $p_H = 11.6-11.7$, for the so-called Ca caseinate sols and at $p_H = 11.1$ for the Na caseinate sols. This max. is independent of the casein concn. The influence of neutral salts on the viscosity of the sols is explained as due to an electro-viscous effect. Measurements of the cataphoretic potential show that there is a variation in the hydration of the sol particles corresponding with the variation of p_H . Hence the max. in the viscosity curve cannot be explained by assuming that only the charging effect of the OH ions comes into play. H. B. W.

The complete solution of Fourier's partial differential equation for a given limiting value and its special application to colloid chemical problems. E. L. LEDEFER. *Kolloid-Z.* **44**, 108-20 (1928).—The Fourier partial differential equation has been applied to several specific colloid problems. Having derived the equation for various limiting values of the consts. employed, L. tabulates values for convenience. He then applies the equation to heat, cond., diffusion and swelling and shrinking. For the latter he studies the change in moisture content of a pure soap and obtains data in very close agreement with values calcd. from the equation. L. expects to apply the formula to coagulation and sedimentation of colloids and similar problems. R. H. L.

The "adaptation phenomenon" on coagulation of an arsenic sulfide sol in the presence of barium chloride. VA. N. KRESTINSKA AND V. S. YAKOVLEV. *Kolloid-Z.* **44**, 141-8 (1928).—The adaptation phenomenon of an As₂S₃ sol in the presence of BaCl₂ depends on the rate of addn. of the electrolyte and the slower the addn., the greater becomes the concn. of the point of coagulation. An irreversible hydrolysis of As₂S₃ to H₃AsO₃ takes place. This is explained by an outer layer of H₂S in the micelle giving a negative charge to it. BaCl₂ gives Ba⁺, which reacts with H₂S and H₃AsO₃ to give slightly dissoed. or slightly sol salts. Hydrolysis is, therefore, more complete on gradually adding BaCl₂. HCl does not accelerate hydrolysis and the adaptation phenomenon is not observed on coagulation. Also in *J. Russ. Phys.-Chem. Soc.* **60**, 295-310 (1928). RAYMOND H. LAMBERT.

Influence of the hydrogen-ion concentration on the coagulation index of iron oxide sol. H. FREUNDLICH AND G. LINDAU. *Kolloid-Z.* **44**, 198-202 (1928).—Fe₂O₃ sol was prepd. by Graham's method. Its coagulation by means of NaCl is studied as a function of the p_H . NaOAc and AcOH have been used as buffers to maintain the p_H const. For a const. concn. of buffer, the coagulation index increases with the p_H . For a low p_H , the index is practically proportional to the H-ion concn. If the buffer concn. is modified, the coagulation indexes for NaCl decrease with the buffer concn., for a const. p_H . The process must be interpreted as an antagonism between the Cl and the acetate ions. A. L. HENNE.

Action of ammonium hydroxide on the flocculation of sols by electrolytes. P. C. L. THORNE, A. R. KENNEDY AND A. H. HOLLOWAY. *Kolloid-Z.* **44**, 190-8 (1928).—NH₄OH in small concn. stabilizes neg. sols of varied constitution against pptn. by electrolytes. A high concn. favors their pptn. The protective action parallels a decrease of the coagulation velocity. NH₄OH does not act chemically on the particles, but acts by adsorption on their surface. It reacts the same on suspensions and on sols, i. e., it is easily adsorbed on the suspensions, thus protecting them against pptn. by electrolytes. A. L. HENNE.

The kinetics of peptization. A. V. BUZAGH. *Kolloid-Z.* **44**, 156-62 (1928); cf.

C. A. 22, 1018. The peptization of many colloids is shown to be of an autocatalytic character. Such results are given for $\text{Fe}(\text{OH})_3$ peptized by HCl , humic acid by NaOH , Berlin blue with $\text{K}_2\text{C}_2\text{O}_4$ and $\text{Al}(\text{OH})_3$ with HCl . The inferred rate formula is given for peptization and is shown to hold at several concns. of peptizing agent. It shows a reaction of the first order. The viscosity of the sol under similar conditions passes through a max. with time, then falling to a limiting value showing that peptization first passes through a stage of swelling. R. H. LAMBERT.

Constitution of clay-mud. H. CHATLEY. *Proc. Inst. Civil Eng. (London)* 1927, No. 52, 3-15. The characteristic phys. properties of clay as compared with wet sand of similar compn., considerable tensile strength and apparent cohesion, also its impenetrability to water, are the consequence of the fineness of the particles which renders mol. forces important. The properties are best shown when there is a sufficiency of colloid particles to cover and cement the larger ones. Tezagh's theory of clay structure is discussed. C. has investigated quantitatively the settling of clay particles from fresh-water suspension by addn. of sea salt, a phenomenon due to the neutralization of the charges on the colloid particles by the adsorption of oppositely charged ions. Sea salt was 10 times as effective as NaCl in producing coagulation, this being due to the effect of bivalent Ca and Mg ions. Alum is more than 10 times as effective as salt. There is an optimum concn. of electrolyte for a given colloid concn., as reversal of the charge takes place with an excess. B. C. A.

Isoelectric point of silk fibroin. W. S. DENHAM AND W. BRASH. *J. Text. Inst. (special issue)* 18, 520-1T (1927). For samples of China and Italian silks, the results of expts. with Cu acetate, AgNO_3 and K chromate place the isoelec. point between p_{H} 3.6 and p_{H} 4.0, the value 3.8 being accepted, although the possibility of the existence of more than one point or of a broad isoelec. range, is not excluded. The p_{H} values were detd. colorimetrically. No conspicuous difference is shown between the values for China and Italian silks or between those for mulberry and tussah fibroin. The isoelec. point for sericin of raw silk is about p_{H} 4. A considerable increase in the quantity of base fixed by fibroin from 0.02 N solns. of Na or CaCl_2 is shown when the p_{H} of the solns. is greater than 5, negligible quantities being absorbed near the isoelec. point. B. C. A.

Solubility in a mixture of solvents. I. Solubility of picric acid. F. ANGELSCU AND D. DUMITRESCU. *Z. physik. Chem.* 132, 217-31 (1928). The soly. of picric acid has been detd. in a mixt. of 2 org. solvents. The curves are of various forms. For systems in which ether or benzene is one component a max. occurs. This would indicate chem. union with the solvent. For H_2O as one component negative curves are obtained showing greater dissociation of the acid. CHCl_3 and CCl_4 give intermediate curves. The change in soly. can be calcd. from the formula $S_t - S_o = K C^p$, in which K and p are consts., S_t = S_o is the soly. lowering and C the concn. of solvent added to 100 g. of the other solvent. This formula applies to all curves irrespective of their shape. R. H. L.

Lecture-table demonstration of osmotic pressure. J. W. RAMSEY AND R. N. MAXSON. *J. Chem. Education* 5, 476-7 (1928). R. H.

Osmosis of ternary liquids. I. Experimental part. F. A. H. SCHREINEMAKERS AND B. C. VAN BALEN-WALTER. *Verslag Akad. Wetenschappen Amsterdam* 37, 20-30 (1928). An aq. soln. of NaCl is sepd. from a Na_2CO_3 soln. by means of a membrane (parchment, bladder) and allowed to diffuse. The kinetics of the osmotic process are recorded. II. Experimental part. *Ibid.* 341-50. In the same kind of expts. as in part I, but with a membrane of colloidal or of colloidal and $\text{Cu-Fe}(\text{CN})_6$ investigations were carried out with aq. solns. of $\text{Na}_2\text{S}_2\text{O}_8$ and BaSO_4 . A. J. HENNE.

Osmosis of ternary liquids. General considerations. IV. F. A. H. SCHREINEMAKERS. *Verslag Akad. Wetenschappen Amsterdam* 36, 1218-26 (1927), cf. C. A. 22, 1508.—A continuation of the series of theoretical papers on this subject. B. J. C. v. D. H.

The effect on miscibility of binary liquid systems on the addition of a third substance. CARL WAGNER. *Z. physik. Chem.* 132, 273-94 (1928).—A theoretical paper on the effect of adding a material to a binary liquid system. Equations derived from thermodynamic relations show the type of curve obtained and its change on addn. of the third component. The miscibility is lowered if the soly. of the third material is lower than the additive relation would require and the soly. curve is then convex. If the soly. is greater a concave curve is obtained. Exptl. data show that the theory gives only qual. results. The field strength about a dissolved mol. in a mixt. is believed to be greater than required from the additive law, thus causing deviations observed. R. H. LAMBERT.

Chemical studies on organic coloring matters. III. Effects of some inorganic compounds on the viscosity of Orange GG. TAKU UEMURA AND SADAHIRO HACHIYA. *J. Chem. Soc. Japan* 48, 6-16 (1927).—U. and H. measured the abs. viscosities and sp.

viscosities of mixts. of aq. solns. of Orange GG of const. concn. and aq. solns. of Na_2SO_4 , Na_3PO_4 , Na_2HCO_3 and H_2SO_4 , varying their mixing ratio, and obtained the following results: (1) Both abs. viscosity and sp. viscosity are linear functions of the mixing ratio; (2) abs. viscosity is inversely proportional to the temp.; (3) there is no definite relation between the sp. gr. and the time of flow through the capillary of the viscometer; (4) the relation between sp. viscosity and temp. is linear, while the relation between abs. viscosity and temp. is not linear.

S. KUNISAWA

Conductometric and cryoscopic studies of salts of dimethylpyrone and acetic and chloroacetic acids in benzene. MARK RABINOVICH. *Z. physikal. Chem.* **132**, 83-100 (1928).—In order to furnish further data (cf. *C. A.* **20**, 1751) for the theory of electrolytic dissociation R. has measured the cond. of AcOH , mono- (I), di- (II) and trichloroacetic acids in C_6H_6 (dried over CaCl_2 and Na) in the presence of varying amts. of dimethylpyrone (DP) (dried over P_2O_5) at 25° and found that it exceeds the value obtained for these acids alone in C_6H_6 ($K_{25} < 1 \times 10^{-12}$) and increases in the order $\text{I} < \text{II} < \text{III}$ as in H_2O . The ratio of acid to C_6H_6 was approx. 1.5. The max. ($K \times 10^6$) (I) = 6.60; (II) = 87.8; (III) = 435 corresponds with the max. concn. of (DP) $_2$ S (S = mol of acid). The consens. of the various mol. complexes present were detd. cryoscopically with a Beckmann app. The conductivities of the pure acids are greater than their conductivities in C_6H_6 solns. In C_6H_6 soln. the cond. varies as the assocn. $\text{I} > \text{II} > \text{III}$. R. believes that DP plays the same role in C_6H_6 as H_2O does in aq. solns., forming oxonium salts which dissociate and conduct the current. The opinion is expressed that electrolytic dissociation is detd. by intramol. dissociation, and that reaction with the solvent, solvation or autosolvation so influences the mol. that the intramol. ions dissociate. Cond. and cryoscopic data and graphs are given.

E. R. SCHERZ

Electrical conductance of nickel sulfate solution and ionic conductance of nickel. KWANJI MURATA. *Bull. Chem. Soc. Japan* **3**, 47-53 (1928).—The conductances of aq. solns. of NiSO_4 have been measured at 25° and 18° . If the consens. are 1, 0.5, 0.2, 0.1, 0.05, 0.02, 0.01, 0.005, 0.002, 0.001, 0.0005, 0.0002, 0.0001 resp., the equiv. conductances are, 29.091, 35.222, 43.585, 50.755, 59.160, 72.254, 82.69, 93.16, 105.49, 113.05, 118.66, 124.14, 126.90, at 25° and 25.066, 30.370, 37.595, 43.833, 51.008, 62.02, 70.89, 79.48, 89.94, 96.31, 101.00, 105.37, 108.70 at 18° . From these values, M. calcs. $\lambda_0 = 113.6$, $\lambda_{1/2}\text{Ni}^{++} = 45.1$, $\lambda_{1/2}\text{Ni}^{++} = 45.1$ at 18° and $\lambda_0 = 133.0$, $\lambda_{1/2}\text{Ni}^{++} = 53.0$ -54.2 at 25° . The relative viscosity of a 0.05 *M* soln. is 1.0209 at 18° and 1.0175 at 25° . The degree of ionization of the same soln. is $\alpha_{18} = 0.3883$ and $\alpha_{25} = 0.3939$.

A. L. HENNE

Viscosity and ion speed of dilute salt solutions. FRED BOND AND J. D. ROBERTS. *Col. School of Mines Mag.* **17**, No. 1, 3-14 (1927).—At a cyanide mill the substitution of $\text{Ca}(\text{CN})_2$ for NaCN caused a reduction in the extn. of Ag. The work was undertaken to det. the effect due to the viscosity and the cond. The viscosities of a number of solns. were detd. Cond. measurements were carried out in the same solns. The rate of reaction varies with the viscosity.

L. D. R.

The calculation of electrolytic dissociation from electrical conductivity. W. NERNST. *Sitzb. preuss. Akad. Wiss.* **1928**, 4-8.—The degree of assocn. of strong binary electrolytes is negligible at 0.001 *N* concn. and the equiv. cond. ratio $\lambda/\lambda_{0.001}$ for such salts affords a better comparison of their degrees of dissociation than the λ/λ_∞ formula of Arrhenius.

E. R. SMITH

The hydrogen-ion concentration of aqueous iodine solutions. H. M. DAWSON. *J. Chem. Soc.* **1928**, 259-63.—It is shown how the p_{H} values of aq. solns. which contain iodine and iodide can be calcd. from a consideration of the equil. involved in the interaction of I_2 , I^- and H_2O . The calcs. show that for a fixed concn. of I_2 the H-ion concn. decreases with increase in the amt. of I^- and for solns. with a fixed ratio of (I^-)/(I_2) it increases with diln.

E. R. SMITH

Influence of the isoelectric point of asparagine on its hydrolysis by acids and by alkalis. DENTS BACH. *Bull. sci. pharmacol.* **35**, 93-107 (1928).—Ordinary and *l*-asparagine possess acid and amine functions for which the dissociation constants are $K_a = 1.4 \times 10^{-9}$ and 1.5×10^{-12} , resp. They also have an amide function for which the particular dissociation const. has not been detd. The isoelec. point is p_{H} 4.3-4.4. The hydrolyses of the amide, acid and alkali functions of asparagine are carried out by aid of various buffers in solns. having a p_{H} range from 0.9 to 9.6 and at temps. from 100° to 127° , the amt. of NH_3 formed per hr. measuring the extent of the hydrolysis. The min. of NH_3 for each of 6 temps. ranging from 100° to 127° was at p_{H} 4.6. The relations of these findings to the nutrition of certain fungi are discussed.

L. W. RIGGS

Ion partition coefficient. PERIK LARSSON. *Svensk Kem. Tids.* **39**, 122-30 (1927); cf. *C. A.* **21**, 3309.—The ion partition coeffs., P_{B} and P_{A} of a compd. BA between 2 solvents are given by $P_{\text{B}} + P_{\text{A}} = 2 \log (h_1/h_2) - 0.4 l_1^{-3} + 4 l_2^{-3}$, in which h_1 and h_2 are

the solubilities in the resp. solvents. P_A for H_2O and $EtOH$ has been previously detd. as 2.1. The solubilities in mols. per l. of the Ag salts of the following acids in H_2O and $EtOH$, resp., at 25° are. $AcOH$ 0.067, 0.00113, $EtCO_2H$ 0.050, 0.00085; $BzOH$ 0.0114, 0.00035; $PhCH_2CO_2H$ 0.0145, 0.0018; $PhCH_2CH_2CO_2H$ 0.0042, 0.00026; $PhOCH_2CO_2H$ 0.015, 0.00036; $Ph_2C(OH)CO_2H$ 0.0036, 0.00051; $C_{10}H_7CO_2H$ 0.0060, 0.0016; $Ph_3CCH_2CO_2H$ 0.00037, 0.000117, $P_B + P_A = 2.1$ (i. e. P_A) for these anions are. resp : 1.7, 1.6, 1.1, 0.2, 0.4, 1.3, -0.1, -0.5 and -1.2. A. R. ROSE

The activity coefficient of nitric acid in water. E. ABEL, O. REDLICH and B. v. LENGVEL. *Z. physik. Chem.* **132**, 189-207(1928).—The activity coeffs. of HNO_3 in H_2O soln. have been detd. by the f-p. method. The app. contg. a special stirring mechanism is described; temps. can be measured to 0.0002° . The range of concns. studied was from 0.005 to 4.0 M and 40 concns. were measured. The osmotic coeff., j , is calcd. from the Debye-Hückel theory and results are compared with others from the literature. The activity coeff. passes through a min. with concn. R. H. LAMBERT

Strong electrolytes. J. A. V. BUTLER. *Nature* **121**, 500(1928).—While the equations of Hückel (*C. A.* **19**, 1649) are capable of representing the activity coeffs. of salts in concd. solns. using const. evaluated from the data themselves, it is doubted if these const. have the postulated relation with the dielectric const. lowerings actually produced by electrolytes (*C. A.* **20**, 1162). A modification of Debye's equation is proposed, which leads, however, to a differential equation the solution of which B. has been unable to obtain. F. A. JENKINS

Buffer action. VI. Phase buffer action. KARL KLINKE. *Helv. Chim. Acta* **10**, 627-42(1927); cf. Moser, *C. A.* **21**, 2279.—If one of the constituents of a buffer is only slightly sol. the usual equations for buffer action are modified because of the requirement of const. soly. product. This modification is developed mathematically and illustrated (data in graphs) for the titration of glycolic acid with $Ca(OH)_2$. The case where one constituent is a slightly sol. gas is illustrated by the reaction $Ca(OH)_2 + CO_2$. F. R. B

The thermal decomposition of hydrogen peroxide in aqueous solutions. B. H. WILLIAMS. *Trans. Faraday Soc.* **24**, 245-55(1928).—In glass and SiO_2 reaction vessels, the thermal decompn. of pure H_2O_2 solns. is a zero-order reaction, for the first portion of the decompn., for all initial concns. in a glass surface, and above a limiting concn. in the SiO_2 surface; the decompn. is due to adsorption of the H_2O_2 mols. on the walls of the reaction vessel, and to adsorption of the H_2O_2 mols. on the surface of the dust present in soln. An upper limit to the magnitude of the decompn. due to adsorption by the dust has been detd. by using a wax vessel. The critical increment of the decompn. of this process is 9000 cal. The adsorption of the H_2O_2 mols. on the SiO_2 surface is directly proportional to the concn. of the H_2O_2 in the bulk of the soln., below a limiting concn. of 1.7%. Between 1.7% and 5%, the adsorption on the SiO_2 surface is independent of the concn. of the H_2O_2 in the bulk of the soln. This is accounted for by the assumption that the surface of the SiO_2 is satd. with a unimol. film of adsorbed H_2O_2 . This implies that the SiO_2 surface possesses a certain no. of *preformed* active points. The critical increment of the decompn., due to adsorption on the SiO_2 surface alone, is 17,000 cal. For higher concns. (above 5%) in the bulk of the soln., other factors are brought into play, such as secondary adsorption films. On the glass surface, any one decompn. is, for its first portion, a zero-order reaction, which changes into one of a unimol. nature, as the concn. of the H_2O_2 in the bulk decreases. This is due to the fact that the effective catalytic area of the glass surface and dust surface is satd. with adsorbed H_2O_2 mols. for the first period of the reaction; any mol. suffering decompn. is immediately replaced by other mols. from the bulk of the soln. As the concn. of the H_2O_2 in the bulk decreases, a point is reached when the mols. suffering decompn. are no longer immediately replaced by mols. from the bulk, and now the concn. of the adsorbed H_2O_2 mols. becomes proportional to the concn. of the H_2O_2 in the bulk. The critical increment of the process involving adsorption on the glass surface alone is 23,000 cal. The initial activity of the glass surface is proportional to the initial concn. of the H_2O_2 soln. This is accounted for on the assumption that the H_2O_2 creates centers of activity on the glass surface; the active points, when once formed, remain active throughout any one decompn. There is, therefore, a sharp contrast between the glass surface and the SiO_2 surface in regard to active points. A. L. HENNE

Decomposition of carbon monoxide by reduced copper below 400° . A. STROPOR. *Bul. chim. soc. română științe* **29**, 79-82(1926).—Asbestos satd. with $CuSO_4$ soln. was treated with 50% KOH , washed, dried at 120° and reduced by CO at 200° to 210° to const. wt. In a 50-mm. layer (11-mm. tube) for a gas stream of 200 cc. CO per hr. further reduction was effected and decompn. of CO at temp. up to 360° . From the

wt. changes of the catalyzer and the CO_2 caught in the gases follow values for x the CO_2 from CuO reduction and y the CO_2 from CO decompn. The figures obtained were: from 200° to 210° per 100 cc. gas 4.37 cc. CO_2 , $x/y = 5/72$, from 250° to 260° 1.40 cc. CO_2 , $x/y = 2.04$; from 300° to 310° 1.77 cc. CO_2 , $x/y = 1.80$, from 350° to 360° 2.34 cc. CO_2 , $x/y = 3.63$. In 3 other expts. it was found that the total quantity of CO_2 from CO decomposed from 200° to 360° is const. for the same quantity of catalyzer. The results with pure CuSO_4 (in the former expts. it contained 0.99% FeSO_4) were largely the same.

B. J. C. VAN DER HOEVEN

Decomposition of diacetone alcohol by weaker bases. GÖSTA ÅKERLÖF. *J. Am. Chem. Soc.* **50**, 733-44.—The decompn. velocity of diacetone alc. in solns. of weak bases contg. NaCl or Na_2SO_4 was measured at 25° . The ionization consts. for the bases: methylamine, dimethylamine, trimethylamine, ethylamine, diethylamine and triethylamine are probably more accurate than previous published values. The activity coeffs. of the weaker bases as electrolytes in salt solns. cannot be calcd. on the assumption that a weak base has the same proportionality factor between activity of base and reaction velocity as a strong one. A correction factor has been calcd., and the activity coeffs. decrease in dil. salt solns. to the same extent as for weak acids in the same salt solns.

JAMES M. BELL

Decomposition of triethylsulfonium bromide in mixed solvents. R. F. CORRAN. *Trans. Faraday Soc.* **23**, 605-14 (1927).—The velocity coeffs. of the unimol. decompn. of triethylsulfonium bromide have been detd. at 80° and 90° in mixts. of benzyl alc. with toluene and glycerol, resp. In general the reaction in org. solvents reaches practical completion, but in the mixts. containing glycerol an equil. was obtained and a correction for it applied to the velocity coeffs. in these mixts. The results show that the rate of decompn. is increased by toluene and decreased by glycerol. Both solvents, however, cause a fall in the apparent crit. increments of activation as calcd. from the temp. coeffs. This indicates anomalous behavior on the part of the glycerol. The absorption spectra of the salt in various mixts. have been detd. for the short infra-red region by the methods of Taylor and Lewis (*C. J.* **16**, 2263), the radiomicrometer being replaced by a thermopile and Moll galvanometer. With the benzyl alc.-toluene mixts. there is a shift in the position of the band head which is in satisfactory agreement with the alteration in the observed crit. increment. For the glycerol mixts. the head of the band shifts towards the shorter wave lengths, which is opposite to that calcd. from the crit. increments, but in the direction to be expected from the effect of glycerol on the velocity coeff. Therefore the band head probably gives the true crit. increment. No explanation of the anomaly can be given. Investigations on the velocity of decompn. in practically dust-free propyl alc. solns. indicate that the dust ordinarily present has no appreciable influence. (Cf. Rice, *C. A.* **20**, 3374.)

B. C. A.

Reactivity of glucose in presence of hydrochloric acid. I. E. A. MOELWYN-HUGHES. *Trans. Faraday Soc.* (advance proof) Feb. 1928.—An increase in rotation of N HCl solns. contg. 10, 20, 30, 40 and 50 g. glucose in 100 cc. occurs to the extent of 4.51% for the first soln. and 20.84% for the last soln. This increase is due to the partial conversion of glucose into diglucose and water—a condensation already demonstrated. Furthermore, the reaction is of the first order—a result not in agreement with the accepted mechanism. This is a pseudo-unimol. change, since the concn. of one of the reactants, normal glucose, far exceeds that of the other, active glucose. On this basis and from the velocity consts. at 60° and 70° the crit. increment of the process is calcd. as 33,500 cals., a value somewhat higher than that for the inversion of sucrose, or the hydrolysis of maltose or of amygdalin.

JAMES M. BELL

Kinetics of the hydrolysis of certain glucosides (salicin, arbutin and phlorhizin). E. A. MOELWYN-HUGHES. *Trans. Faraday Soc.* (advance proof) Feb. 1928.—The rates of hydrolysis of these glucosides by means of HCl have been detd. at 60° and 70° . A comparison of velocity consts. and crit. increments of certain disaccharides, trisaccharides, and glucosides shows that the crit. increment of the reaction is a more significant quantity than velocity itself in that it lends itself more readily to comparative treatment. The mean value of the crit. increment for 3 fructoses (sucrose, raffinose and melezitose) is 25,700 cals., for 3 glucosides (maltose, salicin and arbutin) is 31,600 cals. and for lactose is 27,100 cals. The exptl. value of the crit. increment seems to be detd. largely by the nature of the link ruptured and is apparently independent of the stereochem. (α or β) character of the bond. The crit. increment for phlorhizin (23,100 cals.) is abnormally low. This glucoside is exceptional also in the sp. rotation of the parent glucose and in its physiol. action.

JAMES M. BELL

Constant of mass action. R. D. KLEEMAN. *Phil. Mag.* [7], **5**, 263-71 (1928).—When the law of mass action is derived as has been done heretofore by means of a cyclic

process, it has not been considered that certain mol. species (HI for instance) would dissociate after having passed through a semipermeable membrane. K. takes the view that this situation must be taken into account and proposes a derivation of the mass law which yields the equil. const. in general as a function of such quantities as the vol. of the mixt., its temp., the masses of the constituents, etc. GEORGE GLOCKLER

Quantum theory of quasi-unimolecular reactions. O. K. RICE. *Proc. Nat. Acad. Sci.* 14, 113-8(1928); cf. *C. A.* 21, 3149 and following abstract.—The author discusses the modifications required by quantization in the general equation for the reaction rate of gaseous reactions which are unimolecular at high pressures but which deviate from the unimolecular at low pressures. It is shown how to evaluate the necessary quantities in terms of the thermal properties of the decomposing molecule. W. W.

Theory of the decomposition of azomethane. O. K. RICE. *Proc. Nat. Acad. Sci.* 14, 118-24(1928).—The mathematical theory previously developed (cf. preceding abstract) is applied to the case of azomethane. The chain reaction described by Christiansen and Kramers is not important for the thermal case. The evidence is strongly in favor of the view that in the decomposition of azomethane activation is produced by collisions. The chance of reaction of an activated mol. depends upon the energy in about the same way that one would expect if the reaction is due to energy becoming localized in a particular place in the mol. ARTHUR FLEISCHER

The mechanism of chemical reactions. H. S. TAYLOR. *Proc. Am. Phil. Soc.* 65, 90-8(1926); *Science Abstracts* 30A, 346; cf. *C. A.* 20, 546; 21, 678.—Evidence is brought forward for the view that a no. of reduction processes depend on the intervention of H atoms, especially reactions conducted in the presence of excited Hg vapor. The evidence includes the production of H_2O_2 from mixts. of H and O; also the observed ratio between the no. of mols. reacting and the quanta absorbed at least 20 mols. of H disappear per quantum at a frequency corresponding to $\lambda = 2536.7 \text{ \AA}$. Further evidence is supplied by expts. which show the sensitization of the reaction between H and ethylene by the thermal decomposition of metallic alkyls. H. G.

Hydrolysis of the peptide (—CO.NH—) linking. A. I. ESCOLME and W. C. M. LEWIS. *Trans. Faraday Soc.* 23, 651-60(1927).—The rate of hydrolysis of acetylglycine at 60° and 70°, and of benzoylglycine at 80° and 90°, by HCl of different concns. has been detd. in aq. solns., and also in solvents consisting of mixts. of water with glycerol, propyl alc. and KCl, resp. In all cases the reaction is unimolecular. Under all conditions the same crit. increment of activation has been obtained for both amino acids, namely, 22,000 g.-cal. No quant. statement of the mechanism of the process involved has been found possible, but the results suggest that the activity of the H ion and of the water are important factors, except where a strong electrolyte, such as KCl, is present, when the activity theory becomes inapplicable. The results also suggest that the activity of the substituted amino acid, which should logically enter into any "activity" theory of chem. change, cannot differ much from the ordinary vol. concn. With the object of getting further information on this point, soly. detns. of acetylglycine and benzoylglycine in mixts. of water, glycerol and HCl have been made. The addn. of glycerol, however, diminishes the soly. of acetylglycine, while it increases that of benzoylglycine. B. C. A.

Electrochemically prepared perphosphates. FR. FICHTER and ERNST GUTZWILLER. *Helv. Chim. Acta* 11, 323-37(1928).—The electrolysis of a soln. contg. KH_2PO_4 and KF gives a mixt. of $K_4P_2O_8$ and K_3HPO_4 , thus: $2K_2HPO_4 + F_2 = K_4P_2O_8 + 2HF$; $K_4P_2O_8 + H_2O = K_2HPO_4 + K_2HPO_4$. A procedure is given whereby the formation of the unstable mono-perphosphate is retarded and an 80% yield of $K_4P_2O_8$ is obtained. Rb_2HPO_4 gives $Rb_4P_2O_8$, which is difficult to purify. $(NH_4)_2HPO_4$ gives a 97% yield of $(NH_4)_4P_2O_8$, which is unstable because of the oxidation of the NH_4 ion by the P_2O_8 ion. $K_4P_2O_8$ with $BaCl_2$, $ZrSO_4$ and $Pb(NO_3)_2$ gives $Ba_4P_2O_8$, $Zn_4P_2O_8$ and $Pb_4P_2O_8$, resp. $MgSO_4$ (or magnesia mixture) does not ppt. $K_4P_2O_8$. This reaction may be used to sep. phosphate from perphosphates. The oxidizing action of $K_4P_2O_8$ is accelerated by the addn. of $MnSO_4$, Fe^{++} , Ni and Pb salts; and particularly by $AgNO_3$. J. S. REICHERT

Effect of water on reactions in the solid state. BERNWARD GARRE. *Zement* 16, 658-60(1927); cf. *C. A.* 22, 520.—Inorg. compds. in powd. form were mixed with varied amts. of water and formed into pellets $0.7 \times 1 \text{ cm.}$ under 500 kg. pressure. SiO_2 pellets when heated to 900° showed increased strength with increased water content of the batch. Similar results were obtained from $CaCO_3$, $Al(OH)_3$ and Al_2O_3 . H. F. K.

Oxidation of stannous hydroxide in sodium carbonate solution by means of air. SUSUMU MIYAMOTO. *Bull. Chem. Soc. Japan* 3, 43-7(1928); cf. *Bull. Chem. Soc. Japan* 2, 155(1927).—The oxidation velocity of $Sn(OH)_2$ suspended in Na_2CO_3 solns. of various

concn. by means of air is independent of the quantity. The effect of the concn. of Na_2CO_3 is small. Temp. has little effect. Na_2SnO_2 oxidizes rapidly, $\text{Sn}(\text{OH})_2$ very slowly. • • • A. L. HENNE

Reduction of carbon dioxide. HANS KAUTSKY. *Naturwissenschaften* **16**, 204 (1928).—A preliminary note. Efforts were made to obtain reduction of CO_2 by chemosynthetic or photochem means as a parallel to the biol. CO_2 reduction process. By absorption on permutoid aminosiloxenes, e. g., $\text{Si}_6\text{O}_8(\text{NH}_2)_8$ carbaminosiloxenes were formed, colored, fluorescent and oxidizable by air. Reduction of the CO_2 is effected by slow oxidation (addn. of small quantities of O_2 during several days at room temp.) of the Si-Si bonds in the boundary space, HCN was formed, O_2 being taken up by the Si compds. No CO_2 reduction was obtained without O_2 addn., unless the substance was irradiated with visible light. B. J. C. VAN DER HORVEN

The dissociation pressure of cupric metaborate. N. PARRAVANO AND G. MALQUORI. *Z. physik. Chem.* **130**, 167-9 (1927).—The pressure of O_2 in equil. with cupric metaborate at different temps is: 725°, 47 mm Hg, 800°, 107, 837°, 172; 860°, 237, 885°, 360, 900°, 462, 950°, 757. For these data $\log P$ is a linear function of $\log T$. The dissociation pressure of cupric metaborate is much greater than that of CuO at the same temp. This study was suggested by the change in color from the blue to reddish yellow of fusions of $\text{CuO} + \text{B}_2\text{O}_3$ between 700° and 900°. R. H. LOMBARD

Equilibrium (polarization) composition of the liquid salt phase and the liquid alloy phase in a system composed of equiatomic quantities of sodium, potassium and iodine. H. F. SILL. *J. Phys. Chem.* **32**, 466-70.—When equiv quantities of KI and metallic Na, or of NaI and metallic K are brought to equil. at 700° the metal phase has the composition $\text{Na K} = 10:1$. Comparison with the results of Jellinek and Czerwinski (*C. A.* **18**, 2693) and of Jellinek and Tomoff (*C. A.* **19**, 1084) shows that the combined effect of replacing I by Cl and of dissolving the alkali metal in Pb was to reduce the equil. at ratio to 3:4:1. Comparison with the results of Smith and Ball (*C. A.* **11**, 416) shows that the further substitution of Pb by Hg and the introduction of the solvent water reduces the ratio to 1:5:1. JAMES M. BELL

Thermodynamic equilibria and reciprocal action in the new gas theory. W. BOTHE. *Z. Physik* **46**, 327-34 (1928).—The law of mass action is derived in such a way that it may apply to mixts. of the Bose-Einstein and Fermi gases. The law of reciprocal action of mols., atoms and electrons in such mixts is discussed. R. H. L.

The efflorescence of sodium sulfite. D. N. TARASSENKOV. *Z. anorg. allgem. Chem.* **169**, 407-12 (1928).—The vapor pressure of the system Na sulfite heptahydrate, Na_2SO_3 and water was measured by the static van Bemmelen method at 15° and by the tensimeter from 0° to 30°. The measurements at 15° by the 2 methods agree. The vapor pressure at this temp. is 9.3 mm. If the humidity of the atm. is below this value at this temp. Na sulfite heptahydrate will effloresce. A. FLEISCHER

The influence of pressure on the reaction velocity and the function of the medium. A. L. TH. MOESVELD AND WILHELMINA A. T. DE MEESTER. *Proc. Acad. Sci. Amsterdam* **30**, 1039-53 (1927).—See *C. A.* **22**, 1084. F. H.

Catalysis under reduced pressures. VICTOR GRIGNARD. *Bull. soc. chim. Belg.* **37**, 41-62 (1928).—A summary of the question, based chiefly on the work of Grignard, Escourrou and Mingasson. The following points are emphasized: reduction of ethylenic alics.; hydrogenation of nitriles into aldimines; reduction of acid chlorides; mechanism of the hydrogenation of α -ethylenic ketones and of phenols, mechanism of the catalytic dehydrogenation of alics. A. L. HENNE

New vanadium catalyst for sulfuric acid. L. F. NICKELL. *Chem. Met. Eng.* **35**, 153 (1928).—Patented catalysts consisting of complex V silicates, with or without inert diluents, have shown activities closely paralleling those of the best Pt catalysts. Furthermore, the V catalysts are not poisoned by such substances as As or HCl. It is believed that within the next decade the use of Pt catalysts for H_2SO_4 will be entirely abandoned, and the use of V catalysts completely established in their stead. R. L. DODGE

Catalytic actions. E. K. RIDEAL. *Chem. Reviews* **5**, 67-84 (1928).—A crit. discussion of various opinions that have recently been expressed with respect to the mechanism of some simple catalytic reactions. The reactions include contact hydrogenation and dehydrogenation, homogeneous oxonium and OH^- ion catalysts and oxidative gas-phase reactions. R. L. DODGE

Researches on gaseous catalysis by means of the metals of the platinum group. L. DUPARC, P. WENGER AND CH. UFFER. *Helv. Chim. Acta* **11**, 337-48 (1928).—A study of the oxidation of NH_3 with Rh, Pd and Ir catalysts, and the reduction of N_2O and NO with Pd and Ir catalysts. Neither catalyst gave NH_3 in the reduction of the

oxides of N, but only N_2 and H_2O . Gaseous catalysis is therefore not phys. but chem. and implies the momentary fixation of one of the reacting gases by the catalyst. If the phenomenon were simple occlusion, the combination of N_2 with both O_2 and H_2 should be realized with the same catalyst. J. S. REICHERT

The reaction of organic halogen compounds with copper in the presence of pyridine. P. KARRER, W. WEHRLI, E. BIEDERMANN AND M. DALLA VEDOVA. *Helv. Chim. Acta* 11, 233-9(1928).—Reaction between Cu and many org. halogen compds. is greatly facilitated by the addn. of dry pyridine, the reaction in such cases often becoming violent. The catalytic effect is considered due probably to the soly. of the Cu halide in pyridine and the formation of a complex salt. The reaction is limited for preparative purposes by the no. of Cu pyridine complexes usually occurring together, the difficulty of sepn. and possible resin formation. The reactions of Cu in the presence of pyridine on toluenesulfonyl chloride, phthalyl chloride and hippuric acid were studied. A possible mechanism of the reaction is suggested. R. K. WORNER

Conductivity and catalytic action of trinitro-*m*-cresol in ethyl alcohol solutions. HEINRICH GOLDSCHMIDT, ERLING MARUM AND LIEF THOMAS. *Z. physik. Chem.* 132, 257-72(1928).—The conductivities of the Na and aniline salts of trinitro-*m*-cresol in abs. and ordinary EtOH are measured, from which λ_∞ for the cresol salt is calcd. The same is done for the free cresol itself and the degree of disson. and the affinity const. are calcd. therefrom. Trinitro-*m*-cresol is used as a catalyzer for the esterification of phenylacetic acid, acetic acid, butyric acid and isovaleric acid in abs. and in aq. EtOH. The rate const. K_4 for the H-ion concn. is larger than when picric acid is used as the catalyzer and it also appears not to depend on the concn. of the cresol. The rate of esterification with cresol catalyzer is exceptionally large for acetic and phenylacetic acids, is small for butyric acid and very small for isovaleric acid. R. H. LAMBERT

Catalytic reduction of nitro-organic compounds in the liquid system. O. W. BROWN, G. ETZEL AND C. O. HENKE. *J. Phys. Chem.* 32, 631-5(1928).—Nitrobenzene, α -nitronaphthalene, *p*-nitrotoluene, *o*-nitrophenol, *p*-nitrophenol, and dinitrotoluene were reduced with H gas at 15 to 47 atms. pressure. The reductions were catalyzed by reduced, powdered NiO (from $Ni(NO_3)_2$). The static method was used. The effects of variations in pressure, temp., time of reduction, kind of solvent and amt. of catalyst were studied. Quant. reduction of the nitro compds. to amines was obtained at 215° and 34 atm.; 0.52 g. catalyst per g. nitro compd. was the optimum catalyst ratio. C_6H_6 and CH_3OH were the best solvents. Ethylene glycol was a poorer solvent. R. L. DODGE

Effect of thermometric lag in fractional distillation. W. R. ORMANDY AND E. C. CRAVEN. *J. Inst. Petroleum Tech.* 14, 94-105(1928).—Hg-thermometer vapor-temp. observations are always liable to be in error, and the use of a thermocouple is greatly to be preferred in distns. of any importance. Lags occur at turning points in a distn. and may obscure indications of small amts. of components. In the case of nearly pure liquids the slow rise in temp. during distn. does not necessarily indicate impurities. The cold neck of a flask or column increases the initial lag. The total lag of a thermometer may be expressed as the sum of two terms and it appears that the initial lag of the Hg thermometer depends on the layer of condensed liquid around the bulb, the last slow rise depends more on the heating of the stem than upon the passage of heat into the bulb. Methanol, benzene, heptane, toluene, ether-isopropyl alcohol, benzene-toluene and petroleum spirit were used. S. L. B. ETHERTON

Heat transfer from a hot body in a moving liquid. JOH. SMEKEL. *Z. tech. Physik* 9, 49-57(1928).—A mathematical paper. B. J. C. VAN DER HOEVEN

A method for accurate determination of the specific heats of salt solutions up to 80°; including results for potassium nitrate and chloride solutions. F. T. GUCKER, JR. *J. Am. Chem. Soc.* 50, 1005-16(1928).—The app. used is a modification of the "twin calorimeter" of Joule and Pfaudler (see Richards and Gucker, *C. A.* 19, 2593); it is described in detail. An improved method for its standardization is given, it no longer being necessary to det. its heat capacity or the sensitivity of the thermal galvanometer system. The sp. heats of KCl and KNO_3 are detd. at 20°, 50° and 80°, and are nearly const. over this range. The results are accurate to at least 0.5 per mille. Zwicky's theory (*Physik. Z.* 27, 271(1926)) accounting for the abnormally low heat capacities of electrolytic solns. is not confirmed. J. B. LOZIAN

The accurate measurement of the specific heats of solid substances between 0° and 1625°. II. The specific heats of platinum and tungsten. F. M. JAEGER AND F. ROSENBOHM. *Proc. Acad. Sci. Amsterdam* 30, 1069-88(1927).—See *C. A.* 22, 1087. E. H.

Emissivity methods of determination of thermal conduction of metals. H. GREG-

ORY AND C. T. ARCHER. *Phil. Mag.* [7], 3, 931-44(1927).—Crit. discussion of development of emissivity methods for detg. thermal cond. of metal, where Newton's law of cooling holds, the wires being heated electrically. GEORGE GLOCKLER

A contribution to the thermodynamics of mixtures. V. FISCHER. *Z. Physik* 46, 427-43(1928).—A general relation is derived for various kinds of concn. and equil. limitations for a mixt. of two or three constituents. The expression for heat content and entropy are also derived. Application is made to the system Au-Cu. R. H. L.

Method of measuring radiant heat emitted during gaseous explosions. C. H. JOHNSON. *Phil. Mag.* [7], 5, 301-22(1928).—In a gaseous explosion, it is very important to discriminate between the emission of radiant energy from the wave-front and that from the hot products of combustion, a point to which little consideration seems to have been given by other investigators. In order to attain the desired result, a long narrow explosion vessel was used in which the rapid cooling of the burnt gases behind the wave reduced to almost negligible proportions the amount of radiation received from that source. A simple method for the calibration of a linear thermopile, necessarily placed at some distance from the bomb, is described. The effect of water, and incidentally of other catalysts, upon the emission of infra-red radiation from the wave-front in explosions of CO and O₂ has proved to be of considerable magnitude. In particular, an additional 7% of the gross heat of combustion was radiated from a dried gas mixt., in excess of that emitted in the presence of 1.9% of water vapor. In future, therefore, no theory designed to explain the action of water in promoting spread of flame through CO-O₂ mixts. can be considered complete that does not include the hitherto unrecognized radiation factor. GEORGE GLOCKLER

The principle of the unattainability of zero absolute. F. SIMON. *Z. Physik* 41, 806-9(1927); *Science Abstracts* 30A, 583.—It is postulated that an arrested system, such as a supercooled liquid, soln. or metastable crystal condition, for which there is still an entropy change at zero abs., cannot be employed for the attainment of zero abs. This is illustrated by data for H₂, which indicate that the temp. coeff. of the melting pressure disappears at zero abs. Similar relations apply to the entropies of amorphous glass and supercooled glycerol previously considered. (Cf. *C. A.* 21, 1217.) According to the theorem of the unattainability of zero abs. the entropy differences of all the states of a system between which a reversible transition can occur disappear at the lowest temps. H. G.

Mercury and its compounds in ancient times. E. R. CALEY. *J. Chem. Education* 5, 419-24(1928). E. H.

Mercury as electrolyte. GEORG NEIDL. *Z. tech. Physik* 9, 76-7(1928).—Expts. are described in which the solution tendency of Hg in water causes Hg drops to revolve between electrodes and to give a boiling effect. B. J. C. VAN DER HOEVEN

The measurement of the conductance of electrolytes. I. An experimental and theoretical study of principles of design of the Wheatstone bridge for use with alternating currents and an improved form of direct-reading alternating-current bridge. GRINNELL JONES AND R. C. JOSEPHS. *J. Am. Chem. Soc.* 50, 1049-92(1928).—A new form of Wheatstone bridge is designed and built, using audio frequencies of 500-2400 cycles per sec. Sources of error in standard bridges have been found exptly. and eliminated in the new app., making it more precise, sensitive (to 1 p.p.m.) and convenient. Some of the new features claimed for it are: (1) a correct method of grounding; (2) use with either a.c. or d.c., changing from one to the other by throwing 2 switches; (3) direct reading; and (4) resistance adjustment to 0.001 ohm in the resistance instead of the ratio arms. Two new resistance boxes are built and described. J. B.

The conductivities of dilute germanium, gallium, silver and copper amalgams. A. L. JOHNS AND E. J. EVANS. *Phil. Mag.* [7], 5, 271-89(1928).—Amalgams of 0.01 and 0.1% by wt. were measured at various temps. The resistivities for various concns. are given in tables as also the temp. coeffs. GEORGE GLOCKLER

The constitution of solid electrolytes. III. Studies with cuprous bromide. (From researches conducted with FRITZ LEOPOLD.) J. N. FRERES. *Ber.* 61B, 377-92(1928); cf. *C. A.* 21, 2093.—CuBr is a true mixed conductor, with only the Cu ion concerned either in electronic or ionic conduction. Between 200° and 330° the character of the conduction changes gradually from pure metallic to pure electrolytic. Increase in electrolytic cond. may be brought about through increase of surface in the conductor, through long-continued electrolysis, and through discharge of Ag and Pb ions from their salts by CuBr. These observations are in good agreement with the hypothesis of functional differentiation of the ions in the lattice. R. J. HAVIGHURST

Haber's glass cell. W. S. HUGHES. *J. Chem. Soc.* 1928, 491-506.—The method of making and using the glass-cell electrode is explained. The glass should be nearly

free from K_2O , Al_2O_3 and borates. A glass contg. 72% SiO_2 , 8% CaO and 20% Na_2O proved satisfactory. The bulb should be blown rapidly to avoid devitrification. The behavior of the cell is best explained by the hypothesis that the H -ion concn. is held relatively const. within the glass phase by the buffer action of the Na acid silicate in the glass. The following dissoc. consts. were detd. by measuring the p_H of $1/2$ neutralized buffer mixts.: H_2AsO_4 , $K_1 = 8.3 \times 10^{-8}$; H_2CrO_4 , $K_2 = 1.0 \times 10^{-7}$; H_2AsO_4 , $K_1 = 6 \times 10^{-10}$; HN_3 , $K = 2.56 \times 10^{-5}$; $H_2N.NH_3OH$, $K = 1.4 \times 10^{-8}$. Detn. of the H -ion activity of $CuSO_4$ solns. showed that the hydrolysis of $CuSO_4$ is a slow reaction at ordinary temp. The p_H of an iodide-iodate mixt. was found to be about 6.9 after $1/3$ of the iodate was decomposed by the addn. of HCl . E. R. SMITH

Silver nitrate concentration cells in acetonitrile and benzonitrile. F. K. V. KOCH. *J. Chem. Soc.* 1928, 524-7.—The usual formula for the e. m. f. of a concn. cell was found to apply to solns. of $AgNO_3$ in acetonitrile and benzonitrile. The cation transference number of 0.1 N $AgNO_3$ in benzonitrile was detd. to be 0.396. E. R. SMITH

The dependence of electrochemical processes on pressure. HANS ERLÉNMEYER. *Helv. Chim. Acta* 11, 348-54 (1928).—Numerous electrolytic processes (both oxidation and reduction), which proceed in a normal manner under atm. pressure, become irregular and are retarded when the electrolysis takes place under N_2 pressure, e. g., K fumarate, $K_2S_2O_8$, $KHSO_4$ and $AcOH$. This is attributed to poorer agitation by the gases escaping from the electrolyte under pressure. The electrolysis of a mixt. of $Cu(NO_3)_2$ and HNO_3 is a rhythmic periodic process under atm. pressure but becomes steady under a N_2 pressure of 1000 atm. The electrolysis of Na_2S , which takes place without gas formation and depends only on the rate of diffusion of sulfide ion, shows the periodic variations independent of the pressure. Data are given for the resistance of 1.05 N H_2SO_4 , for the potential of a Cu anode, and for the passivity of a Ni anode. J. S. REICHERT

Chemical-electrical measurement of water. ANGELO BARBAGELATA. *Proc. Am. Soc. Civil Eng.* 54, 789-802 (1928); *Elettrotecnica* Feb. 15, 1926.—A method of measurement of the distribution of salt by cond. between fixed electrodes as a measure of rate of flow is described. The change in cond. between normal and salt water is measured by a Wheatstone bridge previously calibrated. Irregular distribution of the salt and air bubbles may be overcome. The method requires only a knowledge of the total amt. of salt introduced and time for mixing as values may be plotted and the flow calcd. from the consts. of the app. Corrections for temp. are important. Results check current meter and bulk measurements closely. A detn. can be made in 30 min. under conditions unsuited to other methods. FOSTER DEE SNELL

The solution tension of silver in solvents other than water. F. K. V. KOCH. *J. Chem. Soc.* 1928, 269-80.—E. m. f. measurements were made on cells of the type $Ag|AgNO_3(aq.)|AgNO_3(non-aq.)|Ag$. The non-aq. solvents were acetonitrile, benzonitrile, phenyl acetonitrile, ethyl cyanoacetate, pyridine, aniline, acetone, $MeOH$ and $EtOH$. Solns. of 3 concns. (approx. 0.1 N , 0.01 N and 0.001 N) were used in H_2O and in the non-aq. solvents except those in pyridine (0.01 N , 0.002 N , 0.001 N , 0.0005 N , aniline (0.01 N , 0.002 N) and acetone ($N/90$, $N/540$, $N/1000$). The sp. conductivities of all the solvents and solns. were detd. The e. m. f. values support the view that the electrolytic soln. tension of a metal varies with the solvent but shows no relation at all between the soln. tension and the dielec. const. of the solvent. Sp. attractive forces between metal ion and solvent mol. are assumed to explain the observed effects. Mols. contg. groups of an ammoniacal or nitrile character have a greater affinity for the Ag ion than those contg. OH or ketone groups. The results are tabulated. E. R. S.

The electromotive force and solvents of reversible cells. TAKEKO YOSHIDA. *J. Chem. Soc. Japan* 48, 435-41 (1927).—The e. m. f. of a cell is independent of the solvents of a reversible cell when the solvents have no relation to the cell reaction. By using the cell, $Cd(amalgam)|CdI_2(solid\ and\ satd.\ soln.)|Hg_2I_2|Hg$, the following e. m. f.'s were detd. for the solvents water, methanol, propyl alc. and acetone. For H_2O , $E = 0.41885 + 0.0003568(t - 30) + 0.0000008(t - 30)^2$; $MeOH$, $E = 0.41903 + 0.0003548(t - 30) - 0.0000029(t - 30)^2$; $EtOH$, $E = 0.41919 + 0.0003663(t - 30) - 0.0000012(t - 30)^2$; $PrOH$, $E = 0.41947 + 0.0003596(t - 30) - 0.0000065(t - 30)^2$; Me_2CO , $E = 0.41866 + 0.0003621(t - 27.5) - 0.0000011(t - 27.5)^2$. The temp. coeffs. of the cell at 30° are: For H_2O , $dE/dT = 0.0003568$ v.; $MeOH$, $dE/dT = 0.0003548$ v.; $EtOH$, $dE/dT = 0.0003663$ v.; $PrOH$, $dE/dT = 0.0003596$ v.; Me_2CO , $dE/dT = 0.0003679$ v. From the value E and $(dE/dT)_{30^\circ}$, the ΔF and ΔH from Gibbs-Helmholtz equation $\Delta H = nF(TdE/dT - E)$, are: For H_2O , $-\Delta H = 14,338$ cal., $-\Delta F$ (cal.) = 19,329; for $MeOH$; $-\Delta H = 14,375$, $-\Delta F = 19,337$; for $EtOH$; $-\Delta H = 14,221$, $-\Delta F = 19,345$; for $PrOH$ $-\Delta H = 14,328$, $-\Delta F = 19,358$; for Me_2CO ; $-\Delta H = 14,215$, $-\Delta F = 19,361$. T. SAITO

The calomel and silver chloride electrodes in acid and neutral solutions. The activity coefficient of aqueous hydrochloric acid and the single potential of the decimolal calomel electrode. MERLE RANDALL AND LEONA E. YOUNG. *J. Am. Chem. Soc.* **50**, 989-1004 (1928).—Dil. HCl reacts with Hg in the presence of air, forming HgCl, this causing an error in the e. m. f. of the H₂, Hg-HgCl cell. Detns. are made at 25° of the potentials of the Ag-AgCl, Hg-HgCl and H₂ electrodes in varying HCl concns, after freeing the HgCl, Hg and acid used of air. The activity coeff. of HCl is detd. from f. p., vapor pressure and e. m. f. (at 25°) measurements, and at 25° from the activity coeff. at the f. p. The potentials of various standard electrodes are recalcd. J. BALOZIAN

The electrolytic reduction potentials of organic compounds. III. Reduction potentials of nicotinic acid. MASUZO SHIKATA AND ISAMU TACHE. *Bull. Agr. Chem. Soc. Japan* **3**, 95-6 (1927).—In acidic or neutral salt soln. the observed reduction potentials shows agreement with calcd. values and it is assumed that the first stage of the reduction process consists in the reduction of the carbonyl group of nicotinic acid to aldehyde. The sec. stage is the reduction of the pyridine ring. Reduction in excess alkali does not take place. No products have so far been isolated. E. G. V. B.

An example of anode passivity. C. R. HARDY. *Chemistry & Industry* **47**, 214 (1928), cf Evans, *C. A.* **21**, 2836.—The screening effect of Fe(OH)₂ in the electrode of the alk. accumulator is probably much greater than of FeSO₄ in Muller's expt., but insufficient to cause more than a slight passivity. With unduly prolonged discharge, passivity is more pronounced. When the Fe(OH)₂ is reduced to Fe by charging, passivity may remain, although H₂ produced at the plate is considered to remove most of it. The condition is partially avoided by the use of extremely fine Fe powder and Hg or other catalyst. Passivity manifests itself as smaller capacity, lower voltage with a drop in the middle of the curve, poor capacity at high rates of discharge, and excess of hydrated compds. of Fe₂O₃ in the plates. FOSTER DEE SNELL

The valve effect of silicon electrodes. AUDUBERT. *Recherches et inventions* **9**, 93 108 (1928), cf *C. A.* **22**, 533.—The advantages of Si electrodes over metallic electrodes for current-rectifying valves are briefly discussed. The effects of c d, temp, self induction, frequency and chem. compn. were investigated, the method used is described and the results obtained are given in tabular and graphical forms. A. P.-C

Measuring differences of potential by means of dropping electrodes. A. FRUMKIN AND A. DONDI. *Trans. Karpon Inst. Chem.* **1926**, No. 5, 34-8. "The Hg dropping electrode used for measuring the adsorption difference of potential on the boundary Hg/soln. can also be applied to measuring the difference of potentials on the boundary air/soln. The latter measurement can be made by means of Kenrick's app. if the water electrode is replaced in this app. by a Hg dropping electrode. If the dissolved substances are not too volatile, the results obtained by this method are in fair agreement with those obtained by Kenrick's method." BERNARD NELSON

Measurements of contact potential between metals in vacuo. GÜNTHER MÖNCH. *Z. Physik* **47**, 522-41 (1928).—Description of 2 new methods for detg. the contact potential between 2 metals in a high vacuum. The expts. have been carried out with Cu and Ni. A. J. HENNE

The electrolysis of benzoic acid. EMIL BAUR AND EMIL MÜLLER. *Z. Elektrochem. angew. physik. Chem.* **34**, 98-103 (1928).—In the electrolytic reduction of benzoic acid (I) in aq. alc.—H₂SO₄ soln. a Pb cathode being used, the cathode gas contains benzene, CO₂, a small quantity of CO, and traces of formaldehyde, and the cathode liquid contains Δ²-cyclohexenone as the predominating aromatic product, the cathode being coated with C. In the electrolytic oxidation of I, the anode gas contains benzene, CO₂ and some CO, which are apparently formed through the intermediate formation of benzoyl peroxide. FREDERICK C. HAHN

The electrodeposition of indium with the dropping-mercury cathode. SEISU TAKAGI. *J. Chem. Soc.* **1928**, 301-6.—The electrodeposition of In at the dropping Hg cathode from solns. of InCl₃ in 0.1 N HCl proceeds reversibly in accordance with the Nernst equation. The normal deposition potential of the In ion in these solns. is -0.500 v. referred to the N calomel electrode and depends on the concn. of the HCl, being more negative the higher the concn. The method can be applied to the detection and estm. of In in metallic Zn and Ga. For this purpose the metals should be dissolved in HCl and the free acid concn. should be 0.1 N. The min. concn. of InCl₃ which can be detd. in this manner is 10⁻⁶ mols./l. The deposition potential of Ga cannot be detd. in acid soln. E. R. SMITH

The electrolysis of anhydrous formic acid. EMIL BAUR. *Helv. Chim. Acta* **11**, 372-5 (1928).—The electrolysis of anhyd. HCOOH gives CO₂ with traces of O₂ and CO at the anode. The reactions are formulated as follows: 2HCOO⁻ + 2 F = (HCO)₂O₂

(formyl peroxide); $(\text{HCO})_2\text{O}_2 = \text{HCOOH} + \text{CO}_2$; $2(\text{HCO})_2\text{O}_2 = 2(\text{HCO})_2\text{O} + \text{O}_2$; $(\text{HCO})_2\text{O} = \text{H}_2\text{O} + 2\text{CO}$. The formyl peroxide was detd. quantitatively. Oxalic acid and glyoxal were absent. Formaldehyde was produced at the cathode. J. S. R.

Temperature variation of the elasticity of Rochelle salt. E. P. HARRISON. *Nature* 120, 770(1927).—Attention is directed to the analogy between piezo electric phenomena and the reciprocal relations between strain and magnetic properties shown by ferro-magnetic metals. B. C. A.

The vibrating crystals. KLAUS SIXTUS. *Z. tech. Physik* 9, 70-4(1928).—Static characteristic curves (v vs. c . d.) are given and the influence of contact pressure, pole direction, c . d. and air pressure studied of the system zincite ore-steel point. An equation $P_{\text{max}} = \frac{1}{2} \sqrt{AR_0/\alpha}$ for P the contact potential, A the reciprocal heat resistance of the surrounding crystal surface, R_0 the elec. resistance of the contact at 0° , α its temp. coeff., represents the data well, confirming the thermoelec. theory of this phenomenon. From the falling characteristic of the contact resistance follows its ability to generate vibrations. Several oscillograms are shown. B. J. C. v. d. H.

Thermoelectric phenomena with thin metallic films. T. TERADA, S. TANAKA AND S. KUSABA. *Proc. Imp. Acad. Tokyo* 3, 200-3(1927).—A preliminary account of the thermoelec. effects produced by local heating of thin films of Ag, Bi, Sb, deposited chemically or by sputtering, on glass. When the image of a 300-c.p. filament lamp is focused on such films, voltages of the order of 10^{-7} v. were observed with Ag and of 10^{-6} v. with Bi and Sb. B. C. A.

Electrical phenomena in a billionth of a second. W. ROGOWSKI. *Naturwissenschaften* 16, 161-9(1928).—A lecture on the methods of R. (cf. *Arch. Elektrotechnik* 18, 479(1927)) for photographing elec. potential variations in extremely short lapses of time; the resolving power for details in the potential-time curves goes as low as 10^{-9} sec. The app. consists mainly of a vacuum (0.01 mm. Hg) discharge tube (30,000 v., 1 mm. opening in anode) with a photographic plate inside the tube as target. One variable magnetic field serves to move the electron stream over the plate with time (time coordinate), another field perpendicular to the first one is actuated by the potential to be examd. (potential coordinate). Several remarkable photographs are shown of various elec. phenomena: breakdown of elec. insulation, traveling waves in long circuits, immediately after closing, etc. B. J. C. VAN DER HORVEN

Low-voltage arcs. G. MIERDEL. *Physik Z.* 28, 344-60(1927); *Science Abstracts* 30A, 652.—M. collects and summarizes the results of numerous workers on low-voltage arcs. The various theories that have been put forward to explain the observed phenomena are then considered and the possible methods of ionization in the discharge chamber are fully discussed. It appears that since such effects as thermal or photoelec. emission, impact of pos. ions, or secondary collisions do not afford a satisfactory explanation of the phenomena of low-voltage arcs, it is necessary to assume that all normal arcs of this type and non-oscillatory must possess a cathode fall of potential of the same order of magnitude as the excitation potential of the gas in question, and that the field in the other part of the discharge is directed in opposition, so that the measured p . d. between the electrodes is less than the excitation potential. The explanation of the abnormal low-voltage arc is somewhat different. Again by assuming freedom from oscillation, it appears probable that the ionization of the atom can in this case take place in 2 stages, complete ionization by electron impacts following excitation due to absorption of resonance radiation. The theory advanced gives an explanation of all the effects observed with low-voltage arcs, including the decrease of min. potential with increased cathode temp. and with increased pressure. H. G. ●

Limits of the state of ionization and conductivity of the upper atmosphere by the Hessian cosmic radiation. H. BENNDORF. *Physik. Z.* 27, 686-92(1926); *Science Abstracts* 30A, 312.—Expressions are developed to det. the no. of ions per cc. and the cond. at any height in the atm. in terms of the measured values at the earth's surface. Consideration is given to the dependence of ionization, mobility of the ions and the cond. on the d. of the air and also to the effect of temp. changes. Taking a mass absorption coeff. between the limits 2.2×10^{-3} and 4.5×10^{-3} cm.²/g. for the cosmic radiation, the ionization and cond. produced by it at different heights are tabulated. Three sep. regions are considered: (1) in the lowest the neg. elec. carriers are the normal ions; (2) in the next they are partly normal ions and partly electrons; and (3) electrons only. The differences existing in these regions are discussed. The cond. (for d. c.) at a height of 100 km. acquires a value 10^{10} times that at the earth's surface, the air at this height conducting as well as dry earth. At 70-80 km. (Heaviside layer) a rapid increase of cond. occurs, while the calcd. and observed values at 9 km. agree very well. This provides an explanation of the presence of strong ionization in the

air and also of the large values found at night from expts. on the propagation of elec. waves. (See also *Z. Hochfrequenztechn.* 27, 66-73(1926).) H. G.

Theory of the electrical breakdown in gases at atmospheric pressure. L. B. LOEB. *J. Franklin Inst.* 205, 305-21(1928).—Townsend's theory of the elec. break-down of gases is discussed in the light of recent criticism and is found to be adequate except for one serious discrepancy. β , the no. of pairs of ions produced, according to the theory, by impact of positive ions with the gas mols. per cm. of gas cannot have this significance at the assumed fields at which air at atm. pressure breaks down, and in inert gases at low pressure, as the ions cannot acquire at these fields the ionizing energy. The theory would be applicable if fields about 10 times as great as those calcd. for a uniform potential drop between the electrodes before sparking, and it is shown that, because of the development of space charges by the difference in velocity between ions and electrons, such fields are possible under the conditions of spark discharge expts. The existence of these fields requires a finite spark lag interval of about 10^{-4} seconds, as yet not definitely observed. W. WEST

Alternating currents in rarefied oxygen in the same circuit. P. J. KIRKBY. *Phil. Mag.* [7], 2, 913-44(1926). *Science Abstracts* 30A, 313-4.—The phenomena described in this paper are an extension of the effects of which an account was previously given [cf. *Phil. Mag.* 15, 559-69(1908)]. In that paper the question is raised whether the elec. discontinuities at about 0.8 mm. were connected with the discontinuity in conforming to Boyle's law in O at the pressure 0.7 mm., described by C. Bohr and confirmed by other physicists, although Rayleigh, with the most careful investigation and with Bohr's result in his mind, entirely failed to discover any such departure from Boyle's law in the neighborhood of 0.7 mm. The results established in the present paper, however, show that the abrupt changes of current are not discontinuities in the strict sense of the word, but sudden shifts from one to the other 2 possible modes of conduction of electricity through the O at certain pressures and with certain orders of current assocd. with those pressures. Both these modes are regular and continuous with continuity of pressure, but the one is const. and the other is liable to modification by the past treatment of the gas. If these are assocd. with different mol. states, one of those mol. states, that of the ordinary currents, might conform to Boyle's law consistently, but not necessarily the other. H. G.

Variation of the specific inductive capacity of fluids in intense electric fields. L. CAGNIARD. *Compt. rend.* 185, 1195-7(1927).—Herweg's calcs. of elec. induction (*C. A.* 15, 467) are extended to include the effect of electrostriction, and it is shown that for an isothermal transformation there is an increase in the dielec. const. The calcs. do not apply to liquid dielectrics and do not afford evidence for or against the existence of dipoles. B. C. A.

Variation of dielectric constants of some gases with temperature and pressure. MAGDALENE FORRÖ. *Z. Physik* 47, 430-45(1928).—Measurements of the dielec. const. of H_2 , N_2 , air, CO and CO_2 were made at different temps. by a heterodyne method to find if the consts. of the Debye equation $(\epsilon - 1)/(\epsilon + 2)(T/d) = aT + b$ change with pressure. For H_2 , N_2 and air, a , the measure of the optical contribution to the dielec. const., is constant, and b , the permanent dipole contribution, is 0. For CO, b has a value varying with pressure at const. temp., with a temp. coeff. indicating a dipole moment of 0.108×10^{-18} at 1 atm. to 0.147×10^{-18} at 6 atm. The variation of b with density can be expressed equally well by a linear and by a quadratic equation. For CO_2 , the variation of b with density is given by a quadratic formula. The dipole moment of CO_2 varies from 0.192×10^{-18} at 1 atm. to 0.217×10^{-18} at 6.53 atm. W. WEST

Temperature changes of the dielectric constants of liquid helium. Preliminary measurements. M. WOLYKE AND W. H. KESOM. *Verslag. Akad. Wetenschappen* 36, 1209-17(1927).—Small capacity changes of the He condenser were detd. by a compensation method with a microcondenser (accurate to 8.7×10^{-4} cm.) consisting of brass cylinder with adjustable iron core, amber-insulated. High-frequency circuits were used for adjustment of the condenser, the final accuracy being 0.003% of the capacity change. The value of C_0 for the empty condenser was 174 cm. at the He b. p. The results of the 2 series of measurements between $T = 1.75^\circ$ abs. and 2.64° (4.21° abs. is b. p. of He) gave values for the const. K between 1.0566 and 1.0590; $(K - 1)/(K + 2)$ was between 0.1320 and 0.1283. A probable discontinuity around 2.3° abs. was found. B. J. C. VAN DER HOEVEN

The effect of electrostatic fields upon the dielectric constants. F. KAUTZSCH. *Physik. Z.* 29, 105-17(1928).—K describes in detail various methods and the app. finally used for his measurements. The liquids used and found suitable for the work were Et_2O , $CHCl_3$, chlorobenzene, CS_2 and hexane. The dielec. consts. of $CHCl_3$ and ether in-

creased with increase in the strength of the field. At the higher field strengths the dielec. consts. were smaller than those calcd. by the Debye theory. The mol. moments calcd. from the data for ether, CHCl_3 and chlorobenzene are resp., 12.07, 10.26 and 6.45×10^{-19} . A. FLEISCHER

Relation between the temperature and the dielectric constant of gases and vapors. I. Method and results in carbon dioxide and air. H. A. STUART. *Z. Physik* 47, 457-78 (1928).—The dielec. const. of CO_2 and air is measured at temps. ranging from 0 to 180° . The limit of accuracy of $\epsilon - 1$ is 2%. From the values obtained it is calcd. that the elec. moment of CO_2 equals 0. Air shows a slight increase of the mol. polarization by increasing temp.; this is analogous to the increases of the mol. refraction with the temp. The absence of elec. moment shows that the 3 atoms of the CO_2 mol. are located on a straight line; the same result could also be derived from electrostriction measurements. A. L. HENNE

The dielectric constant of liquid bromine. ANNE I. ANDERSON. *Proc. Phys. Soc. (London)* 40, 62-70 (1928).—A redetn. of the dielec. const. of liquid Br gave 3.12 at 15° and at a frequency of 187,000 per sec. with a temp. coeff. of -0.00191 referred to 0° . The app. and method consisted of 2 generators of high-frequency oscillations which produced a heterodyne note in a third detector circuit operating a loud speaker. The Br condenser is described. By applying the dipole theory of Debye and Gans to the results, a value of 0.40×10^{-18} is deduced for the elec. moment of the mol. Br_2 . The elec. cond. was 9.6×10^{-10} ohm $^{-1}$ cm. $^{-1}$ at 0° with a temp. coeff. of -0.0188 per degree. The actual resistance of Br_2 was 5.46×10^6 ohms at 0° . H. M. McLAUGHLIN

Application of the Debye dipolar theory to binary mixtures of liquids. J. W. WILLIAMS. *Physik. Z.* 29, 174-81 (1928).—W. measures the dielec. const. of a series of compds. dissolved in CCl_4 , CS_2 , C_6H_{14} or C_6H_6 . No polarization was detected with C_6H_6 , CCl_4 , CS_2 , C_6H_{14} , SnI_4 , $p\text{-Me}_2\text{C}_6\text{H}_4$ and $p\text{-(NO}_2)_2\text{C}_6\text{H}_4$. I, C_{10}H_8 , 1,3,5-(NO_2) $_3\text{C}_6\text{H}_3$ are doubtful. The following values of $\mu \times 10^{-18}$ have been detd.: in C_6H_6 : MePh, 0.52; $o\text{-Me}_2\text{C}_6\text{H}_4$, 0.52; PhNO $_2$, 3.90; $o\text{-(NO}_2)_2\text{C}_6\text{H}_4$, 6.05; $m\text{-(NO}_2)_2\text{C}_6\text{H}_4$, 3.81; $o\text{-NO}_2\text{MeC}_6\text{H}_4$, 3.75; $m\text{-NO}_2\text{MeC}_6\text{H}_4$, 4.20; $p\text{-NO}_2\text{MeC}_6\text{H}_4$, 4.50; PhCO $_2\text{H}$, 1.00; PhOH, 1.70; ClPh, 1.55; CHCl_3 , 1.10; Et $_2\text{O}$, 1.22; AgClO $_4$, 4.70. In CCl_4 : MePh, 0.40; CHCl_3 , 1.15; Et $_2\text{O}$, 1.24; MeOAc, 1.67; EtOAc, 1.74; Me $_2\text{CO}$, 2.70; EtOH, 1.63; iso-AmOH, 1.85. In CS_2 : NO $_2\text{Ph}$, 3.89; PhOH, 1.63; ClPh, 1.52. In C_6H_{14} : NO $_2\text{Ph}$, 3.89; ClPh, 1.55. Within the exptl. error, the mol. polarization of a substance is independent of the solvent providing the latter is not dipolar. A final discussion emphasized the theoretical importance of this kind of measurements. A. L. HENNE

Absolute measurement at high frequency of the dielectric constants of liquids. R. DARBORD. *Compt. rend.* 185, 1193-5 (1927).—The new type of condenser described for the measurement of ϵ by the Wheatstone-bridge method consists of a cylindrical vessel divided into an upper and a lower portion, the latter contg. 2 shaped horizontal armatures, one of which is fixed, while the other rotates inside it. If c_1 and c_2 are the capacities of the empty lower portion for the 2 extreme positions of the armatures, and ϵc_1 and ϵc_2 are the corresponding capacities after the addn. of the liquid, then $\epsilon = (\epsilon c_2 - \epsilon c_1)/(c_2 - c_1)$. If the armatures are fixed, the instrument must be standardized against a liquid of known ϵ . The app. avoids the influence of dispersion of the lines of force, and may be used with liquids for the vapors of which ϵ is nearly unity. B. C. A.

Magnetic properties of single crystals of zinc and cadmium. J. C. McLENNAN, RICHARD RUDY and ELIZABETH COHEN. *Nature* 121, 351 (1928).—Single crystals of Zn and Cd, prepd. by Bridgman's method, were suspended vertically from one arm of a balance so that the lower end hung between the poles of an electromagnet. Weighings were taken in the presence and absence of a known magnetic field, at intervals of 15° as the crystal was rotated through 360° about a vertical axis. Fields up to 12,000 gauss were used. The susceptibility of Zn is -0.183×10^{-6} in a direction parallel to the principal axis of the crystal and -0.147×10^{-6} perpendicular to it. The corresponding values for Cd are -0.276×10^{-6} and 0.169×10^{-6} . W. W. STIFLER

Magnetic properties of thin films of electrolytic iron. E. P. T. TYNDALL. *Phys. Rev.* 30, 681-91 (1927).—Films of Fe are made by electrodeposition on brass tubes. The thickness ranges from 26.5 to 102 millimicrons. Magnetization curves and hysteresis cycles are obtained by a magnetometric method. The films show increasing magnetic hardness with decreasing thickness. In a 150-gauss field the max. intensity of magnetization reached is 1480 units for a thickness of 50 millimicrons. Thicker and thinner films are slightly less completely satd. The coercive force, from $H_{\text{max.}} = 150$, is related to the thickness as follows: $H_c = 5 \times 10^4/(89\theta + 2260)$, where θ is the thickness in millimicrons. The theory of McKeehan is found adequate to explain the

observed magnetic properties, which are traced to the constraint placed on the films by the cathode on which they are deposited. The films when demagnetized must be in a state of tension.

BERNARD LEWIS

Passivity and protective oxide films. ULICK R. EVANS. *Nature* **121**, 351-2 (1928).—From the work of Kruger and Nahring it is stated (*Nature* **121**, 222) that oxide films thicker than 10^{-7} cm. are not present on the surface of a passive metal. E. discusses the factors which det. the thickness of protective films and considers the x-ray method unsuitable for a study of surface layers. With freshly abraded Fe in the presence of penetrating anions, the film thickness may exceed 4×10^{-6} cm. "Air-passivity" is a property of the pure metal.

J. E. SNYDER

The relation of specific heat to ferromagnetism. J. R. ASHWORTH. *Nature* **121**, 323(1928).—The sp. heat of Fe, Ni and Co increases with temp. up to the crit. temp. at which point an abrupt decrease occurs. The relations between the several quantities involved are given by the equations. $m \cdot a \cdot C_\theta = 5 \cdot n \cdot a \cdot \Delta C$; $n \cdot \Delta C \cdot J \cdot \rho = 278 \cdot R' \cdot I_0$; $\theta/I_0 = q \cdot 8/27$; and $\rho \cdot R_{\text{an}} = R' \cdot I_0$, where $m \cdot a$ and $n \cdot a$ are mol. wts., C_θ is sp. heat at crit. temp. θ , ΔC is decrease in sp. heat, I_0 is max. intensity of magnetization, R' is reciprocal of Curie const., J is Joule's equiv., ρ is density, R_{an} is the gas const., and q is an integer. For Fe, Co, Ni and Fe₃O₄ the values of q are 2, 3, 4 and 6, resp. A specimen of Heusler alloy satisfied these relations quantitatively. For it $q = 5$.

W. W. STIFLER

The temperature dependence of remanent magnetism. HERMANN GEWECKE. *Z. tech. Physik* **9**, 57-60(1928).—The magnetism of a steel rod will decrease on heating, however repeated heating and cooling between 100° and 150° causes the magnetism to assume final const. values depending on the temp. only. For 16 differently treated steel rods (1 to 6 mm diam., 250 to 300 mm. length) these reversible changes were studied. The value of α from $\varphi_k = \varphi_{15}[1 + \alpha(t - 15)]$ varied from -12.2×10^{-4} (cast steel rod, not hardened) to $+7.9 \times 10^{-4}$ (spring steel rod, cold drawn). Mech. hardening of the material seems to give a high positive α which may be reduced to zero or negative values by annealing at temps. around 1000°. Chrome steel had low negative values for α .

A. L. HENNE

Mechanical theories in physics and chemistry. A. KORN. *Physik. Z.* **27**, 801-3 (1926); *Science Abstracts* **30A**, 253-4.—On a mech. theory an electromagnetic field can be produced only by oscillations of extraordinarily short period and of considerable inertia, such that the particles always retain their elec. mass; that would be without analog in classical mechanics and would lead to the quantum theory. The oscillating particles would not radiate, nor would the electrons in their stable orbits, except when disturbed; this view would accord with Bohr's, except that radiation would be caused by slight deviations from the orbit, not by jumps from one orbit to another, and that the stable orbits would not depend upon quantum relations. The restricting forces maintaining the orbits could for spectra (x-ray and others) be Coulomb forces; but these forces could not hold the nucleus particles together. K. suggests a nucleus consisting of particles a , b , c , the a appearing gravitational with respect to the outer field, the b and c elec.; there would be repulsion between all the particles of the same kind, whether a , b or c , but attraction between the a and either b and c , and this attraction must be qualified by an absorption factor by virtue of which the attraction would turn into repulsion at greater distance. On these lines stable constellations are possible for all the atoms.

H. G.

Highly dilute flames. I. H. BEUTLER AND M. POLANGI. *Z. Physik* **47**, 379-406 (1928).—The "highly dilute flames" are produced by the interaction of Na vapor and Cl₂ or I₂. The gases are introduced from opposite ends of the reaction tube at a pressure of 10^{-3} mm. Analysis of the distribution of the reaction products pptd. on the walls allows an estn. of the reaction velocity, which is very great. The luminous zone, emitting the D lines at an intensity which may reach several candle power, is displaced 5 or 6 cm. towards the Na side of the zone of pptn. The displacement is greater in the I flame than in the Cl. This fact, and the absence from the Cl flame of a secondary

zone of pptn. present in the I flame shows at. Cl reacts with Na vapor more readily than at. I. The displacement of the luminescent and pptn. zones shows that the primary reaction, assumed $\text{Na} + \text{I}_2 = \text{NaI} + \text{I}$ is not luminescent; the light emission must be due to reactions $\text{Na} + \text{I} = \text{NaI} + 68.7 \text{ cal.}$ or $\text{Na}_2 + \text{I} = \text{NaI} + \text{Na} + 54 \text{ cal.}$ The light yield, about $1/_{200}$ to $1/_{500}$ of that if every elementary process in the secondary reaction caused the emission of 1 quantum, falls on increasing the temp. of the Na vapor, suggesting that the luminescent reaction is between $\text{Na}_2 + \text{I}$, since the Na concn. falls off with temp. Thermodynamic calcs. of the heat of disson. of the alkali halides at zero abs. lead to values for NaCl 93.4 cal., for NaBr 85.8 cal., for NaI 68.7 cal., in agreement with the band spectra data. W. WEST

Further studies on light-scattering in liquids at high temperatures. S. R. RAO. *Indian J. Physics* 2, 179-93(1928).--Measurements similar to those previously described (*C. A.* 22, 1091) have been made for C_6H_{18} , CCl_4 , EtOAc , C_6H_6 , $\text{C}_6\text{H}_5\text{Cl}$ and PhMe. Results are analogous to those previously found. Curves for paraffin hydrocarbons show a progressive change with increase in length of mol. Values for anisotropy of MeOAc are greater than for EtOAc and those for Et formate are higher than for EtOAc. PhMe resembles C_6H_6 while $\text{C}_6\text{H}_5\text{Cl}$ differs from both. In all cases anisotropy increases with temp. and tends toward the value for the vapor. W. ALBERT NOYES, JR.

Valency. VIII. Extinction coefficients and molecular conductivities of Vernon's isomeric α - and β -dimethyltelluronium salts. Molecular structure of quadrivalent tellurium compounds. T. M. LOWRY, ROSE A. GOLDSTEIN AND F. L. GILBERT. *J. Chem. Soc.* 1928, 307-21; cf. *C. A.* 14, 1815, 2918; 15, 2413.—Vernon's specimens of the isomeric dimethyltelluronium halides are used for measurements of extinction coeffs. in abs. alc, the absorption curves being plotted. Both the α - and β -diiodides give the characteristic twin maxima obtained in the absorption spectra of CH_3I . The α - and β -dichlorides exhibit only a general absorption of moderate intensity, but the dibromides show a well-marked "step out." The mol. extinction coeff. of the α -dibromide remains almost const. at $\log \epsilon = 3.7$ over a range of 200 Å. U. from 2600 to 2800 Å. U., while the coeff. of the β -compd. is almost const. at $\log \epsilon = 4.0$ over a similar range. The

α tetraiodide, TeMe_2I_4 , also shows 2 maxima and is given the formula: $[\text{TeMe}_2]\text{I}_3$. Measurements of mol cond show that the dihalides do not behave as binary or ternary electrolytes, but attain values which exceed 500, indicating that 1 halogen atom is

hydrolyzed and the other forms a halogen ion $[\text{TeMe}_2\text{Cl}]\text{Cl} + \text{H}_2\text{O} \rightleftharpoons [\text{TeMe}_2\text{OH}]\text{Cl} + \text{HCl}$. The hydroxy halides thus produced are not hydrolyzed to any large extent, giving cond. in the neighborhood of 100. The free bases exhibit cond. of the same order as that of a weak base like NH_3 . A discussion of the mol. structure of these compds. is given, and the following formulas are assigned to them: for the hydroxy halides $[\text{TeMe}_2\text{OH}]\text{X}$; for the dihalides $[\text{TeMe}_2\text{X}]\text{X}$; for the bases $[\text{TeMe}_2\text{OH}]\text{OH}$.

H. STOERTZ

Extinction coefficients of mixtures of uranyl nitrate and organic acids in the ultra-violet, as experimental evidence in favor of the formation of unstable intermediate compounds. JNANENDRA CHANDRA GHOSH AND BHUPENDRA NATH MITTER. *Quart. J. Indian Chem. Soc.* 4, 353-66(1928).—Extinction coeffs. of mixt. of uranyl nitrate and formic, acetic, propionic, succinic, glycolic and mandelic acids were measured with the aid of rotating sector photometer (Adam Hilger) and quartz spectrograph. The coeffs. were higher for the mixts than for the separate substances. It was assumed that the mass law held, and where U is 1 mol. of the nitrate, A 1 mol. of org. acid, yielding M , 1 mol. of the complex intermediate compd. with concn. x . By using the equations $(U_1 - x_1)(A_1 - x_1) = Kx_1$ and $E_1\lambda = E_0\lambda(U_1 - x_1) + E_M\lambda(A_1 - x_1) + E_M\lambda(x_1)l$, where l is the length of the soln. tube. For 2 dilns. the 4 unknowns x_1, x_2, K and $E_M\lambda$ were detd. $E\lambda'$ for any other wave length can be calcd. once K is known. This theory explains in most cases the exptl. data of coeffs. of mixts., assuming equil. and a definite value for mol. extinction coeff. for each wave length for the intermediate complex. In a homologous series K diminishes with each addnl. CH_2 in a definite ratio, increases 12 times as a H of CH_3 is replaced by COOH , and in the case of monobasic acids, replacement of H of CH_2 by OH increases K 2.5 times. C. E. P. J.

- Direct evidence of atom building. R. A. MILLIKAN AND G. H. CAMERON. *Science* 67, 401-2(1928).—Expts. in high mountain lakes, and with self-recording electrosopes in sounding balloons, show that cosmic rays consist of bands of definite frequency. Four of these are found, extending over a spectral range of 3 octaves. Einstein's equation ($E = Mc^2$) predicts an absorption coeff. of 0.305 for the radiation produced in the formation of a He nucleus from 4 protons and 2 electrons, and this is within a few percent of the absorption coeff. observed for the most conspicuous band. The other 3 bands are similarly interpreted as resulting from the formation of the nuclei of O and N, of Si and Mg and of Fe. The abundance of these elements in meteorites, and their occurrence in astronomical spectra, as well as the fact that other nuclear changes are inadequate to account for radiation of such high frequency, are cited in support of the interpretation. - Recombination of carriers in gases. J. SCHEMEL. *Ann. Physik* 85, 137-88(1928).—The recombination coeff. α , of the equation $dn/dt = -\alpha n^2$, where n is the no. of carriers per unit vol. for a homogeneous distribution, is, for the ions produced by the Po α -rays in air at N. T. P., 1.7×10^{-10} cm. 3 sec.⁻¹; this value is 20% lower in well-dried and filtered air, and decreases slightly with diminishing pressure. α increases with temp., at first quickly, then more slowly. Recombination takes place in N₂ much as in air, but in N₂ satn. in an elec. field is attained more quickly. The abnormality of the coeff. for short exposures is attributed to the formation of discrete columns of ions which slowly increase in vol. W. WEST
- Purification of gas by ionization by collision. W. DEUTSCH. *Z. tech. Physik* 7, 12, 623-30(1926); *Science Abstracts* 30B, 305-6; cf. *C. A.* 20, 150.—An arrangement

is here described by means of which it is possible to measure in the ultra-microscope the satn. of single particles in ionization by collision, whereby it is shown that the limiting potential to which the particles are charged is approx. const. A series of illustrations is given which illustrate the industrial importance of the procedure. H. G.

Relativity fine-structure of helium. F. PASCHEN. *Ann. Physik* 82, 689-96 (1927); *Science Abstracts* 30A, 633.—Photometric investigation of the spectrum of He excited by d. c. shows that the He⁺ line 4686 abs. wave length corresponds exactly with the theoretical value. Also the sepn. of the components leads to the exactly correct value $\Delta\nu_H = 0.365 \text{ cm}^{-1}$. Thus the conclusions of Leo (who ascribed a component to He bands) are unfounded. H. G.

Notes on the structure of the manganese spectrum. M. A. CATALÁN. *Anales soc. españ. fís. quím.* 26, 67-74 (1928).—A résumé and rearrangement of existing data. E. M. SYMMES

Non-combining terms in the new quantum theory. I. E. WIGNER. *Z. Physik* 40, 492-500 (1926); *Science Abstracts* 30A, 462.—Using the methods of Schrödinger's wave mechanics, it is shown that in a system with 3 electrons the terms fall into several groups, the members of different groups not combining. One of these groups is shown to satisfy Pauli's rule, and for the other the equil. distribution is given by the Bose-Einstein statistics. H. G.

Model of the triatomic molecule of water and carbon dioxide. F. J. v. WISNIEWSKI. *Z. Physik* 47, 567-88 (1928).—W. adopts for the triatomic mols. a model consisting of 3 ions and 3 electrons. The 3 positive ions are located on a straight line. They are in a position such that the distances between the central and the external ions are equal, at least in first approximation. The mol. revolves as a whole around the axis passing through the ions. The electron paths are perpendicular to the same axis. The consts. of such a mol. are calcd., and the results are applied to the H₂O and the CO₂ mols. A. L. HENNE

Thermally excited quantum emission in solid bodies. F. SIMON. *Sitzb. preuss. Akad. Wiss.* 1926, 477-87; *Science Abstracts* 30A, 498.—Consideration has been given to the changes of sp. heat with temp. of a series of monotonic, regular cryst. substances, and it is shown that their atoms are capable of existing in two states so little different that the distribution taking place in the homogeneous system occurs at very low temps. The energy difference of the two states, on the nature of which nothing definite can be said yet, is of the order of magnitude of 1% of the lattice energy. The substance dealt with are gray Sn, Si, diamond, Na, K, Fe, Ni and Co. For the diamond, confirmation is provided by optical measurements on absorption, while the Grüneisen formula of the proportionality of thermal expansion and sp. heat for isotropic substances provides an independent measure of the point of abnormal increase of sp. heat. For the alkali metals support is provided by values of elec. resistance and by the Lindemann melting-point formula. Finally, several conclusions regarding the phys. and chem. behavior of these substances are discussed. H. G.

Secondary emission from molybdenum due to bombardment by high-speed positive ions of the alkali metals. W. J. JACKSON. *Phys. Rev.* 30, 473-8 (1927).—Work has been extended to measurements on secondary emission from Mo due to the bombardment of positive ions of Na⁺, Rb⁺ and Cs⁺ following the method used for K⁺ and described in a previous paper (*C. A.* 21, 206). Confirmatory evidence is obtained that heat treatment in general reduced the secondary emission. With degassed targets the following results were obtained: Na⁺ ions showed a positive-ion reflection of 3 or 4% independent of the speed of the impacting ion and electron emission of about 2% of 1000 v. Expts. with Rb⁺ indicated a reflection of positive ions of less than 2% and no electron emission within the exptl. error. Cs⁺ gave a secondary emission of about 9% at 1000 v. The relatively large secondary emission from an untreated target as compared with a well-degassed metal may be due to the fact that the min. distance of the electron from the metal surface is greater in the former than in the latter case; also, if secondary emission is due to local high temps. arising from positive-ion bombardment there would be more rapid dissipation of energy by the target surface than by the gas mols. BERNARD LEWIS

Absorption of ultra-sonic waves by hydrogen and carbon dioxide. T. P. ABELLO. *Proc. Nat. Acad. Sci.* 13, 699-701 (1927).—An ultra-sonic beam, generated by a piezo-electric crystal, was passed through a mixt. of air and CO₂ (or H). The energy of the emergent beam was measured by the pressure it exerted on a torsion vane. B. C. A.

The Zeeman effect and Stark effect of hydrogen in wave mechanics; the force equation and the virial theorem in wave mechanics. A. E. RUARK. *Phys. Rev.* 31, 533-8 (1928).—The Zeeman levels of hydrogenic atoms are detd. by a new and simple

method, neglecting terms in H^2 . The frequency of the Larmor precession is $L = L_0(1 + E/mc^2)$. L_0 is the frequency of precession obtained by Newtonian mechanics and E the energy of the atoms. The formula for the first-order Stark effect and for the Paschen-Back effect can be obtained by similar methods. An extension of Ehrenfest's (*Z. Physik* 45, 455(1927)) law of motion for a particle is proved. It is applicable to any conservative system. From it, a theorem of wave mechanics analogous to the virial theorem is obtained.

BERNARD LEWIS

Anomalous groups in the periodic system of elements. F. FERMI. *Nature* 121, 502(1928).—By considering the electrons in a heavy atom as forming an atm. of completely degenerated gas, formulas have been derived giving the density of electrons and the potential as a function of the distance r from the nucleus. The method is extended to calc the no. of electrons having a given azimuthal quantum no., k , in order to arrive at an interpretation of the anomalous groups in the periodic table. The theory predicts that electrons with $k = 4$ will exist in the normal state only for atoms with at no $z \geq 55$. This agrees with the empirical result that the rare earth group, which corresponds to the bonding of electrons in 4_f orbits, begins at $z = 58$ (Ce). Similarly, according to the theory, electrons with $k = 3$ should appear first at $z = 21$, and the bonding of 3_d electrons is known to begin with the first long period ($z = 21$, Sc).

F. A. JENKINS

The laws of radioactive decompositions. V. A. SOKOLOV. *Z. Physik* 45, 409-15 (1927). There is a connection between the decompn. const. and the no. of radioelements in the decompn. series. Those elements which deviate from this relation have several of the same properties. There exists also a relation between the decompn. const. of the β radiators and the position of the radioelements in the decompn. series.

MARIE FARNSWORTH

Heating effects of thorium and radium products. S. W. WATSON AND M. C. HENDERSON. *Proc. Roy. Soc. (London)* A118, 318-34(1928). The heat evolution of 5 combinations was measured by a resistance thermometer method. Agreement within 2% of the Hess and Lawson rate of emission of α particles from Ra (3.72×10^{10} per g. per sec.) was obtained.

L. D. ROBERTS

The radium standard solution. W. BOTHE. *Z. Physik* 46, 896-9(1928).—Standard Ra solns. were tested with an instrument to measure Rn and results obtained are in good agreement with expected values. Solns kept for nearly 7 yrs. showed the same results as fresh solns.

R. H. LAMBERT

Yields of atom disintegration by α -rays. W. BOTHE AND H. FRANZ. *Naturwissenschaften* 16, 204-5(1928); cf. *C. A.* 21, 3152.—The large differences in yield between expts. of Rutherford and Chadwick and of Kirsch and Petterson caused the authors to repeat this work. With a Po prepn. as α -ray source, a Geiger counter as debris indicator, the "backward" radiation was examd. (by Al absorption) as emitted by a thick layer of irradiated substance (Be, C, Al or Fe) under an angle of 130° with the incident rays. Never more than 2 H particles were found per million incident α -particles (K. and P. found 17-40). From special expts it was learned that at least $1/3$ of the H particles were captured on the counter. For the "forward" radiation was found for Al and Mg around one H per million α , for (CN) and B resp., 9 and 12 H (10 cm. air absorption). For B the absorption curve shows peaks, i. e., two separate H-ray groups of 20 and 32 cm. max. range, possible isotope effect. For air or A filling of the counter instead of H₂, stronger effects were observed (K radiation of the substances).

Studies on the radioactivity of some sources of mineral water and of potable water

of Transylvania. GH. A. DIMA. *Bull. sec. sci. acad. Roumaine* 11, 53 5(1928).—Radon has been detd. in a large no. of springs, and Ra has been found and detd. in several. I. D. R.

Stellar temperature and ionization. E. A. MILNE. *Nature* 118, 738-40(1926); *Science Abstracts* 30A, 270.—A recapitulation of recent astrophys. advances. Saha's theory is described and the temp. scale derived by Payne from considerations of absorption line maxima and ionization equilibria. A very recent development of promise is the method devised by Yu where the continuous absorption assocd. with the limit of the Balmer series is measured on the same spectrum plate as the color-temp., these 2 quantities together enabling the abs. magnitude to be detd. H. G.

The refraction quotients of the deBroglie waves of the electron. OTTO KLEMPERER. *Z. Physik* 47, 417-21(1928).—According to the equation $v_p v_k = c^2$, where v_k is the mass velocity and v_p the phase velocity of the free electron, there must be a sudden increase in v_p when an electron penetrates matter from a vacuum, and therefore there must be for the electron an angle α of total reflection such that $n = \sin \alpha$, n being the refractive index for the phase waves. Some previously not understood measurements of Wehnelt and Schmidt can be interpreted in terms of this phenomenon by the introduction of an inner elec. potential in insulators. W. WEST

The theory of thermic emission and the reflection of electrons on metals. LOTHAR NORDHEIM. *Z. Physik* 46, 833-55(1928).—On the assumption that an electron in a metal is gaseous the Richardson-Dushman formula may be applied to the electron glow. The const. has the same value as that derived from the Fermi-Dirac statistics except for a factor involving the wt. of a quantum state and an av. reflection coeff. for the electron at the surface. The latter is calcd. from quantum mechanics. This consideration necessitates a large potential drop at the surface layer. The factor approaches 1 for a metal with a clear surface. This agrees with observed data. It also gives a qual. agreement for the influence of a monomol. surface layer. RAYMOND H. LAMBERT

The mobilities of gaseous ions in hydrogen sulfide-hydrogen mixtures. L. B. LOEB and L. DUSAULT. *Proc. Nat. Acad. Sci.* 14, 192-9(1928); cf. C. A. 21, 3504.—By the method previously described the mobilities of ions of H_2S and H_2S-H_2 mixts. were measured at varying pressures. The new abs. mobilities for H_2S were found to be: the positive ions 0.71 and the negative ions 0.69 cm./sec. per volt/cm. The pressure law does not seem to hold for the positive ions as it does for the negative. The data do not agree with the Alexievsky theory of the decrease in cluster size at low pressures. On some occasions H_2S at low pressure showed unmistakable signs of the presence of free electrons. The negative and positive mobilities of H_2 were tremendously lowered by traces of H_2S . ARTHUR FLEISCHER

Diffusion coefficients of gas ions in flames in their dependence on temperature. HANNS BÜCKERT. *Ann. Physik* 85, 63-80(1928).—The diffusion coeffs. of both + and - ions from flames of H in air, coal gas in air, and CO in air, are almost independent of the temp. of the diffusion space up to a certain value, 50° for H; then suddenly increase regularly with temp. The coeff. diminishes rapidly with the age of the ions. The small values at low temp. point to the existence of large ionic complexes which break down to smaller and more mobile ions at higher temps. For the CO flame the increase with temp. is much smaller than for H and CO flames, indicating the comparative stability of the ionic complexes from this flame. W. WEST

Effect of catalysts on the speed of flame, infra-red emission and ionization during the combustion of carbon monoxide and oxygen. W. E. GARNER AND C. H. JOHNSON. *J. Chem. Soc.* 1928, 280-98; cf. C. A. 21, 1059.—Measurements are made of the rate of emission, the duration and magnitude of ionization, and speed of flame for CO and O mixts. to which catalysts have been added. H and H-contg. substances such as $EtNO_3$, $EtBr$, EtI and $CHCl_3$ act similarly to H_2O in promoting an increased speed of flame and in reducing the emission of radiant energy. CCl_4 and NO_2 have an opposite effect. The persistence of ionization after the passage of flame is discussed and an explanation alternative to "after burning" is suggested, in which the retarded neutralization is assumed to be connected with the emission of "residual" infra-red radiation. H. STOERTZ

Impacts of the second kind, excitation and reunion in the glow discharge. RUDOLF FRERICHs. *Ann. Physik* 85, 362-79(1928).—Mixts. of a noble gas (A, Ne) with a small quantity of metal vapor (Al, Mg, Zn, Cd, Cu) were studied in a glow discharge between tube electrodes. The noble gas is primarily excited and transfers the energy of excitation of its first (metastable) excitation stage quant. to the metal by collisions of the second kind, the metal being excited to a definite stage. In the cathode glow

the energy is transferred mostly to ions. In the positive, column, the transfer is mainly to atoms. •In a side tube outside of the discharge proper, the energy transfer is only to normal atoms or eventually to excited metastable atoms. J. E. SNYDER

Recombination of ions and electrons. J. FRANCK. *Z. Physik* **47**, 509-16; *J. Franklin Inst.* **205**, 473-9(1928).—The hypothesis is made that during an ionization process it is possible that an electron can be recovered by an ion before it has had time enough to escape the influence sphere of the atom. Such a recombination makes it possible to explain the excitation function in the range of high electronic speed. An attempt is made to explain the observation made by Langmuir of a Maxwellian velocity distribution of cathodic rays in highly ionized gases on the assumption of ternary impacts occurring between positive ions, primary and secondary electrons.

A. I. HENNE
The photo-effect in salts exposed to light. N. GUDRIS AND I. KULIKOVA. *Z. Physik* **45**, 801-7(1927).—Halogen salts were exposed to light from various metal sparks. The limit of the wave lengths effective for the photo-effect was detd. for NaCl, NaBr, KCl, KBr, KI and RbI. It is established that former exposure displaces the effective wave length, the displacement being different for different salts. A series of observations was carried out on NaCl exposed to γ - and Rontgen rays. Naturally and electrically colored NaCl was also studied. MARIE FARNSWORTH

Detection of protons in metals. ALFRED COEHN. *Naturwissenschaften* **16**, 183-4(1928).—A Pd wire 6 cm. long was charged in a center loop with H_2 by electrolysis; several V-shaped bends dipping in 0.1 N H_2SO_4 at regular distances from the center could be used to measure the local (oxygen) potential of the wire against a normal electrode by quadrant electrometer. The H_2 absorbed in the center will diffuse through the wire towards both ends; however, on applying a potential such as to give a one-amp. d. c. current through the length of the wire (0.015 v./cm. potential drop) it was found that the H_2 reached the V bends on the cathodic side earlier than those on the upstream side of the center. Between corresponding places on both sides of the center the p. d. after 55 to 60 hrs. was 0.1 to 0.15 v., decreasing again subsequently in consequence of continued diffusion. Without d. c. applied no such differences were found. It is, therefore, shown that at least part of the H_2 is present in the Pd as H^+ ions. B. J. C. v. d. H.

The action of positive ions in an independent gas discharge. F. M. PENNING. *Physica* **8**, 13-23(1928).—The expts. recently described (*C. A.* **22**, 1097) were continued. By including a few more retarding and filtering elements in the low-pressure side of the discharge tube the ion speed (Ne ions) was cut down to 10 v. Even at that speed the no. of electrons (α) liberated from the Ag or Fe target by 100 striking ions was found to be more than 3. For 30 v. speed it was 3.5. In a different type of discharge tube with magnetic field to direct the electron stream α was found to be larger than 4 for ion speed smaller than 7 v. It is most probable that a value of α of the same magnitude holds for zero speed. B. J. C. VAN DER HOEVEN

The saturation of a photoelectric primary current in crystals. WERNER FLECHSIG. *Z. Physik* **46**, 788-97(1928).—A study has been made of crystals having a low optical refraction, i. e., rock salt. The satn. tension depends on the thickness of the crystal, Ohm's law being approached with increase in thickness. The satl. photoelec. primary current is obtained when all the light from freed electrons reaches the electrode. For rock salt, satisfactory results for the satd. current can result only with crystals about 0.1 mm. thick.

R. H. LAMBERT
A further investigation of synthetic galena detector and a new theory of crystal rectifiers. W. OGAWA, T. NEMOTO AND S. KANEKO. *Researches Electrotech. Lab., Tokyo*, No. 196, 77 pp.(1927); (in English); cf. *C. A.* **21**, 1928.—By a metallographic investigation, the activating effect of Ag in synthetic galena crystals is fully explained. A new theory is proposed from the following results. (1) Argentiferous synthetic galena shows a better sensitivity with a needle of an electropositive metal than with a noble metal, while in zincite the case is quite contrary. (2) I. c. characteristic curves were plotted for galenas of various Ag contents, with various metallic needles and of different contact pressures. From these curves, it was manifested that an improvement of sensitivity does not necessarily depend upon an increase of current in the direction of rectified current but a decrease of current in the opposite direction may bring the same result. With regard to synthetic galenas, an improvement of sensitivity by a different metallic needle may be ascribed to an increase of current in the rectifying direction but those by variations of Ag content in galenas and of contact pressure must be attributed to the decrease of current in the opposite direction, the abs. value of current in the rectifying direction also being decreased. (3) With argentiferous synthetic galena, a sharper needle point gives a better sensitivity, but with zincite

it is not necessarily so. (4) The crystals in common use as detectors may be arranged in a series of a definite order relating to the direction of the rectified current as in the Voltaic series, argentiferous synthetic galena and zincite being the both extremities. (5) A remarkable rectification by a couple composed of two broken pieces cut from one and the same galena crystal was observed, the direction of the rectified current always being from a flat surface to a sharp point. Also specific resistance and thermoelec. power of synthetic galenas were detd. and many numerical data are given.

W. OGAWA

The general theory of magnetic properties of matter. B. CABRERA. *Anales soc. españ. fis. quim.* 26, 50-66(1928).—In a previous article (*Anales soc. españ. fis. quim.* 24, 293) there was given a theory of paramagnetism assuming that the magnetic axis of the atom can take different orientations at the instant of reorganization following shock. It also tacitly assumed that the time during which the disturbances produced by the shock develop is infinitely small in relation to the av. life of each state of the atom. The value of E_1 is large, and the agreement of theory with exptl. results for the Fe and rare earth groups shows that this condition is brought about in these cases. For the Pd and Pt groups the value of E_1 is certainly very small and the thermic variation of X does not follow the Curie-Weiss law. For these substances the no. of atoms taking part in the appreciable magnetization is only a fraction of the no. which could be drawn from the mass. If account is taken of the fact that the probability of a fluctuation of energy comprised between ϵ_1 and $\epsilon_1 + d\epsilon$ for an element of infinitely small vol. is given by $e^{-(E+d)/kT}$, we immediately have $N_1 = N(1 - e^{-(E_1/kT)})$, which adds to the Curie-Weiss law the temp. function in parenthesis. Orientation of the magnetic axes of atoms is not the general effect which the magnetic field produces. There is also an elastic deformation of the electron system, appreciable in the case where X is small, which can be divided into (a) a variation of velocity of electrons in their orbits, which is the interpretation of diamagnetism and (b) a change of orientation of the magnetic axes of orbits without variation in velocity of electrons, which produces a paramagnetic effect. Both parts of the deformation are independent of T , detg. X in const. terms, positive or negative, depending upon whether a or b is the predominating effect. The second is empirically the most general, but it could be expected that the first is produced with electrons which take part in chem. linkages whose orbits should be more sensitive to external effects.

E. M. SYMMES

Soft x-ray emission and absorption spectra with tangential grating. JEAN THIBAUD. *Nature* 121, 321-2(1928).—Recent work of T. on the photography of soft x-ray emission spectra with a glass grating used at a grazing angle is summarized. A continuous spectrum lying between 15 and 250 A. U. has now been obtained, an x-ray tube run with an electronic current of 100 milliamp. being used as a source. The K absorption edges of O, N and C are recorded on this background, arising from traces of these elements in the vacuum spectrograph. The edges are without structure, and have the following wave lengths: C 43.5 A. U., N₂ 31.1, O₂ 23.5. These agree with previous results by the ionization method. The reproductions given of these spectra are the first examples of photographic records of absorption in this spectral region.

F. A. JENKINS

X-ray spectra of long wave length. T. H. OSGOOD. *Phys. Rev.* 30, 567-73(1927).—The paper describes a photographic method of obtaining x-ray spectra of long wave length, based on the exptl. fact that x-rays are totally reflected from a mirror (or grating) provided the angle of incidence is sufficiently large. Details are given of a *vacuum spectrograph* employing an x-ray tube as a source of radiation in conjunction with a two-meter concave grating. About 15 lines have been measured between 40 and 200 A. U. As it has not been possible to obtain a pure spectrum of any one element, the interpretation of these lines is a matter of considerable uncertainty. Nearly half of them appear to be due to Sr and Ba deposited on the anticathode from the oxide-coated filament of the x-ray tube. The method is applicable to all wave lengths greater than about 20 A. U.

BERNARD LEWIS

Dispersion and scattering of x-rays. H. KALLMANN AND H. MARK. *Ann. Physik* 82, 585-604(1927); *Science Abstracts* 30A, 636-7.—On the assumption of a continuous succession of resonances in the region of the x-ray absorption spectrum a calcn. is made of the elec. moment of an atom-electron under the influence of incident radiation, making use of the theoretical quantum dispersion law. The const. of the absorption law found empirically is now shown to agree with the theoretical deductions. A formula for the scattering of x-rays in gases, amorphous substances and crystals is discussed. The anomalous dispersion of crystals in the neighborhood of the crit. region is calcd. and shown to be in qual. agreement with experience.

H. G.

Absorption of x-rays from $\lambda = 0.08$ to 4.0 A. U. S. J. M. ALLEN. *Phys. Rev.* **28**, 907-22(1926); *Science Abstracts* **30A**, 575.—The mass-absorption coeffs. of a no. of elements from C to U for homogeneous x-rays ($\lambda = 0.709$ to 1.933 A. U.) have been measured. Combined with previous observations by A. (cf. *C. A.* **20**, 1942), the present results give a series of absorption coeffs. from $\lambda = 0.08$ to $\lambda = 4$ A. U. Over the complete range of wave lengths the absorption coeff. of Al appears to be accurately represented by the formula $\mu/\rho = (13.9 \text{ or } 14.0)\lambda^{2.92} + (0.14 \text{ to } 0.18)$. It is considered that the N^4/A law is only approx., a more accurate expression being $\tau/\rho = C\lambda^3 N^4/A$, in which C is a const. The effect of impurities in various absorbing elements has been ascertained. H. G.

Molecular spectrum of hydrogen. H. KONEN AND FINKELNBURG. *Naturwissenschaften* **16**, 184(1928).—Measurements of the mol. H_2 spectrum with a dispersion of 2 A. U. per mm. are announced. B. J. C. VAN DER HOEVEN

The origin of the nebulae lines. W. GROTRIAN. *Naturwissenschaften* **16**, 177-82, 193-7(1928).—A review, discussing mainly Fowler's and Bowen's work.

B. J. C. VAN DER HOEVEN
Diffraction of deBroglie waves by a crystal lattice. E. E. WITMER AND L. ROSENFELD. *Naturwissenschaften* **16**, 149(1928).—On the basis of energy and impulse rules it has been deduced that for photoelectrons liberated inside a crystal lattice diffractive phenomena are to be expected completely analogous to those found for electron waves by Davisson and Gerner (*C. A.* **22**, 350). It is proposed to irradiate a metallic monocrystal by soft x rays (300 A. U.) and to det. the directions of the photoelectrons.

B. J. C. VAN DER HOEVEN
The hydrogen molecule. O. W. RICHARDSON. *Nature* **121**, 320(1928).—The supposed identification of the 2^3P level of the visible H_2 bands with the "C" level of the far ultra violet bands is incorrect. That the 2^1S level is the same as the "B" level is fairly certain. However, R. finds that the $2^1S - m^1P$ bands may appear in emission without a trace of the $1^1S - B$ ultra-violet bands. The non-occurrence of the transition $B \rightarrow 1^1S$ indicates that H_2 mols. in the B state tend to give up their energy by dissoeg. other H_2 mols. with which they collide. The new value, 14, suggested by Birge for the mol. const. B_0 in the 2^1S state gives satisfactory agreement. The spectroscopic results on H_2 are now in essential accord with the calculus of the new mechanics and with the theory of sp. heats. Many important lines in the secondary spectrum are still unexplained. F. A. JENKINS

The alkaline earth halide spectra and their origin. O. H. WALTERS AND S. BARRATT. *Proc. Roy. Soc. (London)* **A118**, 120-37(1928).—The absorption spectra of alk. earth halide vapors were observed in the visible and ultra-violet. The conditions under which the bands can be excited prove that they originate from mols. contg. both alk. earth and halogen atoms. The point upon which no exptl. evidence had previously borne is whether these mols. are those of normal halides such as $CaCl_2$, or of a subhalide such as $CaCl$, or possibly Ca_2Cl_2 . The present observations eliminate 2 of these possibilities and show that the bands have their origin in subhalide mols. of the type MX , where M stands for an alk. earth and X for a halogen atom. Such mols. exist in a vapor state at 1000° in equil. with the metal and the normal salts. Approx. wave lengths of the bands ascribed to CaF , $CaCl$, $CaBr$, CaI , SrF , $SrCl$, $SrBr$, SrI , BaF , $BaCl$, $BaBr$, BaI , MgF , $MgCl$, $MgBr$ and MgI are tabulated. A band of CaF at 5292 A. U., when examd. in emission with larger dispersion, exhibited fine structure which appeared in absorption only at reduced pressures. W. F. MEGGERS

Applications of spectroscopy to molecular problems. W. E. CURTIS. *Proc. Univ. Durham Phil. Soc.* **7**, 165-7(1927).—C. discusses briefly the main features of band spectra and their relation to mol. structure. R. L. HERSHEY

Intensities in the hydrogen spectral series. F. G. SLACK. *Phys. Rev.* **31**, 527-32 (1928).—The abs. intensities of the components of the most important lines of the first 6 series in the spectrum of the H atom as computed on the basis of wave mechanics are tabulated. The components are summed to give the total line intensities per atom in the initial state. The probability coeffs. for the components and lines are also tabulated. The results of comparison between expt. and theory are briefly discussed and an expt. for giving values more directly comparable with the calcd. values is suggested. BERNARD LEWIS

Certain multiplets in the spectra of Cb III and Cb IV. R. C. GIBBS AND H. E. WHITE. *Phys. Rev.* **31**, 520-6(1928).—By applying the irregular-doublet law to the data already known for the triad of multiplets 3DF , $^3DD'$ and 3DP , ($ds-dp$) in the two electron systems of Sr I and Yt II, and the corresponding multiplets for Zr III and Cb IV have been identified. Similarly the triads of multiplets $^3F'D'$, $^3F'F$ and $^3F'G'$

(d^2S-d^2p) in the three-electron system of Yt I and Zr II have been extended to Cb III and the stronger lines of 'F'G' multiplet of Mo IV. In passing successively from element to element in both of these iso-electronic systems, the shift in the frequency of the radiated lines for each of these multiplets is approx. const. BERNARD LEWIS

Series spectra of potassium and calcium. I. S. BOWEN. *Phys. Rev.* **31**, 497-502 (1928).—Several of the strongest extreme ultra-violet lines in the K_{III} , K_{IV} , Ca_{IV} and Ca_V spectra are given their series designation. In K_{II} several lines are identified in addn. to those found by de Bruin (*C. A.* **21**, 857). The abs. values of the terms of K_{II} are detd., thus fixing the ionization potential at 31.7 v. 137 lines are classified in Ca_{III} and the term values of the levels involved are calcd. These correspond to an ionization potential of 51 v. BERNARD LEWIS

A new type of secondary radiation. C. V. RAMAN AND K. S. KRISHNAN. *Nature* **121**, 501-2 (1928).—Expts. on the scattering of visible light when an intense beam is passed through a pure dust-free liquid or vapor show that the scattered light of the original wave length is accompanied by a small quantity of scattered light of lower frequency. The existence of the modified radiation was detected by a method using complementary color-filters, and also spectroscopically. About 60 liquids and a few vapors (ether, amylene) show the effect to a greater or less degree. Since the modified light is extremely faint, and is polarized almost as much as the ordinary scattered light, R. and K. doubt if it can be explained as fluorescence. They interpret the phenomenon as similar to the Compton effect. F. A. JENKINS

Examples of the Zeeman effect at intermediate strengths of magnetic field. K. DARWIN. *Proc. Roy. Soc. (London)* **A118**, 264-85 (1928).—Until recently the frequencies and intensities of the lines in the standard Zeeman effect could be calcd. only for strong or weak magnetic fields. New formulas by C. G. Darwin (*Proc. Roy. Soc. (London)* **A115**, 1 (1927)) permit the calcn. at any intermediate field, they are now applied to 3 cases, $s-p$ and $p-d$ doublets and $s-p$ triplets. W. F. MEGGERS

The analysis of the absorption spectrum of cobalt chloride in concentrated hydrochloric acid. W. R. BRODE. *Proc. Roy. Soc. (London)* **A118**, 286-95 (1928).—The absorption spectrum of $CoCl_2$ in concd. HCl as a solvent was detd. between the wave length limits 7500 Å. U. and 4400 Å. U. The principal absorption band consists of at least 7 component bands; a const. frequency difference (12.28 fresnels) exists between adjacent bands; the frequencies of the component bands are integral multiples (35 to 41) of this const. frequency difference; and the intensities of the odd-numbered bands are greater than those of the next higher even-numbered band. W. F. MEGGERS

Absorption spectra of formaldehyde in solution. S. A. SCHOU. *Compt. rend.* **186**, 690-2 (1928).—A soln. of monomol. CH_2O is produced in hexane cooled to -70° and absorption spectrograms are made of the soln. in a quartz tube of variable thickness. The spectrum consists of a series of at least 17 bands, each 10 to 40 Å. U. wide, distributed between 3542 and 2750 Å. U., the max. being at 2935.0 Å. U. W. F. M. M.

The infra-red absorption spectra of acetylene, ethylene and ethane. AARON LEVIN AND C. F. MEYER. *J. Optical Soc. Am.* **16**, 137-64 (1928).—The spectra of C_2H_2 , C_2H_4 and C_2H_6 in the region between 2μ and 15μ are investigated with echelette gratings and vacuum thermocouple. Each gas shows a more or less characteristic type of structure for its vibrational-rotational bands. The 3 main absorption regions of acetylene, 13.7μ , 7.5μ and 3.0μ , are resolved into individual lines which are alternately intense and faint. The mol. moment of inertia, $I = 2.4 \times 10^{-39}$ g.-sq. cm., is computed from the spacing of the fine structure; this value is in good agreement with that derived from the classical theory on the assumption of a linear mol. model. For C_2H_4 , 7 regions of absorption are investigated but only 2 of these have been resolved into individual lines. Three principal regions of absorption in C_2H_6 reveal bands, each consisting of a single succession of absorption max. but the spacing of these max. is different for each of the bands. W. F. MEGGERS

The near infra-red absorption bands of some hydrocarbons. JAMES BARNES AND W. H. FULWEILER. *J. Am. Chem. Soc.* **50**, 1033-5 (1928).—The near infra-red absorption spectra of liquid pentane, decane and tetradecane were photographed with grating and prism spectrographs (cf. *C. A.* **22**, 730); each consisted of a doublet and a singlet series of bands. The frequencies of the doublet series of the paraffins were lower than the frequencies of the corresponding series of the benzenes. The frequency difference for the paraffin doublet band at 0.92μ was 7×10^{12} sec. $^{-1}$, while for the band at 0.75μ it was 8×10^{12} sec. $^{-1}$. The 0.874μ band of benzene and the 0.877μ band of toluene were also found to be close doublets with a frequency difference of 3×10^{12} sec. $^{-1}$. W. F. MEGGERS

Residual rays from mixed crystals. F. KRÜGER, O. REINKOBER AND R. KOCH-

HOLM. *Ann. Physik* **85**, 110-28(1928).—The residual rays of mixed crystals of NaCl + KCl, KCl + RbCl and KCl + TlCl, detd. by the reflection method, with the use of the micro-radiometer and wire grating, show only one max., lying between those of the pure components. The position of the max. is displaced between the frequencies of the pure components linearly with the concn. The reflecting surfaces were prepd. by subjecting the finely powdered material from a fusion to a pressure of 8000 to 10,000 atms., and polishing the resulting plates, a treatment without effect on the max. of the pure substances. Mechanical mixts. subjected to the same pressure treatment showed the max. of the components, and as a mixed crystal aged, decompn. was shown by the gradual appearance of the characteristic frequencies of the components. W. WEST

Spectrographic study of cyanamide. Ultra-violet absorption spectra of cyanamide, dipropylcyanamide and dipropylcarbodiimide. A. FRANSSEN. *Bull. soc. chim.* **43**, 177-93(1928); cf. *C. A.* **11**, 2461; **21**, 1407.—Dipropylcyanamide (I) in C_6H_6 and in Et_2O shows no absorption band in the ultra-violet. Dipropylcarbodiimide (II) in Et_2O shows an absorption band with a max. at $\lambda = 2599$ and $\nu = 1154.11^{12}$. ϵ , the mol absorption coeff., is 14.73. A specially prepd. soln. of cyanamide (III) in Et_2O gave an absorption band with a max. at $\lambda = 1180.10^{12}$. The value of ϵ was 62. The absorption curves of III in Et_2O and $EtOH$ show discontinuities which indicate changes in the structure of III with variations in the concn. of the solns. These changes cannot be interpreted as due to progressive polymerization of III, since solns. of III in Et_2O were kept for several weeks without any pptn. of dicyanodiamide. Evidently in solns. of III in the neutral org. solvents used by F. there is an equil. between the two forms $N \equiv CNH_2$ and $HN=C=NH$. This equil. varies with the concn. of the solns., the proportion of the $HN=C=NH$ form increasing with the dilm. L. K.

The characteristic infra-red frequencies of binary oxides (BeO , MgO , CaO , ZnO). STYLLÉ TOLKSDORF. *Z. physik. Chem.* **132**, 161-84(1928).—A method is developed for studying the infra-red absorption of powders in thin layers. Transmission spectra of BeO , MgO , CaO and ZnO were studied. MgO showed a fundamental frequency corresponding to 14.2μ and overtones at two and four times this frequency were observed. CaO showed a fundamental frequency corresponding to 22.05μ and the first overtone only was observed. BeO and ZnO (hexagonal structure) showed by over- and combination tones that three fundamental frequencies exist. The optically detd. values of $h\nu/k$ (h = Planck's const., ν = fundamental frequency, k = Boltzmann's const.) are in agreement with values calcd. from data on m. p., compressibility and sp. heats. Reflection measurements were less satisfactory but showed only fundamental frequencies without overtones.

Color change in crystals at low temperature. I. OBREIMOV AND W. J. DE HAAS. *Verslag Akad. Wetenschappen Amsterdam* **37**, 31-4(1928).— $K_2Cr_2O_7$, I and azobenzene crystals placed in a quartz container were cooled to $20^\circ K$. I becomes red, the two others yellow. Their absorption spectra were photographed. At low temp. very sharp lines appear, these were measured and recorded. W. ALBERT NOYES, JR.

The relative intensities of the D-lines. W. LOCHTE-HOLTGREVEN. *Z. Physik* **47**, 362-78(1928).—By Wood's method of stimulating fluorescence in Na vapor by only one of the D-lines, the increase in intensity of the other component in the resonance spectrum under the action of impacts with mols. of a foreign gas is quantitatively detd. A new form of Na arc lamp is used as the primary source. With addns. of A or Ne + He, the theoretical intensity ratio ($I_D/I_1 = 2$) is reached at a pressure of 8-12 mm. With N_2 and H_2 , which have a strong quenching effect on the fluorescence, the theoretical ratio is not reached. The curve for the quenching of the secondary resonance radiation by A is measured. This makes it possible to distinguish between impacts which cause a transition to the normal state without radiation and those which put the atom in the neighboring P level, and to compare the relative frequency of their occurrence under the conditions used. Impacts with Na or K atoms are about 200 times as efficient in causing the transition between the components of the 2P level as are impacts with noble gas atoms.

Spectrum of ionized sodium. K. MAJUMDAR. *Nature* **121**, 423(1928).—The irregular doublet law is used to identify several of the terms in the Na II spectrum. Those found belong to singlet and triplet systems, and have a spacing roughly double that of the corresponding Ne terms. The ionization potential of Na^+ is estd. as 47 v., and a radiation potential as 32.8 v. These agree with Mohler's values from crit. potential measurements. F. A. JENKINS

The nebular spectrum. J. C. McLENNAN AND RICHARD RUEDY. *Nature* **121**, 319(1928).—The importance of temp. conditions in nebulae for the appearance of the forbidden nebular lines $\lambda\lambda 5007, 4959$ of O^{++} in the spectra is emphasized. The

fact that these lines are stronger in planetary than in diffuse nebulae is taken as indicating that the O is present in the form of a mol. or mol. ion, and not as the at. ion. The emission of the forbidden lines then takes place in the act of dissociation of the mol. This indicates that there is also the possibility of the absorption of these lines.

F. A. JENKINS

Nebulium and hydrogen in new stars. B. P. GERASIMOVICH. *Nature* 121, 422 (1928).—The calcs. of Pike (C. A. 22, 1532), based on Saha's equation and on the coexistence of H and O^{++} in new stars required by spectroscopic evidence, gave a density of the order of 10^{-7} g./cc. This is much too high to account for the forbidden transitions which take place in O^{++} ions, and G. explains the result as due to the inapplicability of Saha's formula to a system not in thermodynamic equil. A more general ionization formula gives a density of the order of 10^{-17} g./cc., in approx. agreement with the conclusions of Elvey (*Nature* 121, 12(1928)).

F. A. JENKINS

The origin of the nebulium spectrum. MEGHNAD SAHA. *Nature* 121, 418(1928).—The lower spectroscopic terms of C, Si, Ge and Pb are due to electron configurations similar to those which give the terms of the O^{III} spectrum. Bowen (C. A. 22, 23) concluded that certain nebular lines represent forbidden transitions in the O^{++} ion and S. finds that lines resulting from similar transitions in Pb occur in the spectrum of the heavy Pb arc. Under the same conditions the corresponding lines of C, Si and Ge should appear. The violation of the selection rule $\Delta k = \pm 1$ appears in this case to be due to strong elec. fields. Such fields are probably present in nebulae and Wolf-Rayet stars, on account of the high state of ionization, and may explain the occurrence of forbidden transitions in the spectra of these bodies.

F. A. JENKINS

Ultra-violet radiation in industry. A. A. KING. *Chemistry and Industry* 47, 301-5 (1928).—Impurities to the extent of less than 0.0001% affect the ultra-violet absorption spectra of CCl_4 . A very small amt. of org. matter on the quartz arc-tube will greatly reduce the efficiency of the lamp. To obtain max. penetration, the substance to be irradiated should be a moving film free of dust and spray. A revolving plate-glass table in which the substance is fed at the center of overflow at the periphery is the best app. In making the *Gutzeit test for As*, stains which are invisible to the naked eye become strikingly visible under ultra-violet radiation, and the technic of making this test is described in detail.

T. S. CARSWELL

The rotational distortion of multiplet electronic states in band spectra. E. C. KEMBLE. *Phys. Rev.* 30, 387-99(1927).—Hund's (cf. C. A. 20, 2283) theoretical interpretation of the contracting multiplet type of band spectra for diatomic mols. is thrown into quantum form for the doublet case and also for the extreme components of higher multiplicities. The discussion is based on the conventional Bohr theory. The theory is applied to the ultra-violet doublet OH bands and is shown to be in approx. agreement with the data. These bands are interpreted as of the $^3S \rightarrow ^3P$ type with the 3P doublet inverted.

BERNARD LEWIS

Analysis of a rectilinear vibration of ultra-violet light. G. BRUHAT and M. PAUTHENIER. *Rev. d'optique* 6, 163-84(1927); *Science Abstracts* 30A, 689-90.—Light from a Hg arc passes through a special form of double spectroscop to get the max. purity in the radiation. All optical parts are of quartz or fluorspar. A parallel beam of light traverses an analyzer and a polarizer with the substances to be tested placed between them. Finally the light is focused on a photographic plate. Special precautions are taken to eliminate stray radiations. A series of records is obtained on the photographic plate for successive positions of the analyzer equally spaced on either side of the central position. The results are examd. with a Fabry-Buisson microphotometer, and the direction of vibration of the light tested is found with great accuracy. By an elec. arrangement the successive exposures are made automatically. Many possible sources of error are examd. and the means employed to eliminate them explained. An accuracy up to a few seconds in angle is possible. Where the polarimeter vessel is closed at its ends by quartz plates of the same thickness, it is necessary to pay special attention to parallelism, good optical definition of the surfaces and the mean ray perpendicular to the surfaces. It is best to work at a little below the normal exposure of the photographic plate, towards the region of under-exposure.

H. G.

Proposed experiment on resonance radiation and derivation of the formula for the Doppler shift of scattered or of resonance radiation. A. E. RUARK. *Phil. Mag.* [7], 3, 1051-6(1927); *Science Abstracts* 30A, 693.—When light of wave length 2536 \AA . U. from a Hg resonance lamp is allowed to fall on a bulb containing Hg vapor heated above 275° , the effects observed depend to a marked degree on the density of the Hg vapor (cf. C. A. 17, 493). It is suggested that our knowledge of resonance and scattering will be increased by studying the space distribution of the light sent out by the Hg vapor.

Different vapor pressures should be used and the incident beam polarized in various planes, as well as unpolarized. Further, the polarization of the emitted light should be studied in the neighborhood of the regularly reflected beam. Schrödinger's formula for the Doppler shift of the radiation from a moving atom is extended to obtain a formula for the shift in scattered radiation. H. G.

Continuous spectra in hydrogen. G. HERZBERG. *Physik Z.* **8**, 727-8(1927).—The continuous limit of the Balmer series, hitherto observed in emission only in solar prominences etc., has been produced in the lab. with the aid of the electrodeless ring discharge. The continuous spectrum observed by Stark with canal rays is not the continuous limit in question. The work of Oldenburg (*C. A.* **21**, 1226) on the ordinary H continuum and the many-lined spectrum is in general confirmed. Various hypotheses for the origin of the continuum have been suggested (cf. Schüler and Wolf, *C. A.* **20**, 2285; Blackett and Franck, *C. A.* **20**, 1027), but these are regarded as erroneous. The emission of the continuous spectrum is in some way connected with the decompn. of the H_2^+ ion, possibly as follows, $H_2^+ + H_2 = H_3^+ + H$ (Dorsch and Kallmann, *C. A.* **21**, 3823). B. C. A.

Radiation and absorption on Schrödinger's theory. J. C. SLATER. *Proc. Nat. Acad. Sci.* **13**, 7-12(1927); *Science Abstracts* **30A**, 488.—Radiation and absorption of light by atoms are treated analytically by replacing the atoms by a set of oscillators, as previously described (cf. *C. A.* **19**, 1985). The analysis is developed on the lines Schrödinger's wave mechanics (*Ann. Physik* **81**, 109-39(1926)). H. G.

The influence of an electric field on the absorption spectrum of rubidium. A. ARSENYEVA. *Z. Physik* **45**, 851(1927).—An elec. field causes a spreading and flattening of the reflection and absorption maxima. The change of the absorption lines 667 μ and 691 693 μ is directly visible on the photographic plate. Further study is planned. MARIE FARNSWORTH

Absorption and scattering of mercury vapor for the line 2536. J. Z. ZIHLINSKI. *Phys. Rev.* **31**, 539-68(1928).—A beam from a Hg arc is passed through a vessel filled with Hg vapor at 16.2° and excites in it resonance radiation of wave length λ 2536. The absorption coeff. is 1 cm⁻¹ and is not changed measurably by the admission of air up to 4-mm. pressure, although resonance radiation is strongly quenched by the air. In vacuum the scattering coeff. is equal to the absorption coeff. within the limits of exptl. error. This proves the assumption first made by Wood that in vacuum there is no true absorption but that the whole loss of energy is due to scattering. For higher pressures the scattering coeff. diminishes. BERNARD LEWIS

The shape and intensities of infra-red absorption lines. D. M. DENNISON. *Phys. Rev.* **31**, 503-19(1928).—An expression for the shape of an infra-red absorption line is developed on the basis that the principal factor in the broadening of a line is the limitation of the length of a wave train a mol. may absorb due to its perturbation by thermal collisions. In applying this result to the analysis of observed infra-red spectra allowance must be made for the low spectrometer resolution due largely to the wide slits employed. Two expressions are developed holding for all but very weak lines, which relate the area under the absorption lines *Abs.*, the min. value of the transmission T_{min} and the true intensity α with the slit width a , the cell length l and the mol. const. $Abs. = [5.412\alpha a\sigma^2]^{1/2}/[\pi h m]^{1/4}$, $Abs. = -2.42 a \log_{10} T_{min}$. It is shown that these formulas are capable of interpreting the absorption line of the infra-red spectrum of HCl observed by Paton (*Phys. Rev.* **15**, 541(1920)) and yield a value of 10.8×10^{-8} cm. for σ . The meaning of σ , the distance to which 2 mols. may approach without altering each others phases, is discussed and a correction to the absorption area formula for faint lines is deduced. In connection with a consideration of the absorption measurements of HCl by Kemble and Bourgin (cf. *C. A.* **20**, 2790), a computation of the effective moving charge of the mol. yields a value $e = (0.199) 4.77 \times 10^{-10}$ E.S.U. BERNARD LEWIS

The atomic spectral lines associated with the band fluorescence of alkali metals. J. C. MCLENNAN AND RICHARD RUEDY. *Nature* **121**, 500-1(1928).—The fluorescence of Na vapor upon illumination with the blue-green part of the solar spectrum shows the at. D-lines as well as the blue-green band system. Since the incident radiation does not contain the wave lengths 589 and 330 μ , it cannot excite the at. lines directly. Their occurrence must be due to optical dissocn. of the excited mols. The abnormal width of the D-lines under these conditions is due to the Doppler effect, since the mols. dissocd. by a quantum having an energy greater than the sum of the dissocn. energy and the at. resonance potential may possess considerable translational energy. F. A. JENKINS

The structure of the band spectra of helium. IV. W. E. CURTIS. *Proc. Roy.*

Soc. (London) A118, 157-69(1928).—Details are given of 3 new bands which have the same final electronic state ($2P$) as the 3 which were first investigated (*C. A.* 16, 2077; 17, 2535; 19, 2912), their relationships and interpretation are discussed in terms of vibrational transitions and electronic levels. The rotational terms have been accurately evaluated for all 6 bands. New evidence is presented which favors the view that the He and H_2 mols. are structurally similar. W. F. MEGGERS

The distribution of intensity in the band spectrum of helium: the band at $\lambda 4650$. W. H. J. CHILDS. *Proc. Roy. Soc. (London) A118*, 296-317(1928).—Preliminary measurements of the intensity distribution in the first of the main series of He bands at 4650 A. U. are made by photographic photometry. The predicted distribution is of the correct type, but agreement with observation is by no means complete. Notably the P and R' branches are much stronger, relative to the Q branch, than the theory indicates. W. F. MEGGERS

The arc spectrum of carbon. A. FOWLER AND E. W. H. SELWYN. *Proc. Roy. Soc. (London) A118*, 34-51(1928).—In the region extending from the red to 2000 A. U. in the ultra-violet the ordinary C arc shows only a single line, 2478 A. U. However, other lines attributable to C have been observed in spectra of vacuum tubes contg. a mixt. of C compds. and He, and many of these appear with great intensity at the negative pole in high-current arcs between C electrodes. Nearly 100 lines ranging in wave length from 1260 A. U. to 10,119 A. U. are thus ascribed to the C I spectrum and about half of these are now classified as combinations between terms belonging to a singlet system or to a triplet system. The deepest term is a triplet P_0 , the value of which is estd. at 91,017, corresponding to an ionization potential of 11.2 v. Comparisons are made with the spectra of N^+ and O^{+1} , the atoms of which are similarly constituted, but differ in nuclear charge. W. F. MEGGERS

The shifting of residual rays into the visible spectral region. GEORG JOOS. *Physik. Z.* 29, 117-8(1928).—A certain analogy of ordinary band spectra and the absorption and emission spectra of crystals which at low temps. give lines of considerable sharpness is pointed out. In the band spectra of mols the elementary change in energy may consist of 3 parts, rotational, vibrational and electronic. Whereas the rotational bands are usually outside of the observable range some information concerning them may be deduced from the other bands. Similarly the grating vibrations of crystals give rise to the so-called residual rays which fall in about the same region in the far infra-red as the rotational bands, but if an electron jump is superposed upon the residual rays, the radiation phenomena are displaced to a more accessible region. Thus, the absorption spectrum of Cr K selenate and of homologous Cr double salts of alum type have been photographed and a line series up to 11 members with almost const. sepn. of 43 cm^{-1} has been found. Interpreting this line series as the superposition of grating vibrations upon an electron, and perhaps also a mol. vibration, one arrives at a wave length of $1/\lambda_0$ cm. or 232μ for the residual rays. W. F. MEGGERS

Excitation of gases to luminescence by α -rays. H. GREINACHER. *Z. Physik* 47, 344-56(1928).—The intensity of the light produced by the passage of α -rays through air, CO_2 , O_2 and H_2 is unaffected when an elec. field is applied so as to prevent recombination of the ions; the spectra, therefore, cannot be emitted in recombination, but must be due to primary excitation by the α particles or to a reaction luminescence. In H_2 , the band spectrum at 120 to 100μ , or the continuous spectrum from 330 to 195μ is probably produced. W. WEST

The after-glow of nitrogen and oxygen and the influence of walls thereupon. GERHARD HERZBERG. *Z. Physik* 46, 878-95(1928).—A study was made of the ring discharge effect in mixts. of O and N at various pressures. Especially the after-glow of N and to some extent that of O can be removed, unless some of the other gas be present, if the quartz tube used be thoroughly baked out before the expt. is started. The walls of the tube have a distinct catalytic effect, producing atomic H, which merely purifies N by attacking O. The after-glow of both N and O can again be obtained if once removed by introducing traces of H. Fluorescence and phosphorescence of quartz and glass are believed to be combined in this phenomenon. R. H. L.

Anomalous dispersion in the phosphorescence of alkali halides. M. A. BREDIG. *Z. Physik* 46, 899(1928); cf. *C. A.* 22, 731.—A correction; four light quanta instead of one are stored up for each quadrivalent Bi atom. R. H. LAMBERT

Fluorescence of mercury vapor. R. W. WOOD AND V. VOSS. *Nature* 121, 418-9 (1928).—Previous expts. by W. indicated that Hg vapor fluoresces in the light of the Al spark only when distg. New expts. show that the effect depends on the removal of traces of impurity by the stream of distg. vapor. A bulb which does not fluoresce because of small quantities of water vapor will do so after treatment with a high-fre-

quency electrodeless discharge All the brighter arc lines are present in the fluorescence, and their intensity increases with the square of that of the exciting light, showing that they result from a two-stage absorption. Superheating the vapor greatly enhances the intensity of the arc lines and of the ultra-violet band, but destroys the blue-green band fluorescence.

F. A. JENKINS

The origin of luminescence effects of phosphorus. A. PETRIKALN. *Naturwissenschaften* 16, 205(1928).—Excitation of P_2O_3 vapor by different means showed a band spectrum identical in all details with the one occurring during oxidation of P or of P_2O_3 . It has been partly classified. Contrary to previous results (C. A. 18, 1787) the luminescence spectrum of P is therefore ascribed to P_2O_3 . Excitation of P_2O_3 at temps up to 380° gives only an O spectrum. The band group at 3270 Å. U. (Timelcus and Purcell, C. A. 21, 2435) only appears in impure P_2O_3 .

B. J. C. VAN DER HOEVEN

The light sensitivity of dyes. II. A. STEIGMANN. *Kolloid-Z.* 44, 173-5(1928).—The new theory of optical sensitizing in which the sensitizer itself is not used up in the sensitizing process is contradictory to the hydrogenation and dehydrogenation theory which appears to be founded on facts. The latter is quite analogous to the CO_2 assimilation hypothesis, in which chlorophyll is reduced by a photochemical activated-hydrogen process. A review is given on the effect observed when ergosterol is subjected to ultra-violet light. The process is explained as due to activated H. A study is to be made on protein systems in ultra-violet light in the presence of dyes.

R. H. L.

Photolysis of hydrogen iodide solution in hexane and in water. F. WARBURG AND W. RUMP. *Z. Physik* 47, 305-22(1928).—Measurements were made on stirred solns., in an atm. of CO_2 , at wave lengths 207, 222 and $282m\mu$, the absorbed radiation being measured by the bolometer, and the chem. changes by titration. The Einstein law holds for hexane solns. of HI, the quantum efficiency varying between 1, at low concns. of HI, and 2, at high concns., and ϕ , the no. of mols. decomposed per calorie of absorbed radiation, increasing with increasing wave lengths approx. as required, though rather more quickly. The same explanation is suggested as for the gaseous reaction, primary decompn. of the HI mol. into its atoms, followed by the reaction $H + HI = I + H_2$, and the lower quantum efficiency at small concns. is attributed to deactivating collisions of the H atoms with solvent mols. In aq. solns. ϕ diminishes rapidly with increasing wave lengths, and with diminishing concn. to 0 at 0.01 N, while for hexane solns., it varies only slightly with concn. The true photolyte is undissoc. HI, which apparently exists at high concns. in water, and the diminution of ϕ with concn. is to be attributed to disson., the I^- ion being unaffected by the wave lengths used. The true ϕ values for aq. solns. are, therefore, higher than those measured on the assumption of complete photochem. effectiveness of all of the energy absorbed by HI. At $207m\mu$ the apparent quantum efficiency for aq. solns. 7.5 N exceeds 2; it is suggested that an activated HI mol. may react with several consecutive normal mols., $2HI = H_2 + I_2$. Data are given on the absorption coeff. of hexane in the ultra-violet, and photographs of the absorption spectra of HI, I_2 and mixts. of HI and I_2 in aq. soln.

W. WEST

Studies in photochemical reactions. I. The effect of the dielectric constant of the medium on the equilibrium constant. K. G. MATHUR, R. S. GUPTA AND S. S. BHATNAGAR. *Indian J. Physics* 2, 243-55(1928).—Winther (C. A. 20, 545) suggested a possible relation between velocity const. of photochem. reactions and dielec. const. The bromination of cinnamic acid was studied in seven solvents and the change of o-nitrobenzaldehyde into o-nitrosobenzoic acid was studied in 5 solvents. No relationship between velocity and dielec. const. is obvious.

W. ALBERT NOYES, JR.

The mechanism of the photochemical dissociation of hydrogen iodide. K. F. BONHOEFFER AND I. FARKAS. *Z. physik. Chem.* 132, 235-56(1928).—The HI mol. is dissociated by light into atoms in one step. Fluorescence expts. at low pressures show that less than $1/1000$ of the absorbed energy is reradiated. In agreement with Lewis (C. A. 21, 1760), the equivalence law is obeyed at low pressures. H and I atoms may be shown to be formed by their high adsorption on the quartz walls. The reaction $HI + I_2$ seems to limit the HI decompn.

W. ALBERT NOYES, JR.

Contribution to the photochemistry of the halogens. Action of bromine on the nitrile of α -phenylcinnamic acid. A. BERTHOUD AND G. NICOLET. *J. chim. phys.* 25, 40-64(1928); cf. C. A. 21, 3898.—A study was made of the reaction between Br and α -phenylcinnamic acid (designated by A) both in the dark and in the light. The action $A + Br_2 \rightleftharpoons ABr_2$ is reversible as stated by Bauer and Moser (C. A. 1, 1407) and Plotnikov (*Lehrb. Photochemie* 250(1920)). Both reactions are much slower in the dark than was believed by Bauer and Moser, since the latter did not work in total darkness. The photochem. equil. is independent of the intensity of light and is detd.

by the empirical equation $([A] + m[ABr_2][Br_2])/[ABr_2] = K$, which becomes $[A]/[Br_2]/[ABr_2] = K$, when the nitrile is in great excess. The velocity of addition of Br is expressed by the equations $d[ABr_2]/dt = k_1 I_0^{1/2} [Br_2]^{1/2}$, when the absorption is slight and $d[ABr_2]/dt = k_1 I_0^{1/2} [Br_2]$ when there is complete absorption. The decompn. is expressed by the equation $-d[ABr_2]/dt = k_2 I_0^{1/2} [ABr_2][Br_2]^{1/2}/[A]$ when there is slight absorption and $-d[ABr_2]/dt = k_2 I_0^{1/2} [ABr_2]/[A]$ when the absorption is complete. The photochem. decompn. of ABr_2 takes place only in the presence of Br, which acts as a sensitizer. The mechanism of the sensitizing action is discussed.

HARRY B. WEISER

Contribution to the study of the halogens. Action of bromine on ethyl alcohol. A. BERTHOUD AND J. BÉRANECK. *J. chim. phys.* 25, 28–39 (1928); cf. *C. A.* 21, 2227.—The velocity of oxidation of EtOH by Br in the dark is proportional to the product of the concns. of the two substances. HBr retards the action less than was observed by Bugarszki (*Z. physik. Chem.* 38, 561 (1901); 48, 63 (1904); *C. A.* 4, 1407). Under the action of light and when the absorption is slight, the velocity increases a little more rapidly than the square root of the luminous intensity and of the Br concn. The order of the reaction with respect to the EtOH is not const. KBr retards the action. The quantum yield is lower than the value calculated from the law of equivalence. From the results it is concluded that light dissociates the mols. of Br_2 and that there is formed an intermediate compd. C_2H_5O by the action of an atom of Br on a mol. of EtOH. It is suggested further that the C_2H_5O may react with a mol. of Br thus: $C_2H_5O + Br_2 \rightarrow C_2H_5O + HBr + Br$, $2Br \rightarrow Br_2$ or with an atom of Br thus: $C_2H_5O + Br \rightarrow C_2H_5O + HBr$; but neither hypothesis alone is sufficient to account for the observed facts.

HARRY B. WEISER

Some additional facts on experiments dealing with photochemical yields with complex light. V. M. PADOA AND NERINA VITA. *Gazz. chim. ital.* 58, 3–6 (1928); cf. *C. A.* 21, 2104.—The reasons advanced by Berthoud and Béraneck (*C. A.* 21, 2227) are not sufficient to explain the yields obtained by P. and V. (*C. A.* 18, 2647; 20, 3647) in the bromination of cinnamic acid, for these yields vary with the order of exposure and with the solvent and are the same for light filtered through solns. as for unfiltered light. Furthermore in new expts. on the oxidation of III, in which the exposures were of such duration that the same concn. of I was obtained, the yields were proportional to the sq. roots of the intensity, but when the times of exposure to the different intensities were the same the yields were proportional to the intensities. The Berthoud law is not of general application, because if the intensity I is divided into n parts, the sum of n photochem. actions of intensity I/n and the action of intensity I are related, thus: $[n\sqrt{(I/n)}]/I = \sqrt{(n/I)}$. When n approaches infinity, the expression also becomes infinitely great, so that the diminution of intensity would increase the photochem. yield to an infinite degree. A study of the photochem. reaction: $Fe_2(C_2O_4)_3 \rightarrow 2FeC_2O_4 + 2CO_2$, in which equal yields were obtained with very different intensities, the proportionality between the chem. action and the intensity still held true. Together the expts. of B. and B. and of P. and V. show that the sum of the actions of the component lights differs from, and is in general greater than, the action of resultant complex light, not only when the intensities vary but when the frequencies vary.

C. C. DAVIS

The Weigert effect in photochloride exhibiting anisotropy. H. ZOCHER AND K. COPER. *Z. physik. Chem.* 132, 302–12 (1928).—A method is described whereby the Weigert effect can be measured for photochloride free from a binding agent. Other light-sensitive materials such as asphalt, $K_2Cr_2O_7$ in gelatin, $TiCl_3$ and $CuBr$ were studied. $AuCl_3$ was found to be insensitive to light. Dichroism and double refraction for photochloride without a binder exposed to red, green and white light are graphically described. Photochloride in gelatin was studied in like manner. The results for the Ag without a binding medium is qual. the same as anisotropic Ag in an emulsion. The trend of double refraction is about the same as that of a dye with the same curve for dichroism.

RAYMOND H. LAMBERT

The production of optical activity by circular light. H. ZOCHER AND K. COPER. *Z. physik. Chem.* 132, 313–9 (1928).—Circular polarized light has been used to produce optical activity in photochlorides. Specially prepd. photochloride is necessary in order to have it not too light-sensitive for study. A description is given of the method for obtaining circularly polarized light and its action on photochloride is analogous to linear anisotropy by the Weigert effect. White and red circular light was used and both dichroism and optical activity were obtained.

R. H. LAMBERT

The production of anisotropy of surfaces. H. ZOCHER AND K. COPER. *Z. physik. Chem.* 132, 295–302 (1928).—A discussion is given of the various forms of anisotropy.

Anisotropy produced by rubbing glass surfaces is a property of the pure surface and can only be removed by etching away the surface. Nearly all solid substances can be made anisotropic at the surface merely by rubbing. Other dyes as well as methylene blue and anisotropic melts of *p*-azoxyanisole and phenetole show this property. A fresh fracture of glass shows anisotropism which is polar with respect to the direction of fracture. The Weigert effect exhibits no influence on glass surfaces. R. H. L.

Radiochemistry and photoelectricity. R. AUDUBERT. *J. chim. phys.* **24**, 357-69 (1927). The uncertainty involved in the application of the formula $Q = h(\nu' - \nu)$, where Q is the energy change, ν and ν' are the frequencies for the direct and reverse reactions, and h is the product of Planck's const. and Avogadro's no., may be avoided by taking as ν and ν' the threshold frequencies. This formula has been examined by means of e. m. f. measurements with a cell consisting of a soln. of an electrolyte into which dip 2 electrodes, one kept dark and the other illuminated (cf. *C. A.* **18**, 788). The threshold frequencies are obtained by assuming a linear form for the e. m. f.-frequency curve, and extrapolating to zero e. m. f. With ferric salts, the e. m. f. due to the light is pos., i. e., the illuminated electrode behaves as anode. For FeSO_4 , the observed e. m. f. is pos. for p_H below 1.8, and neg. for higher p_H . This effect is apparently due to the action of the light on the H ions bound electrostatically on the surface of the electrode, the true e. m. f. for ferrous salts always being neg. In this way, the value $-30,000$ g.-cal. is obtained for the energy of the reaction $2\text{Fe}^{++} + 2\text{H}^+ = 2\text{Fe}^{+++} + \text{H}_2$, in good agreement with the value obtained from e. m. f. detns. with the cell $\text{Pt}|\text{acid soln.}|\text{KCl}_{\text{sat}}|\text{Pt}|\text{ferrous salt}|\text{Pt}$. Similar expts. with NaI solns. give $-26,000$ g.-cal. for the heat of the reaction $3\text{I}^- = \text{I}_3^- + 2\text{e}^-$, while e. m. f. detns. with the cell $\text{Pt}|\text{NaI}|\text{KCl}_{\text{sat}}|\text{NaI}|\text{Pt}$ give $-27,800$ g.-cal. COLIN G. FINK

Formation of ozone by electric discharge in presence of foreign gases. A. PINKUS AND A. JULIARD. *J. chim. phys.* **24**, 370-90 (1927).—When O is subjected to the silent discharge, the fraction which is ozonized is, for a given rate of flow of the gases, nearly the same for all pressures between 300 and 600 mm., this being a max. value. Under comparable conditions of pressure and rate of flow, H and, to a less extent, Si tetrafluoride reduce the yield of O_3 . If the rate of flow is high and the voltage is small, the presence of N may cause the yield to be better than with pure O under comparable conditions. With increase in the voltage and decrease in the rate of flow, however, the optimum amt. of N diminishes, probably because in these circumstances more oxides of N are formed, and these exert a greater destructive action on the O_3 , according to the equations $2\text{NO} + \text{O}_3 = \text{N}_2\text{O}_5$, and $2\text{NO}_2 + \text{O}_3 = \text{N}_2\text{O}_5 + \text{O}_2$. • **"Knowles" plant for electrolysis of water.** Q. SESTINI. *Giorn. chim. ind. applicata* **9**, 318-20 (1927), *Brit. Chem. Abstracts* **1927B**, 785.—A short description of the construction of this cell, in which 15% NaOH is used as electrolyte and which is said to deliver 99.5% O and 99.8% H_2 . Operating characteristics are given for a cell consuming 4500 amps. at 2.5 v. C. A. DAVIS

Electrochemical preparation of Scheele's green. B. P. BRUNS. *Ukrainskii khim. Zhurnal* **2**, Tech. Pt. 143-54 (1926).—When a 5-10% Na_2SO_4 soln. satd. with As_2O_3 was electrolyzed, a Cu anode being used, a compd. was obtained very similar to Scheele's green in color and compn. The best product was obtained when electrolysis was carried out at 80°. Current d. and deposition of Cu_2O on the anode influence the yield. Schweinfurt green can be similarly obtained by adding Na acetate to the electrolyte. B. C. A.

• **Electrolytic recovery of zinc from pyrites calcination residues rich or poor in copper.** H. PAWECK AND H. WENZL. *Z. angew. Chem.* **40**, 1106-12 (1927).—In the Kellner process (Austr. pat. 5484 of 1901) the residues are treated with SO_2 , giving a soln. of Zn, Cu and Fe bisulfites, from which ZnSO_4 is pptd. by boiling out of contact with air. The

ZnSO_3 is collected on a filter, and converted into sulfate by air oxidation, its soln. being freed from Fe by treatment with bleaching powder and ZnO , and is then further converted into ZnCl_2 with NaCl . The soln. of ZnCl_2 is finally electrolyzed. This process is modified by Paweck in that the ZnSO_3 is converted into sulfate by the calcd. quantity of warm 10% H_2SO_4 , and the resulting soln. is electrolyzed in a Paweck diaphragm cell. These processes apply, however, only in the absence of appreciable quantities of Cu, ZnSO_3 being obtained free from Cu only when the soln. contains less than 0.3% Cu and more than 1.6% Zn. The yield of ZnSO_3 increases with increasing concn. of bisulfite, and attains 75% with a concn. of 6.5% Zn. With residues rich in Cu the pptn. of ZnSO_3 is interfered with, and the Cu must first be removed by heating the bisulfite soln. to 75°, when the Cu is pptd. as sulfide, the Zn remaining in soln. Traces of CuSO_4 in the soln. are removed by adding Zn, and the remaining sulfites of Fe and Zn are oxidized by adding bleaching powder and blowing in air. Addn. of Zn dust rich in oxide ppts. $\text{Fe}(\text{OH})_3$, and the clear ZnSO_4 soln. is electrolyzed, with a Pb anode and steel cathode. With residues rich in Zn and poor in Cu the ZnSO_3 is converted into ZnSO_4 by addn. of the anolyte (contg. 10–12% of H_2SO_4) from a previous electrolysis of ZnSO_4 . B. C. A.

Electroplating on aluminum and its alloys. H. K. WORK. *Trans. Am. Electrochem. Soc.* 53 (preprint) 24 pp. (1928).—Ten reasons for the difficulty of plating on Al are listed and some are briefly discussed. A group of the most commonly used Al alloys was used for plating tests. Deposits were tested for adhesion and for corrosion resistance. Cleaning procedures included employment of: org. solvents, mixed alkali cleaners, acid cleaners and dil. and concd. mixed acids, passive dips and mech. cleaners. Plating on a roughened surface is most practicable, as plating on a smooth Al surface has doubtful value unless heat treated. Several etching solns. are listed, none of which is generally applicable. A dip is described for commercially pure Al which simultaneously roughens the Al surface and forms an immersion layer on the surface. A dip that attacks one constituent of the eutectic network is best for alloys contg. one. Successful electroplating of strong alloys is possible if the alloy is given the usual heat treatment accorded these alloys to develop strength. Al plating improves the appearance and increases resistance to abrasion. Numerous photomicrographs and exp't data are given. W. H. BOYNTON

Theory of electrolytic deposition of chromium from chromic acid solutions. V. SHISHKIN AND HELEN GERNET. *Z. Elektrochem. angew. physik. Chem.* 34, 57–62 (1928).—The electrolysis of CrO_3 solns. in which the relation $\text{Cr}^{\text{III}}:\text{Cr}^{\text{VI}} = 1:35$ is studied. A bright deposit is obtained at a c. d. of 10 amp./sq. dm. at about 45°. At temps. around 10°, the deposit is thick and scaly, consisting chiefly of brown oxide. As the temp. rises to 20–30°, the deposit becomes dull and shows knobby growths under the microscope, while at 65° the dull deposit again appears. As the temp. rises the current efficiency falls. At 45°, if the c. d. becomes too high, (30 amp./sq. dm.) the deposit becomes dull and defective, although at this value of current, rotating the cathode at 200 r. p. m. gives a bright, uniform deposit. Increasing SO_4 concn. makes it possible to obtain a bright deposit at lower temp. and higher c. d. With 28 g. Na_2SO_4 per l. (250 g. $\text{CrO}_3/\text{l.}$) a bright deposit is obtained at 25° and 14 amp./sq. dm. The theory is advanced that the formation of a bright deposit is accompanied first by the deposition on the cathode of a colloidal hydroxide, preventing direct contact of CrO_3 . H. S.

Electrolytic precipitation of iron from aluminum salts. L. WASILEWSKI AND S. MANTEL. *Przemysl Chem.* 12, 48–52 (1928).—The electrolytic pptn. of Fe on Cu or Fe cathodes from a soln. of NH_4 alum is not successful. The high overvoltage for H_2 on a Hg cathode and the immediate dissolution in it of deposited Fe makes it possible to decrease the Fe content of such a soln. to 0.003 g. Fe_2O_3 per 100 g. Al_2O_3 . Expts. performed at cathodic current densities of 150 and 300 amp. per square m. showed a current efficiency with respect to Fe of 18.9%, where the Fe content had to be decreased to the required max. of 0.01%. This yield was independent of the Fe content of the Hg up to 1%. Fe deposited electrolytically on a Hg cathode dissolves in it even when the soln. contains the cations of Fe only, and probably forms a colloidal soln. with it. A. C. ZACHLEN

Study of the variation of the resistance of thin strips of platinum as a function of their thickness and the influence of oxygen compounds on such resistances. ANDRÉ FÉRY. *J. phys. radium* 9, 38–48 (1928).—By electrodeposition metallic deposits of varying thickness can be obtained. The thickness, a , (in millimicrons) can be calcd. by measuring the optical density D , from the relationship $a = 63.4 D$. The resistance of the deposit, ρ (in ohms per cm.), is given by the expression $\log(10^3 \rho) = 5.7 - 0.0156a$. With a thickness of about 380μ the deposits assume the resistance of the metal. Ad-

sorption of H_2O , SO_2 or MeOH increases considerably the resistance of Pt deposits. It is suggested that the deposit is not homogeneous. Thin deposits (between 11 and 600 at. diams.) may not have the same structure as the compact crystal.

E. G. VANDENBOSCHE

Electrolytic oxidation of *p*-toluic acid in alkaline solution. A. J. ALLMAND AND A. PUTTICK. *Trans. Faraday Soc.* **23**, 641-50(1927).—An attempt has been made to increase the efficiency of the electrolytic process for the oxidation of *p*-toluic acid in alk. soln. to terephthalic acid by the superposition of an a. c. on the d. c. With d. c. alone the highest current efficiency, 16%, is obtained at a Pt anode with a current d. of 4 amp./sq. dm. in 2*N* KOH containing 0.25*N* K *p*-toluate. Discolored solns. are obtained when the free alkali concn. is decreased, and the yield is lowered when either alkali or salt concn. is increased, or the c. d. is increased or decreased. With superposed a. c., whether of frequency 50 or 500, or of high or low c. d., no improvement in efficiency is effected, and with currents of low frequency, or with large currents of high frequency, the efficiency is definitely lowered. There are 3 anodic processes, (1) evolution of unutilized O , (2) oxidation of *p*-toluic acid to terephthalic acid, (3) complete oxidation of *p*-toluic acid with formation of CO and CO_2 . The action of the a. c. is to favor (1) and (3) more than (2). Anode potential measurements have been made, and it is impossible to trace any connection between these and the different terephthalic acid yields.

Molded ebonite battery boxes. A. FRASER. Brit. 273,358, Feb. 17, 1926. Mech. features.

Apparatus for electrodeposition of metals. H. C. HARRISON. Brit. 274,405, Jan. 5, 1926. In effecting electrodeposition of metal at high c. ds. on a moving cathode, the electrolyte is caused to flow through the cell in 2 sep. streams of different velocities, one flowing at high velocity through a closed tunnel and the other being open to atm. pressure; the streams are subsequently commingled. The cathode ribbon may be prepd. by coating with Na sulfide and the cathode walls may comprise C granules bonded by cement or by a phenolic condensation product. Various other structural features are described.

Electrodeposition of metal laminae. W. A. F. PFANHAUSER. Brit. 274,426, July 14, 1926. Metal laminae of uniform thickness such as Ni for use in flake form in elec. batteries or as a catalyst are deposited on an endless band which passes repeatedly through a plating bath and then through a second bath in which a sepg. layer is deposited. The sepg. layer may be of Cu, wax or rubber.

Electrodeposition of chromium. W. M. PHILLIPS. Brit. 273,659, June 30, 1926. An anode of ferrous metal such as Fe or steel is used which may be shaped to conform to the shape of the article being plated and may form the cell itself. The electrolyte may comprise chromic acid of at least 97% purity together with not more than 12.5 g. per l. of Cr sulfate, with or without small quantities of H_2BO_3 or a borate. With this electrolyte the Fe is not corroded.

Electrolytic production of aluminum. SOC. ITALIANA DI ELETTROCHIMICA. Brit. 274,108, July 8, 1926. $Al(OH)_3$ is supplied to an electrolytic furnace for the production of Al, after agglomeration by compression or by use of a binder such as gelatin, glue or other colloids or acids or salts and drying.

Electroplating apparatus. F. P. GREEN. U. S. 1,667,515, April 24.

Apparatus for electroplating printing plates, etc., with chromium. W. S. EATON. Brit. 273,629, May 2, 1927.

Preparing and electroplating absorbent nonconductive materials. A. BIDDLE. Brit. 273,664, July 3, 1926. Materials such as wood, paper, leaves and textile fabrics are prepd. for electroplating with metals by coating them with an aq. dispersion of an irreversible colloid such as natural rubber latex, applying a film of finely divided cond. material such as graphite, Cu, bronze, Ag or Sb and dehydrating the coating. Substances such as clay, ZnO , Na silicate or casein may be added to the latex to give it the desired consistency. Electrodes for receiving detachable metal deposits may be formed from plastic colloidal preps. in which are admixed clay, wood pulp, fiber or pulverized cork or asbestors, with or without softening oils, waxes or resins. An anode to receive a rubber deposit from latex may comprise a conductor provided with a coating of irreversible colloid in aq. dispersion contg. $NaHCO_3$ or $(NH_4)_2CO_3$ which is afterward heated to liberate gas and render the mass porous.

Cadmium plating. C. M. HOFF. Can. 276,468, Dec. 20, 1927. A compn. for use for the prepn. of a Cd plating bath consists of a dry mixt. of $Cd(OH)_2$ and $(NH_4)_2SO_4$. Cf. C. A. 21, 862.

Alarm or cut-out device for preventing overheating in electrical apparatus. M. BUCHHOLZ. Brit. 273,701, July 1, 1926.

Luminescent fuse plug for electric circuits. L. F. MILLER. U. S. 1,666,339, April 17. A substance such as sulfide of Zn or Cd is used which renders the plug luminescent for some time after it is "blown."

Electric cut-out fuses. SIEMENS-SCHUCKERTWERKE GES. Brit. 273,322, June 25, 1926. Arcing discharges which tend to occur when a fuse blows out are suppressed by introducing into the path of the discharge a substance which effects absorption of electrons or ions. I_2O_5 may be used with a Ag wire. Halogen compds. of Si and B nitride also may be used.

Luminous indicators for electric switches, etc. C. H. HOLMWOOD. Brit. 274,358, Jan. 22, 1927. A layer of Ra bromide or other luminant is placed under a lens or disk in the knob of a tumbler switch or like device.

Temperature control for electric ovens. S. HALL. U. S. 1,667,595, April 24. An electron discharge tube is assocd. with the control devices.

Electric annealing furnace. AKT.-GES. BROWN, BOVERIE, ET CIE. Brit. 273,320, June 23, 1926.

Electric induction furnace. E. F. NORTHRUP. Brit. 274,007, April 26, 1927.

Electric induction furnace (adapted to work under pressure or vacuum). E. F. NORTHRUP. Brit. 274,008, April 26, 1927.

5—PHOTOGRAPHY

C. E. K. MIES

Photochemical studies. X. Photographic fog. A. REYCHLER. *Bull. soc. chim. Belg.* **37**, 33-9(1928); cf. *C. A.* **21**, 2440.—The fog which is often found after development of unexposed films may be greatly reduced by treatment of the plate, before exposure, with a weakly acid soln. of an oxidizing agent. Suitable solns. are 0.01-0.03% KMnO_4 , 0.2-0.5% CrO_3 or 0.0005-0.001% $\text{K}_3\text{Fe}(\text{CN})_6$ in 0.025 N H_2SO_4 . Of these $\text{K}_3\text{Fe}(\text{CN})_6$ is the most effective antifogging agent. The oxidizing soln. is allowed to act 3 min. and then the action is stopped by treatment with slightly acidified 2.5% Na_2SO_3 soln. HgCl_2 , also, may be used as the oxidizing agent, but in this case no reducing agent is used. After about 10 sec. the plate is dried over H_2SO_4 .

A. L. HENNE.

Photographic silver halide emulsions. W. DIETERLE, O. MATTHIES and J. REITSTÖTTER. U. S. 1,667,589, April 24. Substances extractable from proteins by electro dialysis are added during emulsion manuf. to produce high-speed emulsions free from fog. Cf. *C. A.* **22**, 1109.

Pictures in color. W. V. D. KELLEY. U. S. 1,667,477, April 24. In producing color pictures upon a support having a sensitive coating including strata of different speeds, a color selection print is first printed, developed and bleached in the faster stratum, a complementary print is then printed and developed in the slower stratum, and both are fixed.

Color photography. W. LANGGUTH and C. HUMMEL. Brit. 274,129, July 9, 1926. In producing tri-color photographs by printing 3 color-record negatives successively in register on the same support with the aid of light-sensitive dye components, the support is sensitized in succession for the green-blue, green-yellow and purple components, and each of these is printed while the support is still moist under the corresponding negative in a printing frame having a cooling device. As azo dye components it is stated that there may be used. (1) salts of dianisoletetrazodisulfonic acid and 1,8-aminonaphthol-2,4-disulfonic acid for the green-blue component; (2) salts of methylbenzidinetetrazodisulfonic acid and acetoacetic acid or an ester or anilide derived therefrom for the green-yellow component; and (3) salts of anisidinediazosulfonic acid and hydroxynaphthoic acid or its derivs. for the purple component.

Photographic transfer process for imitating grains of different kinds of wood, etc. E. M. TALENT. Brit. 274,030, July 10, 1926.

Photographic printing material. T. RODY. Brit. 274,075, July 7, 1926. A carrier for the sensitized layer consists of a velour-like material produced by applying fine white wool dust or other suitable vegetable or animal dust to a backing such as paper by use of an adhesive.

Photochemical printing surfaces. HAMBURGER FREMDENBLATT BROSCHEK & CO. Brit. 274,407, July 15, 1926. Composite diapositives of text and picture illustrations after being varnished as described in Brit. 264,131 (*C. A.* **22**, 34) are covered with a thin sheet of cellophane so that the diapositives may be used before the varnish is dry.

Photomechanical printing surfaces. K. H. SCHWIMMER and H. PAWECK. Brit. 273,688, June 30, 1926. A gelatino-Ag layer on glass or film, carrying a negative, positive or half-tone image, is soaked in water or other suitable liquid, the relief thus produced is rendered conductive, e. g., with graphite, and a Cu coating is deposited by a galvano-plastic process and this may be transferred and removed from the glass or film after the usual "setting-up" for the press.

Photomechanical printing surfaces. E. MÜLLER. Brit. 274,422, July 14, 1926. A screen negative for photolithographic printing is made by exposing a sensitive plate through a screen placed at such a distance from the plate that the graining consists of black nuclei fading toward the edges; the negative is retouched, e. g., by use of mat varnish and graphite, and its front surface is locally etched with a dil. etching agent mixed with a viscous or gummy substance to prevent spreading.

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

The most recent progress in inorganic chemistry. GIOVANNI CANNERI. *Giorn. chim. ind. applicata* 10, 12-7(1928).—The review deals with studies on new elements, on the transmutation of elements, and on mol. structure by the use of x-rays. Sixty references are included.

C. C. DAVIS

Observations on the rare earths. XXVII. 1. Fractional precipitation of the cerium group earths by electrolysis. 2. Solubility of rare earth oxalates in nitric acid. J. W. NECKERS AND H. C. KREMERS. *J. Am. Chem. Soc.* 50, 950-4(1928).—An attempt to sep. (1) La from Pr, (2) a mixt. of all the Ce earths in the presence of a small quantity of the Y metals, (3) the same as 2, excepting that 5% NaCl is added (this increasing the cond. three-fold without effecting the efficiency of sepn.) and (4) the Pr and Nd chlorides in the presence of 5% NaCl. La can be sepd. from Pr and other Ce metals by this method, but further sepn. are not possible with it. The solubilities of La, Pr, Nd, Sm, Dy and Y oxalates are detd., at 90°, in 1.25, 2.50 and 5.00 N HNO₃ alone, and also on addn. of 5% oxalic acid. At this temp. no definite satn. point is reached in 5 N HNO₃. XXVIII. The separation of cerium. *Ibid* 955-8.—Ce(NO₃)₃ and Ce₂(SO₄)₃ are electrolytically oxidized, at the anode, to 90% completion without pptn. In the presence of the phosphate ion 99% oxidation and pptn. take place. By oxidizing with slightly acid KMnO₄, Ce is 100% pptd. by a sol. phosphate, thus giving complete sepn. from other rare earths (Th excepted). The phosphate method of sepn. possesses certain advantages over the other methods used in Ce manuf. XXIX. The preparation and properties of some anhydrous rare earth chlorides. J. H. KLEINHEKSEL AND H. C. KREMERS. *Ibid* 959-67.—The chlorides (III) of La, Ce, Pr, Nd, Sm, Dy, Y, Ho and Tm are dehydrated by heating their 6-hydrates in the presence of dry HCl at ordinary (gives slow dehydration) and reduced (rapid) pressures. Their m. ps. (by the cooling-curve method), ds. (by an air displacement method) at 25°, and p_H values at varying concns. of aq. solns. (with a potentiometer and H electrode) are detd.

J. BALOZIAN

Formation of carbides in the systems: metal-carbon-oxygen. G. MEYER AND F. E. C. SCHEFFER. *Rec. trav. chim.* 47, 401-5(1928)(French); cf. C. A. 21, 3011.—The theoretical considerations of the first article are augmented. The knowledge of the values of the heats of formation of the different equilibria helps to det. to which one of the 4 types of P-T diagrams a certain system belongs. The system Ni-C-O is taken as an example to prove the conclusions.

E. SCHOTTE

The systems: Cd(NO₃)₂-HNO₃-H₂O, Zn(NO₃)₂-HNO₃-H₂O and Mg(NO₃)₂-HNO₃-H₂O at 20°. G. MALQUORI. *Atti accad. Lincei* [6], 7, 146-8(1928).—For the systems: Zn(NO₃)₂-HNO₃-H₂O and Mg(NO₃)₂-HNO₃-H₂O, the soly. curves extend to satd. solns. of Zn(NO₃)₂·4H₂O and Mg(NO₃)₂·6H₂O in HNO₃ (d. 1.52), while for the system Cd(NO₃)₂-HNO₃-H₂O the soly. curve extends over the entire field of concns. Cd(NO₃)₂·4H₂O, Cd(NO₃)₂·2H₂O, Zn(NO₃)₂·6H₂O, Zn(NO₃)₂·4H₂O and Mg(NO₃)₂·6H₂O can exist in equil. with aq. HNO₃ up to concns. of 52.95, 60.01, 34.45, 59.21 and 49.12% HNO₃, resp. Cd(NO₃)₂·4H₂O can be completely dehydrated at ordinary temps. by HNO₃ (d. 1.52), but under the same conditions Zn(NO₃)₂·6H₂O loses only 2 mols. of H₂O, and Mg(NO₃)₂·6H₂O remains unaltered.

C. C. DAVIS

The system: mercuric iodide, potassium iodide, water. (Miss) M. PERNOT. *Compt. rend.* 185, 950-3(1927).—The results obtained via Schreinemakers at 20°, 34° and 80° are given in a diagram. They show the existence of a single cryst. compd., HgI₂·KI·H₂O, which was studied by Pavlov (*J. Russ. Chem. Soc.* 32, 732(1900)) and indicated by Dunningham (C. A. 8, 1532). Dunningham also concluded there is a salt HgI₂·KI; but his observations were not sufficiently numerous nor accurate to justify his conclusions. HgI₂·KI·3/2H₂O, which was prepd. by Bonsdorf (*Ann. chim. phys.* [2], 34, 146(1827)), Boullay (*Ann. chim. phys.* [2], 34, 343(1827)) and Berthemot (*J. pharm. chim.* [2], 14, 185(1828)) and indicated by Clayton (*Chem. News* 70, 102(1894)) and François (*Compt. rend.* 129, 959(1899)) is probably HgI₂·KI·H₂O, from which H₂O was incompletely sepd. HgI₂·2KI·2H₂O is probably only a mixt. of HgI₂·KI·H₂O with KI and H₂O.

A. PAPINEAU-COUTURE

The molecular volume of water in crystalline hydrates. II. Constitution of some sulfates. 6. Notes on the law of additivity of volumes. E. MOLES AND M. CRESPI. *Anales soc. españ. fis. quim.* 25, 549-66(1927); cf. C. A. 22, 704.—The method of dehydrating sulfates of Mn, Fe, Co, Ni, Cu and Zn was altered and their densities were detd. before and after dehydration. Study of the mol. vol. of H₂O confirms the existence

of anion and cation hydrates. According to the predictions of Werner the constitution of these sulfates would be $[X(OH)_6](SO_4.OH_2)$, but it was found that the mol. of H_2O of the anion is more strongly held. The $SO_4.OH_2$ group is stable at temps. above 200° and was maintained intact in double salts of the schoenite type. These double sulfates should conform to the compn. $[X(OH)_6.X_2SO_4](SO_4.OH_2)$, where the central atom has a coordination no. of 6. The existence of neutral mols. as connectors is not new; known data on compds. of Zn and Mg confirm this. Violet Cr sulfate, Cr alum, Cr tetrasulfate, gray-blue Cr chloride and green Cr sulfate in varying degrees of hydration were prepd. in a high state of purity. The ds. of these compds. (17 in all) were detd., for the most part for the first time. The mol. vol. of the H_2O shows that in all these sulfates the $SO_4.OH_2$ group is maintained, as with sulfates of bivalent metals. From analysis after dehydration and mol. vols. the violet sulfate is $[Cr(OH)_6]_{1/2}(SO_4.OH_2) \cdot (SO_4.OH_2) + 2H_2O$, violet alum $[Cr(OH)_6.KSO_4](SO_4.OH_2) + 6H_2O$, tetrasulfate $H[Cr(1H_2O)_6](SO_4.OH_2)$; green sulfate $[Cr(OH)_2]_4(SO_4.OH_2)_3$. The identity of the tetrasulfate with the free acid of alum, assumed by Weinland, does not appear plausible.

E. M. SYMMES

Reaction between arsenite and permanganate in sulfuric acid solution. JOSEF HOLUBA *Z. anorg. allgem. Chem.* **168**, 361-8(1928).—The following equations are given for the reduction of permanganate by means of arsenite: (1) $2(MnO_4)^- + AsO_3^{---} = MnO_4^- + AsO_4^{---} + 4H^+ + MnO_4^- + Mn^{++} + 2H_2O$; (3) $Mn^{+++} + 2AsO_4^{---} = [Mn(AsO_4)_2]^{---}$; (4) $2Mn^{+++} = Mn^{++} + Mn^{++++}$; (5) $MnO_4^- + 4Mn^{++} + 8H^+ = 5Mn^{+++} + 4H_2O$, (6) $Mn^{++++} + 4H_2O = Mn(OH)_4 + 4H^+$, (7) $2(Mn^{+++} + H_2O + AsO_3^{---} = Mn^{++} + AsO_4^{---} + 2H^+)$; (8) $2Mn^{+++} + H_2O + AsO_3^{---} = 2Mn^{++} + AsO_4^{---} + 2H^+$. The conditions which govern the emphasis or suppression of the individual steps are discussed. H_2SO_4 adds cause a displacement of (3) and (6) from the right to the left and an acceleration of (7). The acid anion favors (5) and almost entirely prevents the formation of MnO_2 ions. Addition of Mn^{++} causes (4) to go from the left to the right and suppresses (8), while (7) is accelerated. All Mn salts in soln. are of a complex nature. H. STOERTZ

The preparation and constitution of soluble bismuth sodium citrate, and of the intermediate products. W. F. VON OETTINGEN, Y. ISHIKAWA AND TORALD SOLLMANN. *J. Pharmacol.* **31**, 353-60(1927).—There are 3 stages in the formation of Bi citrate, prepd. by adding Na citrate to Bi nitrate in glacial AcOH. They are: (1) formation of insol. normal Bi citrate, which dissolves in excess; (2) formation of a sol. intermediate compd., $NaCl \cdot Bi \cdot ClNa_2$, which hydrolyzes to give (3) H_2C_2BiO ; this seps from the soln. on standing. When NaOH is added drop by drop to a suspension of monobismuthyl citrate, there is obtained $NaCl(BiO)_2$, having 63.4% Bi, and 4% Na (theoretical 63.0% Bi and 3.5% Na). The p_H of the final soln., and the amt. of alc. used for final pptn. are important in obtaining a pure product. C. RIEGEL

Ethylenediamine compounds of thallium. III. Halides. WALTER HIBBER AND FRITZ SONNEKALB *Ber.* **61B**, 555-7(1928).—By addition of H_2O solns. of $C_2H_4(NH_2)_2$ to solns. of Tl halides, compds. of the type $TlCl_3 \cdot 3C_2H_4(NH_2)_2 \cdot 3H_2O$ are formed, in which 1, 2 or 3 mols. of the diamine combine with 1 mol. of TlX_3 . These are very stable cryst. compds., hydrolyzed in H_2O by great diln. and heat and pptd. by NH_4OH . In the prepn. it is generally necessary to add alc. to aid in crystg. out the salt. The compd. $TlH_3 \cdot C_2H_4(NH_2)_2$ is pptd. by addition of KI to a soln. of $TlCl_3 \cdot 3en \cdot 3H_2O$ as a brick-red to bronze-colored, non-hygroscopic powder, sol. in alc., $C_2H_5NO_2$ and hot $C_2H_5Br_2$. The color varies with conditions of crystn. Tl is detd. in these compds. by pptn. as hydroxide with NH_4OH , soln. in HNO_3 and final weighing as TlI. H. STOERTZ

Reaction between chromic acid and iodide induced by ferrous salts. CARL WAGNER AND WILHELM PREISS. *Z. anorg. allgem. Chem.* **168**, 265-78(1928).—In the presence of Fe^{II} , CrO_3 reacts with iodides to liberate I, 2 equiv. of I being formed as a max. for every equiv. of Fe^{II} oxidized. Cr^V is assumed as an intermediate product, and expts. are conducted to test this assumption. An excess of KCl is maintained in the soln. to exclude any effect of variation in degree of disson. and the presence of Fe^{III} suppresses the tendency of Cr^V to decompose into Cr^{VI} and Cr^{III} . The reactions proceed as follows: $Cr^{VI} + Fe^{II} = Cr^V + Fe^{III}$; $Cr^V + 2Fe^{II} = Cr^{III} + 2Fe^{III}$; $Cr^V + I^- \rightarrow Cr^{III} + IOH$; $IOH + H^+ + I^- \rightarrow I_2 + H_2O$. The action of an AcOH soln. of pyridine-oxytetrachlorochromate, $CrOCl_3 \cdot C_5H_5N \cdot HCl$, in liberating I from KI solns. is further indication of Cr^V . In H_2O soln., decompn. into Cr^{VI} and Cr^{III} is very rapid. H. STOERTZ

Ferric acetate. ALFONS KRAUSE. *Z. anorg. allgem. Chem.* **169**, 273-92(1928); *Bull. intern. acad. Polonoise* **1927A**, 237-72.—The system ferric hydroxide gel, con-

taining 7.5% Fe_2O_3 , acetic acid and water was studied at 20° . The curve obtained by plotting the ratio of acetate to iron in the gel against the normality of the acetic acid has 2 max. and one sharp min. The beginning of the curve represents a chem. reaction on the surface of the gel particles without change in their size. The remainder is a periodic adsorption curve in which the phenomena of adsorption, absorption and peptization occur. The peptization of the gel starts at 0.035 N and is complete at 0.153 N or a p_H range of 3.2–2.8. Above 1.185 N there is a decrease in the quantity of Fe in the hydrosol; above 1.58 the quantity is const. The color of the sol increases with increasing normality, changing from a yellow to a brick-red above 1.58 N . Up to 1.58 the dry residues of the sol are glassy; above this point cryst. residues corresponding to the mono-, di- and triacetates are obtained. The sol residue of the soln. at 0.069 N contains the least acetic acid; residues from other sols are unstable in the air and lose AcOH . The isoelec. point of ferric acetate is at p_H 3.05 or 0.069 N acetic acid. The dissoen. const. of the acetoferic base is of the order of 10^{-18} . A. F.

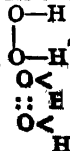

Compounds of hydrazine with metallic sulfites and nitrites. PRIYADARANJAN RAY AND BIJOY KALI GOSWAMI. *Z. anorg. allgem. Chem.* 168, 329–38(1928).—Metallic sulfites react in the presence of excess H_2SO_3 with N_2H_4 solns. (dil. or concd.) to form compds. of the type: $(\text{MSO}_3)_x \cdot x\text{N}_2\text{H}_4$. These react further with SO_2 to form more complex compds. such as $\text{CoSO}_3 \cdot (\text{N}_2\text{H}_4)_2 \cdot \text{SO}_3 \cdot 2\text{H}_2\text{O}$. The following compds. are prepd. With Mn: $\text{MnSO}_3 \cdot \text{N}_2\text{H}_4 \cdot \text{H}_2\text{SO}_3$, acid to litmus, slightly sol. in H_2O , stable on boiling, and pptd. by NH_4OH as $\text{Mn}(\text{OH})_2$. With Co: From the normal sulfite $5\text{CoSO}_3 \cdot 9\text{N}_2\text{H}_4 \cdot 6\text{H}_2\text{O}$ (A), a light red powder, neutral to litmus, slightly sol. in H_2O , decompd. by boiling to $\text{Co}(\text{OH})_2$. From the bisulfite was obtained, on careful drying of the product $\text{CoSO}_3 \cdot 2\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$ (B), red, cryst., alk. to litmus, decompd. on boiling to $\text{Co}(\text{OH})_2$. On treating A with SO_2 and pptn. with alc., $2\text{CoSO}_3 \cdot \text{N}_2\text{H}_4 \cdot 3\text{H}_2\text{O}$ is formed, cryst., neutral to litmus, stable on boiling. B, treated with SO_2 , gives a red cryst. product, $\text{CoSO}_3 \cdot (\text{N}_2\text{H}_4)_2 \cdot \text{SO}_3 \cdot 2\text{H}_2\text{O}$, very sol. in H_2O , sol. in NH_4OH . If B is repeatedly evapd. to dryness with H_2SO_3 , $\text{CoSO}_3 \cdot \text{N}_2\text{H}_4 \cdot \text{H}_2\text{SO}_3 \cdot \frac{1}{2}\text{H}_2\text{O}$ is formed, red, cryst., acid to litmus, sol. in H_2SO_3 , sol. in NH_4OH . With Ni: From the carbonate treated with SO_2 and N_2H_4 was obtained, $\text{NiSO}_3 \cdot 3\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$, rose colored, alk. to litmus, insol. in H_2O , decomposed violently by concd. HNO_3 . The bisulfite gives $\text{NiSO}_3 \cdot 2\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$ (C), blue, alk. to litmus, slightly sol. in H_2O . On treating C with SO_2 , $4\text{NiSO}_3 \cdot 3\text{N}_2\text{H}_4 \cdot 7\text{H}_2\text{O}$ is obtained, green, cryst., neutral to litmus, insol. in H_2O . With Zn: The bisulfite gives $\text{ZnSO}_3 \cdot 2\text{N}_2\text{H}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ (D), white, alk. to litmus, slightly sol. in H_2O , sol. in NaOH . D, treated with SO_2 , yields $\text{ZnSO}_3 \cdot \text{N}_2\text{H}_4 \cdot \text{H}_2\text{SO}_3$, acid to litmus, sol. in NaOH . With Cd: From CdCO_3 treated with SO_2 and then with N_2H_4 was obtained $\text{CdSO}_3 \cdot \text{N}_2\text{H}_4$ (E), alk. to litmus, insol. in H_2O , sol. in dil. NH_4OH . E, treated with SO_2 , gives $\text{CdSO}_3 \cdot \text{N}_2\text{H}_4 \cdot \text{H}_2\text{SO}_3$, acid to litmus, sol. in dil. NH_4OH . N_2H_4 forms similar compds. with the nitrites of Co, Ni and Cd, but not with Zn and Mn. The following are described: $2\text{Co}(\text{NO}_2)_2 \cdot 3\text{N}_2\text{H}_4$, dull red; $\text{Ni}(\text{NO}_2)_2 \cdot 2\text{N}_2\text{H}_4$, blue violet; $\text{Cd}(\text{NO}_2)_2 \cdot 2\text{N}_2\text{H}_4$, white. These decompose with detonation on heating, and explode when treated with concd. H_2SO_4 or HNO_3 . Dil. acid gives N_2 and N_2O . They are all alk. to litmus.

H. STOERTZ

Studies on hydrogen cyanide. I. Mercuric methyl cyanide and the alleged isomerides of hydrogen cyanide. J. E. COATES, L. E. HINKEL AND T. H. ANGEL. *J. Chem. Soc.* 1928, 540–3.—Enklaar's expts., claiming the isolation of the isomerides of which HCN is thought to consist, are repeated. Thus, $\text{C}_2\text{H}_3\text{NHg}$ is prepd. from CH_3HgI_2 (5 g.) in abs. alc. (25 cc.) shaken with AgCN (2.1 g.) as white crystals, m. 85° (not sharp), Enklaar's value being about 60° . After purification with boiling Et_2O and light petroleum (b. 40 – 60°) it melts sharply at 93° . Et_2O or MeOH may be used instead of abs. alc. No evidence is obtained for the existence of a form melting at 60° . $\text{C}_2\text{H}_3\text{NHg}$ suffers no change in m. p. on standing and dil. H_2SO_4 liberates HCN , contrary to Enklaar.

J. BALOZIAN

A new theory on the structure of hydrogen dioxide and the mechanism of its reactions. P. N. RAIKOW. *Z. anorg. allgem. Chem.* 168, 297–304(1928).—R. proposes the theory that H_2O_2 is an allotropic mixt. of 2 tautomers: the symmetrical compd.

which he calls "hydrogen pseudo peroxide," and the unsymmetrical compd.

which he calls "hydrogen peroxide." The mixt. is called hydrogen dioxide, and consists

principally of the pseudo compd, with only a very small amt. of the peroxide. This

explains the vigorous reducing action, written as follows

$$\begin{array}{c} \text{O} - \text{H} \\ | \quad | \\ \text{O} - \text{H} \end{array} + \text{O} \begin{array}{c} \diagup \text{Ag} \text{O} \\ \diagdown \text{Ag} \text{O} \end{array} = \text{O} = \text{O} +$$

$\text{H}_2\text{O} + 2\text{Ag}$, and the mild oxidizing action

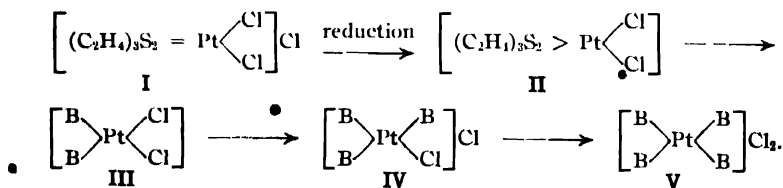

$$\text{H} \begin{array}{c} \diagup \text{O} \\ \diagdown \text{H} \end{array} + \begin{array}{c} \text{H} - \text{I} \\ | \quad | \\ \text{O} < + \text{H} - \text{I} \end{array} = 2\text{H}_2\text{O} + \text{I}_2$$

Spontaneous decompn. of H_2O_2 is due to interaction of these 2 forms, as follows

$\begin{array}{c} \text{O} - \text{H} \\ | \quad | \\ \text{O} - \text{H} \end{array} + \begin{array}{c} \text{H} \\ | \\ \text{O} < \end{array} > \begin{array}{c} \text{H} \text{O} \\ | \quad | \\ \text{H} \text{O} \end{array} = \text{O} = \text{O} + 2\text{H}_2\text{O}$ It proceeds slowly because of the small amt. of the peroxide.

H. STÖERTZ

Varying valency of platinum with respect to mercaptanic radicals. VI. P. C. RAY, K. C. BOSE-RAY AND N. B. ADHIKARI *Quart J Indian Chem. Soc* **4**, 467-75(1928), cf. *C. A.* **21**, 2855.—A series of complex compds obtained by the action of NH_3 and amine bases on $\text{PtCl}_2(\text{C}_2\text{H}_5)_2\text{S}_2$ (previously described) include (a) $\text{PtCl}_2 \cdot 4\text{NH}_3$, (b) $\text{PtCl}_2 \cdot 4\text{C}_2\text{H}_5\text{CH}_2\text{NH}_2$; (c) $\text{PtCl}_2 \cdot 2\text{C}_2\text{H}_4(\text{NH}_2)_2$; $\text{Pt}_2\text{Cl}_6 \cdot 3\text{C}_2\text{H}_4(\text{NH}_2)_2$, $(\text{C}_2\text{H}_5)_2\text{S}_2$ and $\text{PtCl}_2(\text{C}_2\text{H}_5)_2\text{S}_2$; (d) $\text{PtCl}_2 \cdot 4\text{C}_6\text{H}_5\text{N}$; $\text{PtCl}_2 \cdot 4\text{C}_6\text{H}_5\text{N}$, (e) $\text{PtCl}_2 \cdot 2\text{C}_6\text{H}_5\text{N} \cdot \text{N}(\text{CH}_3)_2$; (f) $\text{PtCl}_2 \cdot 3\text{C}_6\text{H}_{11}\text{N}$; (g) $\text{PtCl}_2 \cdot (\text{C}_2\text{H}_5)_2\text{S}_2$, (h) $\text{PtCl}_2 \cdot 2(\text{C}_2\text{H}_5)_2\text{NH}$, $\text{PtCl}(\text{C}_2\text{H}_5)_2$; $\text{NHCH}_2\text{COCH}_3$; (i) $\text{Pt}_2\text{Cl}_6 \cdot 4\text{C}_6\text{H}_4(\text{NH}_2)_2$. a, formed by reaction with NH_3 , is hygroscopic and does not melt at 200° . Its mol. cond. gives a value intermediate between ternary and quaternary electrolytes. b may be expressed as a Werner type. It m. 195° . Ethylenediamine yields 3 compds (c) The first is a Werner type, the second is a mol. compd. and the third can be expressed either way. Pyridine yields 3 compds. (d), the first being a mol. compd and the others of the Werner type. Cond. measurements showed the second to be a ternary electrolyte. It turns yellow at 140° , but does not melt. PhNMe_2 yields e, which may be regarded as a mol. compd. of the type $\text{AgCl} \cdot \text{NH}_3$. The probable constitution of f, due to the action of piperidine, was suggested but not established. Tripropylamine yields g, which may be represented on the Werner model. Et_2NH gives h, the first of which is a Werner type and the second may be so represented. The compd. i due to the action of phenylenediamine has been isolated. The reactions with the bases support the assumption that 1 of the 3 Cl atoms is more reactive than the others. If the parent substance is represented by formula I the mechanism of the reaction in most cases is

Examples of each type have been described.

C. E. P. JEFFREYS

Hydroxylaminomolybdates and molybdicomolybdic complexes. Action of hydroxylamine on paramolybdates. G. CANNORI, *Gazz. chim. ital.* **57**, 872-80(1927).—The great tendency of MoO_3 to form compds with weak acids or with oxides of weak bases indicated the possibility of prepg. compds. of MoO_3 with lower oxides of Mo, i. e., with its own partial reduction products. Among numerous reducing agents, NH_2OH was chosen as best suited for the partial reduction and establishment of an equil. between Mo^{IV} and Mo^{V} (cf. Heide and Hoffmann, *Z. anorg. allgem. Chem.* **12**, 277(1896)). In the reaction between NH_2OH and paramolybdates, red liquids are formed which on heating ppt. orange-colored powders and these dissolve, evolving gas and giving brown-red solns. from which the NH_4 salt crystallizes. H. and H. did not, however, investigate the initial stage of the reaction before reduction. Moreover Kohlschütter and Hoffmann (*Ann.* **307**, 314(1899)) obtained from alk. solns. of $(\text{NH}_4)_2\text{MoO}_4$ and NH_2OH

products considered to be salts of hydroxylaminomolybdic acids, HONH_2 presumably acting as an acid. In the present work, the reaction was studied more systematically and under different conditions from those of K. and H. When NH_2OH is added to dil. paramolybdate solns., the soln. turns red and when cooled yellow microcryst. ppts. sep. On heating these decomp. with evolution of gas and, if excess NH_2OH is present, reduction continues to Mo blue. These yellow molybdicomolybdates do not give the reactions of Mo^{V} and their compn. corresponds to $\text{R}_2\text{O} \cdot 4\text{MoO}_3 \cdot 4\text{NH}_2\text{OH}$ or $\text{R}_2\text{Mo}_4\text{O}_{13} \cdot 4\text{NH}_2\text{OH}$. When the red soln. is heated, gas is evolved, and when evapd. a dark red cryst. substance seps., aq. solns. of which are orange-yellow, and ppt. Ag from NH_3 - AgNO_3 , reduce ferric Fe and give an intense red with acidic KSCN. The formula of the salts is $\text{Mo}_2\text{O}_5 \cdot 4\text{MoO}_3 \cdot 2\text{R}_2\text{O} \cdot x\text{H}_2\text{O}$, where R is NH_4 , K or Na. A discussion of their constitution leads to the conclusion that based on the Werner classification they

are molybdico pentaoxomolybdates: $\left[\text{Mo}_2 \begin{smallmatrix} \text{Os} \\ (\text{Mo}_2\text{O}_7)_2 \end{smallmatrix} \right] \text{R}_4 \cdot x\text{H}_2\text{O}$. The following hydroxylaminomolybdates were prepd. by adding aq. ClNH_2OH to the hot aq. alk. molybdate, heating on the water bath and washing the ppt. successively with water, EtOH and Et₂O: *NH₄ tetrahydroxylaminomolybdate* $4\text{MoO}_3 \cdot 4(\text{NH}_2\text{OH})(\text{NH}_4)_2\text{O}$, yellow; *K hydroxylaminomolybdate* $4\text{MoO}_3 \cdot 4\text{NH}_2\text{OH} \cdot \text{K}_2\text{O}$, yellow; *N hydroxylaminomolybdate* $4\text{MoO}_3 \cdot 4\text{NH}_2\text{OH} \cdot \text{Na}_2\text{O}$, yellow; *guanidine tetrahydroxylaminomolybdate* $4\text{MoO}_3 \cdot 4\text{NH}_2\text{OH} \cdot (\text{CN} \cdot \text{H}_2)_2\text{O}$, yellow. The following molybdicomolybdates were prepd. by prolonged heating on the water bath of the reaction mixts until N and N oxides were no longer evolved, concg. in vacuo and allowing to crystallize: *NH₄ molybdicomolybdate* $\text{Mo}_2\text{O}_5 \cdot 4\text{MoO}_3 \cdot 2(\text{NH}_4)_2\text{O} \cdot 8\text{H}_2\text{O}$, red, gives red solns. in water; *Na molybdicomolybdate* $\text{Mo}_2\text{O}_5 \cdot 4\text{MoO}_3 \cdot \text{Na}_2\text{O} \cdot 10\text{H}_2\text{O}$, brick-red; *K molybdicomolybdate* $\text{Mo}_2\text{O}_5 \cdot 4\text{MoO}_3 \cdot 2\text{K}_2\text{O} \cdot 5\text{H}_2\text{O}$, red, gives orange-red solns. in water.

C. C. DAVIS

Perphosphoric acids and perphosphates. SYED HUSAIN AND J. R. PARTINGTON. *Trans. Faraday Soc.* **24**, 235–45 (1928).—Perphosphoric acids are not obtained by the action of 30% H_2O_2 at 0° on POCl_3 . Most of the alk. and alk. earth phosphates react with H_2O_2 , giving definite compds. contg. H_2O_2 of crystn. Primary Li, NH_4 , Ca and Sr phosphates and the Tl phosphates, however, do not react with H_2O_2 . K_3PO_4 decomposes it. Apparently there is no relationship between H_2O of crystn. and H_2O_2 of crystn. There seems to be some relation between the basicity of the phosphates and the formation of compds. contg. H_2O_2 of crystn. Acid-reacting phosphates (primary phosphates) do not react with H_2O_2 or give very unstable compds. Slightly acid-reacting phosphates, like secondary, or alk. earth phosphates give unstable compds. Alk. phosphates, secondary phosphates or pyrophosphates of alkalis give rather stable compds., while strongly alk. phosphates decompose H_2O_2 . Electrolysis of H_3PO_4 or of phosphates of Li, Na and Tl does not give rise to perphosphates while secondary phosphates of K, Rb, Cs and NH_4 produce on electrolysis 2 perphosphates in soln. (H_3PO_4 and $\text{H}_4\text{P}_2\text{O}_8$). Electrolysis was carried out with a low anodic and a high cathodic c. d., at a low temp., in the presence of a little K_2CrO_4 to prevent cathodic reduction. With Rb and Cs, perphosphates may be obtained even without the addn. of fluoride; K and NH_4 do not give perphosphates even with such addn. NH_4 perphosphates can be obtained in soln. with a current efficiency of over 57% by using a 4 mol. soln. of $(\text{NH}_4)_2\text{HPO}_4$, contg. 3 mols. NH_4F and 0.32 g. $(\text{NH}_4)_2\text{CrO}_4$ per l. at 0° with an anodic c. d. of about 0.0146 amp./sq. cm. The current efficiency for production of perphosphate by electrolysis of alkali phosphate without the addn. of fluoride shows a relation to the at. vol. of the metal. H, Li and Na do not give rise to perphosphates. K produces perphosphates only in the presence of fluoride. Rb gives a current efficiency of 12.32% and Cs 22.33%. A comparison between the products obtained by electrolysis, and the ones obtained with H_2O_2 shows that only the former are true perphosphates.

A. L. HENNE

A new induced reaction. The oxidation of potassium nitrite with iodine, induced by sodium thiosulfate. A. BERTHOUD AND W. BERGER. *Helv. Chim. Acta* **11**, 364–8 (1928).—In a soln. of $\text{Na}_2\text{S}_2\text{O}_3$ and KNO_2 quant. results are obtained when the $\text{Na}_2\text{S}_2\text{O}_3$ is titrated with I_2 . On the contrary, if a soln. of KNO_2 and I_2 is titrated with $\text{Na}_2\text{S}_2\text{O}_3$ the quant. relation no longer exists. With increasing concns. of KNO_2 ($N/64$ to $4N$) and with decreasing concns. of $\text{Na}_2\text{S}_2\text{O}_3$ (0.05 to 0.0025N) the percent of theoretically required $\text{Na}_2\text{S}_2\text{O}_3$ decreases from 95.9 to 49.9. With the addn. of HOAc ($N/48$ to $N/3$) this effect becomes less pronounced as the H-ion concn. is increased. This phenomenon is attributed to a reaction between I and KNO_2 induced by $\text{Na}_2\text{S}_2\text{O}_3$ as follows: (a) $\text{Na}_2\text{S}_2\text{O}_3 + \text{I}_2 \longrightarrow \text{Na}_2\text{SO}_3 + \text{NaI} + \text{I}$; (b) $2\text{Na}_2\text{S}_2\text{O}_3 \longrightarrow \text{Na}_2\text{S}_2\text{O}_4$; (c) $2\text{I} + \text{H}_2\text{O} \longrightarrow \text{HIO} + \text{HI}$; (d) $\text{HIO} + \text{HI} \longrightarrow \text{I}_2 + \text{H}_2\text{O}$; (e) $\text{HIO} + \text{KNO}_2 \longrightarrow \text{KNO}_3 + \text{HI}$. When the concn. of KNO_2 is high (d) is negligible compared to (e). When

the concn. of $\text{Na}_2\text{S}_2\text{O}_3$ is high, as when a soln. of I_2 is dropped into a soln. of $\text{Na}_2\text{S}_2\text{O}_3$, (e) becomes negligible as compared to (d) and the at. I resulting from (a) can react with new mols. of $\text{Na}_2\text{S}_2\text{O}_3$ thus, $\text{Na}_2\text{S}_2\text{O}_3 + \text{I} \rightarrow \text{Na}_2\text{SO}_3 + \text{NaI}$. J. S. R.

Selenium oxyfluoride. E. B. R. PRIDEAUX AND C. B. COX. *J. Chem. Soc.* 1928, 739-45; cf. *C. A.* 21, 2231.— SeOF_2 (I) is prepd. as described in the preceding study; the $\text{SeO}_2 + \text{HF}$ (II) mixt. by distg. HF on SeO_2 . To analyze, solns. of these compds. are titrated to the end point, p-nitrophenol being used, with 0.1 N alkali; slightly more than $\frac{2}{3}$ the vol. of alkali used of 0.1 N AgNO_3 is added, the pptn. is completed with further alkali (until the soln. turns yellow); the mixt. is filtered and the titration is completed on the filtrate and washings with phenolphthalein as an indicator. Densities are detd. in specially constructed Monel metal tubes, of 0.5-cc. capacity, that of I being detd. as 2.67 and II as 2.57. The b. p. of I is detd. as 124° , in a similarly constructed tube by Smith and Menzies method (*Z. physik. Chem.* 75, 494 (1911)) with a bromonaphthalene bath. The m. p. of I is detd. as 4.6° , with a pentane thermometer the bulb of which is sheathed in Pt foil, a cooling bath of an alc. and CO_2 mixt. being employed and heating curves being taken. The b. p. and m. p. of II are indefinite. Red P is ignited by I, probably forming phosphoryl chloride, while P reacts more violently with II, the intensity of reaction decreasing with increase in the HF content of II. J. BALOZIAN

The constitution of silver subfluoride. E. BRODY AND TH. MILLNER. *Z. anorg. allgem. Chem.* 168, 349-55 (1928).—The authors advance the theory that Ag_2F is formed by the insertion of a negative F ion into the distended Ag lattice, rather than by the insertion of a neutral Ag atom into the distended AgF lattice. This is supported by energy calcs., which give for heat of formation in the first case +27.1 kg.-cal. and in the second -24.5 kg.-cal. Metallic appearance and high elec. cond. are also in agreement with this theory. From 27.1 k.-cal. as the heat of disson., the temp. of disson. T_D is calcd. to be 1200° abs. and the F tension 0.1 mm. at 600° abs. and 10.0 mm. at 800° abs. H. STOBRTZ

Trimethylplatinum acetylacetonate, a volatile platinum compound. R. C. MENZIES. *J. Chem. Soc.* 1928, 565-6.—The double decompn. between Ti (I) salts and halides is used to prep. a new Pt compd. Thus trimethylplatinum acetylacetonate $\text{Me}_3\text{Pt}(\text{O} \begin{array}{c} \text{CMe} \\ \diagup \\ \text{CH} \\ \diagdown \\ \text{O.Me} \end{array})_3$ (2.4 g. in 2 crops; yield 70%) is obtained from a warm C_6H_6 soln.

of 3-methylplatinic iodide (3.7 g.) and Ti (I) acetylacetonate (3.03 g.), refluxed, the Ti formed filtered, the filtrate evapd. to dryness and crystd. from hexane. When heated in a capillary tube it decomposes at 200° without melting, but in larger app. it sublimes at 160° . Under proper conditions Pt is deposited from the compd. as a mirror. Ferric acetylacetonate and 3-methylplatinic iodide are also prepd. J. BALOZIAN

Tungstates of cerous cerium and sodium. G. CAROBBI AND G. YANCRODDI. *Gazz. chim. ital.* 58, 45-52 (1928).—There have been no hydrated *Nuceros tungstates* heretofore described. Various proportions of $\text{Ce}_2(\text{WO}_4)_3$ were agitated with Na_2WO_4 soln. at 25° until equil. was reached (15-20 days), filtered and the solids were dried and analyzed. Three compds. were identified: (1) $\text{Ce}_2(\text{WO}_4)_3 \cdot 5\text{Na}_2\text{WO}_4 \cdot 11\text{H}_2\text{O}$, (2) $\text{Ce}_2(\text{WO}_4)_3 \cdot 3\text{Na}_2\text{WO}_4 \cdot 16\text{H}_2\text{O}$ and (3) $\text{Ce}_2(\text{WO}_4)_3 \cdot 5\text{Na}_2\text{WO}_4 \cdot 23\text{H}_2\text{O}$. At 25° (1) is stable in contact with solns. contg. 4-15% Na_2WO_4 and 0-60% $\text{Ce}_2(\text{WO}_4)_3$, (2) with solns. contg. 15-27.65% Na_2WO_4 and 0-4% $\text{Ce}_2(\text{WO}_4)_3$ and (3) with solns. contg. a min. of 27.65% Na_2WO_4 and a max. of 0.22-0.0% $\text{Ce}_2(\text{WO}_4)_3$. The crystals were too small to study crystallographically. (1) is gray-yellow, (2) is light yellow and (3) is yellow. They lost no H_2O of crystn. when exposed in the air for 4 months. A systematic study was made of the dehydration of the 3 compds. when exposed to air, over CaCl_2 and over H_2SO_4 at different temps. The results, tabulated in complete detail, show that the H_2O of crystn. is not evolved at a const. velocity, probably because other hydrates are formed. C. C. DAVIS

Molybdates of lanthanum and sodium. G. CAROBBI. *Gazz. chim. ital.* 58, 53-6 (1928).—The expts. were carried out in a similar way to those with $\text{Ce}_2(\text{WO}_4)_3$ and Na_2WO_4 complexes (cf. preceding abstr.), different proportions of $\text{La}_2(\text{MoO}_4)_3$ being brought to equil. with aq. Na_2MoO_4 at 25° . Such work is of potential value because it may lead to methods for the sepn. of rare earth elements. Two compds. were identified: (1) $\text{La}_2(\text{MoO}_4)_3 \cdot 2\text{Na}_2\text{MoO}_4 \cdot 2\text{H}_2\text{O}$, stable in contact with solns. contg. a max. of 11.50% Na_2MoO_4 and (2) $\text{La}_2(\text{MoO}_4)_3 \cdot 2\text{Na}_2\text{MoO}_4 \cdot 3\text{H}_2\text{O}$, stable in contact with solns. contg. 11.0-25.20% Na_2MoO_4 . Both compds. were microcryst. and had a yellowish tinge. C. C. DAVIS

Vanadovanadates. G. CANNERI. *Gazz. chim. ital.* 58, 6-25(1928).—Though Prandtl (*Ber.* 38, 657(1905)) showed that a chem. reaction takes place when V_2O_5 is fused with alk. carbonates or phosphates and definite compds. are formed, he was unable to explain the mechanism of the reduction. This suggested a study of the intimate nature of the reaction, as a means to which the proportions of the components and the character of the alk. component were varied. The proportion of O evolved is independent of whether an alk. carbonate, phosphate, borate, silicate, arseniate, etc. is used, and O is evolved with Ti compds., but not from V_2O_5 and alk. earth oxides. By varying the proportions of V_2O_5 and alk. compd., it was found that for each mixt. there is a proportion for which the vol. of O is a max. In the system of V_2O_5 - Na_2O , the evolution of O increases rapidly to a max. at 5% Na_2O and then decreases so that O is no longer evolved when the concn. of Na_2O is 32%. In the systems V_2O_5 - K_2O and V_2O_5 - Ti_2O_3 , the max. evolution is at 8% K_2O and 7% Ti_2O_3 , resp., and it is no longer evolved at 20% K_2O and at 14% Ti_2O_3 , resp. Diagrams of state of the systems V_2O_5 - Na_2O , V_2O_5 - K_2O , V_2O_5 - Li_2O and V_2O_5 - Ti_2O_3 are given. They show that in each case 3 definite compds. are formed, corresponding to the meta-, pyro- and orthovanadate. The following m. ps. were obtained. V_2O_5 675°, $NaVO_3$ 630°, $Na_2V_2O_7$ 632°, Na_3VO_4 850°, KVO_3 495°, $K_2V_2O_7$ 910°, K_3VO_4 > 1000°, $LiVO_3$ 618°, $Li_2V_2O_7$ > 900°, $TiVO_3$ 391°, $Ti_2V_2O_7$ 416°, Ti_3VO_4 555°. The formation of vanadovanadates with accompanying reduction and evolution of O probably depends upon the appearance of secondary bonds in the complex formed, which weakens the bonds which hold the O to the pentavalent metal. The O is liberated ($V_2O_5 \rightleftharpoons V_2O_4 + O$) during the interval of temp. between the upper limit of stability of the vanadovanadate and the solidification of the fused mass. A new method of prepn. of pure vanadovanadates consists of the fusion of alk. vanadites with metavanadates, under which conditions no oxidation or other complication takes place. By this method the products contain a relatively high proportion of base. The following cryst. vanadovanadates were prepd., the last two by the new method: $5V_2O_5 \cdot V_2O_4 \cdot Na_2O$, steel-blue; $4V_2O_5 \cdot V_2O_4 \cdot Na_2O$, steel-blue; $4V_2O_5 \cdot V_2O_4 \cdot 2Na_2O$, black; $5V_2O_5 \cdot V_2O_4 \cdot 3Na_2O$, black; $5V_2O_5 \cdot V_2O_4 \cdot K_2O$, steel-blue; $4V_2O_5 \cdot V_2O_4 \cdot K_2O$, steel-blue; $4V_2O_5 \cdot V_2O_4 \cdot 2K_2O$, iridescent brown; $V_2O_5 \cdot V_2O_4 \cdot Na_2O$, lustrous black; $V_2O_5 \cdot V_2O_4 \cdot K_2O$, black. 7—ANALYTICAL CHEMISTRY

WILLIAM T. HALL

Potentiometric titration of electrolytes. MILLE L. DE BROUCKERE. *Bull. soc. chim. Belg.* 37, 103-7(1928).—In an e. m. f. series like $Cd|CdSO_4||K_2SO_4|xCdSO_4|Cd$, where $CdSO_4$ represents a soln. of known concentration, it is possible to det. the unknown concn. x , by simply dilg. with water until the e. m. f. becomes 0. A. L. H.

Laboratory scheme of instruction in qualitative analysis. DOMENICO SCRUTO. *Notiz. chim.-ind.* 3, 6-9(1928).—The new method is for the qual. analysis of substances sol. in water or in acids and has been adopted for instruction at the Royal Commercial Institute of Catania. The reactions are for the most part well known, but the sepn. of the cations and anions is novel. The cations are first sepd. into 4 groups, based on the behavior of their aq. salts towards aq. NaOH: (1) those which do not give ppts. with aq. NaOH (Li, NH_4 , As (alk. arsenates or arsenites), K, Na); (2) those which give with aq. NaOH white ppts. which are sol. in excess aq. NaOH (Pb, Al, Zn, Sb, Sn); (3) those which give with aq. NaOH white ppts. insol. in excess NaOH (Bi, Cd, Mg, Ca, Ba, Sr), and (4) those which give with aq. NaOH colored ppts. whether or not sol. in excess NaOH (Cr, Ag, Hg, Cu, Fe, Ni, Co, Mn). Among the anions, the acetate, NO_2 , and NO_3 ions are first identified, after which the soln. is divided into 3 parts, which are tested for: (1) H_2S , $H_2S_2O_8$ and H_2SO_3 ; (2) H_2CO_3 , H_3PO_4 and H_2SO_4 and (3) HCl, HBr and HI. These tests are influenced by the cations, for when certain cations are present, the absence of certain anions is according to the scheme of analysis assured beforehand. After sepn. of the cations and of the anions into the groups described above, the sepn. and identification involves, for the most part, standard reactions, the details of which are given in complete form, with explanation of the chemistry involved. C. C. DAVIS

Titration of alumina as phosphate. A. LEBJUN. *Bull. soc. chim. Belg.* 37, 110-4(1928).—The titration of Al_2O_3 by pptn. as $AlPO_4$ always gives too high results when more than the theoretical amt. of phosphate is used. The gravimetric method according to Blum (C. A. 10, 1970) or Muravlev and Krassnovskii (C. A. 21, 572) is much better. A. L. HENNY

The analysis of acid-resisting bronzes, antimonial lead and babbitt. R. F. SMITH. *Pulp Paper Mag. Can.* **26**, 106-7, 389-90(1928).—The methods used in the lab. of the Hoyt Metal Co. of Canada, Ltd., are briefly described. A. PAPINEAU-COUTURE

Determination of free alkali in hypo-halogenite solutions. E. RUPP AND F. LEWY. *Z. anal. Chem.* **73**, 283(1928). When NaClO or NaBrO is treated with H_2O_2 , Na halide, O_2 and water are formed. Any free alkali can then be titrated with acid, methyl orange being used as indicator. If the excess of H_2O_2 bleaches the indicator, heat the soln. to boiling to decompose Na_2O_2 , cool, add fresh indicator and titrate.

W. T. H.

The potentiometric determination of copper as cupric ferrocyanide. ERICH MÜLLER AND S. TAKEGAMI. *Z. anal. Chem.* **73**, 284-8(1928).—In attempting to det. Cu by titration with $\text{Li}_4\text{Fe}(\text{CN})_6$, some interesting curves were obtained when the e. m. f. was plotted against the vol. of Li soln. added. The inflection points of the curves were not sharply enough defined to make it seem probable that this titration will ever be of practical value. The ppt. of $\text{Cu}_2\text{Fe}(\text{CN})_6$ tends to form a solid soln. with excess ferrocyanide.

W. T. H.

Determination of azides. D. A. COPEMAN. *J. S. African Chem. Inst.* **10**, 18-22 (1927).—Existing methods are reviewed and 2 satisfactory methods described. In the first method, Na azide is treated with H_2SO_4 and the resulting HN_3 is distilled over into a definite vol. of standard NaOH . The decrease in alkali is found by titration with standard acid, using phenolphthalein as indicator. In the second method a soln. of ceric NH_4 nitrate is allowed to act on the azide and the resulting N is collected in a nitrometer. Both methods yield results of great accuracy.

B. C. A.

Gravimetric and volumetric micro-determination of bismuth. R. STREIBINGER AND W. ZINS. *Mikrochem.* **5**, 166-92(1927). The nitrate soln. is evaporated to dryness, the residue dissolved in 0.1-0.15 cc. of 3N HNO_3 and 2-2.5 cc. of water, and the soln. treated with KI, added a small crystal at a time until the liquid above the black ppt. of BiI_3 appears yellow. A further 2.5 cc. of water is added and the mixt. is heated slowly on the water bath until the black ppt. is converted into copper colored, glistening crystals of BiOI . Another 5 cc. of water is added and heating is continued until the ppt. settles and the supernatant liquid is colorless, the soln. is treated with 2-2.5 cc. of 1% Na acetate soln., cooled, and filtered and the ppt. is washed with cold water, then with alc., dried at 105° and weighed as BiOI . Alternatively, the dried ppt. may be heated in a current of air or O and the liberated I collected in KI and titrated with $\text{Na}_2\text{S}_2\text{O}_3$.

B. C. A.

Determination of small quantities of carbon monoxide in air. N. KOMAR. *Ukrainski Khim. Zhurnal* **2**, Tech. Pt. 165-78(1926).—Froboese's method (cf. *C. A.* **9**, 1287), hitherto used only for small quantities of CO_2 , has been found very satisfactory for detg. minute quantities (up to 0.01% by vol.) of the gas in air.

B. C. A.

Determination of the chlorine value of effluents. H. BACH AND K. GLASER. *Z. angew. Chem.* **40**, 1115-6(1927).—Chloramine is used instead of KClO as a source of Cl. Its 0.1 N soln. is stable if kept in a dark bottle. To the filtered effluent, contg. a small quantity of 10% NaOH (to fix any CO_2 and so prevent the liberation of Cl from the chloramine), is added a known vol. of 0.1 N chloramine soln. and the mixt. is gently boiled under specified conditions. A small quantity of 10% KI is added, then concd. HCl , and, after some minutes, starch-Zn soln., and the I is titrated with 0.1 N thio sulfate. A blank expt. must be made. A comparison of this method with the KMnO_4 and biochem. O-absorption methods shows no general agreement in the results.

B. C. A.

Loss of chlorine during ashing. W. v. BRUCHHAUSEN. *Z. Untersuch. Lebensm.* **54**, 485-7(1927).—Detn. of Cl in the ash of carbohydrate materials is impracticable, because of loss of Cl during incineration, even in presence of Na_2CO_3 , methods based on extrn. are more reliable.

WILLIAM J. HUSA

Some experiences in the determination of very small quantities of iodides. J. T. DUNN. *Analyst* **53**, 211-2(1928).—For detg. I^- in iodized salt, a modification of the method used by Hunter (*C. A.* **4**, 431) and later by Brubaker and others (*C. A.* **20**, 3052-3) was found most satisfactory. Dissolve 50 g. of salt in 250 cc. of water, add a few drops of NaClO reagent and 1-5 cc. of 40% H_3PO_4 . Boil for a few min. to expel all Cl_2 , cool, add 1-2 cc. of 1% KI soln. and titrate with $\text{Na}_2\text{S}_2\text{O}_3$. The NaClO oxidizes I^- to IO_3^- . The soln. must be acid when boiled to remove Cl_2 and a blank must be run on all reagents used.

W. T. H.

Theoretical notes on sample taking. JOSEF MIKA. *Z. anal. Chem.* **73**, 257-64 (1928).—A mathematical discussion of the problems involved in getting a representative

sample. It is shown that even a mg. of a sample ground finely in an agate mortar may be representative but in sampling material such as coal, the error due to improper sampling is often greater than has been supposed and to avoid this error larger quantities from the original shipment should be taken. W. T. H.

Determination of antimony in bronze, brass and other alloys. S. A. CHERNIKOV. *Z. anal. Chem.* **73**, 265-70(1928).—When a fresh ppt. of SnO_2 and Sb_2O_3 is digested together with the filter paper in hot concd. H_2SO_4 , the Sb is obtained in the tervalent condition and the Sn in the quadrivalent state. Considerable experimentation with the method showed that it was possible to treat ignited SnO_2 and Sb_2O_3 in a similar manner; they are heated with 20 cc. of concd. H_2SO_4 and 0.5 g. of cane sugar in a 250-cc. Erlenmeyer flask until all the C is oxidized (6-10 hrs.) and finally the temp. is raised till the acid begins to boil. In these expts. it was found that some Sb_2O_3 is always lost by volatilization when the ppt. is ignited, together with the filter, in a porcelain crucible unless a considerable excess of SnO_2 is present. If five times as much Sn as Sb is present, there is no loss of Sb to be feared. The following procedure is suggested for the analysis of bronze, or brass. Treat 1 g. of the alloy with HNO_3 and filter off the oxidic residue after the usual boiling and evap. Ignite and weigh to get the sum of SnO_2 , Sb_2O_3 together with traces of P_2O_5 , etc. Transfer the oxides to a 250-cc Erlenmeyer flask, add 0.5 g. of cane sugar and heat with 20 cc. of concd. H_2SO_4 as explained above. Finally, cool, dil. with 50 cc. of cold water and titrate the Sb with 0.1 N KBrO_3 . To the titrated soln. add 5 cc. of 50% tartaric acid, NaOH till alk. and a little Na_2S soln. Exam the ppt. for traces of Cu, Fe, etc. Det. Sn by difference. W. T. H.

Quantitative precipitations at extreme concentrations. V. NJEGOVAN AND V. MARJANOVIC. *Z. anal. Chem.* **73**, 271-9(1928).—Acting on the hypothesis that the purest precipitates are obtained when the crystals are small and that fine ppts. are formed either when the soln. is extremely dil. or highly concd., the expt. was tried of pptg. BaSO_4 in precisely the opposite manner to that which has previously been attempted. The results thus obtained were quite satisfactory although, as might be expected, some trouble was encountered when other substances were present. To lessen the error in such cases, treatment of the ppt. with strong HCl proved effective. According to the directions recommended, good results can be obtained in the presence of Mg, Fe, Na, NH_4 and Mg, although the last-mentioned cation proved prone to adsorption. In the presence of phosphate the results are too high and Ca causes too low results; in this respect the behavior of Ca is exceptional. Doubtless the method could be modified so that satisfactory results could be obtained even in the presence of Ca, for there is a compensation of errors involved in the procedure. The method is as follows: Evap. the soln. contg. 0.2-0.3 g. of SO_4^{--} to dryness, moisten the residue with 5 cc. of 10% HCl and add 1 cc. of cold, satd. BaCl_2 soln. Stir up the paste well, dil. with 50 cc. of hot water and heat on the water bath for 30 min. Decant through a Gooch crucible contg. a heavy felt of asbestos, add 1 cc. of concd. HCl to the ppt. left in the casserole, stir well, add 50 cc. of hot water and heat 10 min. on the water bath. Filter and wash with cold water till free from chloride. Dry and ignite within another crucible, using a Méker or Teclu burner. W. T. H.

A new and rapid method for determining cadmium. G. SPACU AND J. DICK. *Z. anal. Chem.* **73**, 279-83(1928).—If a soln. contg. Cd^{++} and CNS^- is treated with pyridine in the cold, a finely crystalline, white ppt. of $[\text{CdPy}_3](\text{SCN})_2$ is obtained which is not very stable in the air. At the boiling temp. a much more stable ppt. is obtained, corresponding to the formula, $[\text{CdPy}_2](\text{SCN})_2$, which can be weighed after drying in a vacuum for 10 min. The procedure is as follows: To 50-100 cc. of soln. contg. Cd^{++} , NH_4Cl or NH_4OAc , add 0.5-1.0 g. of solid NH_4CNS , heat to boiling and add 1 cc. of pyridine. Stir, allow to cool and filter into a filtering crucible. Wash 4 times with a soln. obtained by taking 73 cc. of water, 25 cc. of 95% alc., 2 cc. of pyridine and 0.1 g. NH_4CNS , then once or twice with 10% pyridine in abs. alc. and finally with 15 cc. of ether contg. 3 drops of pyridine. Place in a vacuum desiccator and weigh after 10 min. drying in a vacuum. Some 20 detns. of solns. contg. 0.2-0.8 g. of $3\text{CdSO}_4 \cdot 8\text{H}_2\text{O}$ all showed excellent agreement with the theoretical % of Cd. W. T. H.

Estimation of cadmium in aluminum alloys. N. F. BUDGEN. *Metal Ind. (London)* **32**, 297(1928).—Attempts to det. Cd by weighing the CdS ppt. and by electrolyzing in H_2SO_4 soln. showed that the latter method gives more accurate results. W. T. H.

Pertinent and practical observations on the theory of sampling. T. T. READ. *Eng. Mining J.* **125**, 574-8(1928).—The importance of D. W. Brunton's work (*Trans. Am. Inst. Mining Eng.* **25**, 826(1896)) is pointed out. The comments made are indeed pertinent, practical and sometimes facetious. W. T. H.

The reaction of hexamethylene upon salt solutions of elements of the third group

and a new method for the quantitative separation of iron from manganese, zinc, nickel and cobalt. PRIYADARANJAN RAY AND A. K. CHATTOPADHYA. *Z. anorg. allgem. Chem.* **109**, 99-112(1928).—Kobayashi (C. A. **15**, 1114) showed that $(\text{CH}_3)_4\text{N}_4$ could be used advantageously for sepg. Fe^{+++} from Mn^{++} . This substance, although a very weak base, hydrolyzes as follows in the presence of H^+ : $(\text{CH}_3)_4\text{N}_4 + 6\text{H}_2\text{O} + 4\text{H}^+ \rightarrow 6\text{CH}_3\text{OH} + 4\text{NH}_4^+$. It has, therefore, the same effect as NaAcO or BaCO_3 in causing pptn of $\text{Fe}(\text{OH})_3$, $\text{Al}(\text{OH})_3$, etc. To the soln. contg. 60-150 mg. of Fe add 1 g. of NH_4Cl , unless sufficient acid is present to furnish this quantity on neutralization, and at a vol. of 125-500 cc., add pure $(\text{NH}_4)_2\text{CO}_3$ soln. until nearly neutral. Heat to gentle boiling and slowly add 10% $(\text{CH}_3)_4\text{N}_4$ until pptn. of $\text{Fe}(\text{OH})_3$ is complete. Under these conditions all of the $\text{Fe}(\text{OH})_3$ is pptd. without contamination by Mn , Zn , Co or Ni . A similar treatment will probably serve to sep. Al , Ti , Zr , etc., from these bivalent cations but the method is unsatisfactory with Cr^{+++} . W. T. H.

The exact determination of the equivalence point in potentiometric titrations. I. M. KOLTHOFF. *Rec. trav. chim.* **47**, 397-400(1928).—Hahn and Frommer (C. A. **21**, 2626) have criticised K.'s method of detg. the end point but K. points out that the proposed new method is impractical. Moreover, the points criticised by H. and F. refer to mistakes that would not be made by any one familiar with the subject. A new method is here suggested for detg. end points in cases where the e. m. f. curve has only a slight slope near the end point. From the exptl. data obtained during titration, it is possible to compute the equil. const. of the reaction and from this the magnitude of the inflection potential. The exptl. data show the end point within about 2 drops in a titration like that of AgNO_3 with $\text{Na}_2\text{C}_2\text{O}_4$. From this the e. m. f. at the equivalence point can be computed. Thus in titrating 50 cc. of 0.2 *N* AgNO_3 with 0.2 *N* ($= 0.1 M$) oxalate it would be found that the end point comes at approx. 50 cc. of oxalate. When 45 cc. of oxalate was added, $E_1 = +0.300$ v. and at 55 cc., $E_2 = +0.131$ v. At 25° , $(E_1 - E_2)/0.059 = \log_{10} \text{Ag}_1/\text{Ag}_2$, but from the approx. end point, it is known that about 5.0 ml. of 0.2 *N* AgNO_3 remains dissolved in 95 cc. of soln. when E_1 was measured, therefore $\text{Ag}_1^+ = (5 \times 0.2)/95 = 1.05 \times 10^{-2}$. Substituting this value in the above equation, one finds that $\text{Ag}_2^+ = 1.44 \times 10^{-5}$. This is the concn. of Ag^+ after an excess of 5.0 cc. of oxalate has been added. It remains dissolved in 105 cc. of soln. The oxalate concn. is then $(5 \times 0.1)/105 = 4.8 \times 10^{-3}$ mols. per l. From these 2 values the soly. product of $\text{Ag}_2\text{C}_2\text{O}_4$ is $[\text{Ag}^+]^2[\text{C}_2\text{O}_4] = (1.44 \times 10^{-5})^2 \times 4.8 \times 10^{-3} = 10^{-12}$. At the end point, the concn. of Ag^+ is $[\text{Ag}^+]_e = \sqrt{2 \times 10^{-12}}$ for if *x* mol. of $\text{Ag}_2\text{C}_2\text{O}_4$ are present in a satd. soln. which is completely ionized into $2 \times$ mol. of Ag^+ and *x* mol. of $\text{C}_2\text{O}_4^{--}$, the soly. product is $4x^3 = 10^{-12}$, $x = \sqrt[3]{10^{-12}}/4$ and $2x = \sqrt[3]{2 \times 10^{-12}}$. The e. m. f. at the equivalence point is $E_2 = E_1 - 0.059 \log_{10} [\text{Ag}^+]_1/[\text{Ag}^+]_e = 0.187$ v. W. T. H.

The action of sodium hydroxide on carbon disulfide. J. G. WERLDENBURG. *Rec. trav. chim.* **47**, 496-512(1928).—Considerable doubt exists as to exactly what happens when CS_2 dissolves in NaOH soln. From the conflicting statements in the literature, the presence of NaOH , Na_2CO_3 , Na_2CSO_2 , Na_2CS_3 , Na_2S , Na_2S_x and $\text{Na}_2\text{S}_2\text{O}_3$ might be expected but qual. tests show that the last 3 substances are not present in freshly prepared solns. Apparently the reaction proceeds as follows: (1) $\text{CS}_2 + 2 \text{NaOH} = \text{Na}_2\text{CS}_2\text{O} + \text{H}_2\text{O}$. Then the $\text{Na}_2\text{CS}_2\text{O}$ decomposes into (2) $3 \text{Na}_2\text{CS}_2\text{O} = 2 \text{Na}_2\text{CS}_3 + \text{Na}_2\text{CO}_3$. A scheme of analysis is outlined for the detn. of NaOH , Na_2CO_3 , $\text{Na}_2\text{CS}_2(\text{O})$ and Na_2CS_3 . In one sample the total alkali is detd. by boiling with a slight excess of HCl and titrating the excess with NaOH and using phenolphthalein or methyl red as indicator. In a second portion the total sulfur is detd. after oxidation with perhydrol in NaOH soln., either by weighing as BaSO_4 or by titrating with NaOH after adding an excess of acid and boiling off CO_2 . The third step consists in neutralizing a fresh portion of soln. with phenolphthalein as indicator and then titrating with standard I_2 soln. The fourth step is to neutralize to phenolphthalein in the presence of BaCl_2 (which leaves BaCO_3 pptd.), then to titrate with I_2 and finally with acid till BaCN_3 is dissolved. The fifth step is to neutralize with acid with methyl red as indicator. The last step is to titrate with I_2 in acid soln. From analyses made in this way, the conclusion is drawn that the quantity of Na_2CSO_2 present is practically zero and the carbonate content corresponds to the assumption that the essential reaction is $3 \text{CS}_2 + 6 \text{NaOH} = \text{Na}_2\text{CO}_3 + 2 \text{Na}_2\text{CS}_3 + 3 \text{H}_2\text{O}$. W. T. H. •

Rapid potentiometric determination of lead and cadmium in the same solution. F. MULLER AND W. PRÉGE. *Z. anal. Chem.* **72**, 195-200(1927).—Of the neutral nitrate soln., take an aliquot part and titrate both the Pb and the Cd with 0.1 *N* $\text{Na}_4\text{Fe}(\text{CN})_6$ soln. Have the soln. at 75° and titrate with an opposed e. m. f. of 0.18 v. until the

galvanometer shows no current. In another portion, ppt. the Pb as PbSO_4 by adding Na_2SO_4 and alc. and then titrate the Cd alone with ferrocyanide at 60° and an opposed e. m. f. of 0.2 v. W. T. H.

Volumetric determination of bismuth. H. KUBINA AND J. PLICHTA. *Z. anal. Chem.* 72, 201-7(1928).—To the cold soln. contg. 0.2 g. of dissolved Bi, add 0.1 g. of Al powder and 40 cc. of 3 N KOH soln. Shake gently for 20 min. to ppt. all the Bi. Finally heat the liquid to boiling, until the excess Al is all dissolved, filter and wash by decantation with hot water. Dissolve the ppt. in 15 cc. of 20% FeCl_3 in 3 N HCl. Titrate the resulting ferrous salt with KMnO_4 after adding the usual quantities of MnCl_2 and H_3PO_4 . Good results can also be obtained by pptg. the Bi with Cu in an atm. of CO_2 and titrating the resulting Cu_2Cl_2 with KBrO_3 . W. T. H.

Analysis of nitroglycerin waste acid. A. S. WEBB. *J. S. African Chem. Inst.* 10, 13-4(1927).— H_2SO_4 and HNO_3 are detd. by titration methods, total N in the nitrometer, and the org. matter by oxidation and subsequent titration with KI and $\text{Na}_2\text{S}_2\text{O}_3$. The method of calcg. results is given. B. C. A.

Microchemical detection of rubidium. E. S. BURKSER AND S. G. RUBIN. *Ukrainskii Khim. Zhurnal* 2, 355-64(1926); *Mikrochem.* 5, 137-45(1927).—A soln. of a Ru salt in concd. HI yields with equal vols. of a 14% soln. of AgI in the same acid and of a 4.5% soln. of Au in I and HI black, hexagonal crystals of $3\text{AuI} \cdot \text{AuI}_3 \cdot 4\text{RbI} \cdot \text{AgI}$ when the Rb is in excess, and of $3\text{AuI} \cdot \text{AuI}_3 \cdot 3\text{RbI} \cdot 2\text{AgI}$ when an excess of the reagents is used. The formation of these black crystals forms a delicate test for Rb in the presence of K or NH_4 salts, as little as $1-3 \times 10^{-8}$ g. of Rb in one drop of a soln. on a microscope slide giving a detectable reaction; Cs interferes, as it gives a similar reaction, but the crystals have a pronounced tendency to collect into stellar aggregates. The method is far more delicate than the corresponding tests using chlorides or bromides of Au and Ag. The AuI_3 soln. is made by allowing fine filings of gold to remain for 1 week in contact with I, HI (d 1.5), and a little ether and the Ag soln. by dissolving freshly pptd. and washed AgI in HI. B. C. A.

Oxidation-reduction reactions. W. T. HALL. *Science* 67, 315-6(1928).—It is pointed out that the third edition of Douglas and Prescott's "Qualitative Analysis" published in 1880 contained a chapter on oxidation-reduction written by Otis Coe Johnson on the basis of a theory of *negative bonds*. In this way J. anticipated very closely the present theory of electron transfer now used as a basis for writing equations of oxidation and reduction. W. T. H.

Separation and determination of metals with the aid of 8-hydroxyquinoline. VI. Determination of bismuth. R. BERG. *Z. anal. Chem.* 72, 177-9(1927); cf. C. A. 21, 3850.—In AcOH or ammoniacal tartrate solns. Bi gives an orange-yellow, cryst. ppt. of $\text{Bi}(\text{C}_9\text{H}_6\text{ON})_3 \cdot \text{H}_2\text{O}$ in which form it can be weighed after drying at 105° . After long heating at $130-140^\circ$ the ppt. becomes anhyd. The soln. in which pptn. takes place must be free from Cl^- and should be at $60-70^\circ$ when the reagent is added. A satd. soln. of 8-quinolinol in acetone or in alc. should be used as precipitant. The ppt. can also be titrated bromometrically. W. T. H.

Rapid potentiometric determination of silver and zinc in the same solution. E. MÜLLER AND H. HEYTSCHL. *Z. anal. Chem.* 72, 188-93(1927).—First the Ag is titrated with 0.1 N KBr soln., Ag and the calomel cell being used as electrodes, and with an opposed e. m. f. of 0.176 v. Then, without removing the AgBr ppt., the Zn is titrated with $\text{K}_4\text{Fe}(\text{CN})_6$ and an opposed e. m. f. of 0.31 v. W. T. H.

Systematic qualitative analysis of cations without the use of hydrogen sulfide or its derivatives. O. MACCHIA. *Z. anal. Chem.* 72, 180-5(1927).—See C. A. 22, 559. H. G.

Quantitative analysis by means of a thermobalance. IV. ICHIRO NOSHIDA. *J. Chem. Soc. Japan* 48, 520-6(1927).—The most suitable temps. for heating ppts. obtained in the detn. of Be, Zn and Cd were detd. by a thermobalance as follows: $\text{Be}(\text{OH})_2 \rightarrow \text{BeO}$, 950° ; basic Be carbonate $\rightarrow \text{BeO}$, 350° ; ZnNH_4PO_4 , weighed as such, $<200^\circ$; $\text{ZnNH}_4\text{PO}_4 \rightarrow \text{Zn}_3\text{P}_2\text{O}_7$, 550° ; basic Zn carbonate $\rightarrow \text{ZnO}$, 450° ; $\text{Zn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O} \rightarrow \text{ZnO}$, 350° ; $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O} \rightarrow \text{ZnO}$, 950° ; $\text{CdNH}_4\text{PO}_4 \rightarrow \text{Cd}_3\text{P}_2\text{O}_7$, 550° ; basic Cd carbonate $\rightarrow \text{CdO}$, 400° ; $\text{Cd}(\text{NO}_3)_2 \cdot \text{H}_2\text{O} \rightarrow \text{CdO}$, 550° ; $3\text{CdSO}_4 \cdot 8\text{H}_2\text{O} \rightarrow \text{CdSO}_4$, $210-820^\circ$. T. SAITO

Quantitative spectrum analysis. F. TWYMAN AND D. M. SMITH. *Am. Inst. Mining Eng. Tech. Pub. No.* 79, 27 pp.(1928); cf. C. A. 21, 2234. W. T. H.

The analytical study of nitrous acid. J. V. DUBSKÝ AND A. OKAČ. *Spisy vydané přírodovědeckou Fakultou Masarykovy Univ.* No. 83, 3-82(1927).—The tests for HNO_2 usually depend upon diazotizing and coupling with another nitrogenous org. substance whereby a color is produced. Reactions have been chosen for the most part, which

cause the formation of a color in a colorless soln., but quite recently tests have been proposed whereby HNO_2 after diazotizing is made to react with another colored substance, whereby a change in color is produced. Thus a change from red to blue or yellow to red is just as characteristic as the formation of a yellow or red color from a colorless soln. The behavior of HNO_2 in concns. of 10^{-4} – 10^{-7} , after diazotizing with 23 amines, was tested against some 600 different substances; the stability of the color formed and the sensitiveness of the test were noted. W. T. H.

Direct oxidimetric determination of perchlorate in the presence of large quantities of chlorate and chloride. EUGEN SPITALSKII AND S. JOFA. *Z. anorg. allgem. Chem.* **169**, 309–18(1928).—By means of SO_2 , HClO_4 is reduced to chloride, whereas HClO_4 is unaffected. The HClO_4 can then be reduced by TiCl_3 and the excess titrated with KMnO_4 . The presence of a little chromate or considerable chloride does not affect the results seriously. With 0.05–0.1 g. of KClO_4 the results were accurate within 2 mg. in all cases. Sat. the soln. at a vol. of about 100 ml. with SO_2 to reduce the HClO_4 . Expel the excess SO_2 by boiling or heating while passing air through the soln., add 20–60 cc. of 7 N H_2SO_4 and dil. to 400 cc. Expel air by passing CO_2 through the soln. for 15 min., add a measured vol. of standard TiCl_3 and titrate the excess with KMnO_4 . W. T. H.

Titration by Fajans' method. II. Determination of the mercurous and bromide ions. R. BURNSTEIN. *Z. anorg. allgem. Chem.* **168**, 325–6(1928); cf. *C. A.* **21**, 3173.—Excellent results were obtained in the titration of KBr with HgNO_3 in the presence of Na alizarinsulfonate as indicator. At the end point a change of yellow to reddish violet takes place. W. T. H.

Osmium. II. Determination of osmium. E. FRITZMANN. *Z. anorg. allgem. Chem.* **169**, 356–64(1928).—The element Os is usually sep'd from other elements by taking advantage of the volatility of OsO_4 , and the OsO_4 is usually adsorbed in an alk. soln. Afterwards the soln. can be treated with a suitable reducing agent and the Os weighed as metal or an iodometric titration can take place. Some substances, such as certain sulfidic mixts. are extremely hard to oxidize and it was found necessary to develop a suitable rapid method for use in such cases. Introduce enough of the substance to yield about 0.1 g. of Os into a 100–150 cc. long-necked Wurtz distg. flask in such a way that none of the powder adheres to the sides of the flask. Connect the flask to a condenser and to 2 receivers, using ground-glass connections. As the first receiver use a long-necked 250-cc. distg. flask contg. 3 drops of a nearly satd. soln. of NaOH and have the bulb under cold, running water. Connect this flask with a gas-wash bottle contg. 50 cc. of 1% NaOH soln. The top of the first distg. flask should be fitted by a ground-glass connection to a 75-cc. separatory funnel. After introducing the sample, make all connections air-tight and add from the funnel 10 cc. of water, 50 cc. of concd. H_2SO_4 , and 5 cc. of 10% CrO_3 soln. Heat so that there is a slow distn. After this has proceeded for 10 min. add 5 cc. more of the CrO_3 soln. and after the same period add 2 more portions of this soln. while constantly distg. Finally add 5 cc. of water and continue until 5 drops of distillate will give no red color when added to 2 drops of 5% $\text{CS}(\text{NH}_2)_2$ soln. mixed with an equal vol. of 6 N HCl . Transfer the alk. soln. in the receivers to a wide-mouthed Erlenmeyer flask, dil. to 250 cc., heat to 85–90° for 15 min., add 6 N HCl until the odor of H_2S is apparent and add 1 g. of NH_4Cl . If any CrO_3 distd. over it is well to add 5–10 drops of 30% formalin soln. with the $\text{CS}(\text{NH}_2)_2$. Heat 15 min. longer to coagulate the OsS_4 ppt., filter into a Gooch crucible, wash 10 min. with hot water without letting the ppt. drain dry at any time and finally with 2–3 portions of alc. Dry at 70° for 15 min., ignite in H_2 and weigh as metallic Os. W. T. H.

The potentiometric determination of gold. ERICH MÜLLER AND FRITZ WEISBROD. *Z. anorg. allgem. Chem.* **169**, 394–8(1928); cf. *C. A.* **21**, 35.—Further data are given concerning the titration of AuCl_3 with FeSO_4 . The effect of HNO_3 was studied and of various other cations. With HNO_3 the titration curve is higher and the second break, upon which the titration depends, is less abrupt but addn. of K_2SO_4 and alc. prevents this disturbance to a considerable degree. Cu, Hg and Pb do not interfere but the method is useless when considerable Pd or Pt is present. The titration with TiCl_3 is unsatisfactory in dil. solns. W. T. H.

Determination of small amounts of carbon monoxide in air. G. M. EDALL. *Ind. Eng. Chem.* **20**, 275(1928).—For the detn. of small concns. of CO in air, with an app. modeled after Graham's portable type, it was found necessary to use very pure I_2O_5 and to run a blank with pure air. Under these conditions the I_2O_5 method is more sensitive than has been generally known. W. T. H.

Detection of chromium, manganese, mercury, silver and gold by the spot-test

method. N. A. TANANAEV AND IV. TANANAEV. *Z. anorg. allgem. Chem.* **170**, 113–27 (1928).—The cations of inorg. chemicals can be divided into two groups—those which are not pptd. from a soln. by adding an excess of $(\text{NH}_4)_2\text{S}$ and those which are pptd. thereby either as sulfides or hydroxides. In the latter group which includes Al, Cr, Fe, Co, Ni, Zn, Mn, Hg, Pb, Ag, Bi, Cd and Cu, the ions of Al, Zn and Cd alone are always present in a single state of oxidation Cr^{+++} , Fe^{++} , Co^{++} , Ni^{++} , Mn^{++} , Hg^+ and Pb^{++} are susceptible to oxidation, preferably in alk. solns. The ions Fe^{+++} , Ag^+ , Bi^{+++} , Hg^{++} and Cu^{++} , on the other hand, can be reduced or act as oxidizing agents. It is of interest, therefore, to ascertain to what extent these oxidizable and these reducible ions can react with one another. In this respect the p_H value of the soln. exerts considerable effect. The ions Fe^{++} and Hg^+ can be oxidized in acid as well as in alk. soln. The Bi^{+++} ion, even in strongly alk. solns., is not reduced by any of the above-mentioned ions and the Cu^{++} ion only under certain conditions, usually when cyanide or iodide is present. The tests here described resulted from a study of the extent to which the oxidizable and reducible ions react together to give characteristic reaction in the presence of NaOH or of NH_4OH . **Chromium.**—An interesting test for Cr consists in treating the soln. of Cr^{+++} with AgNO_3 ; CrO_4^{--} and metallic Ag are formed in the presence of NaOH but less readily when NH_4OH replaces NaOH. Treatment with satd. NH_4NO_3 soln. dissolves the Ag and then reddish Ag_2CrO_4 is seen. With benzidine soln. a blue color is obtained; as little as 0.002 mg. of Cr^{+++} in a drop of 0.03 cc. can be detected. **Cobalt, nickel and lead.**—Under the same conditions as in the Cr test, the ions of Co^{++} , Ni^{++} and Pb^{++} react with Ag^+ and the resulting black spot consists of Ag, $\text{Co}(\text{OH})_2$, $\text{Ni}(\text{OH})_2$ and H_2PbO_3 , of which only the Ag dissolves in satd. NH_4NO_3 soln. The test is particularly sensitive with Co but is not sufficiently characteristic. It fails in the presence of NH_4OH . **Manganese.**—The test for Mn is like that of Co, Ni and Pb but is extremely sensitive; 0.0007 mg. of Mn can be detected in a single drop of soln. The reduction takes place even with ammoniacal Ag soln., which is not true for Co^{++} , Ni^{++} and Pb^{++} . **Silver.**—The reverse of the Mn test serves to detect 0.002 mg. of Ag in one drop. **Mercury.**—If a drop of 6 N HCl is placed on a piece of blotting paper, then a drop of soln. to be tested, followed by a small drop of HCl, a white ppt. of Hg_2Cl_2 will be obtained which blackens on exposure to NH_3 . In the absence of Ag^+ and Hg^+ , a spot test for Hg^{++} can be obtained by producing a spot of the soln. on blotting paper, adding a drop of satd. $\text{Mn}(\text{NO}_3)_2$ soln. and one of NaOH. This test is less characteristic than that with SnCl_2 and aniline previously described (*C. A.* **19**, 1108). **Copper.**—A sensitive spot test depends upon the formation of Cu_2I_2 by treatment with KI, removal of the liberated I_2 with 0.1 N Na_2HASO_3 soln. and treatment with a soln. of AgI in KI. The black deposit of Ag is obtained with 0.006 mg. Cu in 0.025 cc. Fe^{+++} alone interferes with the test but it can be washed away from the spot before adding $\text{Ag}(\text{NH}_3)_2^+$, leaving insol. Cu_2I_2 . Special directions are also given for the detection of both Hg^+ and Ag^+ when present together, for the detection of Mn^{++} and Ag^+ when both are present and for Cr^{+++} and Hg^{++} in the presence of one another.

W. T. H.

The use of manganese in the assay of fine gold. A. O. WATKINS. *Chem. Eng. Mining Rev.* **20**, 165–66 (1928).—In assaying Au bullion contg. no Cu it is customary to add some to the charge for cupellation. The presence of the Cu ensures an even edge to the fillet and prevents spouting when the button cools. But the presence of Cu causes slight losses and it has been recommended to use instead of pure Cu a eutectic alloy of 71.8% Ag and 28.2% Cu. If now about 0.025 g. of Mn is added the results are still better. This will cause a black stain on the top edge of the cupel.

W. T. H.

Volumetric estimation of carbon and carbon dioxide in rock products by electrical incandescence. W. J. PIRR. *Chem. Eng. Mining Rev.* **20**, 167–70 (1928).—The method applies to the detn. of C and H in org. material as well as to the detn. of CO_2 in rocks. The substance, together with suitable oxidizers such as CuO and PbCrO_4 when necessary, is placed in a transparent quartz tube 160 mm. long and 29 mm. in diam. The top of the tube is closed by a rubber stopper carrying three tubes. The middle tube is of Ni and at its lower end, which reaches nearly to the bottom of the quartz tube, there is fused to it a resistance wire of Pt or Ni-Cr. Another tube reaches well into the quartz tube and serves for the introduction of O_2 or air. The other tube reaches just below the lower edge of the rubber stopper and serves for the exit of O_2 , CO_2 , H_2O and N_2 in case air is used. To carry out the detn. the substance is mixed with catalyst and promptly heated to about 950° by the resistance coil and a Bunsen flame at the bottom of the tube. The CO_2 and H_2O are adsorbed in the usual manner but it is recommended to use $\text{Ba}(\text{OH})_2$ for the former. After the absorption, the excess reagent is titrated

with acid with phenolphthalein as indicator and then the BaCO_3 is titrated with methyl orange. The app. is recommended for the detn. of humus in soil. When it is desired to distinguish between the C of a carbonate and that of org. matter, the former can be detd. by absorbing the CO_2 evolved on treatment with acid, and the total C in the app. described. W. T. H.

Separation of the platinum metals. ANON. *Chem. Eng. Mining Rev.* 20, 142-3, 170-1 (1928).—The following method is based on a study of the various characteristic reactions of the 6 Pt metals and appears to be easier to carry out than most sepn. in this group. It was tested with a mixt. of the 6 metals with an av. content of about 0.3 g. each (except with Os, of which less was used). The results were accurate within less than 10 mg. in every case. To 100 cc. of the chloride soln., add 7-8 cc. of concd. HCl and ppt. Pd as bright-yellow $\text{Pd}(\text{C}_4\text{H}_7\text{O}_2)_2$ by adding a 1% soln. of dimethylglyoxime in alc. Filter, wash with cold water contg. a little HCl, dry at 105° and ignite first in air and finally in H_2 . Weigh as Pd. To the filtrate add a 2% soln. of furil dioxime and 10% of alc. Boil 30 min. to ppt. reddish brown $\text{Pt}(\text{C}_{10}\text{H}_7\text{O}_4\text{N}_2)_2$. Filter, wash with water contg. a little alc., dry, ignite as with the Pd ppt. and weigh as Pt. Evap. the filtrate from the furil dioxime pptn. to $\frac{1}{3}$ of its vol. and for each 100 cc. of soln. add 5 cc. of concd. HCl and 5 g. of NaClO_3 . Boil to oxidize the org. matter and continue heating till the excess Cl_2 is removed. To the soln. add an equal vol. of alc. and, while boiling, add portions of satd. KNO_3 soln. until alk. to litmus; the Rh is pptd. as pale yellow $\text{K}_2\text{Rh}(\text{NO}_3)_6$. Filter, wash with 50% alc. and use the filtrate for detg. Ru, Os and Ir. Dissolve the ppt. in aqua regia, evap. off the excess acid and reduce the RhCl_3 with Mg or Zn. Filter, wash with dil. HCl and weigh the Rh after heating in H_2 . Evap. the filtrate from the $\text{K}_2\text{Rh}(\text{NO}_3)_6$ pptn. until no more nitrous fumes are evolved, add 10 cc. concd. HCl for 100 cc. of soln. and evap. till solids begin to sep. Dil. with 2-3 times as much water, make alk. with NaOH and add alc. till about 33% is present by vol. Filter off the black $\text{Ru}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ and wash with dil. alc. Use the filtrate for the Os and Ir detns. Dissolve the Ru_2O_3 ppt. in hot, dil. HCl and ppt. Rh with Mg or Zn. Wash the ppt. with water and weigh after ignition in H_2 . Evap. the filtrate from the Ru_2O_3 pptn. till the alc. is all removed and ppt. both Os and Ir with Zn dust. Wash the ppt. with very dil. HCl. Take the ppt. and filter paper and treat with fresh NaClO until all the Ir is dissolved, leaving the Os behind. Filter off the black Os, wash, dry, ignite in H_2 and weigh as Os. To the orange soln. obtained by dissolving the Ir in NaClO soln., add HCl and Zn, filter off the Ir and weigh as such after the usual treatment, preferably drying at 190° in an oven before heating in H_2 . W. T. H.

Determination of silica by means of ultra-filtration in decomposable silicates. HEINRICH HARDT. *Zement* 16, 678-82 (1927).—Instead of evap. the HCl soln. to dryness, the evapn. is stopped when there is gel formation of H_2SiO_3 . Lumps are broken up with a stirring rod, 10-20 cc. of water and an equal vol. of alc. are added and the mixt. is heated carefully, then dild. and filtered, an "ultra" filter being used. The dehydration is claimed to be complete and the method appears to be nearly as rapid and fully as accurate as the conventional procedure. H. F. K.

A new method of preparing a colloidal gold solution. Detection and determination of very small quantities of gold. D. NIDER. *Kolloid-Z.* 44, 139-40 (1928).—A very delicate test for dissolved Au is obtained by adding $\text{K}_2\text{HgI}_4 + \text{KI}$ to the alk. Au soln. 1 mg. per l. can be detected in this manner. The test can be used for the colorimetric detn. of small quantities of Au and is better than the SnCl_2 . R. H. LAMBERT

The preparation and preservation of standard potassium permanganate solution. TAKIO KATO. *J. Chem. Soc. Japan* 48, 408-10 (1927).—Detn. of the strengths of 20 solns. of KMnO_4 prepd. under various conditions, and kept for a year, showed that the following method gives the most stable soln. Boil the soln. of commercial KMnO_4 in ordinary distd. water, let stand one day and filter through asbestos into a steam-washed bottle, which is covered with black paper. S. KUNISAWA

Uses of amalgams in volumetric analysis. XII. Potentiometric titration of molybdenum, iron, titanium, uranium and vanadium by means of metallic electrodes. TAMAKI NAKAZONO. *J. Chem. Soc. Japan* 48, 17-26 (1927).—Two kinds of the electrodes, (A) Pt-Ir and Pt and (B) Pt-Ir and Hg-plated Cu, were found better than any other tried. In using (A), the e. m. f. rises only at the end point, but falls again promptly, while with (B) the variation of e. m. f. can be observed at every stage of titration, and no sudden depression of voltage takes place after the end point has passed. The conditions of potentiometric titration for each of the above elements when titrated with KMnO_4 , KBrO_3 , Br_2 or Fe^{+++} were investigated, and the differential titration of solns. contg. 2 elements with these reagents was also accomplished successfully. XIII.

The determination of tungsten. *Ibid* 76-7.—Cd-amalgam reduces sexivalent W to the quadrivalent condition in 4-6 N HCl soln. By oxidizing the latter with a standard soln. of Fe^{+++} alum, W can be detd. T. IRE

Identification of inks and investigation of documents for legal purposes. E. ALCOBILLA Y AGUADO. *Quim. Ind.* 5, 1-4(1928). MARY JACOBSEN

Comparative study of the use of animal charcoal and of activated alumina in toxicology. G. SENSI AND C. DE ROSA. *Ann. chim. applicata* 18, 3-18(1928).—The expts. were suggested by work of Kohn-Abrest (*Traité de Toxicologie* II, 93(1924)) where it was shown that Al_2O_3 adsorbs alkaloids from alc. soln. Preliminary tests were made to det. the relative decolorizing power of animal charcoal and activated Al_2O_3 for dil. alc. litmus and for caramel soln. Animal charcoal adsorbed both more rapidly and to a greater extent than Al_2O_3 . On the other hand Al_2O_3 adsorbed more solids from a filtered alc. ext. of minced organs than did animal charcoal. Nine alkaloids were then tested, in each the alkaloid being mixed with minced organ, which was analyzed while fresh and after putrefaction. The analyses were carried out by the general methods of Stass, Otto and Ogier. The results show that activated Al_2O_3 gives excellent results as an agent for the purification of dil. alc. liquids from the extn. of toxicological samples analyzed by the Stass-Otto-Ogier method. Compared with animal charcoal it has certain advantages, notably its ease of prepn. of a uniform quality at a low cost in the lab., and the simpler technic involved in its use. With some alkaloids, such as morphine and heroine, it gives better results than does animal charcoal, while with others, such as quinine, cinchonine, strychnine and brucine, it is the equal of animal charcoal as a purifying agent. In no case was it found to be inferior to animal charcoal. The results of the expts. with the individual alkaloids are tabulated in detail, with a detailed description of the technic employed for each. C. C. DAVIS

Elementary organic analysis for carbon and hydrogen without the use of catalysts. IVAN MAREK. *Archiv. Hem. Farm.* 1, 188-94(1927).—An app. for the detn. of C and H in org. substances is described, in which combustion takes place in a current of pure O. B. C. A.

Microchemical detection of volatile aldehydes and ketones. C. GRIEBEL AND F. WEISS. *Mikrochem.* 5, 146-60(1927).—The paper deals with the identification of aldehydes and ketones such as those present in fruits and essences, by the microchem. examn. of derived semicarbazones, *o*-, *m*- or *p*-nitrophenylhydrazones, or *m*- or *p*-nitrobenzhydrazones. B. C. A.

Color tests for ethyl alcohol. I. AD. EKKERT. *Pharm. Zentralh.* 69, 198(1928).—By dissolving 0.01 g. of resorcinol in 2 cc. EtOH and adding 1 cc. of concd. H_2SO_4 , the contact zone develops a very faint rose ring, but on mixing the liquids merely a pale rose develops even on boiling. If, however, only a little alc. and a relatively large amt. of H_2SO_4 is used, the resulting liquid becomes highly colored. By dissolving 0.01 g. of resorcinol in 1 drop EtOH and adding 0.5 cc. concd. H_2SO_4 , the liquid becomes on warming rose to ruby-red and blood-red, while a few drops of alc. cause the warmed liquid to yield a deep blood-red color. 0.1 to 0.05 cc. of a mixt. of 0.1 cc. EtOH and 5 cc. H_2O with 0.01 g. resorcinol and 1 cc. concd. H_2SO_4 gives on warming a rose-red to faint rose color. This reaction is fairly delicate. W. O. E.

The determination of polysaccharides. C. O. APPLEMAN, W. E. LOOMIS, T. G. PHILLIPS, W. E. TOTTINGHAM AND J. J. WILLAMAN. *Plant Physiology* 2, 91-7(1927).—Report of the comm. on methods of the Am. Soc. of Plant Physiologists, consisting of a discussion of methods available for detg. cellulose, starch, hemicelluloses, pentosans, galactan and mannan, insulin and pectins. An extensive bibliography is given. WALTER THOMAS

Determination of sulfur in organic substances. IVAN MAREK. *Archiv. Hem. Farm.* 1, 194-9(1927).—S is detd. by the combustion of org. substances in a current of moist O and absorption of the acid gases produced in 2% H_2O_2 . H_2SO_4 is then detd. gravimetrically or volumetrically. B. C. A.

HAMPSHIRE, CHARLES H.: **Volumetric Analysis for Students of Pharmaceutical and General Chemistry.** 4th ed. revised. London: J. & A. Churchill. 7s. 6d. Reviewed in *Chem. News* 136, 190(1928).

8--MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIKER

Specific gravities of minerals: an index of some recent determinations. I. J. SPENCER. *Mineralog. Mag.* 21, 337-65(1927).—2277 specific gravities of minerals collected from various sources are arranged in tables in increasing order from 1.03 (retinite) to 19 (Pt). Nearly $\frac{1}{4}$ of the entire no. fall between 2.0 and 4.0. An alphabetical list of minerals, with both the min. and max. recorded values, is also given.

W. F. HUNT

- **Rhombic sulfur isolated from volcanoes.** F. RANFALDI. *Mem. accad. Lincei* [vi], 2, 206-318(1927). A comprehensive comparative survey of existing crystallographic data referring to the rhombic S produced by volcanic eruption. B. C. A.

Catalytic action in the oxidation of sulfides and arsenides. FERGA CARMICHAEL. *Univ. Toronto Studies, Geol. Series, Contributions to Canadian Mineralogy* No. 24, 1927, 47-53, cf. C. A. 21, 39. The methods of the previous study were used but with the addn. of the catalysts Pt black, pyrite or MnO_2 , and the agitation was prolonged to 15 days at 18°. Chalcocite, pyrrhotite and nickeliferous pyrrhotite did not oxidize more rapidly because of the presence of the catalysts. Polydymite after agitation for 50 days gave 11.4% of elementary S which was sepd. from the residue by CS_2 . The insol. decompn. product of the oxidation of polydymite was chiefly Fe hydroxide. The small quantity of chalcopyrite in the polydymite was almost completely oxidized and the reaction was accelerated by the presence of Pt black and retarded by pyrite and MnO_2 . The oxidation of rammelsbergite was increased by each of the catalysts, but more by Pt black than by pyrite or MnO_2 . In this test the As_2O_3 of the rammelsbergite did not seem to poison the Pt black catalyst.

I. W. RIGGS

Mineralographic examination of cohenite from Ovifak, Greenland. ELLIS THOMSON. *Univ. Toronto Studies, Geol. Series, Contributions to Canadian Mineralogy* No. 24, 1927, 41-3.—Cohenite, sepd. from native Fe by HCl, appears as a residue consisting of Fe 78.12, S 16.40, insol. 3.86, sum 98.38%, which corresponds roughly to Fe_3S . Etching tests show that this residue is not homogeneous. The specimen studied appears to consist of cohenite, native Fe and troilite in addn. to several non-metallic constituents which were not detd.

I. W. RIGGS

Notice of an occurrence of niccolite and ullmannite at the Settlingstones mine, Fourstones, Northumberland; and of serpierite at Ross Island mine, Killarney, Kerry County Ireland. ARTHUR RUSSELL. *Mineralog. Mag.* 21, 383-7(1927).—Niccolite and ullmannite were found assocd with sphalerite and galena in a witherite vein in the Settlingstones mine. The niccolite has a finely cryst. structure and tendency to form spherical aggregates. Ullmannite is present in small quantities forming fringes around the niccolite and more rarely as minute cubes in the groundmass of the witherite. The occurrence of the rare hydrated basic sulfate of Cu, Zn and Ca (serpierite) is reported from the old Cu mine, Ross Island. It forms small greenish blue spherical tufts composed of minute crystals, flattened parallel to (001) and elongated parallel to a ; biaxial, —, with $Bx_a \perp (001)$, $n = 1.59$.

W. F. HUNT

Canadian localities for chalmersite. ELLIS THOMSON. *Univ. Toronto Studies, Geol. Series, Contributions to Canadian Mineralogy* No. 24, 1927, 44-6.—Samples of chalmersite from Cold Lake, northern Manitoba and from Raglan Township, Renfrew County, Ont. are described.

I. W. RIGGS

• **β -Quartz twins from some Cornish localities.** JULIEN DRUGMAN. *Mineralog. Mag.* 21, 366-82(1927).— β -Quartz twins from 3 Cornish localities showed Esterel twinning (1011) about twice as often as twinning according to the Verespatak law (1122). Less frequent twinning was observed on (3032), (2021), (2131) and (2133). The Sardinian law, twin plane (1012) was not found.

W. F. HUNT

Thermomagnetic study of certain iron minerals. J. HUGGETT AND G. CHANDRON. *Compt. rend.* 186, 694-6(1928).—Tests were made on specimens of magnetite, hematite and several similar minerals for temps. up to approx. 900°. The results are given as a series of curves. These differ for the different minerals but each shows a decided break at about 570°.

W. W. STIFLER

History of witherite. G. FOWLES. *Chem. News* 135, 309-10(1927).—Witherite, discovered by Withering and described by him (*Phil. Trans.* 74, 293(1784)) as a compd. of "terra ponderosa" (BaO) and "fixed air" (CO_2), was obtained from a lead mine at Alston Moor, Cumberland, whereas the origin of the specimen is variously described in the literature as Scotland and Lancashire. Withering's investigations on this "terra ponderosa aërata" are briefly described.

B. C. A.

Reëxamination of bytownite and huronite. T. L. WALKER AND A. L. PARSONS. *Univ. Toronto Studies, Geol. Series, Contributions to Canadian Mineralogy* No. 24, 1927, 5-11.—Analysis of a sample of bytownite (Ottawa) collected by Thomson about 1836 shows it to be a crushed and granulated anorthosite. A sample was ground to pass a 40-mesh sieve, and after treatment with a magnet to remove magnetite and HCl to remove calcite the powder was analyzed by Rickaby with the following results: SiO_2 54.30, Al_2O_3 27.49, Fe_2O_3 1.27, CaO 10.21, MgO 0.50, Na_2O 4.77, K_2O 0.84, H_2O 0.79, sum 100.17%; sp. gr. 2.70. The original specimen of huronite which Thomson reported from near Lake Huron, on analysis by Rickaby, gave: SiO_2 46.70, Al_2O_3 31.60, Fe_2O_3 1.41, FeO 0.57, CaO 6.90, MgO 0.64, MnO 0.05, K_2O 6.96, Na_2O 1.45, H_2O 3.63, CO_2 0.40, sum 100.31%; sp. gr. 2.832. It consists of about 75% muscovite and some zoisite. It resembles closely in appearance and compn. the huronite found on the road between Elk Lake and Gowganda, Ont. L. W. RIGGS

Beryl and associated minerals from Lyndoch Township, Renfrew County, Ont. T. L. WALKER AND A. L. PARSONS. *Univ. Toronto Studies, Geol. Series, Contributions to Canadian Mineralogy* No. 24, 1927, 12-4.—Analysis of pure material by Rickaby gave: SiO_2 64.40, Al_2O_3 18.08, Fe_2O_3 0.97, BaO 14.38, CaO 0.18, MgO 0.33, MnO 0.04, K_2O 0.18, Li_2O 0.18, Na_2O 0.35, H_2O 1.08, sum 100.17%; sp. gr. 2.726. This corresponds best with Penfield's formula for beryl. The assocd. minerals were microcline, albite, tourmaline, garnet, quartz and magnetite. L. W. RIGGS

South African occurrences of willemite. Fluorescence of willemite and some other zinc minerals in ultra-violet rays. L. J. SPENCER. *Mineralog. Mag.* 21, 388-96 (1927).—The various occurrences of willemite are reviewed, especially those of south Africa. The latter include Broken Hill, near the Sable Antelope mine, Mumbwa and near Lusaka, all in northern Rhodesia. Willemite was also found at Guchab, Otawi, South West Africa. While the willemite from New Jersey showed a green fluorescence under ultra-violet rays, specimens from Altenberg, Belgium, and from a no. of south African localities and from Durango, Mexico, were not affected. Others fluoresced in shades of yellow and bluish purple. Other Zn minerals that responded to the ultra-violet treatment were: coarsely cryst. mamillated smithsonite, hydrozincite, hemimorphite, hopeite, parahopeite, black sphalerite and certain diamonds. Fluorescence in ultra-violet rays is not a const. property of a mineral species but depends upon some impurity present in the mineral. W. F. HUNT

Crystals of cornetite and their refractive index. ALFRED SCHOEP. *Natuurw. Tijdschrift* 9, 125-8 (1927).—Crystals of cornetite occurring on a brown sandstone from Katanga, max. size 0.5×0.1 mm., were found to have $a:b:c = 0.9844:1:0.7679$, in agreement with Cesaro (*C. A.* 17, 2096). The 221 and 110 planes were most prominent; 100 was also found. For the ns was found $\alpha = 1.765 \pm 0.003$, β between 1.79 and 1.80, γ between 1.83 and 1.84. B. J. C. VAN DER HORVEN

Yellow incrustation of the Vesuvian lava of (the eruption of) 1631. F. ZAMBONINI AND G. CAROBBI. *Rend. accad. sci. Napoli* [iii], 32, 124 (1926).—The "vesubium" thought by Scacchi to be present in lava from the Vesuvian eruption of 1631 is V. "Vesbina" has the compn. $(\text{Cu,Pb})_2(\text{VO}_4)_2 \cdot 5\text{H}_2\text{O}$, in which Pb is also partly replaced by rare-earth metals, including La, Ce, Nd, Yt and Er. "Vesbina" was formed by the action of water on the cooling lava. B. C. A.

Dehydration of gypsum. A. L. PARSONS. *Univ. Toronto Studies, Geol. Series, Contribution to Canadian Mineralogy* No. 24, 1927, 24-7.—Three samples of gypsum from different Canadian localities were heated, without previous grinding, for 22-hr. periods, the first period at 84° , the second at 95° and the others at 105° , 115° , 128° , 135° , 145° and 165° . Less than 1% of the water remains after the heating at 115° . The optical characters and the % of H_2O are recorded in all stages in the manuf. of plaster of Paris; these show that it is not a definite chem. compd., but an intimate mixt. of bassanite and gypsum in proportions varying between 3 of bassanite to 1 of gypsum to 2 of bassanite to 1 of gypsum. So far as observed $2\text{CaSO}_4 \cdot \text{H}_2\text{O}$ is prepd. only by wet methods. L. W. RIGGS

Canadian minerals—tremolite, clinohumite, stromeyerite, natron and hexahydrite. T. L. WALKER AND A. L. PARSONS. *Univ. Toronto Studies, Geol. Series, Contributions to Canadian Mineralogy* No. 24, 1927, 15-24.—The analyses quoted in this paper are by Rickaby. The optical const. of tremolite crystals from Faraday, Ont. are recorded and the analysis gave: SiO_2 57.36, TiO_2 0.14, Al_2O_3 1.04, Fe_2O_3 0.21, FeO 0.72, CaO 12.41, MgO 25.22, Na_2O 1.49, K_2O 0.47, H_2O 0.44, sum 99.50%; sp. gr. 2.96. Clinohumite from Chaffey's Locks has a yellow color with vitreous luster. Analysis gave: SiO_2 37.42, TiO_2 1.14, Fe_2O_3 0.46, FeO 1.27, MgO 56.32, MnO 0.10, H_2O 0.56, F 5.04, sum 102.31, less O equiv. (2.12) 100.19%; sp. gr. 3.17. Stromeyerite from

Cobalt and Gowganda, Ont. has a blue color and the compn.: Cu 31.00, Ag 53.31, S 16.02, sum 100.33%; sp. gr. 6.26. Natron from Clinton, B. C. was white and chalk-like on the surface but vitreous within. Analysis gave: Na_2O 21.23, CO_2 15.46, H_2O 63.59, sum 100.28%; sp. gr. 1.34, which shows nearly pure natron. Hexahydrate samples from Oroville, Washington, were collected with reference to the most pronounced dehydration. Analysis gave: MgO 17.88, $(\text{Al}_2\text{O}_3 + \text{Fe}_2\text{O}_3)$ 0.10, SO_3 34.64, H_2O 47.32, insol. 0.03, sum 99.97%; sp. gr. 1.71. Five other analyses of samples from the locality, which is partly in U. S. and partly in Canada, show that these deposits may be epsomite, hexahydrate or a mixt. of the two.

L. W. RIGGS

Molybdenite in Lacorne and Malartic Townships, Quebec. WM. GERRIE. *Univ. Toronto Studies, Geol. Series, Contributions to Canadian Mineralogy* No. 24, 1927, 37-40.—The molybdenite veins occur in a contact zone of fine-grained granite and biotite schist of sedimentary origin. It is mostly disseminated in the muscovite, less frequently in quartz and feldspar. Analysis of a concd. sample of ore gave Mo 58.0, S 30.1, insol. 3.88, sum 100.98%. The outlook for profitable mining of this deposit is good.

A puzzolan from S. Paoli near Rome. A. GOLDBERG. *Tonind. Ztg.* 52, 103-4 (1928).—This material is quite similar to trass.

F. O. A.

Contact action of pegmatite on schist. G. M. SCHWARTZ AND R. J. LEONARD. *Bull. Geol. Soc. Am.* 38, 635-44 (1927).—The contact effect of the pegmatite on the quartz mica schist is abrupt and may be noted ordinarily for a distance of 7 or 8 feet. The contact zone consists of a granular rock in which the original schistosity has been destroyed. The biotite and muscovite of the schist have disappeared and plagioclase, orthoclase and microcline are developed. Apatite and tourmaline likewise increase toward the contact.

W. F. HUNT

Contact phenomena of the nepheline syenites of Port Coldwell, Ont. T. L. WALKER AND A. L. PARSONS. *Univ. Toronto Studies, Geol. Series, Contributions to Canadian Mineralogy* No. 24, 1927, 28-32.—Three groups of rock along the line of contact are (1) nepheline syenite composed of anorthoclase, green hornblende, non-pleochroic aegirine and decomn. products of sodalite or nepheline. (2) Country rock which contains orthoclase, plagioclase, hornblende and lesser amts. of diopside, pleochroic titanite, fluorite and magnetite. (3) The dark central part of the dike contains hornblende and plagioclase, biotite and scattered crystals of orthoclase.

L. W. RIGGS

Influence of hot natural brines on dolomitization. T. L. WALKER AND WM. GERRIE. *Univ. Toronto Studies, Geol. Series, Contributions to Canadian Mineralogy* No. 24, 1927, 33-6.—Various calcareous animal materials (shells, etc.) were ground to 100 or 60-100 mesh and weighed amts. thereof were agitated in bottles of sea water from 14 to 36 days. The water was varied as follows: (1) normal sea water at 18°, (2) sea water concd. to $\frac{1}{2}$ its vol., (3) sea water concd. to $\frac{1}{7}$ its vol. and (4) normal sea water at 97° but without agitation. In the last test on powders from 5 different animals the powders gained from 2.7 to 12.6 times the original wt. of Mg. In expts. 1-3 the absorption of Mg by the powders was irregular. The bearing of these results on dolomitization is considered.

L. W. RIGGS

Sedimentation of tufa and of calcareous travertines. SILVESTRE PRAT. *Compt. rend. soc. biol.* 97, 1762-4 (1927).—A study of the water in streams and canals in the region about Prague indicates a wide variation in the CO_2 content at the springs and at successive points down stream. Measured by p_{H} values the figures ranged from 7.0-7.4 at the springs to 8.0-8.3 in the lower levels. As the CO_2 content diminished CaCO_3 was deposited. The deposition of diatoms and algae and the growth of other aquatic vegetation had some relation to the p_{H} and perhaps to the velocity of the water.

L. W. RIGGS

Weathering of Cheviot granite under the peat. S. J. TOMKIEFF. *Proc. Univ.*

Durham Phil. Soc. 7, 233-43 (1928).—The outer crust of granite boulders from beneath a layer of peat was about $\frac{1}{8}$ in. thick, and was sepd. from the inner weathered portion by a thin layer of secondary enrichment of Fe oxides. *The outer crust was white and consisted of quartz and white mica, no kaolin being present. Chem. analysis of the white crust gave: SiO_2 70.67, Al_2O_3 20.57, Fe_2O_3 0.29, MgO 0.31, CaO 1.16, Na_2O 1.31, K_2O 3.02, $\text{H}_2\text{O} +$ (and volatiles) 1.78, $\text{H}_2\text{O} -$ 0.57, sum 99.68%; sp. gr. 2.597; porosity 18.5%. The sp. gr. of the inner unweathered portion of the boulder was 2.649, porosity 0.20%. Arranging the constituents in the order of their relative losses by weathering gives: Fe_2O_3 (FeO) 94.0, MgO 69.5, CaO 47.5, Na_2O 30.1, K_2O 27.2, Al_2O_3 16.75 and SiO_2 14.25%. The selective leaching of various oxides can be accounted for by the nature of the percolating solns. coming from the overlying peat. The probable changes in the mineral compn. during weathering are discussed and illustrated by many calcs. L. W. RIGGS

D. J. DEMOREST AND R. H. ABORN

Some old reduction places for bog ore in Norway. ROLF FALCK-MUUS. *Norsk. Geol. Tids.* 9, 358-67 (1927).—The slags usually consist of magnetite and fayalite. Some have solidified outside the hearth and have the shape of flat pieces with worm-like figures on the surface or of lumps which evidently have been formed from drippings gathering under a slag hole. One type which has solidified within the hearth is very porous and is also filled with half-blurred impressions of charcoal. These pieces contain olivine. Some have ophitic structure, others contain crystals of olivine imbedded in a groundmass of reduced Fe, magnetite, small olivine crystals and a dark isotropic substance, probably a basic glass. Besides these Fe slags there are also a large number of thinner slightly curved pieces looking like fragments of clay pots. They are glassy on their concave side and have the appearance of burnt tile on their convex side. They are remainings of the clay linings of the hearth. On the basis of microscopic examn. of the mineral associations of the slags it may be concluded that the temp. along the inside walls of the hearth has been fairly const., somewhat above 1100° . The ore has been bog ore. All the occurrences are situated above the "marine limit," i. e., the shore lines of the deepest submersion of the country in the Quaternary time. The only fuel used was charcoal. The construction of the hearths may be inferred from the form and constitution of the slags. The hearth was a small pot, 46-8 cm. wide at the top (the crib) and about 27 cm. deep. It was provided with a slag hole and was worked with artificial draft. Remains of the blow holes have been found. Fragments of loop iron (bloom iron) found in tombs from the Viking age show that bog Fe was "blown" about the year 900 A. D. A hone (for needles) found at one of the places in question fixes the time of working for this place at about the same time. There was probably work going on at these places throughout the period from about 800 to about 1570 A. D. C. A. ROBAX

The manufacture of pig iron in Natal. J. E. HOLGATE. *J. Chem. Met. Mining Soc. S. Africa* 28, 155-72 (1928).—H. discusses fully the raw materials, coke and fluxes used and the operation of the blast-furnace plant at New Castle. Natal spruit dolomite contg. 2.60% MnO was a useful flux, which almost eliminated the addn. of extra Mn to the furnace burden. Prestwick raw carbonate ore can be smelted with a coke consumption not exceeding 1750 lbs. (795 kg.) per ton (909 kg.). The principles of carbonate ore smelting are discussed. Pig and slag analyses and furnace data are

tabulated. Future costs and the general economic considerations governing the pig iron industry in Natal are touched upon and a brief discussion of the paper is given.

Specific heat of iron. P. OBKRÖFFER AND W. GROSSE. *Stahl u. Eisen* **47**, 576-82 (1927).—From measurements of the sp. heat of electrolytic Fe between 0° and 1590° the transformation points have been found to be: A2 ($\alpha - \beta$), 785°; A3 ($\beta - \gamma$), 906° and A4 ($\gamma - \delta$), 1401°; and the m. p. 1528°. The absorption of heat on heating the metal is 6.765 g.-cal./g. at A3, 2.531 g.-cal./g. at A4 and 64.38 g.-cal./g. at the m. p. The curve showing total heat-temp. is convex to the temp. axis up to the A2 point, and this fact, coupled with the absence of any heat effect at this temp., shows that the A2 transformation is proceeding regularly throughout the range 0-785°, and is not of an allotropic nature. The total heat-temp. curves for the β - and δ -ranges are portions of the same straight line, showing that the at configuration of both forms is the same. The curve for γ has a smaller slope towards the temp. axis than that for β and δ . The mean sp. heat of pure Fe rises from 0.1107 between 0° and 100° to 0.1628 between 0° and 780°, at which figure it remains const. to 900°, when there is a sharp rise to a max. of 0.1724 at 0-906°, followed by a slow fall to 0.1632 at 0-1400°. The mean sp. heat between 0° and the m. p. is 0.2071. Calorimetric researches with a transformer Fe contg. 4% Si show that this alloy does not undergo the A3 transformation on heating. The true sp. heat rises rapidly from 0.118 at 100° to 0.248 at 750° (A2 point), then falls abruptly to 0.185 between 755° and 1476°. Between 1476° and 1488°, which is the melting range of this alloy, a heat absorption of 26.209 g.-cal./g. takes place; the sp. heat of the molten alloy is 0.141.

B. C. A.

The manufacture of low-carbon semisteel. III. M. HORIKIRI. *Repts. Imp. Ind. Research Inst., Osaka, Japan* **8**, No. 12, 1-156 (1928); cf. *C. A.* **20**, 2647, 3433, 21, 1621.—The properties and the structure of all classes of low-C semisteel used in the industry have been studied from the standpoint of practical industrial application. When 30% of soft steel scrap is introduced, the C content could be reduced to 2.9-3.1% by controlling the condition of the molten soln. and by using a tapping temp. of 1300°. A casting having a tensile strength of 3000 kg. per sq. cm. is thus obtained. In a similar way, when 70% of soft steel is introduced the C content could be reduced to 2.3-2.8% while the tapping temp. is raised to 1360-1400°. A casting of 3500-3700 kg. per sq. cm. tensile strength is obtainable under these conditions. Cylinder liner, piston and other high-class castings were prepd. by using the above ratio. An addn. of 2.5-3% Si to the low-C semisteel enhances the quality of the castings. In addn. to Si, 1.5-2.0% Mn is beneficial in desulfurization and increased tensile strength. The manuf. of low-C semisteel castings with a C content of about 2.6% and having a remarkably fine structure has been easily accomplished in a cupola. In this case, the temp. of the molten soln. has a great influence on the absorption of C, but temp. alone is not an absolute controlling factor. Using a high temp. without prolonged heating is recommended.

*NAO UVEI

[Production of steel by] carbonizing scrap iron. R. HENNECKE. *Stahl u. Eisen* **47**, 777-80 (1927).—Good quality steel may be produced by melting scrap iron and steel without addn. of cast-iron scrap or raw pig iron. The scrap is briquetted together with 1-2% of carbonaceous material, as free as possible from S, the briquets being melted with 3% of limestone in an acid-lined open-hearth furnace. When the charge has melted down and the evolution of gas has almost ceased 1% of fluorspar and a further 3% of limestone are added in 2 portions to assist in the removal of S. Finally the steel is deoxidized in the ladle by the addn. of 5-7 kg. of 80% ferromanganese per ton of steel. The output of steel per hour is about 5.8-5.9 tons per 20 sq. m. of hearth. Cost data compare favorably with those of the usual process.

A Röntgen study of the structure of carbon steel. N. SELYAKOV, G. KURDUMOV AND N. GOODZOV. *Z. Physik* 45, 384-408(1927); cf. *C. A.* 21, 1790.—A centered tetragonal structure is established for C steel which is a little different from that of α -Fe. The parameter ratio of the centered structure increases, for equal hardness conditions, with increasing C content. The parameter ratio increases, for the same C content, with the elevation of the temp. of hardening. The structure is explained as a solid soln. of C in α -Fe. The mechanism of the hardening of C steel can be described as the process of the maintaining of a transition form between the γ - and α -structures.

MARIE FARNSWORTH

Standardization of heat treatments of airplane steels. L. GAZZANIGA. *Technique moderne* 20, 191-4(1928).—The advantages of standardizing heat treatments of steels used in airplane construction are briefly outlined, and suggested standard treatments are tabulated for the various grades of steel used in that industry. A. P.-C.

Low-manganese steels gain favor. JEROME STRAUSS. *Iron Age* 121, 864-6 (1928).—The phys. properties of steels contg. 0.3-0.5% C and 1-2% Mn were tested. These steels may be heat-treated to obtain properties comparable with those of the more expensive alloy steels. Charts show comparative phys. properties of these Mn steels with various alloy steels and indicate that Mn steels are more closely related to the other structural steels than to C steels. Neither moderately high P (0.078%) nor moderately high S (0.103%) adversely affects the strength and toughness of Mn steels. Cutting tests show that high-S Mn steel is less damaging to roughing tools than lower-S steels. Hardening and machining qualities are favorable. Heavier sections of cast steels contg. 1.5% Mn or more may show appreciable segregation and coarse dendritic formation.

W. H. BOYNTON

Creep in five steels at different temperatures. H. J. FRENCH, H. C. CROSS AND A. A. PETERSON. *Bur. Standards, Tech. Paper No. 362*, 235-67; cf. *C. A.* 20, 32, 2643.—Creep tests in which elongation of steels is observed as a function of time under a fixed load were made and correlated with short-time tension tests at corresponding temps. within the range 20-730°. Low-C, high-Cr, Cr-Mo structural, high-speed, high-Cr and high-Ni austenitic steels were used. Creep charts enable the approx. detn. of the stress permitting life of different durations with different total elongations. Correlation of creep tests with short-time tension tests gives somewhat higher values than the long-time tests, but the proportional limit was in the range of stresses which could be sustained for long periods with small amounts of deformation. As the temp. of the test increases a tendency for the proportional limit to become higher than the allowable creep stresses develops. The Cr-Ni steel and the Cr steel show the best resistance to atm. oxidation, but the Cr-Ni steel showed the best load-carrying ability in the range 595-730°. The Cr-Mo steel was not structurally stable at 650° and oxidation was accompanied by decarburization and grain growth.

ALBERT THOMAS FELLOWS

The A-B-C of corrosion-resisting steels. F. R. PALMER. *Chem. Met. Eng.* 35, 149(1928).—The author divides stainless steels into three groups: Group A contg. Cr less than 14% and C less than 0.40%, Group B Cr more than 16% and C less than 0.40%, and Group C steels contg. enough Cr and Ni to make steel austenitic and non-magnetic. Heat treatment, toughness, grain growth, hot and cold working qualities, machineability, corrosion resistance, etc., are tabulated for each class of steels.

A. W. COFFMAN

A systematic view of stainless steels. F. R. PALMER. *Iron Age* 121, 729-30 (1928).—See preceding abstract.

A. W. COFFMAN

Effect of silicon, nickel, chromium and tungsten on the hardening of tool steel? W. HAUFFE. *Stahl u. Eisen* 47, 1365-73(1927).—The no. of annealings at temps. between 780° and 1030° followed by quenchings in water at 0° before hardness cracks begin to appear in a hypereutectoid steel (1.2% C) to which varying amts. of Si, Mn, Ni, Cr and W have been added, has been detd., and the results are reproduced in graphical form, together with the corresponding vol. changes. With increasing Si content, the tendency to fracture on repeated hardening is increased at the higher temps. but high-S steels may be annealed up to 930° and quenched in oil without showing hardness cracks. Mn decreases the hardening range of hypereutectoid steels very considerably, so that, by hardening at the usual temps., there is a tendency towards the production of cracks after quenching. Hypereutectoid steels with a sufficiently high Mn and Si content behave like plain C steels when hardened at 780°, and better than the plain steel when hardened at 830°. Up to 1% Cr decreases the tendency of high-C steels to crack during hardening; with 1-2% Cr these steels become extremely hard without, however, losing their toughness, and hardness cracks may be avoided by quenching from 930° in oil. Ni has scarcely any action on the hardening prop-

erties of hypereutectoid steel, and the action of W is uncertain owing to the sepn. of carbide during annealing. B. C. A.

Tensile properties of boiler plates at temperatures between 20° and 600°. G. URBANCZYK. *Stahl u. Eisen* 47, 1128-35(1927).—The mech. properties between 20° and 600° of 4 typical boiler-plate steels have been detd. after annealing for 1 hr. at 920° and cooling slowly. The elastic limit remains constant up to 220° and then falls slowly with rise of temp., the tensile strength increases slowly to a max. at about 275° and then falls rapidly, and the elongation decreases slowly to a min. at 250-275°, then increases slowly. The impact strength reaches its max. at 120° and a min. at 500-600°. Tables showing the compn. and variation of the mech. properties with the temp. are given together with graphs for all the steels tested. B. C. A.

Metallographic investigation of metallic material [boiler tube]. F. HANAMAN. *Archiv. Hém. Farm.* 1, 236-42(1927) —Metallographic examn. of a burst steel boiler tube shows that it must have been heated at least to 850° and then quenched with steam, thereby causing the formation of martensite; on reheating at 750° it returns to its original homogeneous structure. A modern plant for the heat treatment of miscellaneous steel castings. A. W. LORENZ. *Trans. Am. Foundrymen's Assocn.* 1928 (preprint), No. 28-10, 141-52. E. H.

Transverse surface cracks in rails. H. VITHAUX. *Rev. métal.* 24, 485-95, 601-18, 671-82(1927).—A detailed description is given of exhaustive tests carried out at the Cie des Forges de Chatillon, Commentry et Neuves-Maisons to det. the causes and mechanism of the formation of surface cracks of rails in service and the means of preventing or reducing their formation. Transverse surface cracks are caused by the slipping of the wheels on rails the surface of which has previously become hardened, either by air cooling after it has been heated by friction or by cold-working by the action of the wheels; under the effect of the tension produced by the slipping of the wheels the non-ductile surface layer of the rail breaks. Such cracks can form in steels of any compn. or quality; they form more easily and rapidly become large in hard steel the surface of which has been self-hardened by intense slipping of the wheels but they also form in mild steel (tensile strength 40-45 kg.) and render rails made from such steel extremely brittle if they have not been heat-treated. Micrographic examn. of cracked rails shows that segregation and inclusions facilitate the propagation of the cracks; but these defects also develop in very homogeneous steels of good quality. Though the formation of cracks cannot be entirely prevented by the use of steel which is very pure and sufficiently mild not to harden under the action of the slipping, the danger from the cracks can be very greatly reduced by suitable heat treatment of the finished rails, so that even the cracked rails can safely stand much more severe operating conditions than those to which they are subject at present. The method of treatment at present in use at the Neuves-Maisons rail mill (*C. A.* 20, 2642) allows of obtaining, in any type of steel, the modification in texture required to prevent the propagation of cracks and to render the latter practically harmless. A. PAPINEAU-COUTURE

Minute shrinkage cavities in some cast alloys of heterogeneous structure. W. A. COWAN. *J. Inst. Metals* (advance copy) No 451, 6 pp.(March, 1928).—Minute cavities in certain heterogeneous alloys are attributed to shrinkage, the final solidification of a low f.-p. component when entirely surrounded by other components already solidified being the cause. Some Sn-Cu-Sb alloys are shown to contain these cavities when small percentages of Pb are present and to be practically free from cavities with no Pb content. The main component, of the alloys described, is a solid soln. of Sb in Sn solidifying at 237° and the low f.-p. component is the eutectic mixt. with Pb, solidifying at 183°. Photomicrographs are shown. Cf. *C. A.* 13, 2501. J. W. B.

The behavior of metals and alloys during hot-forging. W. L. KENT. *J. Inst. Metals* (advance copy) No. 462, 18 pp.(March, 1928).—Small cylindrical specimens of Sn, Pb, Zn, Al, Cu and brass (70:30 and 60:40) were forged with a standard blow of 50 ft.-lb. at temps. up to the m. ps., and the mechanism of hot-forging was investigated by measurement of the degree of compression produced and by comparison of the Brinell hardness values so obtained. The following conclusions are drawn: (1) Although the forging test does not measure the malleability of a metal or alloy, it will indicate the relative forgeability at different temps. and also the liability for cracking to occur during the operation. A combination of the forging test and the notched-bar impact test gives the best approximation to the working properties. (2) Work at elevated temps. induces some strain hardening. With Cu this decreases progressively but very slightly up to 550°; with Al the decrease is probably greater. Rapid recrystn. aids hot-forging through the resultant softening. In some cases (Al) the inherent softness of the metal at high temps. aids hot-forging in the absence of

rapid recrystn. (4) The forgeability of 70:30 brass increases but little up to 750°, but that of 60:40 brass increases steadily between 400° and 600° and then very rapidly to the melting point. The presence of Pb caused cracking from 350° upwards but in 60:40 brass the cracks disappeared at 700° and the material contg. Pb produced a better forging than the pure alloy.

ROBERT F. MEHL

Heat treatment of aluminum and its light alloys. ROBERT J. ANDERSON. *Fuels & Furnaces* 6, 315-8(1928).—The theoretical considerations detg. the heat treatment of Al alloys are given and the time-temp. treatment for annealing wrought Al and Al alloys are considered. In mass annealing the time is 2-8 hrs., depending on the quantity of material, and the temp. is 350-450°. A thermocouple in the load is desirable. Small grain size is produced by annealing at the lowest feasible temp. and for the shortest time. "Flash" annealing is produced by passing small loads through a furnace at a rate exposing the alloy to a temp. of 375-450° for from 5 to 20 min. Hardenable alloys of the duralumin type are not heated above 350°. Non-hardenable Al alloys may be heated to 450°. *Ibid* 483-4.—Permanent growth in Al alloys is produced on heating to 260°. On cooling to ordinary temps. the casting will be measurably larger; a 4" casting may increase 0.004" in diam. Heating to 425° followed by slow cooling confers permanent growth on an Al casting and removes all internal strains. Recently self-hardening alloys have been produced which mature by remaining in air at ordinary temp.

J. W. SHIPLEY

Light metals and alloys, aluminum-magnesium. MISS M. G. LORENTZ, *et al.* *Bureau of Standards, Circ. No. 346*, 403 pp.(1927).—The author covers the available information on Al, taking up commercial Al, its production and applications, its metallography giving photomicrographs; its chem. and phys. properties, as well as its technology. The constitution, technology and properties of Al alloys of As, Sb, Bi, Be, B, Cd, Ca, Ce, Co, Cr, Cu, Ge, Au, Fe, Pb, Li, Mg, Mn, Mo, Ni, P, Pt, K, Se, Si, Ag, Na, Ta, Te, Th, Sn, Ti, V and Zn are considered. Mg is also reviewed from the standpoint of properties, metallurgy and technology, while the alloys of Mg with Al, Cu, Cd, Zn and Ni are discussed. An appendix giving the definitions of phys. terms and a bibliography are included.

A. W. COFFMAN

The thermal and electrical conductivity of some aluminum alloys and bronzes. EZER GRIFFITHS AND F. H. SCHOFIELD. *J. Inst. Metals* (advance copy) No. 457, 36 pp.(March, 1928); *Engineering* 125, 301-3(1928).—Two groups of alloys were investigated: (1) those rich in Al, with Ni, Mg, Fe, Zn, Si, Mn or Ag as second or third constituents (22 in number); (2) those rich in Cu, with Sn, Zn, Pb, Mn or Al (7 in number). The Al alloys were found to possess a thermal cond. of roughly 70 to 80% that of pure Al, whereas the bronzes range from 10 to 20% of the value for Cu. In contrast to the pure metals the alloys all give considerable increase of thermal cond. with temp. A minute amt. of P in bronze produces a marked lowering in thermal cond. The ratio of thermal to elec. cond. in the range 80° to 300° obeys Lorentz's law with the exception of the Al alloy contg. 13% Si.

ROBERT F. MEHL

Oxidation of chromium-nickel alloys at high temperatures. W. ROHN. *Elektrotech. Z.* 48, 227-30, 317-20(1927); *Science Abstracts* 30B, 349.—Detn. of the resistance of Cr-Ni wires is not a satisfactory method of estg. the extent to which the surface of the metal has been oxidized. E. g., a hard-drawn wire is increased in resistance about 9% by being heated *in vacuo* to 1000° and allowed to cool. If the resistance method is to be used, the wire must first be heated to a temp. higher than that at which the oxidation is to be investigated, in order to stabilize its structure and therefore the sp. resistance of the metal itself. The method used by the author consists in weighing the scale which flakes off a spiral of wire (a) when it cools suddenly to room temp., (b) when the wire is stretched. The wire is then re-wound as a spiral, and the test is repeated until the total amt. of scale collected after each period of heating becomes practically constant. The stretching of the wire is analogous to, but more severe than, the stress to which heating elements are exposed in service by differences between the thermal expansion of the wire, its supports, etc. In the second part of the paper data are given comparing the performance of various alloys at different temps. and showing the enormous differences between wires of the same compn. but different manuf.

H. G.

Widmanstätten structure of iron alloys. ALBERT SAUVEUR. *Proc. Am. Phil. Soc.* 66, 267-80(1928).—A review of recent expts. and theories concerning the hardening of steels by rapid cooling. Jeffries' "slip interference" theory of the source of hardness and Benedicks' "supersaturated soln." theory are discussed. Photomicrographs are used to illustrate the structures of various alloys of Fe.

WILLIAM F. BERT

The constitution of the alloys of magnesium and zinc. R. CHADWICK. *J. Inst.*

Metals, 1928 (advance copy) No. 449, 14 pp. — An investigation of the equil. diagram of the Mg-Zn system, for all compns. down to 340° and for some compns. to 250°. Both thermal and micrographical methods were used. The metals form two intermetallic compds., $MgZn_2$ and $MgZn_{13}$, and all 4 phases, Mg, $MgZn_2$, $MgZn_{13}$ and Zn, have been shown to form solid soln. There is no great change in the liquidus, but the solidus has been completely modified. A new solid soln., beta, has been found corresponding closely to the compd. $MgZn_{13}$. $MgZn_2$ forms a wide range of solid solns., which probably undergo complex changes at low temp. A summary is given of a method of analysis in which the Mg and Zn are pptd. sep. as phosphates from the soln. of mixed chlorides. Cf. C. A. 20, 2653.

J. W. BOECK

The alloys of sodium-potassium-mercury-cadmium. ERNST JÄNECKE. *Z. Metallkunde* 20, 113-7 (1928). — The system Na-K-Hg is thoroughly examd. and constitutional diagrams are shown. In the binary system K-Hg, the following compds. are found: KHg, bronze colored (m. 178°), KHg_4 and KHg_8 . They have characteristic crystal form and are easily identified. In the system Na-Hg, the compds. Na_3Hg , NaHg (copper-red, m. 217°), $NaHl_2$ and $NaHg_4$ are identified. In the mixt. Na-K-NaHg-KHg, the double compd. $NaKHg$ (m. 188°) is isolated and crystal as blue, glistening, hexagonal prisms. In the system Na-Cd-Hg, the compds. $NaCd_2$ (m. 385°), $NaCd_4$ (m. p. probably 360°), and $NaCdHg$ are found. In the system Na-K-Cd-Hg, the compd. KCd , (needle-like crystals, m. p. over 550°) is indicated. It reacts only weakly with cold H_2O , dil. H_2SO_4 and HNO_3 , but vigorously with warm HNO_3 .

H. STÖBERTZ

Studies on the tin-bismuth and tin-cadmium alloys in the solid state under special equilibrium conditions at different temperatures. M. LE BLANC, M. NAUMANN and D. TSCHESNO. *Ber. Verhand. sächs. Akad. Wiss. Leipzig Math.-Phys. Klasse* 79, 71 (1927). — As a criterion for the existence of perfect equil. conditions the authors take the exact coincidence of cond. curves on heating and cooling. By the elec. cond. and thermoelectric force measurements as well as by the use of microscopic methods there is shown the presence of a solid soln. of Sn in Bi of 3.5 at. % by elec. measurements and of 1.5 at. % by microscopic examn. On the tin side of the system there is present a compd. ($BiSn_2$) which dissociates at room temp. This forms with the excess tin a solid soln. In the Sn-Cd system below 130° the compd. $CdSn_4$ exists at 20 at. % Cd and forms with excess Cd a heterogeneous system. With excess Sn it forms a homogeneous phase at 2.5 at. % Cd. With increasing temp. the compd. breaks down and the homogeneous phase increases from 2.5 at. % Cd at 130° to 7.5% Cd at 175°.

A. W. COFFMAN

The alloys of zirconium. I. T. E. ALLIBONE and C. SYKES. *J. Inst. Metals* (advance copy) No. 458, 14 pp. (March, 1928). — A series of Zr alloys was prepd. *in vacuo* in an induction furnace (which is described). The structures of the Cu-Zr alloys up to 35% Zr, Ni-Zr alloys up to 55% Zr, Fe-Zr alloys up to 30% Zr were detd. In each case the system is eutectiferous, and intermetallic compds. are formed. In the Cu-Zr system the compd. Cu_2Zr is formed, in the Ni-Zr system two compds., probably Ni_3Zr and Ni_4Zr . The solid solv. of Zr in the pure metals Cu, Ni and Fe is in each case less than 0.5%. The hardness, tensile strength and ductility of certain of the alloys are recorded.

ROBERT F. MEHL

Quenching and tempering of brass, bronze and "aluminum-bronze." TSUTOMU MATSUDA. *J. Inst. Metals* (advance copy) No. 463, 42 pp. (March, 1928). — The effect of quenching and tempering on the microstructure, elec. resistance, Brinell hardness, tensile and impact properties of brass, bronze and "aluminum-bronze" was examd. The rate of cooling from high temps. exerts a profound influence on hardness and microstructure. The temper-hardening of brass, bronze and "aluminum-bronze" was investigated and it was confirmed that Cu alloys contg. proper amts. of the second metal may be hardened by suitable heat treatment. The nature of this temper-hardening was investigated by means of microscopic and dilatometric tests and elec. resistance measurements, and it is concluded that the hardening is accompanied by the separation of the α -phase from β - or γ -, or the decompn. of the β - or γ -phase into eutectoid, or both these changes, and is probably caused by the straining of the space lattice produced by these structural changes.

ROBERT F. MEHL

Report on cutting temperatures. Their effect on tools and on materials subjected to work. E. G. HERBERT. *Proc. Inst. Mech. Eng.* 1927, No. 4, 863-908. — By means of a pendulum hardness tester or "hot hardness" tester, tool steel, quenched in oil from 1300°, was found to possess the greatest hardness within the desirable cutting range, viz., 300-600°. Secondary heat treatment of steel hardened by quenching from 1300° showed that reheating to 575° produced a tool with the highest hot hardness and also

the greatest range of hot hardness. It is suggested that the merit of tool steels be appraised by making hot hardness tests on the hot tools immediately after removing them from the furnace in which they have received their heat treatment. A suitable furnace and the pendulum testing device are pictured and described. It is recalled that the resistance a material offers to cutting does not depend upon the original hardness but on the hardness induced by the tool. The induced hardness depends upon the work-hardening capacity of the metal and this latter property is shown to vary considerably with the temp. There is ground for believing that press work on sheet metals can be facilitated by working them at a temp. at which their work-hardening capacity is at a minimum. Strain etching of single crystals and crystal aggregates of Al and Fe showed that the change in work-hardening capacity with temp. is due to a crystn. phenomenon and can proceed both in the presence and absence of grain boundaries.

WILLIAM F. EHRET

Deformation of crystals of β -brass. G. I. TAYLOR. *Proc. Roy. Soc. (London)* **A118**, 1-24 (1928).— β -Brass, which is similar in crystal structure to α -Fe, behaves somewhat like α -Fe when distorted. In both metals distortion results in slip along planes which are not parallel to a definite crystallographic plane. In β -brass, however, with certain orientations of the crystal axes, slip does occur on the {110} plane. Which of these types of distortion will occur in β -brass is shown to depend upon the variation in resistance to shear which occurs as the plane of slip rotates about the direction of slip. This variation is calcd. from exptl. results and it is shown that resistance to shear is least when the plane of slip coincides with a crystal plane of type {110}. In β -brass, resistance to slipping in one direction on a given plane of slip is not the same as that offered in the opposite direction. This is to be expected from the crystallographic symmetry, but is not observed in α -Fe.

WILLIAM F. EHRET

The influence of dissolved gases on the soundness of 70:30 brass ingots. G. I. BAILEY. *J. Inst. Metals* **1928** (advance copy) No. 455, 12 pp.—The object was to det. whether unsoundness could be produced in 70:30 brass by treating the molten metal with N, H and SO₂ before pouring. The degree of unsoundness was detd. by d. measurements, ingots treated with N being taken as gas-free standard. Comparative tests were made on 5% Sn bronze and 70:30 brass with 4 different rates of solidification. It is concluded that whatever the conditions of casting, 70:30 brass is not liable to unsoundness caused by gases. A brief résumé of previous work done is included (cf. C. A. 4, 1951; 14, 3213; 21, 553, 555, 1953). Also in *Metal Ind. (London)* **32**, 351-2 (1928).

J. W. BOECK

Season-cracking of small-arms cartridge cases during manufacture. F. S. GRIMSTON. *J. Inst. Metals* (advance copy) No. 454, 24 pp. (March, 1928); *Engineering* **125**, 304-6.—A short history of the failure of small-arms cartridge cases in India during the past 21 yrs. is given, together with a description of expts. which led to the discovery of the probable cause. Season cracking takes place during the interval between a drawing operation and the subsequent anneal under certain conditions. The conditions are: the existence of differential stresses caused by tools of wrong design, and storage in this condition in contact with soap suds which have become contaminated with dil. H₂SO₄. A method is given of detg. the tension in the outer walls of the cases by measuring the contraction which takes place after removal of the inner supporting metal (cf. C. A. 16, 3293, 3863).

J. W. BOECK

The deterioration of lead-cable sheathing by cracking, and its prevention. S. BECKINSALE AND H. WATERHOUSE. *J. Inst. Metals* (advance copy) No. 459, 25 pp. (March, 1928); *Engineering* **125**, 299-300, 334-6 (1928).—The conditions under which Pb cable sheathing fail are outlined. Exptl. results described indicate that the defect is a fatigue type of failure produced by small alternating stresses, and that the failure is intercrystalline. Addn. of other metals to Pb raises the fatigue limit and so increases its resistance to this type of failure. It was found that Cd hardens Pb to a greater extent than Sb or Sn (which are sometimes alloyed with Pb for cable sheathing). The most satisfactory method of raising the fatigue limit is to use binary or ternary alloys of Pb contg. Sn, Sb or Cd. The fatigue limit is raised to more than 3 times that of pure Pb by the addn. of 0.5% Cd, while similar increases can be obtained by using ternary alloys contg. Cd and either Sn or Sb. The ternary alloys are permanent in compn. during melting and resistant to oxidation at elevated temps. to a greater degree than the binary alloys, and also possess good corrosion-resisting properties. The binary and ternary alloys investigated (Pb + 0.5% Cd, Pb + 0.25% Cd + 1.5% Sn, Pb + 0.25% Cd + 0.5% Sb) show age-hardening.

ROBERT F. MEHL

A contribution to the knowledge of the structure of cold-rolled metals. F. WYER

AND W. SCHMIDT. *Mit. Kaiser-Wilhelm Inst. Eisenforsch. Düsseldorf* **9**, 265-72 (1927).—See C. A. **22**, 589.

The ball hardness and the cold-working of soft metals and eutectics. F. HARGREAVES. *J. Inst. Metals* (advance copy) No. **461**, 27 pp. (March, 1928).—It is shown for a no. of soft metals (Sn, Sb, Cd, Zn, Bi, Cu, Al) and eutectics (Pb-Sn, Sn-Cd, Sn-Zn, Cd-Zn, Sn-Pb-Bi) that the relation between diam. of impression and duration of loading is given by the equation $d = ct^s$, where d = diam. of impression, t = duration of loading, and s and c are factors (which vary in certain ways). The equation is applied to the investigation of the work-softening of eutectics. Except for eutectics, it is suggested that factor s is a measure of the rate of spontaneous annealing. The effect of temp. of testing is found to be very important, and it is suggested that ball hardness results should be expressed as in the following example: Sn (6.35 mm./40.7 kg./30 sec./15°), Brinell hardness no. = 5.3, s = 0.050.

Historical note on density changes caused by the cold-working of metals. HUGH O'NEILL. *J. Inst. Metals* (advance copy) No. **450**, 3 pp. (March, 1928).—A discussion as to priority for the observation that its d . decreases when a metal is cold-worked.

Effect of rolling on single crystals of aluminum. S. TANAKA. *Mem. Coll. Sci., Kyōto Imp. Univ.* **10**, 303-9 (1927).—Single crystals of Al, in the form of plates 1 mm thick, were rolled to varying degrees, and the orientations of the small crystals produced by the destruction were investigated by x-ray methods. Three types of fibrous structures were observed. In the first type the fiber axes correspond with the [110] direction, and most of the (001) planes are nearly parallel to the rolled surface. The max. deviation from this orientation, which is produced by rotation of the crystals about the fiber axis, is about 26°. The second type has an orientation of the microcrystals such that the fiber axis corresponds with the [112] direction, and the (110) planes coincide with the rolled surface; the max. deviation from this orientation is about 28°. In the third type, the [111] direction and the (110) planes are nearly parallel to the fiber axes and the rolled surface, resp.; the deviation is here about 10°. Another arrangement similar to the third type but with the (112) plane parallel to the surface may exist, but the proof is incomplete. No simple relation could be traced between the initial orientation of the single crystal, the direction of rolling and the final state of the fibrous structure.

Volume change in certain type metals during solidification. YOSHIOHARU MATUYAMA. *Science Repts. Tōhoku Imp. Univ.* [1], **17**, 1-25 (1928).—The vol. change in pure Sb and certain type metals is measured by means of a thermobalance. Sb shows a vol. expansion of 0.95% during solidification, while the type metals all contract, the following results being obtained. An alloy contg. 85% Pb, 15% Sb —2.39%; monotype metal (76% Pb, 16% Sb, 8% Sn) —2.06%; linotype metal (79% Pb, 16% Sb, 5% Sn) —2.06%; stereotype metal (83.75% Pb, 11.75% Sb, 4% Sn, 0.5% Cu) —2.04%; electrotpe metal (92% Pb, 4% Sb, 4% Sn) —2.61%; a high-class type metal contg. 50% Pb, 25% Sb, 25% Sn —1.24%; a type metal actually in use —2.35%; an alloy contg. 90% Sn, 10% Zn —2.64%. From the data obtained the d . of the metals above their m. p. is calcd. The high-class type metal gives for d . at 180° —8.679, stereotype metal at 193° —10.345, monotype metal at 200° —9.922, linotype metal at 190° —10.031, electrotpe metal at 190° —10.834, type metal actually in use at 205° —10.284 and for 85% Pb, 15% Sb at 218° —10.362.

The dilatometric study of light metals. MAX HAAS. *J. Inst. Metals* (advance copy) No. **460**, 16 pp. (March, 1928).—An improved form of the Oberhoffer-Esser dilatometer (*Z. Feinmechanik Präzision* **34**, 229-33 (1926)) is described. Measurements on pure Al gave a smooth curve indicating that there is no allotropic change up to 610°. Differential dilatometric curves are given for pure Al, *alumin* (modified eutectic Al-Si), Al-Cu alloys (up to 4.8% Cu with about 0.5% Si and 0.5% Fe), and *duralumin*. These show (for the alloys) the structural changes which accompany change in temp.

Note on the composition of old Roman lead. W. A. COWAN. *J. Inst. Metals* (advance copy) No. **452**, 2 pp. (March, 1928).—Analysis is given of a specimen of Pb pipe found in Rome, dating from A.D. 79, showing it to be of similar compn. to that found in England (cf. C. A. **21**, 1954).

Noble metal thermocouples of high electromotive force. O. FEUSSNER. *Elektrotech. Z.* **48**, 535-7 (1927); *Science Abstracts* **30B**, 449. —Thermocouples consisting of constantan and Cu, Fe or nichrome have a high e. m. f., but the latter is not the same for different "melts" of the alloy; also, such couples are restricted to comparatively low temps. (under 1000°). Au and Ag alloys with Pd and Pt have thermoelectric properties

similar to those of constantan. The Ag alloys are not suitable for use at high temps. The curves for the solid and liquid states of Pd-Au alloys lie much closer together than those of Pt-Au alloys; hence it is easier to obtain homogeneous Pd-Au alloys. Also, allowing for the difference in ds., the cost of Pd is about half that of an equal vol. of Pt. The cost of noble-metal couples is justified by their reproducibility and the fact that small wires can be used at temps. up to 1200°; their high e. m. f. makes possible the use of high-resistance galvanometers. There is no difficulty in obtaining Au of a sufficiently high degree of purity and constancy of elec. properties. Pd contains Pt as an impurity, but F. proposes the use of an alloy contg. a definite percentage of Pt. Values of e. m. f. and cost comparisons are given for a Pt/Pt-Rh couple and for a couple consisting of an alloy of Au, Pd and Pt against an alloy of Pt with Rh or Ir and Pd. The actual compns. of these alloys are not stated. H. G.

The pickling of wire with sulfuric acid. ETTORE FERRARI. *Met. italiana* 20, 8-10(1928).—The conditions described by Falck (*Met. italiana* 1927, No. 11) for pickling wire are not the best. In particular the high temp. is objectionable for several reasons. Experience at the Fiat plant at Avigliana has shown that particularly good results are obtained with 20% H_2SO_4 (1:7 of 66° Bé.) and 0.25-0.5 l of Vogel ext. per 1000 l. of bath at 35-40°. Under these conditions 4 batches per hr. can be pickled, with great economy of acid, min. attack of the Fe and with hygienic advantages. This process is in use at many Italian wire plants. A representative plant consumes 1.5 kg. of 66° Bé. H_2SO_4 and 0.0044 l. of Vogel prepn. per 100 kg. of metal pickled. The use of 10% H_2SO_4 at 40-50° has certain advantages, for the consumption of acid is no greater, that of Vogel prepn. is much less and the process is more easily controlled. C. C. DAVIS

The resistance of metals to corrosion. KRAUSE. *Apparatebau* 40, 61-4(1928).—Notes are given on the resistance to oxidation, acids, etc. J. H. MOORE

Corrosion of aluminum. W. GUERTLER. *Z. Metallkunde* 20, 104-12(1928).—A general discussion of the factors which tend to produce corrosion in Al. Si is harmful unless the metal is heated to 400° and quickly cooled, which causes the Si to sep. in a highly dispersed condition. Si in the surface layer does not prevent the formation of a continuous oxide skin, since it oxidizes in the same manner as Al. Fe forms Al_2Fe , a brittle and coarsely cryst. substance and a good starting point for corrosive action when it occurs in the surface. Cu and Zn are generally not harmful. Al is attacked by alkalis and chlorides, lime and cement, but resists attack by natural waters, milk, wine, beer, etc. Methods of heat treating, casting, pickling, etc., are suggested. H. STOERTZ

Anomaly in the annealing of copper and brasses after cold hardening. P. NICOLAU. *Compt. rend.* 186, 696-9(1928).—When annealed Cu is first cold-hardened to various degrees (5-66%) and then annealed by immersion for 10 min. in a salt bath at increasing temps., the curves obtained by plotting Brinell hardness (or the diameter of the test mark) against annealing temp. exhibit, beyond the so-called "germination" zone, a systematic anomaly marked by a min. hardness (or max. of the diameter of the test mark). The phenomenon is not clearly apparent by micrographic examn. The anomaly is not so marked in the case of 72-28 and 67-33 brasses, being marked merely by an inflection of the hardness curves. Though in practice it is advisable, for the sake of safety, to anneal at a temp. in the region of the anomaly, the internal tensions revealed by immersion in 0.15% aq. $HgCl_2$ disappear at an appreciably lower annealing temp., corresponding exactly to the inflection point of the curve in the "germination" zone proper. A. PAPINEAU-COUTURE

Note in reference to platinum-tungsten welding. J. H. HIBBEN. *J. Am. Chem. Soc.* 50, 1118(1928).—Pt can be welded to W by cleaning the latter with $NaNO_3$, burning several coats of Pt into it from a soln. of lavender oil and $PtCl_4$, coating the Pt with borax and welding with an oxidizing flame. Au may be welded to W by cleaning the latter with $NaNO_3$, covering with borax and plunging, while hot, into a molten Au bead. J. BALOZIAN

Arc welding with methanol. H. MÜNTER. *A. E. G. Mitt.* No. 6, 241-4(1927); *Science Abstracts* 30B, 502.—A new method of arc welding is described in which an atm. of vaporized methanol is created round the arc. The methanol is forced under pressure from a nozzle in the electrode, and immediately vaporizes. Above 700° it decomposes into H and CO_2 , which have been found to have an advantageous effect on the weld. Photographs of welds done by this process are shown and compared with those done by ordinary arc welding and oxyacetylene welding. H. G.

An example of Roman copper "soldering" and welding from Uriconium. J. N. FRIEND AND W. E. THORNEYCROFT. *J. Inst. Metals* (advance copy) No. 453, 2 pp.

(March, 1928) --A Roman iron ferrule from Uriconium was examd. and micrographs were given. It was evidently made by welding two small pieces of iron into a strip, bending it over and "soldering" (brazing) the two ends with Cu. J. W. BOECK

Pigments for iron and steel primers (FASIG, PURDY) 26.

Briquetting iron ore, etc. A. CARLSON. U. S. 1,666,618, April 17. Fe ore or other material contg. Fe compds. capable of reduction are treated in finely divided condition with a small proportion of separately burnt lime, the mixt. is pressed into briquets and the briquets are hardened by high-pressure steam.

Treating sulfide ores. METALLBANK UND METALLURGISCHE GES. AKT.-GES. Brit. 273,976, Jan. 21, 1927. In roasting and sintering fine or sludgy sulfide ores, the fine material is mixed with broken up agglomerate of the same ore, of granular size, and the mixt. is blast roasted. Air or waste gases may be passed through the ore during the roasting.

Extracting metal. F. W. HALE and C. G. FINK. Can. 276,705, Dec. 27, 1927. Zn and S are extl. by decompg. ZnS by Br dissolved in a soln. of a halogen salt and depositing the Zn therefrom, the Br being regenerated by electrolysis.

Metallurgical briquet. W. B. RUNYAN. U. S. 1,666,312, April 17. Ore such as that of Fe is mixed with ground coke, "silicon sand" and lime. The sand and lime are used in approx. equal quantities and in sufficient proportion to hold the carbonaceous material together. Ferro Mn may be added.

Protection of the surface of baths of easily oxidizable metals. G. MICHEL. Can. 276,520, Dec. 20, 1927. The surfaces of the baths of easily oxidizable metals, such as Mg, are protected by covering with a layer of the fluoride of the metal and covering the crust so formed with S. Cf. C. A. 22, 1658.

Extracting gold from sea water with antimony sulfide or other metallic sulfides. B. STOKES. Brit. 273,346, Dec. 23, 1925.

Apparatus for refining molten metals by joint action of centrifugal force and of gas under pressure. N. N. JAROTZKY. Brit. 273,788, April 1, 1926.

Sectional mold for casting continuous steel ingots. M. DOUTEUR. Brit. 273,311, June 22, 1926.

Ingot mold. E. GATHMANN. U. S. 1,667,289, April 24.

Mold with compression walls for forming large castings without cracking. C. VANZETTI. U. S. 1,667,642, April 24.

Apparatus for casting brass, bronze, iron, aluminum or other metals of relatively high melting point. M. C. VALLS and J. S. ESTELLER. Brit. 273,984, Feb. 2, 1927.

Pit furnace for heating metal ingots. G. KEHREN. Brit. 273,671, June 30, 1926.

Reversible regenerative metallurgical furnace. B. TALBOT. Brit. 273,779, March 5, 1926.

Cast iron. R. KRUPP AKT.-GES. Brit. 274,035, July 9, 1926. Non-magnetic or weakly magnetic cast irons contain Mn 6-12, and Si 3-7% or C about 3, Mn 3-8, Si 1-5 and Ni up to 4%.

Pig iron. F. WUST. Brit. 274,438, July 17, 1926. In purifying pig Fe produced in a coke blast furnace, the molten Fe is run into a rotary tubular furnace provided in one of its heads with a tap-hole and a slag produced from lime and Fe ore is added. The furnace is then rotated and as soon as the slag ceases to act the furnace is stopped, the slag is tapped and a fresh slag is produced on the Fe. After further rotation and completion of the purification, the Fe is tapped and the slag left for use with the next charge of Fe.

Pig iron. K. STOBRAWA. U. S. 1,666,428, April 17. In preheating pig Fe in a highly heated flat hearth mixer, pig Fe high in C is supplied and a sep. supply of low-C scrap Fe is preheated as closely as possible to the m. p. by a source of heat sep. from that of the mixer; an immediate carburization of the low-C scrap Fe and a lower m. p. is thus effected and the percentage of Mn in the pig Fe to be treated is maintained substantially const. and the percentage of Si, C and P is reduced.

Iron and steel. E. PIWOWARSKY and P. OBERHOFFER. Brit. 274,419, July 15, 1926. In the production of high-grade Fe and steel as described in Brit. 267,939 (C. A. 22, 1129) a material having less than 1.5% C is produced in the cupola furnace, in one operation and this material may then be treated in the fire-hearth of the furnace and may be cast into blocks or other shapes.

Steel. R. A. HADFIELD. Brit. 273,855, April 29, 1926. To avoid porosity of ingots a melt of normally finished steel is tested by pouring a sample into a small mold

of green sand or other material and, if the sample indicates a rising instead of piping, is treated with a deoxidant such as Al or ferro-Si, to give the steel a "settling nature."

Restoring elasticity in steel. G. L. KELLEY. U. S. 1,667,476, April 24. In restoring elasticity in steel locking rings of automobile wheels, the blank stock is cold-worked to produce the rings and they are then heated to 90–425° for 30–0.5 min.

Alloy for bearings. I. R. VALENTINE. U. S. 1,667,641, April 24. Cu 70 and Pb 25 parts are used with a hardening metal such as Sn 5 parts, and a small proportion of As.

Ferrous alloys. INTERNATIONAL NICKEL CO. Brit. 273,523, Aug. 27, 1926. Ni or a Ni alloy, previous to its addn. to ferrous metal, is united with a substance or substances which will lower the m. p. of the Ni or its alloy and will have no deleterious action on the ferrous metal. C, Si and Al may be added as may also small proportions of P, and Cr, Mn, Cu, W, Mo and S.

Magnetic alloys. G. W. ELMEN. Brit. 274,136, July 12, 1926. A single magnetic element such as Ni may be used with Mo 1–6% so that the initial permeability of the product is substantially greater than that of the magnetic element alone. Very small quantities of Fe, Co and other elements may be present as impurities. Annealing may be effected by heating for about 1 hr at 1100° and then cooling slowly; this may be followed by reheating to about 600° and cooling quickly; or the material may be heated to 1100°, cooled slowly to 600° and then cooled quickly.

Magnesium-silicon-aluminum alloy. W. SCHMIDT. Can. 276,461, Dec. 20, 1927. An alloy contains 4% Si and 6% Al, and shows in its structure a voluminous segregation of particles of Mg silicide.

Silver alloy. A. PETIT. Can. 276,493, Dec. 20, 1927. A Ag alloy contains approx. the following parts by wt: Ag 35–50, Ni 12–10, Cu 38–30, Zn and Cd 15–10. Methods of prepg. the alloy are specified.

Treating aluminum and its alloys to prevent corrosion. A. PACZ. Brit. 273,956, Nov. 27, 1926. See U. S. 1,638,273 (C. A. 21, 3180).

Treating silica precipitates to obtain metal values, etc. R. H. STEVENS, G. C. NORRIS and W. N. WATSON. Brit. 274,297, Aug. 23, 1926. Bulky or gelatinous ppts. of silica, with or without ferric Fe or alumina, obtained by neutralizing solns. of Zn, Cu or V with basic substances such as ZnO, lime or limestone, are converted to granular form by agitating them with an excess of the basic substance at a temp. of 40–65° (preferably 55°). Metal values are recovered from the granular ppt. by passing it in the form of a filter cake through a series of washing chambers in which it is treated with acid liquors. The method is especially applicable to solns. produced by leaching ores.

Magnetic material. J. W. ELMEN. Brit. 273,638, June 30, 1926. A material with negligible variation in permeability and negligible hysteresis loss over a wide range of flux densities may contain Co 5–80, Ni 10–81 and Fe 10–45% with or without small quantities of Cr, Mn or other metals to increase the specific resistance or workability; e. g., Ni 45, Co 25, Fe 30 and Mn 0.5 parts.

Magnetizable materials. A. F. BANDUR. U. S. 1,666,191, April 17. In order to improve the magnetic characteristics of materials as Ni-Fe alloys used as loading material, the material is locally flash-heated to a high temp. and cooled so that a rapid loss of heat occurs from a temp. not below 500°.

Wire for windings or wireless transformers, etc. NAAMLLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 274,079, July 12, 1926. The core of enamelled wire is made of a highly refractory metal such as Mo, W or Ta or their alloys.

Flexible metal walls. F. K. BEZZENBERGER. U. S. 1,667,303, April 24. In making flexible deeply corrugated tubular metal walls such as those of thermostat bellows a tube of Fe or other soft ductile metal is formed into a corrugated tube and the metal of the tube is then combined with a material such as C capable of increasing the elastic limit and tensile strength.

Rolls for rolling mills. M. PETERS. Brit. 273,575, Dec. 10, 1926. Rolls for pilger-mills are forged from ingots cast from a steel alloy contg. Cr 1.5–2.2, W 1–1.65% and which may also contain Mn 0.4–2%, Si 0.015–0.2% and C 0.6–0.8%. The P and S are below 0.03%.

Annealing ferrous metals. F. KRUPP AKT.-GES. Brit. 274,016, July 7, 1926. Low-C irons or steels are rendered more resistant to various liquids, vapors and gases by quenching them at temps. above 650° (varying somewhat with different alloys). The quenched steel may be drawn at temps. not exceeding 750°.

Arc welding in an atmosphere of helium to obtain ductile welds. H. M. HOBART. Brit. 273,706, June 29, 1926.

Chromium-plated torch tip for welding-torches or similar devices. G. I. JONES. U. S. 1,606,387, April 17.

Welding rail joints. C. STENFELD. Brit. 273,326, June 28, 1926. The metal in a welded joint is subjected to a heat treatment after welding to transform its coarse-grained into a fine-grained structure. The joint is preferably first elec. heated above the highest crit. point, quenched by oil or water sprays, reheated and cooled in air, warm oil or water.

W. O. F.

The measurement of reaction velocities in organic chemistry. C. F. VAN DUIN (*Chem. Weekblad* 25, 202-5 (1928)).—The various factors which should be considered when the velocity of an org. reaction is to be measured are discussed, viz.: (1) The reaction chosen should be such that it is possible to explain its course, the influence of substituents, etc., by means of existing theories. (2) The course of the reaction should be detd. experimentally, it being insufficient to det. the order of the reaction by calcul. from the exptl. figures according to various equations. (3) Side reactions should be avoided as far as possible and, if present, it must be shown that they do not play an important role. (4) The substances to be used should be pure: cryst. products should be recrystd. until a const. m. or setting p. is obtained, the last recrystn. being made from the solvent in which the reaction is to be measured. Liquid products should be purified by means of a cryst. deriv. from which the substance can be obtained in a simple way. (5) The independence of the velocity of reaction of the surface area of the reaction vessel must be controlled. (6) With various solvents it should be shown that the same reaction occurs in the solvents used and that the extent of possible side reactions does not vary appreciably with the various solvents. (7) The influence of electrolytic dissocn. should be considered, because not only the velocity of the reaction with the undissociated substance will in general be different from that with the corresponding ion but also the products of the reaction may be different in the two cases. (8) It is emphasized that the phenomenon of cation catalysis occurs far more frequently in org. chemistry than is generally supposed; a method is given for the detection of this phenomenon and for ensuring that it is quant. the same with the various products to be compared.

C. F. VAN DUIN

The slow combustion of the hydrocarbons. STANISLAS LANDA. *Compt. rend.* 186, 589-91 (1928).—L. experimentally demonstrates the probable correctness of Bonnes' theory of the formation of hydroxylated mols. in the slow combustion of hydrocarbons (*C. A.* 1, 550). A sample of white paraffin m. 51° is subjected to slow combustion at 280-300° according to the method of Schulz (*C. A.* 7, 1603). The products identified were EtCHO, Me₂CO, MeQH, EtOH, PrCHO, MeCOEt, C₆H₁₃CHO, C₇H₁₅CHO, C₈H₁₇CHO, C₉H₁₉CHO and C₁₀H₂₁CHO. The formation of these products is taken as a clear indication of the hydroxyl process of oxidation.

D. H. POWERS

Synthesis of higher hydrocarbons from water gas. D. F. SMITH, J. D. DAVIS AND D. A. REYNOLDS. *Ind. Eng. Chem.* 20, 462-4 (1928).—A study was made of the efficiency of different catalysts in producing liquid hydrocarbons from water gas at atm. pressure. Under the best conditions, with Co-Cu-Mn catalyst, 66 g. of oil were produced per cu. m. water gas.

T. S. CARSWELL

Properties of conjugated compounds. IV. Formation of isomeric additive dibromides from butadiene. E. H. FARMER, C. D. LAWRENCE AND J. F. THORPE. *J. Chem. Soc.* 1928, 729-39; cf. *C. A.* 22, 941.—Although the proportion of the 2 isomers (1,2- and 1,4-Br₂ compds.) obtained during bromination shows great constancy under given exptl. conditions, it varies widely with the solvent employed; the % of 1,4-Br₂ compd. obtained in CHCl₃ was 63; in C₆H₆, 38.4; in AcOH, 70; in CS₂, 65.9. The liquid dibromide isomerizes slowly even at room temp.; the change became appreciable in 3-4 days; at higher temps. isomerization was more rapid and at 100° conversion to the extent of about 80% could be effected in a few min. The solid form, stable at room temp., likewise suffers isomerization at higher temps.; there was no indication of a 3rd isomer, the *cis*-1,4-dibromobutene of Griner. The equil. mixt. at 100° con-

tained about 80% solid and 20% liquid isomer. Specimens of the pure liquid dibromide in C_2H_4 or $CHCl_3$ at -15° suffered only slight change, amounting to not more than a few %. The change under similar conditions with $AcOH$ was rather greater but still small. The introduction of small quantities of HBr into solns. of the pure liquid dibromide appeared to have in every case a definite accelerating effect but this was not marked, amounting in $CHCl_3$ to only 8% conversion. Both the 1,2- and 1,4-di-Br compds. liberate I from KI in glacial $AcOH$ at room temp. C. J. WEST

Addition of gaseous hydrogen chloride and hydrogen bromide to ethylene and propylene under the influence of catalysts. J. P. WIBAUT, J. J. DIEKMANN AND A. J. RUTGERS. *Rec. trav. chim.* 47, 477-95(1928); cf. C. A. 19, 1804; *Dutch patent* 12,788; *German patent* 445,981; U. S. A. patent 1,591,151.—The thermochem. data on the addn. of H halides to C_2H_4 and propylene of Thomsen (*Thermochem. Untersuch.* 4, 372) and Berthelot (*Ann. chim. phys.* [5], 23, 238(1881)) are not in agreement with one another, it only being certain that these reactions are exothermic and thus it is to be expected that they can be carried out at room temp. or at slightly elevated temp. providing a suitable catalyst be used. For the reaction between gaseous HCl and C_2H_4 $BiCl_3$ on *asbestos* appeared to be an excellent catalyst, catalysts of lower activity being $FeCl_3$, $VdCl_3$ and $AlCl_3$, while $SbCl_3$ and $BaCl_2$ show no catalytic action. The addn. of gaseous HCl to propylene proceeds much more quickly in the presence of catalysts than the reaction between C_2H_4 and gaseous HCl , $BiCl_3$ and $SbCl_3$ being active catalysts and iso- $PrCl$ being formed. It is to be emphasized that $SbCl_3$, which does not show any catalytic activity with C_2H_4 , is an active catalyst with propylene. For the addn. of gaseous HBr to C_2H_4 and propylene $BiBr_3$ and $SbBr_3$ were found to be active catalysts. For the large amount of details communicated as well as for the expts. on the prepn. of $EtCl$ from gaseous mixts. with low C_2H_4 content reference is made to the original paper. C. F. VAN DUIN

Cryoscopic evidence of compound formation in mixtures of organic liquids. W. M. MADGIN, J. B. PEEL AND H. V. A. BRISCOE. *J. Chem. Soc.* 1928, 707-11.—An attempt was made to apply the f.-p. test for compd. formation in such a manner that the result is obtained directly and without any calcn.; the liquids studied were dissolved separately in a given solvent to give solns. having the same depression of the f. p.; these solns. were then mixed and the depression was detd. for the mixed solns.; C_6H_6 , $PhNO_2$ and $CHBr_3$ were used as solvents. The data prove that compds. are formed in soln. by $o\text{-}ClC_6H_4OH$ with C_6H_5N , $PhNH_2$ or Et_2O ; by $CHCl_3$ with Et_2O or Me_2CO and by $CHBr_3$ with Me_2CO . $PhNO_2$ is less effective than C_6H_6 in causing dissocn. of some of these compds. but the opposite is also true in some cases. The reported results also confirm the earlier view that a rise of temp. on mixing is evidence of compd. formation. C. J. WEST

Liberation of hydrogen from carbon compounds. III. The interaction of monatomic alcohols and esters with fused caustic alkalis. H. SHIPLEY FRY AND EARL OTTO. *J. Am. Chem. Soc.* 50, 1122-31(1928); cf. C. A. 20, 1588.—With $MeOH$, further evidence has been adduced through duplicate series of runs extending over a wide range of temp. ($250\text{--}450^\circ$), confirming certain intermediate reactions assumed to occur according to the proposed type equation $RH_n + n MOH \rightarrow R(OM)_n + n H_2$ ($M = Na$ or K). In the investigation of the behavior of other monatomic alcs. and simple esters at temps. between 450° and 550° , data have been obtained which, within the limits of exptl. error necessarily entailed in the methods employed, substantiate the occurrence of the reactions predicted in conformity with the following equations, originally developed by applying the type reactions, $RH_n + n MOH \rightarrow R(OM)_n + n H_2$ and $RM_e_n + n MOH \rightarrow R(OM)_n + n CH_4$, to the mols. of the compds. investigated. In every instance oxidation of the C compd. by the fused caustic alkalis yielded carbonates, H and CH_4 . $MeOH + 2NaOH \rightarrow Na_2CO_3 + 3H_2$; $EtOH + 2NaOH \rightarrow Na_2CO_3 + 2H_2 + CH_4$; $PrOH + 6NaOH \rightarrow Na_2CO_3 + Na_4CO_3 + 5H_2 + CH_4$; $iso\text{-}PrOH + 2NaOH \rightarrow Na_2CO_3 + H_2 + 2CH_4$. $Me_2COH + 2NaOH \rightarrow Na_2CO_3 + 3CH_4$; $HCO_2Me + 4NaOH \rightarrow 2Na_2CO_3 + 4H_2$; $AcOMe + 4NaOH \rightarrow 2Na_2CO_3 + 3H_2 + CH_4$. The following compds. resisted the action of the fused caustic alkalis: NH_3 , $MeNH_2$, Me_2NH , Me_3N , Me_2O , Et_2O . IV. Interaction of glycol and glycerol with fused caustic alkalis. H. S. FRY AND ELSE L. SCHULZE. *Ibid* 1131-8.—The apparently contradictory results of Buisine and of Nef have been explained by showing that the various oxidation products obtained are dependent upon the quantities of alkalis used, the temps. employed, time of heating and the homogeneity of the reaction mixts. As the temp. is increased, fused alkalis being present in large excess, further oxidation occurs and fewer intermediate products are obtained; at sufficiently high temps. complete oxidation to carbonates with the

liberation of H is effected. Under the special method of investigating the oxidizing action of fused NaOH and KOH upon glycol and glycerol, which permits their slow addn. to a homogeneous reaction mixt. with const. temp. control, quant. data have been obtained which indicate the occurrence of the following reactions: complete oxidation of glycol at 350° to carbonates with liberation of H; partial oxidation of glycerol at 350° to carbonates with the liberation of H and CH₄, while complete oxidation to carbonates with the liberation of H is promoted by raising the temp. to 450°. At 450° about 20% of the glycerol was oxidized according to the reaction $C_3H_8O_3 + 6NaOH \rightarrow 3Na_2CO_3 + 7H_2$ and 78% according to the reaction $C_3H_8O_3 + 4NaOH \rightarrow 2Na_2CO_3 + 3H_2 + CH_4 + H_2O$. V. Interaction of dextrose, levulose, sucrose and cellulose with fused caustic alkalis. H. S. FRY AND EARL OTTO *Ibid* 1138-44.—Both dextrose and levulose, 90-95% of the quantities used, were oxidized to carbonates with the liberation of CH₄ and H; 90% or more of the quantities reacting is oxidized in conformity to the equation $C_6H_{12}O_6 + 8NaOH \rightarrow 4Na_2CO_3 + 2H_2O + 2CH_4 + 4H_2$, while the balance reacts according to the equation $C_6H_{12}O_6 + 12NaOH \rightarrow 6Na_2CO_3 + 12H_2$. Under identical conditions sucrose underwent carbonization to such an extent that the possibility of verifying any proposed equations for reactions occurring was precluded. Cellulose was completely oxidized, about 95% of the quantity reacting in conformity with the equation $C_6H_{10}O_5 + 14NaOH \rightarrow 5Na_2CO_3 + Na_4CO_3 + 12H_2$, while the remaining 5% reacted according to the equation $C_6H_{10}O_5 + 8NaOH \rightarrow 4Na_2CO_3 + H_2O + 2CH_4 + 4H_2$. C. J. WEST

Chlorine dioxide explosion. R. C. WAGNER. *J. Am. Chem. Soc.* **50**, 1233-4 (1928).—A warning of possible danger of explosion in the use of Milas's reaction of oxidizing primary alcs. by means of chlorate and dil. H₂SO₄ in the presence of V₂O₅; care should be taken to keep the temp. at 75-80° during and also following any addn. of fresh acid. C. J. WEST

Catalytic oxidation of ethyl alcohol. G. FESTER AND G. BERRAZ. *Anales asocn. quim. Argentina* **15**, 210-5 (1927).—V₂O₅, Ag₂VO₄ and Cu₂(VO₄)₂ deposited on SiO₂, Ag₂VO₄ on fuller's earth, and ZnO, heated to about 360°, catalyzed the oxidation of EtOH and air, producing AcH, AcOH and CO₂. Above 360° mostly CO₂ is formed. Under optimum conditions V₂O₅ gives 9-13% AcH and 2-5% CO₂; ZnO 10.7% AcH and 4.8% CO₂. E. M. SYMMES

Allyl hexoate and octoate. VENANCIO DEULOFEU. *J. Chem. Soc.* **1928**, 528.—CH₂:CHCH₂I (30 g.) and 42 g. Ag hexoate, boiled 2 hrs., give 75% of allyl hexoate, b. 186-8°; allyl octoate (71% yield), b. 225-30°. C. J. WEST

Preparation of aliphatic and aromatic sulfones with sodium hypochlorite. A. E. WOOD AND E. G. TRAVIS. *J. Am. Chem. Soc.* **50**, 1226-8 (1928).—With NaOCl solns. of low alkyl. (about 0.2% of free NaOH) Et₂S and Pr₂S were readily and completely converted to the corresponding sulfones; Bu₂S, Ph₂S and (PhC₂)₂S were less readily converted to the corresponding sulfones; and heptyl sulfide was the least reactive, being converted principally to the sulfoxide. C. J. WEST

Oxidation of sulfides by benzoylhydroperoxide. I. L. N. LEWIN. *J. prakt. Chem.* **118**, 282-6 (1928).—From expts. with S(CH₂Cl)₂, S(CH₂CH₂Cl)₂, Ph₂S and S(CH₂Ph)₂, it is concluded that sulfides are quant. oxidized to sulfones by BzO₂H. C. J. WEST

Formation of primary amines from Grignard reagents and chloroamine. G. H. COLEMAN AND C. R. HAUSER. *J. Am. Chem. Soc.* **50**, 1193-6 (1928).—Chloroamine reacts with Grignard reagents to form primary amines and NH₃. The yields of amines are greatest with the chlorides and least with the iodides. C. J. WEST

Competitive interaction of alkyl and aryl halides with magnesium. H. WM. RUDD AND E. E. TURNER. *J. Chem. Soc.* **1928**, 686-91.—A mixt. of 2 different halogen derivs. was allowed to react with 1 atom of Mg and the product analyzed after complete soln. of the metal had occurred. The slight difference in surface area and condition between 1 sample and another introduces no material error. The following relative reactivities were found (the no. given is the first term in the ratio x:1): Br:I: Me, 2.5; Et, 0.8; Pr, 1.3; Bu, 0.4; Br:Cl: Et, 3.2, Pr, 4.3; Bu, 9.9; I:Cl: Me, 2.7; Et, 2.5; Pr, 1.3; Bu, 1.2. PhBr-PhI, 52% Br in the product; o-MeC₆H₄Br-o-MeC₆H₄I, 94%; m-series, 88; p-series, 84; BuBr-PhCH₂Cl, 73% Br. C. J. WEST

The condensing properties of mixed magnesium alcoholates. V. GRIGNARD AND M. FLUCHAIRE. *Ann. chim.* **9**, 5-54 (1928).—G. and M. study the action of mixed Mg alcoholates on aldehydes and ketones and suggest a mechanism for the formation of the products obtained. It is suggested that the alcoholate condenses with the aldehyde or ketone to form a hemiacetal and this product condenses further in 4 ways. $RCH_2CHO + R'OMgCl \rightleftharpoons RCH_2CH(OR')OMgCl$ (I). I can react with itself, splitting

out 2 R'OMgCl, and the resulting product with the wandering of an H atom forms $\text{RCO}_2\text{CH}_2\text{R}$. In this reaction the catalyst is regenerated. I may condense with a mol. of RCH_2CHO , splitting our R'OH and yielding an aldol or ketol. In this reaction the catalyst is not regenerated. A 3rd mechanism of I is $\text{RCH}_2\text{CH}(\text{OCH}_2\text{C}_2\text{H}_5)\text{OMgBr} \rightarrow \text{RCH}_2\text{CH}_2\text{OMgBr} + \text{C}_2\text{H}_5\text{CHO}$, a reaction which is carried out in ether, resulting in the reduction of the original aldehyde. Finally, I may lose a mol. of alc. to give an unsatd. compd.: $\text{RCH}_2\text{CR}'(\text{OR}')\text{OMgBr} \rightarrow \text{R}'\text{OH} + \text{RCH} = \text{CR}'\text{OMgBr}$. It was found that pure Mg alcoholate was without catalytic effect, and it is probable that the double compd. of $\text{Mg}(\text{OR})_2\text{MgI}_2$ would have still less effect. The following method was used for prepg. the mixed alcoholates: $(\text{RO})_2\text{Mg} + \text{MgI}_2 \rightarrow 2\text{ROMgI}$. Ethylidene-acetone (II) was obtained in 45% yield by adding over 5 hrs. a mixt. of AcH and 0.5 the Me_2CO to the remaining Me_2CO in Et_2O shaken vigorously with 12% NaOH. Propylidene-acetone (III) (50%), b. 136.7° , d_4^{20} 0.8601, n_D^{20} 1.447, M. R. 30.31, was prepd. in the same manner as II, and at the same time 4-hexanol-2-one, b. 83° , d_4^{20} 0.9639, n_D^{20} 1.4353, was formed. Butylidene-acetone (60%) and heptylidene-acetone (70%) were prepd. similarly. Butylidene-acetone and mesityl oxide were reduced with an active Ni catalyst prepd. according to the method of Tanaka (C. A. 18, 2259) under 6 atm. of H_2 pressure with agitation, giving pure iso-BuCOMe (IV) (90%). BuCOMe (V) (80%) was obtained by the oxidation of BuCH(OH)Me with CrO_3 . Aldehyde condensation was carried out by treating 0.1 mol. of BuOMgI (VI) in 30 g. Et_2O with 0.5 mol. of AcH. After 2.5 hrs. ice and dil. HCl were added and the product was extd. with Et_2O and shown to contain 38% of a mixt. of AcOEt and AcOBu, 14% aldol, 19% high-boiling polymers. PrCHO with EtOMgI gave $\text{C}_3\text{H}_7\text{CO}_2\text{Bu}$, butyraldol and 2-ethyl-1,3-hexanediol butyrate (VII), b. $148-9^\circ$, b_{760} 255° , d_4^{20} 0.9473, n_D^{20} 1.4452, R. M. 60.72. VII boiled with alc. KOH gave PrCH(OH)CHEtCH₂OH, b. $133-4^\circ$, b. 116° , d_4^{20} 0.9367, n_D^{20} 1.4535. VI with BzH in Et_2O after 5 days gives 45% condensation consisting of BzOCH₂Ph (VIII) and 10% benzyl oxide. Furfural condenses in the presence of VI to the extent of 10% in 4 days, forming furfurylic alc. b. $75-6^\circ$, d_4^{20} 1.1359, n_D^{20} 1.4940, R. M. 25.12; and furfurylidene-butyraldehyde, b. $234-5^\circ$, b. $114-5^\circ$, d_4^{20} 1.061, n_D^{20} 1.5668, R. M. 46.18. BzH condensed with Me_2CO in Et_2O with VI to the extent of 60% within 19 hrs. Benzylidene-acetone, dibenzylidene-acetone and VIII, were isolated. In condensing ketones, the rate is generally directly proportional to the concns. of the mixed Mg alcoholate. Me_2CO (3 mols.) in Et_2O (100 g.) with $\frac{1}{3}$ mol. BuOMgBr (IX) after 3 hrs. reflux gives 20% diacetone alc. Refluxing 20 hrs gives a mixt. of 2,6-dimethyl-5-heptene-2,4-dione, b. $95-6^\circ$, d_4^{20} 0.9432, n_D^{20} 1.4577, M. R. 45.11, phorone and isophorone. 140 hrs. reflux shows little change in yield as the alcoholate is used up. MeCOEt with VI gives a better yield (82%) than with IX (75%) of 3-methyl-3,5-heptanone (X), b. 85° , d_4^{20} 0.9315, n_D^{20} 1.4367, M. R. 40.48. X heated with a trace of I_2 gives 3-methyl-3,5-heptenone, b. 167° ; semicarbazone, m. 115° . MeCOPr with XI in Et_2O gives 4-methyl-4,6-nonanolone, b. 110° , d_4^{20} 0.9076, n_D^{20} 1.4424, M. R. 50.18. On heating with $(\text{CO}_2\text{H})_2$ this product gives 4-methyl-4,6-nonenone, b. 90° , b_{760} 202° ; oxime, b. 130° . V gives 5-methyl-5,7-undecanolone, b. 110° , d_4^{20} 0.8975, n_D^{20} 1.4445, M. R. 59.26. Dehydrating gives 5-methyl-5,7-undecenone, b. 120° , d_4^{20} 0.8472, n_D^{20} 1.4541, M. R. 58.18; oxime, b. $140-50^\circ$. IV condenses with difficulty, giving a low yield of 2,4,8-trimethyl-4,6-nonanolone (XI), b. 99° , d_4^{20} 0.8962, n_D^{20} 1.4427, M. R. 59.13. Dehydration gives the expected ketone. MeCOAm (XII), after 5 days gives on vacuum distn. only the dehydration product, 6-methyl-6,8-tridecenone, b. 115° , d_4^{20} 0.8510, n_D^{20} 1.4592, M. R. 66.39; oxime, b. 165° . Oxidation with O_3 gives XII but no amylglyoxal was characterized. Et_2CO with IX gives a low yield of 4-methyl-3-ethyl-3,5-heptanolone, b. 105° , which on dehydration yields the ketone, b. 92° . Pr₂CO after 12 days gives a very small quantity of the dehydration product 5-ethyl-4-propyl-4,6-nonenone, b. 224° , d_4^{20} 0.8506, n_D^{20} 1.4569, M. R. 67.22. II in Et_2O with IX for 0.25 hr. gives the dehydration product 4-methyl-2,4,7-nonatrien-6-one, b. 102° , d_4^{20} 0.9187, n_D^{20} 1.4871, M. R. 46.97. III with IX for 10 min. gives the dehydrated ketone 5-methyl-3,5,8-undecatrien-7-one, b. 120° , d_4^{20} 0.9103, n_D^{20} 1.4899, M. R. 56.54. A small quantity of 3-methyl-4,3-heptenol, b. 62° , d_4^{20} 0.8477, n_D^{20} 1.4421, M. R. 39.96, is also formed. IV is heated with IX in Et_2O for 70 hrs. and then BzCl added and the mixt. refluxed 0.5 hr.; the resulting oil is the benzoate of XI, b. 123° , d_4^{20} 0.9706, n_D^{20}

1.4898. M. R. 60.74. Sapon gives IV and BzOH. Comparing the condensing activity of the different alcohols on PrCHO in 0.5 hr. BuOMgCl gives 65% condensation, IX 71%, IV 80%. In considering condensation products BuOMgCl gives 35% PrCO₂Bu, 11% butyraldol, 19% butyrate of the ethylhexanediol; IV gives 22, 8 and 50%, resp. Under the same conditions MeOMgI condenses to the extent of 18%, PrOMgI 78%, iso-AmOMgI 84% and PhCH₂OMgI 81%. The nature of the alc. affects the rate; iso-PrOMgI condensed to the extent of 70% in 0.5 hr., PrOMgI 78%, Me₂EtOMgI 77% and iso-AmOMgI 84%. D. H. POWERS

Action of bromine on formaldehyde. F. F. C. SCHEFFER AND N. B. VAN WENT. *Rec. trav. chim.* 47, 406-14 (1928). (French.)—The mechanism of the reaction of Br₂ on HCHO is as follows: $\text{HCHO} + \text{Br}_2 + \text{H}_2\text{O} \xrightarrow{k_1} \text{HCO}_2\text{H} + 2\text{H}^+ + 2\text{Br}^-$; $\text{HCO}_2\text{H} \rightleftharpoons \text{HCOO}^- + \text{H}^+$; $\text{HCOO}^- + \text{Br}_2 \xrightarrow{k_2} \text{CO}_2 + \text{H}^+ + 2\text{Br}^-$; $K_{\text{HCO}_2\text{H}} = 2.14 \times 10^{-4}$ (25°); $k_2 = 1.0 \times 10^4 k_1$ (25°) E. SCHOTTE

A reaction between acetone and ammonia. H. HOCK AND H. STUHLMANN. *Ber.* 61B, 470 2 (1928).—When equimol. quantities of Me₂CO and anhyd. liquid NH₃ are mixed at -65° or lower, the mixt. soon becomes strikingly opalescent and distinctly more viscous; then it warms up to 20-2° in the course of a few min., the opalescence and viscosity disappearing at the same time, and on cooling again to about -50° there sep. after a time 10-35% of well-formed colorless crystals, melting about -41°, of the compn. Me₂CO.NH₃ and decomp. a few degrees above the m. p. into their components. Their most probable structure is Me₂C(OH)NH₂. C. A. R.

Possibility of ring-chain valency tautomerism and of a type of mobile hydrogen tautomerism analogous to the Wagner-Meerwein rearrangement. I. Some derivatives of phorone. C. K. INGOLD AND C. WM. SHOPPE. *J. Chem. Soc.* 1928, 365-410.—Using the term "conjugation" in a general sense to connote the yoking together of centers of unsatn., not only when they are contiguous, but also when sep., the change

$\text{R}_2\text{C} \begin{array}{c} \diagup \text{C}=\text{C} \\ \diagdown \text{C}=\text{C} \end{array} \rightleftharpoons \text{R}_2\text{C} \begin{array}{c} \diagup \text{C}-\text{C} \\ \diagdown \text{C}-\text{C} \end{array} \parallel$ implies conjugation through space and suggests the possibility of a similar conjugation between double bonds situated at a distance in

open-chain olefinic compds. Thus a reaction such as $\text{X}_2\text{C} \begin{array}{c} \diagup \text{C}:\text{C} \\ \diagdown \text{C}:\text{C} \end{array} \rightleftharpoons \text{X}_2\text{C} \begin{array}{c} \diagup \text{C}=\text{C} \\ \diagdown \text{C}=\text{C} \end{array}$ appears possible, and, if it were reversible it could appropriately be described as an instance of "ring-chain valency tautomerism." Possible compds. for this study are the phorone

derivs; on passing through the series $\text{C} \begin{array}{c} \diagup \text{C}:\text{C} \\ \diagdown \text{C}:\text{C} \end{array} \rightarrow \text{C} \begin{array}{c} \diagup \text{C}:\text{C} \\ \diagdown \text{C}:\text{C} \end{array} \rightarrow \text{C} \begin{array}{c} \diagup \text{C}=\text{C} \\ \diagdown \text{C}=\text{C} \end{array}$, where

the center member is a general expression representing a gradation of intermediate states, one would expect to observe diminishing color, decreasing refractivity, decreasing parachor, diminishing unsatn., an increasing tendency to react in the last form and a decreasing tendency to react in the 1st form. Phorone itself is undoubtedly mainly of the 1st type. An approach towards the satd. condition is observed in passing to the di-Br deriv. For the extensive discussion of the structure of the following compds. the reader is referred to the original. In the prepn of α, α -dibromophorone (1,4-dibromo-2,2,3,3-tetramethyl-(0,1,2)-dicyclopentanone) (I) the phorone tetrabromide must be perfectly pure. Reduction of I with H₂ and red P gives 3,3,4,4-tetramethylcyclopentanone, m. 130°. 1-Bromo-2,2,3,3-tetramethyl-(0,1,2)-dicyclopentan-4-ol-5-one, m. 116°, yields a Bz deriv., m., 92°; a *d*-bromocamphorsulfonyl deriv., m. 150°; a *Me* deriv., n_D^{20-21} 1.5131-1.5147, d_4^{17} 1.3203, d_4^{20} 1.3159, d_4^{21} 1.3162, b_x 95°, b_{14} 120°, b_{20} 130°, b_{26} 133°; *p*-bromobenzyl deriv., m. 65°; *p*-nitrobenzyl deriv., m. 111°; with 50% EtOH-KCN there results the 1-CN deriv., whose *Ac* deriv., b_{15-16} 120°, d_4^{20} 1.0190, n_D^{20} 1.4549. 2,2,3,3-Tetramethyl-(0,1,2)-dicyclopentan-4-ol-5-one (II) yields a *Me* deriv., b_{18} 108-12°, n_D^{20} 1.4687 (in 1 expt., the product solidified and m. 37°); *p*-bromobenzyl deriv., m. 86°. 3,3,4,4-Tetramethylcyclopentanone (III) gives a dipiperonylidene deriv., yellow, m. 125°; with iso-AmNO₂ in EtOH-HCl there is formed the α, α' -dioximino deriv. (1,3-dioxime of 4,4,5,5-tetramethylcyclopentanetriene), pale yellow, m. 223° (decompn.); hydrolysis with HCl in the presence of HCHO gives a N-free oil, which with NH₂OH.AcOH gives a 1,2,3-trioxime, m. 168-9° and gives a strong purple color with FeCl₃. III gives an oxime, m. 107°; HCl salt, m. 119°. Reduction of the oxime with Na-Hg in EtOH gives 3,3,4,4-tetramethylcyclopentylamine (IV), m. 100-2°; picrate, bright yellow, m. 255° (decompn.); chloroaurate, orange-yellow, m. 230° (decompn.); HCl salt, deli-

quescent, m. 308° (decompn.); *Ac deriv.*, m. 95°. **II** and $\text{NH}_2\text{OH} \cdot \text{HCl}$ give the α -oxime, m. 96°, which crystals with H_2O , m. 75°; *HCl salt*, m. 174–5° (crysts. with 1CCl_4); *Bz deriv.*, m. 134–5°; the α -oxime treated with HCl in cold Et_2O gives the *HCl salt*, m. 69–70°, of the β -oxime, m. 114–5°; this 2nd oxime is sometimes obtained directly from **II**; on boiling with H_2O , the β -oxime is converted into the hydrate of the α -oxime. The β -*HCl salt*, treated with HCl in boiling Et_2O , gives the *lactam* of δ -amino- α -keto- β , β -, γ -tetramethylvaleric acid, m. 113°. α , α , β , β -Tetramethylglutaric anhydride, m. 184°; NH_3 gives the *imide*, m. 200–2°. **II** or the α -oxime, heated with an excess of $\text{NH}_2\text{OH} \cdot \text{HCl}$ and AcONa , gives the *dioxime* of 3,3,4,4-tetramethylcyclopentane-1,2-dione, m. 211°; with NH_3 this gives a *frazan*, $\text{C}_8\text{H}_{14}\text{ON}_2$, m. 209°. **II** and o - $\text{C}_6\text{H}_4(\text{NH}_2)_2$ give a golden yellow *condensation product*, $\text{C}_{18}\text{H}_{18}\text{N}_2$, m. 100°. **II** *semicarbazone*, m. 211–3° (decompn.); *anil*, m. 104°; *p*-dimethylaminoanil, yellow, m. 90°. Reduction of the α -oxime, m. 96°, gives **IV**. Reduction of the *Ac deriv.* of **II** with Zn and AcOH gives the 5-*Ac deriv.*, b_{18} 127°, of 2,2,3,3-tetramethylcyclopentanone, b_{18} 100°, m. 119°; *semicarbazone*, m. 222° (decompn.); *oxime*, m. 101–2° (*HCl salt*, m. 125°); reduction of the oxime gives 2,2,3,3-tetramethylcyclopentylamine, whose *picrate*, yellow, m. 242–3° (decompn.); *Ac deriv.*, m. 115°. The *Bz deriv.* of **II** and $\text{NH}_2\text{OH} \cdot \text{HCl}$ give a γ -oxime, m. 115°; heating with NOCl in CHCl_3 at 100° gives the *lactam*(?) of δ -amino- α -keto- γ , γ -dimethylisohexanoic acid, m. 200°. Reduction of the γ -oxime gives 5-hydroxy-2,2,3,3-tetramethylcyclopentylamine, analyzed as the *picrate*, yellow, m. 220–1°. The action of AmNO_2 and MeONa on 3,3,4,4-tetramethylcyclopentanone gives the γ -oxime(?); under certain conditions there results a δ -oxime, m. 172°, whose monohydrate, m. 83°; it gives a red color with FeCl_3 , a blue-green ppt. with $\text{Cu}(\text{OAc})_2$ and reduces Fehling soln. Reduction of the *Me deriv.* of **II** gives 5-methoxy-2,2,3,3-tetramethylcyclopentanone, b_{18} 88–90°, n_D^{18} 1.4580. The *p*-bromobenzyl deriv. of **II** yields an *oxime*, m. 175°; *HCl salt*, m. 133° (decompn.); *Ac deriv.*, m. 84°, which is reduced to a compd., m. 161–2°, to which no simple formula can be assigned, and 2-hydroxy-3,3,4,4-tetramethylcyclopentylamine, whose *picrate*, m. 215° (decompn.). The action of oxidizing agents on several of these compds. is discussed. 1-Chloro-2,2,3,3-tetramethyl-(0,1,2)-dicyclopentan-4-ol-5-one, m. 116° (*Ac deriv.*, m. 47°); 1,1-dichloro-2,2,3,3-tetramethylcyclopentanedione, orange, m. 187°; 1-chloro-1-bromo deriv., orange, m. 178°.

C. J. WEST

The reduction of α -eleostearic acid; 10,12-linoleic acid and 11-oleic acid. J. BÖRSEKEN AND J. V. KRIMPEN. *Verslag Akad. Wetenschappen Amsterdam* 37, 66–8 (1928).— α -Eleostearic acid, $\text{Me}(\text{CH}_2)_7\text{CH}:\text{CHCH}:\text{CHCH}:\text{CH}(\text{CH}_2)_7\text{CO}_2\text{H}$, m. 46°, b . 169–70.5°, n_D^{15} 1.5043–1.5086, has been esterified; the *Et* ester has been distd. in a cathodic vacuum and hydrogenated with only 1 mol. H_2 . The resulting ester has a mol. refraction = 96.87, indicating an exaltation of 1.59 due to 1 pair of conjugated double bonds. The free acid, m. 28.5°, n_D^{70} 1.4639, obtained therefrom, has 2 double bonds, in the 10,11- and 12,13-positions, this being ascertained by ozonization. A further reduction gives an 11-ethylenic acid, m. 52–3°, which seems to be identical with vaccinic acid (cf Bertram, *C. A.* 21, 2391).

A. L. HENNE

Walden inversion. **XI**. Oxidation of secondary mercaptans to corresponding sulfonic acids and the Walden inversion in the series of secondary carbinols. P. A. LEVENE AND L. A. MIKESKA. *J. Biol. Chem.* 75, 587–605 (1927); cf. *C. A.* 21, 52, 72; 22, 58.—From a study of the changes in the optical rotations in passing from the thiols to the SO_3H acids corresponding to a given sec. carbinol, the following conclusions seem to be justified: Halogenation of simple aliphatic sec. alcs. as well as of benzyl- and phenylcarbinols proceeds without Walden inversion; in methyl-, ethyl- and cyclohexylphenylcarbinols only SOCl_2 brings about the inversion; in PrPhCHOH , iso- PrPhCHOH , BuPhCHOH and $\text{Me}(\text{C}_{10}\text{H}_7)\text{CHOH}$, halogenation always proceeds with a Walden inversion. *l*- PrMeCHOH ($[\alpha]_D^{20}$ –9.06°) and const.-boiling HBr , refluxed 0.5 hr., give *d*-propylmethylbromomethane, b . 115–8°, ($[\alpha]_D^{20}$ 9.14° (Et_2O); with SOCl_2 the carbinol gives the compd. $\text{C}_{10}\text{H}_{20}\text{O}_2\text{S}$, b . 113–9°, ($[\alpha]_D^{20}$ 5.58°. *d*- PrMeCHOH ($[\alpha]_D^{20}$ 6.8°) and 3 mols. EtOH-KHS , boiled 3 hrs., gives *l*-propylmethylmercaptomethane, b . 112°, ($[\alpha]_D^{20}$ –4.66° (Et_2O); oxidation with $\text{Ba}(\text{MnO}_4)_2$ gives *l*-pentane-2-sulfonic acid, whose *Ba salt* has ($[\alpha]_D^{20}$ –2.51° (–3.25° for acid). *l*-Cyclohexylphenylcarbinol ($[\alpha]_D^{20}$ –21.4°) and SOCl_2 give a *chloride*, b . 105–7°, ($[\alpha]_D^{20}$ –29.4° (I), and with PCl_5 a *chloride*, b . 112–3°, ($[\alpha]_D^{20}$ –3.43°. I and KHS give a *mercapto deriv.*, which decompd. in a high vacuum, ($[\alpha]_D^{20}$ 27.7°; oxidation with KMnO_4 gives cyclohexylphenylmethanesulfonic acid, whose *K salt* has ($[\alpha]_D^{20}$ 4.10° (free acid, 4.79°). *d*- $\text{Me}(\text{C}_{10}\text{H}_7)\text{CHOH}$,

with $[\alpha]_D^{20}$ 11.06°, gives with SOCl_2 a chloride, m at room temp., $[\alpha]_D^{20}$ -36.4°; a *l*-carbinol, with $[\alpha]_D^{20}$ -35.2°, gives with PCl_5 a chloride with $[\alpha]_D^{20}$ 5.42°. A chloride with $[\alpha]_D^{20}$ -12.1° and KHS yields a mercapto deriv., having $[\alpha]_D^{20}$ 9.2°; α -1-naphthylethane sulfonic acid, $[\alpha]_D^{20}$ -66.9° (K salt, -53.6°). *d*-Cyclohexylmethylcarbinol, with $[\alpha]_D^{20}$ 7.40°, gives with PCl_5 a chloride, b_{16} 70-72°, $[\alpha]_D^{20}$ -5.02°; the mercapto deriv. has $[\alpha]_D^{20}$ -3.60° and the sulfonic acid, $[\alpha]_D^{20}$ 9.1° (K salt, 6.4°). *d*-Cyclohexylethylcarbinol, $[\alpha]_D^{20}$ 8.95°, with PCl_5 gives a chloride, b_{16} 88-93°, $[\alpha]_D^{20}$ -1.20°; SOCl_2 gives a product with $[\alpha]_D^{20}$ -2.97°; the mercapto deriv. b_{16} 95-100° and has $[\alpha]_D^{20}$ 0.64°; the sulfonic acid has $[\alpha]_D^{20}$ 2.97° (Ba salt, 1.79°).

C. J. WEST

Preparation of butadiene. S. F. BIRCH. *Ind. Eng. Chem.* **20**, 474 (1928).—The liquid hydrocarbon produced in the prepn. of oil gas was fractionated, and the uncondensed vapors were passed into Br_2 . The bromides were recrystd when butadiene tetrabromide (I), m. 117°, was obtained. Treatment of I with Zn dust yielded butadiene.

T. S. CARSWELL

Optical resolution of bromosulfoacetate acid. H. J. BACKER AND H. W. MOOK. *Rec. trav. chim.* **47**, 464-70 (1928).—Like chlorosulfoacetic acid (C. A. **19**, 1128) bromosulfoacetic acid (C. A. **19**, 2637) can be resolved into the optical components by means of the so-called "method of cold crystn." of the salts of this acid with several alkaloids, the *d*-rotatory component being obtained with strychnine and cinchonidine and the *l*-rotatory one with brucine, quinine and yohimbine. By means of strychnine the *d*-acid is obtained optically pure after 1 crystn., 15.3 g. of Ba bromosulfoacetate ($1.5 \text{ H}_2\text{O}$) in 1 l. of water being mixed with 26.9 g. of strychnine in 1 l. of water, acidified with 6-7 cc. of AcOH . The next day 7 g. (20%) of the optically pure normal strychnine salt of the *d*-acid, $\text{C}_2\text{H}_5\text{O}_6\text{BrS} \cdot 2\text{C}_{21}\text{H}_{22}\text{O}_2\text{N}_2 \cdot 4\text{H}_2\text{O}$, had crystd. from the soln. Ammonium salt.—(M) 11°, 15.5°, 20.0°, 24.0°, 28.0° for the lines 6560, 5890, 5460, 5160, 4860, resp. The optically active components racemizing very quickly in the presence of OH ions, an optically active Ba salt of the *d*-acid could not be prepd by decompn. of the strychnine salt with $\text{Ba}(\text{OH})_2$, while by means of BaI_2 an optically active Ba salt was obtained, which, however, was not optically pure, but contained about 20% of the *l*-acid. For the acid itself the following rotations were found: (M) 22.7°, 32.5°, 40.4°, 48.0°, 56.3° for the same lines as above. In order to prep. the *l*-acid by means of brucine it is recommended to sep first a part of the *d*-acid by means of the strychnine salt in the way described above and to use the mother liquor for the prepn. of the *l*-acid. For this purpose 1 l. of the mother liquor is decompd with NH_3 , the strychnine filtered off and 15 g. of brucine in 1 l. of water, acidified with AcOH , added to the soln. of the NH_4 salt. After 3 hours 1.5 g. (10%) of the optically pure brucine salt of the *l*-acid, $\text{C}_2\text{H}_5\text{O}_6\text{BrS} \cdot 2\text{C}_{23}\text{H}_{26}\text{O}_4\text{N}_2 \cdot 4\text{H}_2\text{O}$, had crystd.; this yields a *l*-rotatory NH_4 salt and free acid which show the same optical rotation as the *d*-acid, mentioned above. The *d*-acid can also be prepd in an optically pure condition by the so-called "method of hot crystn." of the brucine salt (cf. Erdmann, *Ber.* **13**, 2180 (1880); Tanret, *Bull. soc. chim.* [3], **15**, 352 (1896); Pope and Peachy, *Proc. Chem. Soc.* **16**, 42, 116 (1900); Mills and Bain, *C. A.* **5**, 479; Werner, *C. A.* **7**, 947; Leuchs and Wutke, *C. A.* **7**, 3330; Leuchs, *C. A.* **15**, 3112), thus making it possible to obtain both the *d*- and the *l*-acid by means of the same alkaloid. At room temp. the optically active substances described in this paper only racemize slowly, the racemization being enormously accelerated by HO ions.

C. F. VAN DUIN

• **Method for the preparation of partially acylated chloronitrotrimethyleneglycols.** ERICH SCHMIDT, GUSTAV RUTZ AND MAX TRÉNEL. *Ber.* **61B**, 472-7 (1928).—The method is based on the condensation of aldehydes with NO_2 compds. having at least one H atom on the C atom carrying the NO_2 group: $\text{O}_2\text{NCHClCH}_2\text{O}_2\text{CR}$ (I) + $\text{HCHO} = \text{HOCH}_2\text{CCl}(\text{NO}_2)\text{CH}_2\text{O}_2\text{CR}$ (II). Attempts to extend the method to the homologs of I met with difficulties, to be reported on later, and the condensation of I with higher aldehydes gave unsatisfactory results even with AcH . Further acylation of the II gives mixed esters. The II, considerably more viscous than the diesters, are high-boiling, colorless liquids, almost odorless when pure, except the mono- and diacetates, which solidify to a radiating mass. On long standing they partially decomp. For the condensation, which takes place only in alk. soln., the choice of the alkali is a decisive factor; its alkyl must be sufficient to rearrange the NO_2 compd. into the aci-form but it must not saponify either the original I or the II. The Na salts of the acid RCO_2H corresponding to each particular ester proved to be the best condensing agents, when, e. g., in prepg. the propionate NaOAc was used, the product was contaminated with the acetate (II, $\text{R} = \text{Me}$). A 6- to 8-fold excess of monomol. or only

little polymerized HCHO should be used; those esters which undergo disturbing side reactions under the influence of the aq. salt can be protected to a great extent by the use of Et₂O solns.: the salts of the higher acids should be employed in concd. aq. soln. *β-Chloro-β-nitroethanol esters*: acetate (89% from O₂NCHClCH₂OH and AcCl in CH₂Cl₂), b₉ 89–90°, d₄²⁰ 1.3580, n_D²⁰ 1.4429; *propionate* (87%), b₈ 95–6°, d₄²⁰ 1.2941, n_D²⁰ 1.4428; *butyrate* (91%), b₉ 107°, d₄²⁰ 1.2379, n_D²⁰ 1.4418; *isovalerate*, b₁₁ 111–3°, d₄²⁰ 1.1891, n_D²⁰ 1.4414. *Chloronitrotrimethyleneglycol monoesters*: *Acetate* (71%), b_{9.02} 107–8°, b₁₀ 146 7°, d₄²⁰ 1.4066, n_D²⁰ 1.4650 (*diacetate*, obtained from the monoacetate in 90% yield, b₁₀ 139 40°, d₄²⁰ 1.3400, n_D²⁰ 1.4513); *propionate* (69%), b_{9.2} 118–9°, d₄²⁰ 1.3436, n_D²⁰ 1.4613; *butyrate* (68%), b_{9.2} 117 8°, d₄²⁰ 1.2921, n_D²⁰ 1.4611; *isovalerate* (72%), b_{9.15} 117 8°, d₄²⁰ 1.2448, n_D²⁰ 1.4600. *Mixed esters*: *acetate propionate* (88%), b_{9.12} 98 9°, d₄²⁰ 1.2898, n_D²⁰ 1.4492; *acetate butyrate* (89%), b_{9.05} 106–7°, d₄²⁰ 1.2499, n_D²⁰ 1.4490; *acetate isovalerate* (86%), b_{9.07} 117 8°, d₄²⁰ 1.2129, n_D²⁰ 1.4476. C. A. R.

The composition of ivy-seed oil. ALPH. STEIGER AND J. VAN LOON. *Rec. trav. chim.* **47**, 471–6 (1928).—According to Palazzo and Tamburello (C. A. **9**, 1476), ivy-seed oil contains an oleic acid, the const. and some derivs. of which agree with those of petroselinic acid, investigated previously by S. and V. L. (C. A. **21**, 3474). The constitution of the solid oleic acid obtained from ivy-seed oil not having been investigated by P. and T., the authors prepd ivy-seed oil in the way described previously (*loc. cit.*) (yield 20%), d₄¹⁶ 0.9151, acid value 11.0, sapon. value 181.1, ester no. 170.1, glycerol as C₃H₂ 4%, I value (Wijs) 102.2, Reichert-Meißl no. 1.0, setting point 13.8, n_D⁴⁰ 1.4670; unsaponifiable matter 6.6%, fatty acids 89%, b. p. of the fatty acids 190–220°/10 mm; mean mol. wt. of the fatty acids 281.9, showing that the mixt. consists mainly of acids contg. 18 C atoms. For the sepn. into solid and liquid fatty acids by Twitchell's method the latter had to be modified (cf. the original paper), 67% solid and 33% liquid fatty acids being found. The quantity of higher satd. fatty acids could not be estimated according to Bertram's method (C. A. **20**, 1145; **21**, 2391, 2994; *Chem. Weekblad* **24**, 141 (1927)) but was calcd. to be 5.1% from Kaufmann's thiocyanate-iodine value (cf. C. A. **20**, 2256) which amounted to 85.4. These higher satd. acids chiefly consist of palmitic acid. On recrystn. of the solid fatty acids from 96% alc. at 0° was obtained petroselinic acid. This result was confirmed by ozonization, lauric and adipic acids being formed. On bromination of the liquid acids in ether and recrystn. of the bromides, thus obtained from petroleum ether (b. p. 40–60°) at –10°, linolic acid tetrabromide, m. 114.5°, was obtained, while linolenic acid hexabromide was absent. Further the presence of 9,10-oleic acid was demonstrated by conversion into elaidic acid (cf. C. A. **21**, 3474) while the quantity of linolic acid, which can be calcd. from the I value (Wijs) of 97.2 and the rhodanometric value (Kaufmann) of 85.4, was found to be 13.1% of the mixt. of fatty acids. It is still to be remarked that the compn. of the acids from ivy-seed oil closely resembles that of the acids from parsley-seed oil. C. F. VAN DUIN

A triple spiran (preliminary communication). P. PFEIFFER AND P. BACKES. *Ber.* **61B**, 434 5 (1928).—In view of the more recent rontgenological studies and conceptions as to the cryst. structure of pentaerythritol (I) P. and B. have undertaken a spatial study of I from chem. points of view (cf. Orthner, C. A. **22**, 1327). I was condensed with Et cyclohexanone-4-carboxylate to the triple spiran Et(O₂CCH(CH₂CH₂)₂C(OCH₂)₂C(CH₂O)₂C(CH₂CH₂)₂CHCO₂Et (II). According to the tetrahedral theory, such a compd. cannot exist in *cis-trans* isomeric forms but the acid should be resolvable with optically active bases. As a matter of fact, only 1 compd. is formed in the condensation; attempts to resolve it into active components are to be made. II (0.5 g. from 0.2 g. I and 5 times the calcd. quantity of the ester cautiously warmed until a clear soln. results), m. 139.5–40.5°. C. A. R.

Formation of lactic acid from sugar by the action of alkalis. W. WINDISCH, P. KOLBACH AND H. RUCKDESCHEL. *Wochschr. Brau.* **44**, 405–10, 417–22, 429–34, 441–6 (1927).—The substances formed are polysaccharides, resinous matters, saccharinic acids, *dl*-lactic acid, dihydroxybutyric acid. A thorough study was made of the formation of lactic acid by treating invert sugar, cane sugar, dextrose and levulose with NaOH, KOH, Ba(OH)₂ and Na₂CO₃. About 48–52% of the wt. of sugar can be converted to lactic acid in 6–8 days with 10% invert sugar and 2.5 N NaOH at 25°. The same quantity was produced in 30 hrs. at 40°, in 3 hrs. at 60°, and in 0.5 hr. at 120–80°. At a given temp. the conversion was proportional to alkali concn. when between 1.25 N and 5 N. Other substances formed were resins sol. in ether. Ba(OH)₂ and sucrose

gave 60% of the sugar as lactic acid if heated to 200°. Dextrose, while giving the same yield, is not converted as rapidly as levulose. Na_2CO_3 is only about 0.02 as active as hydroxides in decomp. sugars and a larger % of resins is found.

C. N. FREY

A new base from beef muscle and its constitution. WILHELM LINNEWEH. *Z. physiol. Chem.* **175**, 91-6(1928)—In attempting to isolate γ -butyrobetaine from Liebig meat ext. a new base, *crotonbetaine*, $\text{C}_7\text{H}_{13}\text{NO}_2$, was isolated as the *chloroaurate*, m. 215-7°, from the carnotine fraction. The yield was 150 mg. per kg. meat ext. The *HCl* salt, which is hygroscopic, is optically inactive. The *ester chloroplatinate*, m. 223-5° (decompn.). A double bond is present, as shown by the decolorization of KMnO_4 in the cold and by hydrogenation to γ -butyrobetaine, but its location has not been detd. The formula of the new base is either $\text{Me}_3\text{N} \cdot \text{CH}_2 \cdot \text{CH} : \text{CH} \cdot \text{CO} \cdot \text{O}$ or

A. W. DOX

Racemization. VI. Action of alkali on peptides and ketopiperazines. P. A. LEVENE AND R. E. STEIGER. *J. Biol. Chem.* **76**, 299-318(1928); cf. *C. A.* **21**, 97. Alkali causes no racemization of ketopiperazines contg. a tertiary asym. C atom which has no mobile H atom attached to it. "Thus the exptl. results are as expected on the assumption (expressed in previous articles) that the racemization of the amino acids in the ketopiperazines is brought about by a tautomeric change (enolization) involving the asym. C atom." The resistance towards the hydrolytic action of H and OH ions of ketopiperazines contg. a tertiary asym. C atom is approx. 10 times that of those contg. an asym. C atom with a mobile H atom attached. The results on other peptides and ketopiperazines amplified those obtained in previous expts. *Glycyl-d-isovaline* $[\alpha]_D^{27}$ 1.7°. *Glycyl-d-isovaline anhydride*, m. 269-70°, $[\alpha]_D^{27}$ 25° in $\text{C}_6\text{H}_5\text{N}$. *Glycyl-l-phenylmethylaminoacetic acid*, $[\alpha]_D^{27}$ -82.8°. *Glycyl-d-phenylmethylaminoacetic anhydride* m. 297-8°, $[\alpha]_D^{28}$ 9.3° in $\text{C}_6\text{H}_5\text{N}$. The deamination of isovaline is considerably slower than that of the common amino acids as it gives correct amino-N figures only after prolonged action of HNO_2 in Van Slyke's app.

A. P. LOTHROP

A racemization phenomenon with derivatives of amino acids. P. KARRER AND M. DALLA VEDOVA. *Helv. Chim. Acta* **11**, 368(1928).—*N-Benzoyl-l-leucine* and *N-Benzoyl-d-alanine*, when converted into the acid chloride with PCl_5 , undergo complete racemization. The change is complete in about 1 hr. at 0°.

J. S. REICHERT

Acetoacetic ester condensation. M. C. FRANKLIN AND W. F. SHORT. *J. Chem. Soc.* **1928**, 591-5.—Scheibler and Ziegner (*C. A.* **16**, 3067) state that the reaction product of Na or NaNH_2 upon AcOEt is $\text{AcCH}_2\text{C}(\text{ONa})(\text{OEt})_2$. According to S. and Friese (*C. A.* **20**, 403) this product reacts with BzH to give $\text{PhCH}:\text{CHCO}_2\text{Et}$, whereas $\text{AcCHNaCO}_2\text{Et}$ does not react with BzH . In repeating this work, the final product of the reaction is obtained in about 60% yield (S. and Z. report 94%) and contains both AcONa and AcONHNa . When the dry product is heated it begins to decomp. at 130° with distn. of a small quantity of EtOH , AcOEt and a trace of Me_2CO . On the other hand it reacts with EtI below 100° to form $\text{AcCHEtCO}_2\text{Et}$, together with AcOEt . Condensation with PhCH_2Cl gives $\text{Ac}(\text{PhCH}_2)\text{CHCO}_2\text{Et}$, $\text{Ac}(\text{PhCH}_2)_2\text{CCO}_2\text{Et}$, $\text{AcCO}_2\text{CH}_2\text{Ph}$ and, if NaNH_2 is used for the prepn. of the Na deriv., AcNHCH_2Ph . These results point to the conclusion that the Na product is very easily transformed into $\text{AcCHNaCO}_2\text{Et}$ even if this substance is not already present in it. The formation of ketene acetal and the ability of the Na product to condense with BzH constitute the only evidence available at present in favor of the structure assigned to it by S. The ketene acetal formation may be due to a secondary reaction. It will be shown later that $\text{AcCHNaCO}_2\text{Et}$ reacts with BzH with considerable violence.

C. J. WEST

α -Isopropylglutaconic acid. KALVOI VENKATAKRISHNA HARIHARAN, KOTTIAZATH NARAYANA MONON AND J. L. SIMONSEN. *J. Chem. Soc.* **1928**, 431-8.—Among the oxidation products of *d*- Δ^3 -carene with KMnO_4 was an acid, $\text{C}_8\text{H}_{12}\text{O}_4$, which was probably *cis*-homocarmonic acid, but might be either α - or β -isopropylglutaconic acid. Synthesis of these acids shows them to be different from the acid from carene. Et sodiodicarboxylglutaconate and iso-PrI give only Et trimesate. The bromination of α -isopropylglutaryl chloride (the acid was prepd from Et α -cyano- α -isopropylglutarate, b_m 195°) does not proceed smoothly and a Br ester of const. b. p. and correct compn. could not be isolated; the main product of the reaction was an acid ester, which gives on hydrolysis the lactone of γ -hydroxy- β -methylpentane- γ,ϵ -dicarboxylic acid. Et α -isopropylacetonedicarboxylate, from the K deriv. and iso-PrI, b_m 142-3°; FeCl_3 gives a deep red color. The free acid decomp. 153° and gradually on keeping. Re-

duction of the ester with Na-Hg in dil EtOH gives *Et β-hydroxy-α-isopropylglutarate*, b_{10} 145–6°; PCl_5 gives the β -Cl deriv., which gives with PhNEt_2 *Et α-isopropylglutamate*, b_{10} 148–50°. Hydrolysis and treatment with AcCl give *cis-α-isopropylglutamic acid*, m. 101°, and the *trans-acid*, m. 132°. The *Me ester* of caronic acid, m. 108–10°, on reduction with Na and EtOH, gives the lactone of δ -hydroxy- β , β -dimethylvaleric acid, b_{10} 137°, b_{100} 232–5°.

C. J. WEST

Action of bromine water on certain olefinic acids. JOHN READ AND WM. G. REID. *J. Chem. Soc.* 1928, 745–9.—With maleic acid, 89.3% of the reacting Br was converted into bromohydrin and HBr in a 0.05 *N* aq. soln., under the conditions adopted; the proportion fell to 81.9% in a 0.10 *N* soln. and to 62.5% in a 0.33 *N* soln. The Na salt, in aq. solns. of equiv. concns., decolorized Br-water with several hundred times the rapidity of free maleic acid; at the same time, the proportions of bromohydrin were distinctly enhanced and the graph connecting these proportions with the corresponding concns. became practically rectilinear over the range of concns. examd. Interaction between fumaric acid and Br-water was exceedingly slow; the Na salt, however, brought about decolorization with approx. half the speed of Na maleate and furnished proportions of bromohydrin slightly higher than those afforded by the latter salt. Free itaconic acid gave closely similar results. Coumarin underwent bromination in the C_6H_5 nucleus when treated with Br-water. Oleic acid also reacts with Br-water, but only 51.5% of the Br was effective in forming bromohydrin at the ordinary temp., in an approx. 0.1 *N* mixt. contg. some KBr.

C. J. WEST

Further data on the rotatory dispersion of alkyl aspartates. F. P. MAZZA. *Atti accad. Lincei* [6], 7, 148–50(1928); cf. *C. A.* 21, 1798.—A discussion of recent work by Pagliarulo (cf. *C. A.* 21, 2462; 22, 945). It is shown that in various ways the technic was not the best and that accordingly the data are not precise. Where they differ from similar expts. and conclusions of M., they are erroneous and they do not put in doubt any of the data or conclusions of M.

C. C. DAVIS

The rotation-dispersion of tartaric acid. FRIEDRICH BÜRKE. *Helv. Chim. Acta* 11, 369(1928)—Values calcd. for the mol. rotation of *tartaric acid* from an exponential formula proposed by B. correspond with experimentally detd. values.

J. S. R

Reactions and derivatives of iron carbonyl. WALTER HIEBER AND FRITZ SONNEKALB. *Ber.* 61B, 558–65(1928).— N_2H_4 reacts with $\text{Fe}(\text{CO})_5$ to form a blood-red soln. of sirupy consistency, which contains traces of colorless prismatic crystals, identified as semicarbazide. Treatment of the sirup with acid causes evolution of CO and H, and extn. of the product with Et_2O yields the tetracarbonyl, $\text{Fe}(\text{CO})_4$. If a soln. of $\text{C}_2\text{H}_5(\text{NH}_2)_2$ in pyridine reacts upon $\text{Fe}(\text{CO})_5$ for 4–5 hrs. at 80°, the substance $\text{Fe}(\text{CO})_4.2\text{en}$ is formed; brick-red, long, monoclinic or triclinic crystals, stable and insol. in the usual org. solvents, decompd. by H_2O . Only 60% is obtained, diamine and pyridine-contg. substances also being formed. Treatment with dil. acid and extn. with Et_2O , with careful exclusion of O, yields a deep brown-red cryst. substance, $\text{Fe}(\text{CO})_5.\text{en}.3\text{H}_2\text{O}$, Fe^+ salts and $\text{Fe}(\text{CO})_4$ being also produced. Treatment with concd. acid yields cyclic C compds. of the type of hydroxylated polyquinones. H. STÖRZ

The acetolysis of mannanocellulose. The production of tetramannohololide and pentamannohololide. GABRIEL BERTRAND AND JULES LABARRE. *Bull. soc. chim.* 43, 311–21(1928).—See *C. A.* 22, 1141.

E. H.

Cyclopentane derivatives with one lateral chain: Tertiary alcohols, ethylenic hydrocarbons and saturated hydrocarbons. G. CHAVANNE AND P. BECKER. *Bull. soc. chim. Belg.* 36, 591–604(1927).—Cyclopentanone has been treated with Et-, Pr- and BuMgBr. The corresponding tertiary alcs. have been obtained (60–75% yield) with a little cyclopentanol as impurity. The formation of the ethylenic compd. is realized by passage over Al_2O_3 at 300°, by heating at 120–30° with dry $\text{Al}_2(\text{SO}_4)_3$ or at 130–40° with $p\text{-MeC}_6\text{H}_4\text{SO}_3\text{H}$. In each case, the double linkage is located in the ring as shown by the products of oxidation. The corresponding satd. compds. were obtained by catalytic hydrogenation in the presence of Pt black and AcOH. *1-Ethyl-1-cyclopentanol*, b_{760} 154.5–5.2°, d_4^{25} 0.9225, $n_D^{11.5}$ 1.4556, $n_D^{11.5}$ 1.4578, $n_D^{11.5}$ 1.4633, $n_D^{11.5}$ 1.4679, $n_D^{18.0}$ 1.4524, $n_D^{18.0}$ 1.4545, $n_D^{18.0}$ 1.4601, $n_D^{18.0}$ 1.4646, its allophanate, m. 169°; *1-ethyl-1-cyclopentene*, b_{760} 106.5–107°, d_4^{25} 0.8941, d_4^{20} 0.8000, $n_D^{21.5}$ 1.4402, $n_D^{21.5}$ 1.4429, $n_D^{21.5}$ 1.4497, m. –123.3°; *ethylcyclopentane*, b_{760} 103–103.2°, $d_4^{14.0}$ 0.7711, $d_4^{14.0}$ 0.7669, m. –137.9°, $n_D^{18.0}$ 1.4179, $n_D^{19.1}$ 1.4201, $n_D^{18.0}$ 1.4253, critical soln. temp. in PhNH_3 , 38.7°; *1-propyl-1-cyclopentanol*, b_{760} 175.2–5.7°, d_4^{25} 0.9083, d_4^{20} 0.9044 \pm 0.0005, n_D^{20} 1.4515, n_D^{20} 1.4540, n_D^{20} 1.4595, its allophanate, m. 178°; *1-propyl-1-cyclopentene*, b_{760}

L. HENNE

Formation of guanidino compounds by the action of guanidine on amino acid esters.
II. Formation of creatinine from sarcosine ethyl ester and guanidine or cyanamide, and of *dl*-5-*p*-hydroxybenzyl-2-imino-4-ketotetrahydroimidazole (*dl*- β -hydroxyphenyl- α -guanidinopropionic acid) from *dl*-tyrosine ethyl ester and guanidine. F. M. ARBER, H. ALDEN AND HANS SICKEL. *Z. physiol. Chem.* **175**, 68-74 (1928); cf. *C. A.* **22**, 1330. - Sarcosine Et ester at -15° reacts with guanidine to form NH₂ and 65% creatinine, with a sudden rise of temp to 20°. A similar reaction occurs between sarcosine ester and CNNH₂, but here the yield is only 29%. In this reaction, in contrast to that between glycine ester and CNNH₂, the addn. of a small quantity of guanidine decreases the yield of creatinine. The mechanism of the reaction may be explained by assuming the formation of a tetraammonomethane deriv. as an intermediate, which then splits off NH₃, or by a thermal decompn. of the guanidine into NH₃ and CNNH₂, which then adds the ester amine. A similar condensation occurs between *dl* tyrosine ester and guanidine, with formation of NH₃ and 27% *dl*-5-*p*-hydroxybenzyl-2-imino-4-ketotetrahydroimidazole, which m 257° and decomps 263°. A. W. DOX

Benzalcreatinine and related compounds. B. H. NICOLLET AND E. D. CAMPBELL. *J. Am. Chem. Soc.* **50**, 1155-60 (1928). Creatine (5 g.), 1 g. BzH, 15 g. fused AcONa, 50 cc. AcOH and 15 cc. Ac₂O, refluxed 1 hr., give 80% of *N*-acetyl-5-benzalcreatinine, m 208.9°, hydrolysis gives 5-benzalcreatinine (I), yellow, m 214° (decomps); *di*-HCl salt, bright yellow. Reduction gives 66% of 5-benzylcreatinine (II), m 282°, hydrolysis gives *N*-methylphenylalanine. Partial hydrolysis gives 1-methyl-5-benzylhydantoin, m 106°. 1-Methyl-5-benzylhydantoin (III), light yellow, m 193-4°, from the Ac deriv. of I. I, MeI and NaOH give *N*-methyl-5-benzalcreatinine, light yellow, m 129°. Hydrolysis gives III nearly quant. C. J. WEST

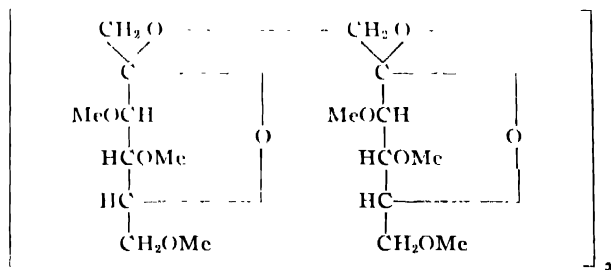

Derivatives of γ -xylose. A study of xylosemonoacetone and its conversion into 2,3,5-trimethyl- γ -xylonolactone. W. N. HAWORTH AND C. R. PORTER. *J. Chem. Soc.* **1928**, 611-8. -The cryst. xylosemonoacetone of Svanberg (*C. A.* **18**, 972) gave on methylation a di-Me deriv. with $[\alpha]_{D}^{20}$ 46.6°, n_D^{16} 1.4455, hydrolysis with 2.7% HBr, followed by oxidation with Br at 75°, gives dimethyl- γ -xylonolactone, b_{100} 105-6°, n_D^{16} 1.4643, $[\alpha]_{D}^{21}$ 81.5° (after 3 min), 85.1° (after 1 day), 83.2° (2 days), 66.0° (7 days), 54.5° (14 days), 44.1° (21 days), 39.6° (40 days), 39° (49 days); the phenyl hydrazide, m 94.5°. Further methylation gives the tri-Me deriv., b_{100} 84°, n_D^{16} 1.4472, whose phenylhydrazide, m 89-90°, is identical with that prepd from the lactone obtained by the oxidation of trimethyl- γ -xylose. The rate of hydrolysis of the lactone was studied by the polarimetric method and the rate of conversion of the free trimethyl xylonic acid into the lactone was similarly studied; these results confirm the butylenic oxide structure of the lactone. The di-Me deriv. is also a γ -lactone and it thus follows that the dimethylxylose is a butylene oxide or γ -sugar. From this it is also argued that the non-reducing xylosemonoacetone also contained a butylene oxide ring. Whether the same oxide-ring structure applies to xylosediacetone is a case for further argument but it is believed that such is the case. C. J. WEST

The structure of tetramethyl- γ -methylmannoside. P. A. LÉVEQUE AND G. M. MEYER. *J. Biol. Chem.* **76**, 809-12 (1928).—Oxidation of 3 g. of tetramethyl- γ -mannose gave 0.3 g. of β -tetramethylmannonic lactone identical in every respect with the product obtained on methylation of mannonic lactone (*C. A.* **21**, 3891). Tetramethyl- γ -methylmannoside, therefore, at least in part consists of a <1,4> mannoside. It is not as yet, however, absolutely certain that the structure of the unmethylated γ -mannoside is identical with that of the methylated γ -Me mannoside nor that the tetramethyl- γ -mannoside is not a mixt. of several ring isomers. A. P. LOTHROP

Dynamic isomerism. XXVI. Consecutive changes in the mutarotation of galactose. G. F. SMITH AND T. M. LOWRY. *J. Chem. Soc.* **1928**, 666-85. This work originated in an attempt to establish a standard value for the velocity coeff. of galactose; the

results thus far indicate that the mutarotation data for galactose cannot be interpreted on a 2-sugar scheme but can be expressed by a 3-sugar scheme; a 3rd sugar must therefore be formed in substantial quantities in soln.; this sugar must be related unsymmetrically to the α - and β -sugars, in rotation or in velocity of formation and reversion, or in both; since the mutarotation of β -galactose proceeds only very slowly during the first few min. and gives rise to inflected curves, the initial product of change must have a similar rotation to the β -sugar. The initial rotatory power of α - and β -galactose were selected as $[\alpha]_{461}^{20}$ 172.5° and 63.5° and of the equil. mixt. 94°. Tables are given of the mutarotation of α - and β -galactose. The equil. concns. deduced from the velocity coeffs. of the 3-sugar scheme are α 28.9%, β 59.5%, μ 12.0%. C. J. WEST

Polysaccharides. I. Structure of inulin. W. N. HAWORTH AND ABRAHAM LEARNER. *J. Chem. Soc.* 1928, 619-25.—Repeated methylation of inulin with Me_2SO , and 35% NaOH and then with MeI finally gives a tri-Me deriv., m. 138-40°, $[\alpha]_{\text{D}}^{20}$ -50.2° (CHCl_3 , c 1.61), does not reduce Fehling soln. Hydrolysis of 5 g. with 250 cc. 70% EtOH contg 2.5 g. (CO_2H)₂ by heating 10 hrs. gives 3,4,6-trimethyl- γ -fructose (I), faintly yellow, $b_{\text{D},20}$ 115°, n_{D}^{15} 1.4675, $[\alpha]_{\text{D}}^{20}$ 27.7° (CHCl_3 , c 1.57); the phenylosazone crystals with H_2O , yellow, m. 80-2°; the anhyd. form m. 137.8°. Oxidation of I with HNO_3 gives a trimethylsuccinic acid, whose ester is pale yellow, $b_{\text{D},18}$ 132-40°, n_{D}^{15} 1.4529, $[\alpha]_{\text{D}}^{16}$ 27.1°, reduces Fehling soln. actively; further methylation gives a product $b_{\text{D},1}$ 115-30°, n_{D}^{15} 1.4453, $[\alpha]_{\text{D}}^{16}$ 2° (approx., H_2O , c 1.2); with NH_3 this gives the amide of tetramethyl- γ -fructose. Oxidation with KMnO_4 gives *d*-trimethyl- γ -arabonolactone. Trimethylinulin thus has the formula

C. J. WEST

Cyclotelluropentane. G. T. MORGAN AND HENRY BURGESS. *J. Chem. Soc.* 1928, 321-9. -Te does not react readily with $\text{C}_8\text{H}_{10}\text{I}_2$ or $\text{C}_8\text{H}_{10}\text{Br}_2$; Al_2Te_3 and the halide, heated at 135-165° (the I_2 compd. reacts the most readily, the Cl_2 the least), give a mixt. of 3 types of products: *Cyclotelluripentane 1,1-dichloride*, m. 106-7° (which, however, is not formed directly from the chloride and Al_2Te_3), results by the thermal disson of I and the action of Cl upon the products or by the direct addn. of Cl to I; Na_2CrO_7 gives a yellow *dichromate*. *1-e-Chloroamylcyclotelluripentane 1-chloride* (I), m. 149-51°; heated, it gives V and $\text{C}_8\text{H}_{10}\text{Cl}_2$; Na_2CrO_7 gives a yellow, oily ppt., darkening on exposure to light. *Pentamethylene- α,ϵ -biscyclotelluripentane 1,1'-dichloride*, decomps 224.5°; the *1,1'-dichromate*, daffodil-yellow, decomps. 193°, is very sensitive to light. *Cyclotelluripentane 1,1-dibromide* (II), pale greenish yellow, m. 105-7°, results from the direct action of Al_2Te_3 upon $\text{C}_8\text{H}_{10}\text{Br}_2$ but is more conveniently prepd by the action of Br in CCl_4 upon the thermal decompn. products of III or IV (90% yields); II is hydrolyzed by H_2O , but no cryst. product sep'd on cooling. *1-e-Bromoamylcyclotelluripentane-1-bromide* (III), m. 143.5°, resolidifies at 147°; it gives an immediate ppt with AgNO_3 . *Pentamethylene- α,ϵ -biscyclotelluripentane 1,1'-dibromide* (IV), crystals with H_2O , decomps. 223-4°; in CHCl_3 Br and IV give a *1,1'-bisperbromide*, crystals with H_2O , m. 102-4°; it decomps. in aq. Me_2CO , giving a lachrymatory vapor. Ag. K metabisulfite transforms II into *cyclotelluropentane* (V), lemon-yellow oil, $b_{\text{D},12}$ 82-3°, $b_{\text{D},12}$ 44-5°, which is rapidly oxidized in the air, reacts violently with fuming HNO_3 and with H_2O_2 gives the *1,1-dioxide*, amorphous, explodes on rapid heating, liberates Cl_2 from HCl , decolorizes warm acid KMnO_4 and decomps. violently on treatment with concd. HNO_3 or H_2SO_4 . *Cyclotelluripentane diiodide*, deep red prisms with purple-blue reflex or highly refractive, slender orange prisms, m. 135-6°; light transforms the orange form into the dark red form in 2 days. The purple crystals become orange at 105°. *1-e-Iodoamylcyclotelluripentane 1-iodide*, m. 135-6°, remelts 197-8°. *Penta-*

methylene- α,ϵ -biscycloelluripentane 1,1'-diiodide, brownish yellow, m. 216–7° (decompn.). The complex bromides, III and IV, have only slight bactericidal action, whereas II and V are considerably more potent and give approx. the same bactericidal coeff. with *B. coli*, a result that indicates that in these cases the active agent is the 1,1-dihydroxide; this value is considerably less than the coeffs. obtained with the 3,5-dione series, but, unlike the latter, it is far less affected in serum. C. J. WEST

Oxidation by permanganate in alkaline medium. R. CORNUBERT AND H. LEBIHAN. *Bull. soc. chim.* 43, 248–55 (1928).—C. has pointed out (cf. C. A. 17, 1454) that oxidation of α -methylallylcyclohexanone (I) by alk. KMnO_4 gives rise to products varying with the nature of the alkali used. This work has been repeated, the alkalies used being NaOH, KOH and soda lime. It was found that the differences mentioned previously were due to secondary reactions occurring in the course of the distn. and that the nature of the alkali does not affect the oxidation process. Whatever alkali was used, the only neutral product was a glycol, obtained either in cryst. form, m. 103° (39.5–100° given previously) or in viscous form. The viscous form was contaminated with a small amt. of the ethylene oxide (II), formed by dehydration of the glycol by heat. II was found to polymerize readily under various conditions. Since I is a mixt. of 2, possibly 3, ketones, the viscous glycol was no doubt a mixt. of different glycols. LOUISE KELLEY

α,α' -Dimethylcyclohexanones. R. CORNUBERT. *Compt. rend.* 186, 585–6 (1928).—In the course of purifying α -methylcyclohexanone (I), 2 oximes were sepd.: the A form, m. 119°, and the B form, m. 64–5°. These oximes were reconverted into 2 forms of I: an A form (II), b_{41} 85°, d_{18} 0.914, n_D^{18} 1.4486 and M. R. 36.9, with a B form (III), b_{41} 80.5°, d_{18} 0.911, n_D^{18} 1.4482 and M. R. 37.0. The oxime of III is readily hydrolyzed at 30° and the oxime of II at 60°. BzH and HCl with II give a tetrahydropyronic deriv. (IV), m. 197–8°, while with III is formed an isomer of IV, m. 175°, b_{20} 271° and contg. a small quantity of a substance, m. 216°. The relative % of the A and B isomers formed varies widely with the conditions used. This class of ketones gives frequent rearrangement products and serves to explain the differences in m. p. of the oximes and semicarbazones observed by different authors. D. H. POWERS

Alkylation of α -cyano- β -alkylacrylic esters and of α -phenyl- β -alkylacrylonitriles. J. A. McRAE AND R. H. F. MANSKE. *J. Chem. Soc.* 1928, 484–91.— $(\text{CH}_2)_3\text{C}:\text{C}(\text{CN})\text{CO}_2\text{Et}$ (I) (Harding, Haworth and Perkin, C. A. 3, 887; Lapworth and McRae, C. A. 16, 4197) reacts with phenacyl bromide or MeI in the presence of EtONa , giving derivs. of the type $\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}:\text{CCR}(\text{CN})\text{CO}_2\text{Et}$ (II); this was thought

by H., H. and P. to furnish fairly conclusive evidence of the validity of structure II ($\text{R} = \text{H}$), which they assigned to the substance, but the products of decompn. were shown by L. and M. to support the formula I. Other reactions of this ester were found to be in agreement with this structure and it was pointed out that the formation of alkyl derivs. (II) can be explained on the basis of the structure I. Further studies are now reported on the Bu and Et derivs. of I in order to establish conclusively the structure II as that of these alkyl derivs. and at the same time to ascertain the behavior of these substances towards these reagents with which the parent α,β -unsatd. substances give characteristic results. The Na deriv. of I from 19.3 g. ester and 2.3 g. Na in 50 cc. EtOH, boiled with 23 g. BuI for 2 hrs., gives 15 g. *Et* α -butyl- Δ^1 -cyclohexenylcyanoacetate (III), b_{18} 163–4°; III absorbs Br readily but eventually HBr was liberated; HCN could not be added. The α -Et deriv. (IV), b_{22} 168°. The decompn. of the ozonide of III gives the half aldehyde of adipic acid and $\text{NCCBuCO}_2\text{Et}$ (isolated as adipic acid and $\text{BuCH}(\text{CO}_2\text{H})_2$ in 77 and 79% yields). From the ozonization of IV only adipic acid was isolated. *Et* α -cyano- α -butyl- Δ^8 -nonenoate, b_{11} 154–6° (11% yield); the decompn. of the ozonide gives $\text{C}_6\text{H}_{11}\text{CHO}$, HCO_2H and $\text{BuCH}(\text{CO}_2\text{H})_2$. $\text{C}_6\text{H}_{11}:\text{C}:\text{CPhCN}$ does not react with BuBr and EtBr in the presence of EtONa . With KCN in EtOH there results 1-cyanocyclohexylphenylacetonitrile, begins to decomp. above 264°. $\text{C}_6\text{H}_{11}\text{CHO}$ (30 g.) slowly added to 40 g. PhCH_2CN and 6.1 g. Na in 200 cc. EtOH at -10° gives 41 g. α -phenyl- β -hexylacrylonitrile, b_{13} 168–70°; attempts to add HCN with subsequent hydrolysis gave in 1 expt. a product consisting largely of $\text{C}_6\text{H}_{11}\text{CH}(\text{CO}_2\text{H})\text{CHPhCO}_2\text{H}$; in another expt., an acid, $\text{C}_{11}\text{H}_{20}\text{O}_4$, m. 170°, was obtained. C. J. WEST

Some derivatives of the cyclooctane series. MARCEL GODCHOT AND MLLÉ. *CAH. CHIM.* *Compt. rend.* 185, 1202–3 (1927).—Cyclooctanone (I), obtained from Th azelaate by the method of Ruzicka and Brugger, b. 197–8°, m. 29–30°; semicarbazone, m. 167°. Oxidation of I with CrO_3 gives suberic acid, m. 140°; diamide m. 216°; di-

anilide, m. 187°. Reduction of I gives cyclooctanol, $\text{CH}_2(\text{CH}_2)_6\text{CHOH}$ (II), b_m 106–8°, m. 14–5°, d₄¹⁷ 0.9663, n_D¹⁷ 1.4844 (phenylurethan m. 62°); and a compd. m. 84–5°, probably azelalyl pinacol, C₁₆H₂₆O₄. Dehydration of II with *o*-C₆H₄(CO)₂O gives cyclooctene, $\text{CH}_2(\text{CH}_2)_6\text{CH}:\text{CH}$ (III). b. 143–4°, d₄¹⁷ 0.8487, n_D¹⁷ 1.4683. In

the residues from the distn. of II is a very small quantity of a solid, probably (C₈H₁₄)_n. Distn. of the reaction product of I and MeMgI gives Δ¹-methylcyclooctene, $\text{CH}_2(\text{CH}_2)_6\text{CH}:\text{CMe}$, b. about 158–60°, d₄¹⁶ 0.8515, n_D¹⁶ 1.4673; nitrosochloride, m.

107–8°, the nitrosochloride of III being a liquid

MARGARET W. MCPHERSON

Alkaline hydrolysis of ω-bromo- and ω-chloronitrostyrenes. A. T. DANN, ALF HOWARD AND WM. DAVIES. *J. Chem. Soc.* 1928, 605–11.—The problem of the transmission of the influence of 1 group in a styrene throughout the mol. has been attacked by comparing the activating effects of the NO₂ group in the different positions in the nucleus on the ω-halogen atoms; the reaction involved was that of aq. KOH and the halogen derivs. at different temps. In the *trans*-ω-bromostyrenes, the *o*-NO₂ compd. is extraordinarily reactive; at the temps. investigated, 14–42°, the *p*- is more reactive than the *m*-NO₂ compd.; the ratios of the conversion in 2 expts., in which only a small % conversion was obtained, are resp. 1.26 and 1.23 to 1; the order of activity of the Br atom is *o* > *p* > unsubstituted > *m*. The *cis*-*p*-NO₂ is far more reactive than the *trans*-*p*-NO₂ compd. and the unsubstituted compd., m. –2.5°, which contains much of the *cis*-form, is more reactive than the mixt., m. 2.2°, which is richer in the *trans*-form. For the ω-chlorostyrenes the order of activity of the halogen atom is, at about 4°, *p* > *o* > *m* > unsubstituted and at 81° *p* and *o* > unsubstituted > *m*. This inversion of the order for the *m*-NO₂ and the unsubstituted compds. may be due to the more reactive, geometrically isomeric ω-chlorostyrene being produced at high temps., whereas the *trans*-*m*-NO₂ deriv. may remain in the *trans*-form. It is also possible that 2 reactions occur simultaneously between the alkali and the NO₂ and unsubstituted styrenes. A similar phenomenon is noticeable, though to a less extent, in the *m*- and *p*-nitro-ω-bromostyrenes, where the increase in temp. from 17° to 24° increases the activity of the *p*- far more than that of the *m*-isomer. ω-Chloro-*m*-nitrostyrene, yellow, m. 83°; *p*-NO₂ deriv., very pale yellow, m. 128°. C. J. WEST

Comparative reactivities of some chloro-, bromo- and iodonitrobenzenes. ALBERT BREWIN AND E. E. TURNER. *J. Chem. Soc.* 1928, 332–4.—With the reactivity of *p*-ClC₆H₄NO₂ towards piperidine as 1, the following reactivities were found: *o*-ClC₆H₄NO₂, 36.3; *o*-BrC₆H₄NO₂, 43.5; *o*-IC₆H₄NO₂, 17.9; *p*-BrC₆H₄NO₂, 2.38; *p*-IC₆H₄NO₂, 2.24; 2,5-Cl₂C₆H₃NO₂, 55.9; 2,5-Br₂C₆H₃NO₂, 56.0; 2,4-(O₂N)₂C₆H₃Cl, 56.9; 2,4-(O₂N)₂C₆H₃Br, 56.4; 2,4-(O₂N)₂C₆H₃I, 34.4; 4,3-Cl(O₂N)C₆H₃CN, 56.1; 4,3-Br(O₂N)C₆H₃CN, 55.1. In competitive expts. with pairs of 1-halogeno-2,4-dinitrobenzenes and piperidine in C₆H₆ at 15° for 60 hrs., the following mol. ratio of piperidine salts in the mixt. was obtained: Cl:Br, 1.75:1; Br:I, 1:2.22; I:Cl, 1:6.83; with the *o*-NO₂ compds. (8 hrs. in boiling C₆H₆), Cl:Br, 0.6:1; Br:I, 1.5:1; I:Cl, 1:5.4.

C. J. WEST

Nitration with nitrogen tetroxide. M. BATTEGAY. *Bull. soc. chim.* 43, 109–34 (1928).—A discussion of the work done on the action of N₂O₄ as an agent for the nitration of aromatic compds. Numerous references to the literature are given. B. considers that in N₂O₄ there may exist simultaneously the 2 forms O₂N.NO₂ and O₂N.O.NO₂.

LOUISE KELLEY

The action of nitric acid and mercury on aromatic hydrocarbons and their derivatives. F. BLÜCHTA AND K. PÁTEK. *Z. ges. Schiess-Sprengstoffw.* 22, 314–7 (1927).—With both C₆H₆ and C₇H₈ and with their mono-nitro compds., HNO₃ in the presence of Hg (2% of the acid used), causes both oxidation and nitration of the benzene nucleus. The nitrating reaction is appreciably accelerated. These effects are the results of an increased activation of the nucleus on its regeneration in nascent state from the intermediate aryl-Hg compd. (e. g., PhHgNO₂). Hot 60% HNO₃ alone has no effect on PhNO₂; with 2% Hg, 6% C₆H₅(NO₂)₂ is produced. C₇H₈ heated with HNO₃ and Hg yields C₇H₇NO₂, trinitro-*m*-cresol and *p*-O₂NC₆H₄CO₂H (not HO(O₂N)C₆H₃CO₂H as claimed by Wolfenstein and Bötters (C. A. 7, 1508). Oxidation occurs only in the *m*-position. The *p*-O₂NC₆H₄CO₂H results from oxidation of the *p*-O₂NC₆H₄Me—a secondary reaction. The results obtained with a weak mixed acid are similar to those with HNO₃ alone; hence it is concluded that H₂SO₄ has no effect on the reaction.

C. G. STORM

Laws of aromatic substitution. VI. Quantitative method for the rapid determination of isomeric nitro derivatives of laterally substituted toluenes. BERNHARD FLUR-SCHUEIM and E. L. HOLMES. *J. Chem. Soc.* 1928, 448-53; cf. *C. A.* 20, 2835.—After a discussion of the oxidation methods (KMnO_4 and dil. HNO_3), a new method is proposed which consists in boiling the acids with 10% HCl until soln. results then adding TiCl_4 until, after 10 min. boiling, the soln. is still colored; any non- NH_2 acids are removed by Et_2O , the Et_2O is removed by air and $\text{Br}\cdot\text{H}_2\text{O}$ added and allowed to stand 24 hrs. at room temp. The solid consists of 2,4,6- $\text{Br}_3\text{C}_6\text{H}_3\text{NH}_2$. The acid mother liquor is freed from Br by air, twice extl. with Et_2O and the exts. are shaken with NaHCO_3 , from which 2,4,6,3- $\text{Br}_3(\text{H}_2\text{N})\text{C}_6\text{HCO}_2\text{H}$ is obtained. • Examples are given. **VII. Constitution and substitution of phenylnitromethane and some of its derivatives.** *Ibid.* 453-83.—Contrary to the statement of Baker and Ingold (*C. A.* 21, 73), the exptl. observations published by F. (*J. prakt. Chem.* 66, 321 (1902)) have been found to be correct throughout. PhC(CN)NOBr (I) yields, on brief treatment with HNO_3 (d. 1.48) and subse-

quent oxidation by the usual methods, practically only BzOH and $p\text{-O}_2\text{NC}_6\text{H}_4\text{CO}_2\text{H}$ (II); the II—amounting usually to 34-8% of the wt. of the total acids—arises essentially from the migration of the NO_2 group during the oxidation. The occurrence of this migration, which can be prevented by prior treatment with alkali, has been quant. proved. *m*-Nitration can occur under various conditions, as stated by B. and L., but it does not take place appreciably under the conditions, nor even approx. in the proportions, recorded by these authors. The complex changes occurring on prolonged exposure of I to HNO_3 (d. 1.48) have been quant. elucidated. The main change—the migration of Br into the m -position—occurs to the extent of 54% in 10 days and the rate of formation of the *m*- BrC_6H_4 compd. is independent of the concn. The following (primary) NO_2 derivs. are formed directly by nitration of the compds. named: I (in HNO_3 , d. 1.52), 92-3% of the *m*- NO_2 deriv. and 8-7% of the corresponding *p* and *o*- NO_2 compds. PhC(CN)NOOH (in HNO_3 , d. 1.48), more than 99% of the *p*- NO_2 deriv. BzCN (in HNO_3 , d. 1.52), 87.6% of the *m*- NO_2 deriv. and 12.4% of *o* and *p*- NO_2 derivs. *m*- $\text{BrC}_6\text{H}_4\text{CO}_2\text{H}$ (in HNO_3 , d. 1.48), 96% of *o* and *p*- NO_2 derivs. and 4% of the *m*- NO_2 derivs. The transfer of Br from the side chain of I to the *m*-position in the nucleus was quant. established by detg. the Br content of the acids obtained by oxidation, by isolating from these acids a large proportion of pure *m*- $\text{BrC}_6\text{H}_4\text{CO}_2\text{H}$ and of 2,4,6- $\text{Br}_3\text{C}_6\text{H}_3\text{NH}_2$ from the nitrated product after oxidation, reduction and bromination. The rate of transfer is independent of concn. and is not affected by the addn. of a substance contg. a *m*-directing group. The migration of Br , though slow, is the main change that occurs in HNO_3 of d. 1.48: after 75 min. less than 3 mol. % has migrated; after 10 days, 54 mol. %. Further changes are shown in charts, for which the original should be consulted. In concd. H_2SO_4 I passes through the following changes: $\text{PhC(CN)(NO)OSO}_3\text{H}$, BzCN , BzCO_2H , BzOH , the *m*- NO_2 deriv. shows analogous reactions; BzC(NOONa)CN also finally gives BzOH . I, on dry heating, gives Br , NO , BzCN (92 mol. %) and $p\text{-O}_2\text{NC}_6\text{H}_4\text{CN}$ (8 mol. %); the *m*- NO_2 deriv. gives $m\text{-O}_2\text{NC}_6\text{H}_4\text{CN}$ (93.5 mol. %) and a brominated mixt. The rearrangement by heating with an oxidizing agent in H_2O (KMnO_4 , HNO_3 , 1.125) is also described. • The results of the nuclear and lateral changes during migration, expressed as mol. %, are given in tabular form. I has been found to be a hypobromite, with an O bridge, in accordance with Willstätter and Hottenroth's formula for *tert.* bromonitro compds. Hypobromite reactions of I and its *m*- NO_2 deriv. are reported. The new compd.: *m*-nitrophenylbromocyanonitromethane, m. 70-70.5°, is reported. The reader must consult the original for the mass of exptl. detail regarding the nitrations and the rearrangements by heating and in aq. oxidizing solns.

C. J. WEST

Mechanism of activation of halogen atoms by a nitro group present in the same aromatic nucleus. ALBERT BREWIN and E. E. TURNER. *J. Chem. Soc.* 1928, 334-7.—Theoretical discussion. The activating effect of the NO_2 group probably depends upon the presence of the O·N group contg. apolar O.

C. J. WEST

Nitration of mixed *m*-dihalogenobenzenes. H. A. MAYES and E. E. TURNER. *J. Chem. Soc.* 1928, 691-7.—1-Chloro-3-iodo-6-nitrobenzene (I), m. 63°; 1-*Br* deriv. (II), m. 76-6.5°; 1-bromo-3-iodo-4,6-dinitrobenzene, m. 125-7°. F.-p. curves are given for 3,6- $\text{Br}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{Cl}$ (III) and the 4- NO_2 deriv. (IV); for I and the 4- NO_2 deriv. (V); and for II and the 4- NO_2 deriv. (VI). Nitration of *m*- $\text{ClC}_6\text{H}_4\text{Br}$ gives 37% III and 61.9% IV, with probably 1% of the 2- NO_2 deriv.; of *m*- $\text{ClC}_6\text{H}_4\text{I}$, 35.2% I and 62.9% V, with probably 2% of the 2- NO_2 deriv.; of *m*- $\text{BrC}_6\text{H}_4\text{I}$, 51.6% II and 45.6%

VI, with probably 3% of the 2-NO₂ deriv. The nitrations were carried out with HNO₃ of d. 1.5 at -5°. C. J. WEST

Nature of the alternating effect in carbon chains. XXIII. Anomalous orientation by halogens and its bearings on the problem of the ortho-para ratio in aromatic substitution. C. K. INGOLD AND C. C. N. VASS. *J. Chem. Soc.* **1928**, 417-25; cf. *C. A.* **22**, 948. — *m*-FC₆H₄NHAc (10 g.) in 30 g. KHCO₃ in 200 cc. H₂O, treated with stirring with 32 g. of bleaching powder, gives about 4.5 g. of the 4-*Cl* deriv., m. 115°; 0.1 g. of the 6-*Cl* deriv. (possibly the 2-*Cl* deriv.), m. 143°; and 0.4 g. of the 4,6-*Cl*₂ deriv., (possibly the 2,6-*Cl*₂ deriv.), m. 124°. Hydrolysis with 20% HCl for 24 hrs. gives 3-fluoro-4-chloroaniline, b. 226°, m. 61-2°; through the diazo reaction this gives 3-fluoro-4-chloronitrobenzene, pale yellow, b₂₄ 114-6°, m. 63-4°; the isomeric 4,3-FCIC₆H₃NO₂, m. 41.5°; the *m*-*p*. curve of the 2 isomers, which shows an eutectic at 22.1° and 59.5% of the 4,3-isomer, is given. The nitration product of *o*-FC₆H₄Cl is essentially a mixt. of these 2 isomers and from an analysis of the product it follows that orientation by F/orientation by Cl = 78.68/21.32%. **XXIV. The directive action in aromatic substitution of certain groups containing triple linkings.** J. WM. BAKER, K. E. COOPER AND C. K. INGOLD. *Ibid* 426-31. — Nitration of PhC≡CCO₂H gives 7.7% of the *m*- and 27% of the *o*-NO₂ deriv.; the Et ester gives 6.1% *m*- and 36% of the *o*-NO₂ deriv. Nitration of PhCN at 0° gives 81% of the *m*-NO₂ deriv., while PhCH₂CH₂CH₂NO₂ gives only 14% (16.5% *o*- and 69% *p*-NO₂ derivs.) C. J. WEST

Preparation and properties of hexanitrodiethyldiphenylurea. LOUIS DESVERGNES. *Rev. chim. ind.* **37**, 41-2 (1928). — Dissolve 27 g. (0.2 mol.) diethyldiphenylurea in 100 g. of 100% H₂SO₄, pour into 110 g. of 80% HNO₃ (keeping the temp. below 25°), let stand 2 hrs., heat 2 hrs. on a boiling water bath, cool, filter the orange-yellow crystals (m. 176-7°) on cotton wool, wash with cold water, dry and recrystallize from 80% HNO₃. This gives 24% of the theoretical yield of [EtNC₆H₄(NO₂)₃]₂CO, m. 248° (Maugenne block), N 20.91% (calcd. 20.81%), soly. (in g. per 100 g. of solvent at 25.5°) in EtOAc 0.839, Me₂CO 1.055, abs. EtOH 0.029, MeOH 0.067, C₆H₆ 0.054, CHCl₃ 0.339, anhyd Et₂O 0.024, C₂H₅N 12.638 (with decompn.), CS₂ 0.007, CCl₄ 0.028, C₇H₈ 0.031. On hydrolysis with 70% H₂SO₄ it gives fine golden yellow needles of *trinitroethylaniline*, m. 178.5°, which cannot therefore be the 2,4,6-deriv., m. 84°. The following are the reactions which probably take place in prep. the hexanitro product: (EtNPh)₂CO + 6HNO₃ = [EtNC₆H₄(NO₂)₃]₂CO + 6H₂O; [EtNC₆H₄(NO₂)₃]₂CO + H₂O = 2EtNHC₆H₄(NO₂)₃ + CO₂; EtNHC₆H₄(NO₂)₃ + 30HNO₃ = HOC₆H₄(NO₂)₃ + 4CO₂ + N₂ + 30NO₂ + 20H₂O. A. PAPINEAU-COUTURE

Nitration of benzylaniline. JOSEPH REILLY, J. J. MOORE AND P. J. DRUMM. *J. Chem. Soc.* **1928**, 563-4. — HNO₃ (d 1.5) added to PhCH₂NHPh gives the *nitrate*, m. 142° (decompn.). Nitration of PhCH₂NHPh with HNO₃-H₂SO₄ at -3° gives the 3-*nitro* deriv., deep orange, m. 84.5-5°, and a little of the 4-*NO*₂ deriv. *Benzophenyl-3-nitrobenzylamide*, m. 103°. C. J. WEST

Chlorination of anilides. II. The decomposition of *N*-chloroacetanilide by heat. A. E. BRADFELD. *J. Chem. Soc.* **1928**, 351-2; cf. *C. A.* **21**, 2669. — PhNHCl heated in sealed tubes at 100° gives the following products: *o*-ClC₆H₄NH₂, 18.2, 16.5%; *p*-ClC₆H₄NH₂, 41.0, 50.7%; 2,4-Cl₂C₆H₃NH₂, 6.3, 4%; PhNH₂, 6.3, —%. The formation of 2,4-Cl₂C₆H₃NH₂ indicates that, contrary to the opinion of Porter and Wilbur (*C. A.* **21**, 3313), Cl appears during the reaction, as in aq. AcOH solns. C. J. WEST

The reaction between the ethylenic linkage and organomagnesium halides. HENRY GILMAN AND J. H. MCGILMUPHY. *Rec. trav. chim.* **47**, 418-22 (1928). — Previously Gilman and his co-workers have shown that a few organomagnesium halides do not add to a wide variety of ethylenic and acetylenic hydrocarbons (*C. A.* **17**, 1422; **19**, 977; **20**, 1049). In contradiction with this statement was the work of Rupe and Burgin (*C. A.* **4**, 1042) on the addn. of cinnamylmagnesium chloride and bromide to the ethylenic linkage of the cinnamyl group, but recently Gilman and Harris have shown that R. and B.'s mechanism of reaction is probably incorrect, PhCMgCl:CHMe being formed in the reaction between PhCH=CHCH₂Cl and Mg and not PhCH=CHCH₂MgCl (*C. A.* **21**, 2676). In the present paper again several reactions between organomagnesium halides and ethylenic or acetylenic hydrocarbons are dealt with, particularly PhCH₂MgCl being chosen because Rupe has presumably proved that PhCH₂MgCl adds to the ethylenic linkage of citronellal and shows a great tendency to add in the 1,2-position of double bonds (*C. A.* **8**, 914) and further CH₂=CHCH₂MgBr and Ph₃CMgCl because of their structural resemblance to PhCH₂MgCl. In the expts. with PhCH₂MgCl comparative results were obtained by comparing the yield of PhCH₂CO₂H obtained after heating with the ethylenic compd. with the yield of this acid obtained from an aliquot part of PhCH₂MgCl that had not been heated with the ethylenic

compd. With other organomagnesium halides partly the same method was used, partly the ethylenic compd. being recovered as quant. as possible from the reaction mixt. In this way it could be shown that in the following systems a reaction does not take place: PhCH_2MgCl with ethylene, amylene, styrene, $\text{Ph}_2\text{C}:\text{CH}_2$ and $(\text{CH}:\text{CH}:\text{Ph})_2$; $\text{CH}_2:\text{CHCH}_2\text{MgBr}$ with amylene and $\text{Ph}_2\text{C}:\text{CH}_2$; Ph_2CMgCl with $\text{CPh}_2:\text{CH}_2$, styrene and $(\text{C}:\text{CPh})_2$; $p\text{-ClC}_6\text{H}_4\text{MgBr}$ with $\text{CPh}_2:\text{CH}_2$, amylene and $\text{Ph}:\text{CCH}$.

C. F. VAN DUIN

Extension of Witt's color theory on coordination chemical grounds. W. DILTHEY AND R. WIZINGER. *J. prakt. Chem.* 118, 321-48(1928).—A theoretical discussion which cannot be satisfactorily abstracted.

C. J. WEST

Phenol and cresol, especially *m*-cresol, derivatives of phosphorus trichloride and phosphorus thiocloride. WALTER BROECKER. *J. prakt. Chem.* 118, 287-94(1928).— PCl_3 (70 g.) and 54 g. *m*- $\text{MeC}_6\text{H}_4\text{OH}$, warmed until the evolution of HCl ceases, give 3 compds.: *m*-cresylphosphorus dichloride, $\text{MeC}_6\text{H}_4\text{OPCl}_2$, b_p 114°; *di*-[*m*-cresyl]phosphorus chloride, b_p 198°; a small quantity of the *tri*-*m*-cresyl deriv., $\text{P}(\text{OC}_6\text{H}_4\text{Me})_3$, b_p 248-50°. Heating 12.5 g. $\text{MeC}_6\text{H}_4\text{POCl}_2$ with 2 g. S at 200° gives the *thio* deriv., $\text{MeC}_6\text{H}_4\text{OPSCl}_2$, b_p 138°; similarly were prepd. (*m*- $\text{MeC}_6\text{H}_4\text{O}$) $_2\text{PSCl}$, b_p 218°, m 33-4°, and (*m*- $\text{MeC}_6\text{H}_4\text{O}$) $_3\text{PS}$, b_p 270-2°, m 40-1°.

C. J. WEST

The reaction of Houben. L. BERT. *Compt. rend.* 186, 587-8(1928).—When EtMgBr (I) was condensed with *p*-iso- $\text{PrC}_6\text{H}_4\text{CH}_2\text{Cl}$ (II), in PhMe (III), instead of the expected hydrocarbon a new substance $\text{C}_{17}\text{H}_{20}$, was obtained. The formation of this compd. is believed to be due to the initial condensation of I and II to give *p*- $\text{PrC}_6\text{H}_4\text{CHMe}_2$ (IV), and MgBrCl , followed by a condensation of II and III, splitting out HCl with MgBrCl acting like AlCl_3 . To check this theory, I and II were condensed in cyclohexane (V) or petroleum ether. In these cases about 50% IV was obtained and no $\text{C}_{17}\text{H}_{20}$ formed. It is further shown that PhCH_2Cl (VI) in V with EtMgBr , PrMgBr and BuMgBr gives PhPr (70%), PhBu (26%) and PhAm (47%). In condensing I with VI the following reaction probably occurs: $\text{EtMgBr} + 2\text{PhCH}_2\text{Cl} \rightarrow \text{C}_2\text{H}_5 + \text{PhCH}_2\text{CH}_2\text{Ph} + \text{MgBrCl} + \text{HCl}$; $\text{EtMgBr} + \text{HCl} \rightarrow \text{C}_2\text{H}_6 + \text{MgBrCl}$.

D. H. POWERS

Organic selenium compounds. Some derivatives of aromatic seleno-ethers. D. G. FOSTER AND S. F. BROWN. *J. Am. Chem. Soc.* 50, 1182-8(1928).— PhSeH and the alkyl halide with NaOH give the following seleno ethers: *Et*, b_p 214-6° (72% yield); *iso*- C_4H_9 , b_p 105° (86.5% yield); *Ph*, b_p 303° (24%). *Diphenylselenium oxide*, m 106-8°, results from Ph_2SeCl_2 and NaOH or from $\text{Ph}_2\text{SeO} \cdot \text{HNO}_3$ and Na_2CO_3 . The action of HNO_3 on the ethers gives selenoxide hydromitrates: *Me*, m 97° (64% yield); *Ph*, m 97° (77% yield); the *Et* and C_4H_9 derivs. are oils. With Na_2CO_3 , CO_2 is evolved and oils are formed which are probably selenoxides but they decomp. too easily to be purified. With concd. HCl there result dichlorides (PhSeCl_2R), which are also obtained by the action of KMnO_4 and HCl on the ethers; *Me*, m 122° (decompn.); *Et*, m 64-5°; C_4H_9 , m 80°; *Ph*, m 142° (decompn.); these compds. were also prepd. by the direct action of Cl on the ethers (*Me*, *Ph*). A mechanism for the production of the dichlorides is proposed.

C. J. WEST

Antimony. II. Derivatives of tri-*p*-tolylstibine. A. E. GODDARD AND V. E. YARSLY. *J. Chem. Soc.* 1928, 719-23; cf. *C. A.* 18, 53.—Heating (*p*- MeC_6H_4) $_3\text{SbCl}_2$ at 5-7 mm. and 60-5° gave *p*- $\text{MeC}_6\text{H}_4\text{Cl}$ and at 160-200° *di*-*p*-tolylchlorostibine, solid; the *Br* deriv., pale cream, m above 290°; the *I* deriv., m 233°; the yields are almost quant. (*p*- MeC_6H_4) $_3\text{Sb}$ in MeOH contg. HCl , boiled on the water bath in a current of CO_2 , dissolves after 15 min., further boiling for 1.25 hr. gives *di*-*p*-tolylstibinic acid, amorphous, sinters 230°, m 260°; this is also obtained by oxidizing with alk. H_2O_2 , in which process there also results *di*-*p*-tolylstibine trichloride, m 141-2°. *p*- $\text{MeC}_6\text{H}_4\text{SbO}_2\text{H}_2$ is best prepd. through the diazo reaction from *p*- $\text{MeC}_6\text{H}_4\text{NH}_2$ and Sb_2O_3 . (*p*- MeC_6H_4) $_3\text{Sb}$ on nitration with fuming acid gives the dinitrate of the *tri*-*m*- NO_2 deriv., light cream, m 182° (decompn.); on hydrolysis with H_2PO_3 in EtOH , there results the oxide, m 225°. Reduction of the dinitrate gives *tri*-*m*-aminotri-*p*-tolylstibine, pinkish gray, m 92°; the diazo compd. with KI gives the *tri*-*m*-*I* deriv., reddish brown, m 146°.

C. J. WEST

Some properties and reactions of β -chloroethyl, β -cyanoethyl and β -carbethoxyethyl toluene-*p*-sulfonates, including an extension of the Friedel-Crafts reaction. G. R. CLAUDIO AND ERIC WALTON. *J. Chem. Soc.* 1928, 723-9.—*p*- $\text{MeC}_6\text{H}_4\text{SO}_3\text{Cl}$ (180 g.), 100 g. $\text{HQC}_6\text{H}_4\text{CN}$ and 150 cc. $\text{C}_6\text{H}_5\text{Me}_2$, refluxed 3.5 hrs., give 25 g. NH_4 toluene-*p*-sulfonate, m 320-5°, and 146 g. (65%) of β -cyanoethyl toluene-*p*-sulfonate (I), b_p 187-9°, m 64°; with $\text{EtOH} \cdot \text{HCl}$ at room temp. this gives 81% of γ -amino- γ -ethoxypropyl toluene-*p*-sulfonate- HCl , m 101°, fairly stable in air, hydrolyzed by H_2O at 70°

to β -carbethoxyethyl toluene-*p*-sulfonate (II), $b_{0.3}$ 187–9°. I, m - $C_6H_4(OH)_2$ and $ZnCl_2$ give 7-hydroxy-3,4-dihydrocoumarin. I and anhyd. K_2CO_3 , heated at 80–120°, give 75% of $CH_3:CHCN$; II gives nearly quant. $CH_3:CHCO_2Et$. p - $MeC_6H_4SO_2OCH_2CH_2Cl$ (III) and K phthalimide, heated 3 hrs. at 200°, give 86% of phthal- β -chloroethyl-imide. With C_6H_6 and $AlCl_3$, III gives $(PhCH_2)_3$. I, C_6H_6 and $AlCl_3$ give 72% of $PhCH_2CH_2CN$, while II gives 74% of $PhCH_2CH_2CO_2Et$. p - $MeC_6H_4SO_2Et$, C_6H_6 and $AlCl_3$ give 64% of $PhEt$, $PhCH_2CH_2CN$ in concd. $EtOH-HCl$ gives 76% of γ -imino- γ -ethoxy- β -phenylpropane- HCl , m. 130°; hydrolysis with H_2O gives 95% of $PhCH_2CH_2CO_2Et$. $CH_3:CHCN$ in $EtOH-HCl$ gives 65% of α -chloro- γ -imino- γ -ethoxypropane- HCl , m. 109°.

C. J. WEST

Condensation reactions of chloral with substituted phenols. F. D. CHATTAWAY AND FERNANDO CALVET Y PRATS. *Anales soc. españ. fis. quim.* 26, 75–91 (1928); cf. *C. A.* 21, 1980. —*p*-Aminophenol condenses with chloral in the presence of strong H_2SO_4 , giving anhydro-5-amino-2- β , β , β -trichloro- α -hydroxyethoxy-1- β , β , β -trichloro- α -hydroxyethylbenzene. *p*-Tolylazophenol and *p*-nitro-*m*-cresol act similarly with chloral, giving anhydro-5-*p*-tolylazo-2- β , β , β -trichloro- α -hydroxyethoxy-1- β , β , β -trichloro- α -hydroxyethylbenzene and anhydro-5-nitro-4-methyl-2- β , β , β -trichloro- α -hydroxyethoxy-1- β , β , β -trichloro- α -hydroxyethylbenzene, the latter showing that a substituent in the *m*-position to the OH group does not prevent the reaction occurring in a normal way. Substituents in the *o*-position interfere with the reaction. *p*-Nitro-*o*-cresol, 5-nitrosalicylic acid and 2,4-dinitrophenol do not condense with chloral in the presence of strong H_2SO_4 , probably because of steric hindrance of *o*-substituents which prevent addn. to the OH group, possibly preceding entrance of the $-CH(OH)CCl_3$ group into the C_6H_5 ring. When the *p*-position of the phenolic group is unoccupied the chloral residue attaches to the C_6H_5 nucleus at the free position, thus *m*- $HOC_6H_4CO_2H$, on subsequent elimination of 1 mol. of H_2O , gives 5-hydroxytrichloromethyl phthalide. Salicylic acid and *p*- and *m*-nitrophenols, where the *p*-position is unoccupied, condense with chloral by the probable introduction of the $-CH(OH)CCl_3$ group into the free position, but the resinous products thus obtained have not yet been crystd.

E. M. SYMMES

Lead subacetate solution ("Goulard's extract") and its reaction with phenols. C. S. GIBSON AND ERNEST MATTHEWS. *J. Chem. Soc.* 1928, 596–602. —If Goulard's ext. is prep'd. according to the 1914 Brit. Pharm., it is possible to prove that the compn. of the solute is $Pb(OH)_2.Pb(OAc)_2$ or $Pb(OH)(OAc)$. If, instead of taking approx. equiv. proportions of PbO and $Pb(OAc)_2$, 3 times the amt. of PbO is taken, the compn. of the solute is $2Pb(OH).Pb(OAc)_2$. The formation of ppts. with phenols is apparently general; their compn. appears to be $Pb(OR)_2.Pb(OH)OAc$. The $PhOH$ compd., $C_{14}H_{11}O_5Pb_2$, is microcryst. and begins to melt at about 80° and then chars, leaving a deposit of Pb and some PbO ; it is sol. with decompn. in warm aq. $NaOH$ and is not pptd. upon acidification with HNO_3 ; the soln. in dil. $AcOH$ gives an immediate yellow ppt. with K_2CrO_4 ; it is sparingly sol. in C_6H_6 but decomp. when the soln. is heated. The o - $O_2NC_6H_4OH$ compd., $C_{14}H_{13}O_5N_2Pb_2$, yellow, changes from yellow to red at 120–30° and explodes on further heating, leaving a deposit of Pb . The reverse color change can be brought about by rubbing. The o - BrC_6H_4OH compd., $C_{14}H_{13}O_5Br_2Pb_2$, begins to m. 255° and later chars.

C. J. WEST

Preparation of *p*-iodoanisole. F. F. BLICKER AND F. D. SMITH. *J. Am. Chem. Soc.* 50, 1229–31 (1928). —Modifications of Brenans's method for the prepn. of *p*- IC_6H_4OMe ($PhOMe$, HgO and I in $EtOH$) consists of the use of about 0.5 the amt. of I , the use of CCl_4 as a solvent and a temp. of 50–60°; the yield is 73%; at room temp. the yield was 57%. The H_2O is removed by a stream of air; when this is not done, $Hg(IO_3)_2$ is formed. PbO or CaO cannot replace the HgO . KI and p - $MeOC_6H_4N_3X$ give 75–80% of *p*- IC_6H_4OMe .

C. J. WEST

Sulfur derivatives of aromatic methyl ethers. H. H. HODGSON AND F. WM. HANDLEY. *J. Chem. Soc.* 1928, 625–8. —2,2'-Diamino-5,5'-dimethoxydiphenyl disulfide, pale yellow, m. 76°; di-*Ac* deriv., m. 202–3°; HCl salt, needles; HNO_3 gives 5-methoxybenzene 2,1-diazosulfide, m. 80°. The 4,4'-diamino deriv., m. 88°; di-*Ac* deriv., m. 136°; HCl salt, needles. 2,2'-Dinitro-5,5'-dimethoxydiphenyl sulfide, yellow, m. 151°; 4,4'-dinitro deriv., m. 154°; the corresponding sulfones, m. 182° and 245–6°, resp. 2-Nitro-5-methoxyphenyl *Me* sulfone, m. 122°; 4-nitro deriv., m. 130°. 5-Chloro-5-methoxythioanisole, m. 41°; 4-*Cl* deriv., m. 36°. Color reactions are given for concd. H_2SO_4 , oleum (20%) and $ClSO_3H$.

C. J. WEST

Action of aminosulfonic acid on unsaturated compounds. A. QUINTO. *Atti accad. Lincei* [6], 7, 141–6 (1928); cf. *C. A.* 22, 1764. — H_2NSO_3H (10 g.) heated 4–6 hrs. at 140–50° with anethole (25 g.), the excess anethole decanted, washed repeatedly

with Et_2O , dissolved in a little hot water, the remaining anethole and resin removed by extr. with Et_2O and the aq. residue evapd., yields 20 g. of NH_4 anetholesulfonate, m. $235-40^\circ$ (decompn.). The yield depends upon the fineness of the $\text{H}_2\text{NSO}_3\text{H}$. *K anetholesulfonate*. *Na salt*. *Ba salt*, mother-of-pearl aspect, treated in water with dil. H_2SO_4 yields the *acid*, hygroscopic, m. around 70° , decolorizes aq. KMnO_4 and reduces $\text{NH}_3\text{-AgNO}_3$. The dry Na salt and PCl_5 when heated gently, poured into ice water, and the ppt. recrystd. from C_6H_6 , yields 100% of anetholesulfonyl chloride, yellow, has a characteristic odor, m. 63.5° . Boiled with alc. NH_3 and the product recrystd. from EtOH , it yields the *acid amide*, m. 156° . The aq. K. salt (5 g.) made slightly alk. with KOH , boiled, aq. KMnO_4 (about 8 g.) added until permanently pink, filtered, the filtrate concd., acidified with HCl , the ppt. extd. with Et_2O , and the ext. evapd., yields 2.5 g. of anisic acid, while the aq. liquor contains AcOH , KCl and K_2SO_4 . The same products are obtained by oxidizing at room temp. Though the formula of anetholesulfonic acid might be either $\text{MeOC}_6\text{H}_4\text{CH}(\text{Me})\text{SO}_3\text{H}$ or $\text{MeOC}_6\text{H}_4\text{C}(\text{SO}_3\text{H})\text{CH}_3$, it is considered that the former is the more probable one. The NH_4 salt is probably formed by the addn. of H_2NSO_3 to $\text{MeOC}_6\text{H}_4\text{CH}(\text{Me})\text{SO}_3\text{H}$, thus $\text{MeOC}_6\text{H}_4\text{CH}(\text{OH})\text{CH}(\text{SO}_3\text{NH}_2)\text{Me}$, the latter then losing H_2O and hydrating again to $\text{MeOC}_6\text{H}_4\text{CH}(\text{SO}_3\text{NH}_2)\text{CH}_3$. This reaction is essentially the same as that with simple phenols, e. g., anisole. The expts. are being continued with phenols with an allyl chain and with unsatd. hydrocarbons. C. C. DAVIS

Wandering of the acyl group in acetyldimethylpyrogallol. F. MAUTHNER. *J. prakt. Chem.* **118**, 314-20 (1928).—2,6-(MeO) $_2\text{C}_6\text{H}_3\text{OAc}$ and ZnCl_2 , warmed 3 hrs. at 120° , give 4,2,3-MeO(HO) $_2\text{C}_6\text{H}_2\text{Ac}$, m. $132-3^\circ$ (di-Ac deriv., m. $146-8^\circ$, *p*-nitrophenylhydrazones, does not m. 260° ; semicarbazone, m. $229-30^\circ$ (decompn.)). The rearrangement also takes place at room temp. C. J. WEST

Nitrosation of phenols. V. Preparation of an *o*-nitrosophenol. H. H. HODGSON AND J. S. WIGNALL. *J. Chem. Soc.* **1928**, 329-32, cf. *C. A.* **22**, 62. 5,3-Cl(HO) $\text{C}_6\text{H}_3\text{OMe}$ with HNO_2 gives the 4-*NO* deriv., deep green, m. 132° (decompn.); concd. H_2SO_4 gives a Bordeaux-red color. Oxidation with $\text{K}_2\text{Fe}(\text{CN})_6$ gives the 4- NO_2 deriv., light golden, m. 105° , identical with the compd. obtained by nitrating 5,3-Cl(HO) $\text{C}_6\text{H}_3\text{OMe}$ (small yield). Me_2SO_4 gives 5-chloro-4-nitroresorcinol di-Me ether (I), light yellow, m. 123° . 3,5,2-Cl $_2$ (O_2N) $\text{C}_6\text{H}_2\text{OMe}$ and MeONa give 5-chloro-2-nitroresorcinol di-Me ether, m. 171° ; 3,5,4-Cl $_2$ (O_2N) $\text{C}_6\text{H}_2\text{OMe}$ and MeONa give I. 5,3-Cl(MeO) $\text{C}_6\text{H}_3\text{NH}_2$ and Me_2SO_4 give 5-chloro-3-methoxydimethylaniline, oil; HNO_2 gives a 4-*NO* deriv., green, decomp. 155° ; concd. H_2SO_4 gives a deep cherry-red color; 10% aq. KOH completely decomp. the compd. C. J. WEST

Rearrangement of benzyl phenyl ether. W. F. SHORT. *J. Chem. Soc.* **1928**, 528.— PhOCH_2Ph , heated to 225° with ZnCl_2 or to 180° in a stream of HCl , gives a mixt. of PhOH , *o*- $\text{HOC}_6\text{H}_4\text{CH}_2\text{Ph}$, *p*- $\text{HOC}_6\text{H}_4\text{CH}_2\text{Ph}$ and high-boiling products. It is probable that the reaction follows a course similar to the Hofmann rearrangement of alkyanilines C. J. WEST

A new general synthetic method for the preparation of arylaliphatic aldehydes. L. BERT. *Compt. rend.* **186**, 699-700 (1928); cf. *C. A.* **22**, 1335.—Mg derivs. of $\text{RC}_6\text{H}_4(\text{CH}_2)_n\text{Cl}$ and $\text{HC}(\text{OMe})_3$ or $\text{HC}(\text{OEt})_3$ give acetals of $\text{RC}_6\text{H}_4(\text{CH}_2)_n\text{CHO}$ (I). The acetals give on boiling with HCl excellent yields of I. This method is easier and cheaper than the method of Braun and Kruber (*C. A.* **6**, 1160). Bert prepd. the following compds., all new except the first 4—homologs of PhCH_2CHO : *p*-Me- and *p*-iso- $\text{PrC}_6\text{H}_4\text{CH}_2\text{CHO}$ (II), 2,4,5-Me $_3\text{C}_6\text{H}_3\text{CH}_2\text{CHO}$, 2,5-Me(Me_2CH) $\text{C}_6\text{H}_3\text{CH}_2\text{CHO}$, *p*-Et $\text{C}_6\text{H}_4\text{CH}_2\text{CHO}$ (III), 2,4-Me $_2\text{C}_6\text{H}_3\text{CH}_2\text{CHO}$ (III), 2,5-Me $_2\text{C}_6\text{H}_3\text{CH}_2\text{CHO}$ (IV); homologs of $\text{Ph}(\text{CH}_2)_2\text{CHO}$: *o*-Me- and *p*-Me $\text{C}_6\text{H}_4(\text{CH}_2)_2\text{CHO}$ (V and VI), 2,4-Me $_2\text{C}_6\text{H}_3(\text{CH}_2)_2\text{CHO}$ (VII), 2,5-Me $_2\text{C}_6\text{H}_3(\text{CH}_2)_2\text{CHO}$ (VIII), *p*-iso- $\text{PrC}_6\text{H}_4(\text{CH}_2)_2\text{CHO}$ (IX) and 2,5-Me(Me_2CH) $\text{C}_6\text{H}_3(\text{CH}_2)_2\text{CHO}$ (X); homologs of $\text{Ph}(\text{CH}_2)_3\text{CHO}$: *p*-Me $\text{C}_6\text{H}_4(\text{CH}_2)_3\text{CHO}$ (XI), 2,4-Me $_2\text{C}_6\text{H}_3(\text{CH}_2)_3\text{CHO}$ (XII), 1,4-Me $_2\text{C}_6\text{H}_3(\text{CH}_2)_3\text{CHO}$ (XIII) and *p*-iso- $\text{PrC}_6\text{H}_4(\text{CH}_2)_3\text{CHO}$ (XIV). Following are the consts.: II b_{13} 108° , d_4^{15} 1.009, n_D^{15} 1.537, semicarbazone, m. 175° ; III b_{13} 136° , d_4^{15} 0.996, n_D^{15} 1.529, semicarbazone, m. 164° ; IV, b_{12} $105-6^\circ$, d_4^{15} 1.004, n_D^{15} 1.531, semicarbazone, m. 183° ; V, b_{13} 120° , d_4^{15} 0.998, n_D^{15} 1.522, semicarbazone, m. 153° ; VI b_{13} 122° , d_4^{14} 0.999, n_D^{14} 1.525, semicarbazone, m. 174° ; VII b_{14} $135-6^\circ$, d_4^{16} 0.994, n_D^{16} 1.525, semicarbazone, m. 188° ; VIII b_{13} $133-4^\circ$, d_4^{15} 0.989, n_D^{15} 1.523, semicarbazone, m. 182° ; IX b_{13} 136° , semicarbazone, m. 158° ; X b_{17} 150° , d_4^{17} 0.974, n_D^{17} 1.518, semicarbazone, m. 149° ; XI b_{13} 124° , d_4^{11} 1.011, n_D^{14} 1.527, semicarbazone, m. 124° ; XII b_{13} $137-8^\circ$, d_4^{10} 1.001, n_D^{10} 1.529, semicarbazone, m.

135°; **XIII** b_{18} 139°, d_4^{12} 0.987, n_D^{12} 1.532, semicarbazone, m. 184°; **XIV** b_{12} 132°, semicarbazone, m. 144°.

MARGARET W. MCPHERSON

Nitration of benzaldoxime and some of its derivatives. O. L. BRADY and R. E. M. MILLER. *J. Chem. Soc.* 1928, 337–42.—The nitration of PhCH:NHOH with a mixt. of 120 g. fuming HNO_3 (10% SO_3) and 12 cc. HNO_3 (d. 1.42) gives 30% of the *m*- NO_2 deriv.; the poor yield is due to the difficulty of suppressing hydrolysis and oxidation leading to the formation of acid. Treatment of *o*-methylbenzaldoxime with a mixt. of fuming H_2SO_4 and fuming HNO_3 at room temp. gives about 10% of the *m*- NO_2 deriv. *N*-Methylbenzaldoxime also gives the *m*- NO_2 deriv. α -*p*- $\text{MeOC}_6\text{H}_4\text{CH:NHOH}$ gives the 3- NO_2 deriv., as does the *O*-Me ether *O*-Methyl-3,5-dinitro-4-methoxybenzaldoxime, m. 129°. α -3,4-(CH_2O) $\text{C}_6\text{H}_3\text{CH:NHOH}$ and its *O*-Me ether give the 6- NO_2 deriv. α ,3,4-MeO(HO) $\text{C}_6\text{H}_3\text{CH:NHOH}$ gives the 5- NO_2 deriv. (almost quant. yield).

C. J. WEST

Condensation of methyl isobutyl ketone with benzaldehyde. C. V. GHEORGHIU and B. ARWENTIEW. *J. prakt. Chem.* 118, 295–302 (1928).— $\text{MeCOCH}_2\text{CHMe}_2$ (24 g.) and 25 g. BzH in 170 cc. EtOH, condensed with 18 cc. 10% NaOH for 48 hrs., give 58% of α -benzalmethyl isobutyl ketone (I), light yellow with aromatic odor, b_{32} 179–83°, b. 260° (partial decompn.), d_4^{18} 1.09781, n_D^{18} 1.5570; dibromide, m. 101°; semicarbazone, m. 167°; oxime, m. 141–2°. The constitution of I is established by its oxidation with KMnO_4 to BzOH and $\text{Me}_2\text{CHCH}_2\text{CO}_2\text{H}$. With NaNO_2 in AcOH I gives oximido-benzoylmethylisopropylglyoxime hyperoxide, yellowish red, m. 182° (decompn.). Condensation with HCl gives the same product, but it is difficult to remove the last traces of Cl.

C. J. WEST

Preparation of larger amounts of vanillin from sulfite waste liquors. KARL KÜRSCHNER. *J. prakt. Chem.* 118, 238–62 (1928).—Details are given of the method of and app. for heating sulfite waste liquor with KOH in the presence of a stream of air, whereby from a liquor contg. 82.5% dry org. matter and 47% lignin, 20.1% of vanillin may be obtained.

C. J. WEST

Union of benzoylacetonitrile with organic bases in the presence of salicylaldehyde. II. PANCHAPAKESA KRISHNAMURTI. *J. Chem. Soc.* 1928, 415–7; cf. *C. A.* 21, 2002.— BzCH_2CN (1 mol.) and 1 mol. *p*- $\text{MeC}_6\text{H}_4\text{NH}_2$ in abs. EtOH contg. 2–3 drops *o*- $\text{HOC}_6\text{H}_4\text{CHO}$ and 1–2 drops piperidine, heated 8 hrs, give 50% of a compd., $\text{C}_{16}\text{H}_{16}\text{ON}_2$, pale yellow, m. 182°; *HCl* salt, m. 194–5°; *di*-Bz deriv., pale yellow, m. 166°; isonitroso deriv., bright orange, m. 158° (Ag salt, light pink). Similarly, PhNH_2 gives 40% of the compd. $\text{C}_{15}\text{H}_{14}\text{ON}_2$, light yellow, m. 163°; *HCl* salt, m. 94–6°; *di*-Bz deriv., pale yellow, m. 168°; isonitroso deriv., blood-red, m. 182° (decompn.). The *m*-4-xyldine compd., $\text{C}_{17}\text{H}_{18}\text{ON}_2$, m. 145–6° (20% yield); Bz deriv., m. 153°; isonitroso deriv., yellow, m. 150–1°. *o*- and *m*- $\text{MeC}_6\text{H}_4\text{NH}_2$ did not react under these conditions. C. J. W.

Optically active derivatives of phenylaminoacetic acid. ALEX. MCKENZIE and NELLIE WALKER. *J. Chem. Soc.* 1928, 646–52.— $\text{C}_6\text{H}_5(\text{CO})_2\text{O}$ and *l*- $\text{H}_2\text{NCHPhCO}_2\text{H}$, heated 2.5 hrs. at 160–70°, give the *dl*-phthalimido acid, which is resolved by morphine, *l*- α -phthalimidophenylacetic acid, m. 192–3°, $[\alpha]_D^{15}$ -51.9° (Me_2CO , *c* 3.5385), $[\alpha]_D^{17}$ -20.3° (MeOH , *c* 4.588), $[\alpha]_D^{12}$ -24.7° (MeOH , *c* 2.251). SOCl_2 gives an optically active acid chloride (C_6H_5 , *l*, *c* 3.33, α_D -4.68°) but with AlCl_3 and C_6H_6 this gives *dl*-desylphthalimide. Hydrolysis of the *l*-acid with KOH apparently gives the dicarboxylic acid, $\text{HO}_2\text{CC}_6\text{H}_4\text{CONHCHPhCO}_2\text{H}$, m. 177–9°, $[\alpha]_D^{19}$ 101.8° (Me_2CO , *c* 1.2525). The resolution of *dl*-desylphthalamic acid by means of morphine gives *l*-desylphthalamic acid, m. 155–7°, $[\alpha]_D^{18}$ -159.1° (Me_2CO , *c* 2.545), but hydrolysis with concd. HCl gives an impure desylamine-HCl. *dl*-Desylamine-HCl was therefore resolved by means of *l*-mandelic acid, *l*- γ,γ,γ -trichloro- β -hydroxybutyric acid and also the corresponding *d*-acid; *d*-desylamine-HCl, decomp. 230°, $[\alpha]_D^{15}$ 223.2° (EtOH, *c* 2.538). With HNO_2 this gives a mixt. of *dl*- and *d*-PhCH(OH)COPh. When the free base, which is very unstable, was liberated from the *d*-HCl salt, the sign of rotation was unaltered. Its optical activity in EtOH was evanescent at the ordinary temp., a result attributed to racemization rather than to decompn.

C. J. WEST

Phenylethylmalonic methyl ester. A new method of synthesis. MARY M. RISING and TSON-WU ZEE. *J. Am. Chem. Soc.* 50, 1208–13 (1928); cf. *C. A.* 21, 906.—The method starts with PhCH_2CN , which is transformed into PhEtCHCN by NaNH_2 and EtI (87.4% yield); with MeOH and HCl this yields 76.9% of *Me imido- α -phenylbutyrate-HCl*, m. 92°; hydrolysis gives 90.3% of PhEtCHCO $_2$ Me, m. 77–8°, which gives with Na in Et $_2$ O the α -Na deriv., which was isolated in the solid state; this is decompd. by H_2O and all acids into the ester; with ClCO_2Me there results 84.7% of

PhEtC(CO₂Me)₂; the over-all yield of PhEtC(CO₂Me)₂ from PhCH₂CN is 43.1%.
C. J. WEST

Addition of bromine to ethylenic compounds in non-hydroxylic solvents. D. M. WILLIAMS AND T. C. JAMES. *J. Chem. Soc.* 1928, 343-7.—The study of the addn. of Br to unsatd. acids and their derivs. in dry CHCl₃ and CCl₄ in the dark indicates that there are 3 classes: (a) Those to which Br is added with considerable rapidity, the addn. being accompanied by substitution and the formation of HBr; the bimol. velocity coeff. steadily decreases as the reaction proceeds (*trans*- and *cis*-o-MeOC₆H₄-CH:CHCO₂H, PhCH:CHCH:CHCO₂H and Me ester, PhCH:CHCH:CPhCO₂H, furfurylacrylic acid, oleic acid, elaidic acid). (b) Those to which Br adds on slowly but with a measurable and increasing velocity, exhibiting a preliminary inhibition period (PhCH:CHCO₂H and Me ester, MeCH:CHCO₂H and PhCH:CHCH:C(CO₂Me)₂). (c) Those to which no measurable addn. takes place under the conditions investigated (maleic anhydride, coumarin, α -phenylcinnamionitrile). The positions of the double bond, especially in the α -position to the CO₂H group, and of substituent groups in close proximity to the double bond have an important effect on the rate of addn. but these are not the deciding factors. The rapidity of addn. to substances of class (a) is due to preliminary substitution with the formation of HBr in small quantities; HBr is found to be an effective catalyst for the addn. reaction; HCl and H₂O produce similar effects to HBr, although not of the same degree. In each case with compds. of class (b), the inhibition period disappears and the reaction becomes bimol. The catalysts do not bring about a reaction with substances of class (c). C. J. W.

Bromination of *m*-methoxycinnamic acid. HERBERT DAVIES AND WM. DAVIES. *J. Chem. Soc.* 1928, 602-5.—Bauer and Vogel (C. A. 8, 1092) found that *m*-MeOC₆H₄-CH:CHCO₂H and 1 mol. Br in AcOH give a compd., m. 186°, to which they assigned the formula *m*-MeOC₆H₄CH:CHCO₂H; at room temp., 10 g. of the acid and 1 mol. Br in 200 cc. AcOH give, after 10 days, 4 g. 6-Br deriv., m. 189°, oxidized by KMnO₄ to 6,3-Br(MeO)C₆H₃CO₂H. The Br acid was also synthesized from 6,3-Br(MeO)C₆H₃CHO and CH₂(CO₂H) in C₆H₅N. No definite products could be obtained from the mother liquor, though it probably contained the dibromide. The same 6-Br acid was obtained by bromination of *m*-MeOC₆H₄CH:C(CO₂H)₂, followed by hydrolysis and heating at 180°. The action of 2 mols. Br upon *m*-MeOC₆H₄CH:CHCO₂H gives a complex mixt., from which, after oxidation, 4(2),6,3-Br₂(MeO)C₆H₃CO₂H can be isolated. 4(2),6-Dibromo-3-methoxycinnamic acid, m. 234°. These reactions are abnormal, for bromination of cinnamic acids usually affects the double bond in the side chain, producing dibromides. C. J. WEST

Isomerism of the oximes. XXXIII. Oximes of opianic acid and of phthalic anhydride. O. L. BRADY, L. C. BAKER, R. F. GOLDSTEIN AND SAMUEL HARRIS. *J. Chem. Soc.* 1928, 529-39; cf. C. A. 22, 950.—Opianic oxime (I) exists in only 1 form and behaves in a similar manner to α -aldoximes. With Ac₂O I gives the anhydride (II), but the action of 2,4-(O₂N)₂C₆H₃Cl on the Na salt of I gives 2,4-dinitrophenyl-opianic oxime, bright yellow, m. 146°. The action of alkalis on II gives 2,5,6-NC(MeO)₃C₆H₂CO₂H, which compd. is regarded as the intermediate stage in the change of II to hemipinimide. Opianic acid and MeNH.OH.HCl in aq. KOH give *N*-methyl-opianic oxime, m. 180.5° (decompn.); refluxing with H₂O for 3 hrs. gives a small amt. of *N*-methylhemipinimide but the main product is apparently the sol. MeNH₂ H salt of hemipinic acid; by heating above 180° for 10 min., the imide was obtained. Heating opianic acid and MeNH.OH.HCl in 80% EtOH for 3 hrs. also gives the imide. *K* hemipinimide and MeI give the *N*-Me deriv. Opianic acid and H₂NOMe.HCl in NaOH give *O*-methyl-opianic oxime, m. 112°; this also results from the oxime and Me₂SO₄. The absorption spectra of these compds. are given; the curves for I and its *N*- and *O*-Me ethers are normal, but the curve for the II differs widely from those usually obtained for acylated oximes and suggests a relationship between the anhydride and hemipinimide which is not borne out by their chem. properties. The 2 forms, white and yellow, of phthaloxime have been reinvestigated. Both forms m. and decomp. at the same temp. and both yield series of derivs. in which the characteristic difference in color persists. The red Na salt of phthaloxime with MeI or Me₂SO₄ gives the yellow *O*-Me ether, while the Na salt from the white oxime gives the colorless *O*-Me ether. Hydrolysis of the white *O*-Me deriv. gives C₆H₄(CO₂H)₂ and H₂NOMe. C₆H₄(CO)₂O and MeNH.OH.HCl give *N*-methylphthaloxime, m. 121-2°; a yellow form could not be found. From a study of the absorption spectra it is felt that the phthaloximes exhibit a special type of isomerism for which an explanation has still to be found. Small yields of *o*-H₂NC₆H₄CO₂H are obtained from both the white and yellow oximes by using a high temp. and AmOH-KOH. C. J. WEST

Constitution of Indian turpentine from *Pinus longifolia*, Roxb. IV. P. PARAMESWARAN PILLAY AND J. L. SIMONSEN. *J. Chem. Soc.* 1928, 359-64; cf. C. A. 18, 247.—Oxidation of *d*- Δ^1 -carene with H_2O_2 in $AcOH$ gives *d*-carene- β -glycol (I), b_{100} 147-50°, m. 90-1°, crystg. with $1H_2O$, optically inactive in $EtOH$ and $CHCl_3$; with CrO_3 it undergoes complete degradation, no trace of a HO ketone being observed. The *H* phthalate, m. 191-2°. The filtrate from I gives a product, b_{100} 155-7°, having the compn. of I. Heating 60 g. I with 200 cc. 5% H_2SO_4 48 hrs. on the H_2O bath gives 10.5 g. b_{100} 101-20°, consisting essentially of *p*-cymene, and 13 g. b_{100} 140-60°, from which *l*-carene oxide is isolated, though not pure; 2 fractions b_{100} 150-3° and 155-9° and had d_{30}^{20} 0.961, 0.9794, n_D^{30} 1.4740, 1.4768, $[\alpha]_D^{30}$ —, —39.16°; after standing several months, it gave a small quantity of a semicarbazone, $C_{11}H_{19}ON_3$, m. 193-3.5°; with $C_6H_5(CO)_2O$ it gives the *H* phthalate of I. The oxide is remarkably stable and does not undergo hydration even when shaken with H_2SO_4 for some days. The oxidation product of the oxide with $KMnO_4$ in Me_2CO is a complex mixt. of acids showing no tendency to crystallize. A small quantity of a semicarbazone, $C_{10}H_{17}O_2N_3$, decomps. 165-6° was obtained, but the corresponding keto acid did not crystallize; $NaOBr$ gave $CHBr_3$, indicating the Ac group. The action of $HOCl$ upon *d*- Δ^1 -carene gives hydroxychlorocarane, b_{100} 90-3°, d_{30}^{20} 1.0123, n_D^{30} 1.4992, and impure dichlorodihydroxy-methylisopropylcyclohexane, b_{100} 110-3°, d_{30}^{20} 1.0821, n_D^{30} 1.5060, probably a mixt. of isomers.

C. J. WEST

Products of the addition of chlorine and bromine to pinene and their dechlorination. I. L. KONDAKOV. *Ber.* 61B, 479-81(1928).—In connection with the paper of Aschan (C. A. 22, 1346), K. calls attention to one of his own published in 1905 (*Chem.-Ztg.* 29, 1225) and many others since then in *Parfumerie mod.*, *Caoutchouc et guttapercha* and *Bull. soc. chim.* in 1923-25.

C. A. R.

Reaction of caryophyllene. D. T. GIBSON. *J. Chem. Soc.* 1928, 750-1.—A soln. of N_3CHCO_2Et in caryophyllene (b_{100} 124°, n_D^{15} 1.5012), gradually added to an excess of caryophyllene at 180-200° in the presence of finely divided Cu gives a cyclopropane ester, b_{100} 130-60°; the ester is hydrolyzed by 10% KOH , giving the cyclopropane acid, $C_{16}H_{26}CO_2H$, m. 165° [α]₄₄₀ —40° ($EtOH$, *c* 1); the acid is stable to Br in $CHCl_3$ and is only very slowly attacked by boiling acid $KMnO_4$. The mother liquor contains a resinous acid, which is the sole product when a more concd. alkali is used in the hydrolysis. The use of this reaction is shown in its application to supa oil. C. J. W.

Oxidation of reactive methylene groups. WILHELM TREIBS AND HARRY SCHMIDT. *Ber.* 61B, 459-65(1928).—Semmler and his collaborators had found that in cedrene, gurjunene and α -pinene the CH_2 group adjacent to a double bond is oxidized to CO or C(OH) by CrO_3 - $AcOH$ and Schroeter converted tetralin into tetralone in the same way. T. and S. undertook to det. how generally applicable the method is and in repeating Semmler's expts. found that the yields are small; moreover, CrO_3 is sufficiently sol. in $AcOH$ only on the addn. of H_2O . Accordingly, T. and S. used CrO_3 in Ac_2O , in which up to 30% CrO_3 can be dissolved; the presence of H_2O , which may be a disturbing factor in some cases, is thus avoided and the H_2O formed in the reaction is removed from the field of action, and furthermore sensitive alcs. are acetylated at the moment of formation and protected from further oxidation. The substance to be oxidized can be dild. with any desired quantity of a solvent stable towards CrO_3 , such as CCl_4 . Although a considerable excess of CrO_3 was used, a part of the material always remained unchanged and a part further oxidized through the alcs. and ketones. α -Pinene gave verbenol and verbenone; dipentene yielded carveol and carvone; cyclohexene formed cyclohexenol and an unsatd. ketone; tetralin was oxidized to tetralone and the corresponding alc.; from terpineol was obtained an unsatd. glycol. Of the terpenes with a semicyclic double bond, sabinene and sabinol yielded cuminaldehyde, isopropylcyclohexenone and cymene; camphene gave camphenilone, camphenilene-aldehyde and camphenilanic acid; α -fenchene gave fenchocamphorone, fenchenilene-aldehyde and fenchenilanic acid; β -pinene (nopinene) formed an unsatd. acid $C_{10}H_{16}O_2$ and an aldehyde smelling of cuminal, together with ketones of a verbenone-like odor and the corresponding alcs. Octylene yielded caprylic acid and an aldehyde $C_{10}H_{16}O_2$ (probably a ketoaldehyde), together with unsatd. alcs. α -Phellandrene gave cuminaldehyde, unsatd. alcs., $C_{11}H_{18}O$ and some cymene. These results show that the observations of Semmler and of Schroeter are a general property of a CH_2 group adjacent to a double bond in a ring while a semicyclic methene union has got the same influence on an adjacent CH_2 group but is itself very reactive.

C. A. R.

2-Aminofluorenone. ALFRED ECKERT AND ERNST LANGBECKER. *J. prakt. Chem.* 118, 263-81(1928).—Upon oxidation of the nitration product of 2-acetaminofluorene

and hydrolysis there are obtained 2 products, 1 sol. in dil. HCl, bluish black, sinters at 279° (the Ac deriv. does not m. 300°) and the residue, 2-amino-3-nitrofluorenone (I), deep violet-red, m. 269° (Ac deriv., red, m. 245-6°); the structure of the latter follows from the removal of the NH₂ group, giving 3-nitrofluorenone, m. 210°. Reduction gives 3-aminofluorenone, m. 158-9° (Ac deriv., m. 215°). Reduction of I gives 2,3-diaminofluorenone, reddish brown, m. 185° (quinoxaline deriv., reddish yellow, m. 209°). Nitration of 2-aminofluorenone gives principally the 7-NO₂ deriv.; the Ac deriv. behaves similarly. Nitration of the 2-carbethoxyamino (reddish yellow, m. 167-8°) or 2-BzNH deriv. gives principally the 3-NO₂ deriv. 2-Carbethoxyamino-3-nitrofluorenone, reddish yellow, m. 204°, the di-NO₂ deriv., a lighter color, m. 256-7°. Nitration of the 2-NH₂ deriv. in concd. H₂SO₄ also gives the 7-NO₂ deriv. 2-Hydroxy-7-nitrofluorenone, red, m. 298-9°. 2-Aminofluorene in AcOH and Br give a tri-Br deriv. (II), pale rose, m. 198°, the corresponding fluorenone, red, m. 279°; a Br could not be replaced by MeO. Through the diazo reaction there is obtained a tribromofluorenone, yellow, m. 267-8°, the II₂ deriv., yellow, m. 303°, results through the diazo reaction from II. 2-Methoxyfluorene and Br give a tri-Br deriv., m. 188°, the fluorenone, light yellow, m. 265-6°. The mother liquor contains a dibromo-2-methoxyfluorene, m. 121°. Nitration of 2-methoxyfluorene gives a mixt. of 2 NO₂ derivs. The mixt., yellow, m. 217°, and the NH₂ deriv. m. 146-7°.

C. J. WEST

Introduction of the triphenylmethyl group into phenols. D. R. BOYD AND D. V. N. HARDY. *J. Chem. Soc.* 1928, 630-8.---Heating Ph₃COH and PhOH to boiling for 1 hr gives 97% of 4-HOC₆H₄CPh₃, m. 282°. Gently boiling 4 g. Ph₃COH and 5 g. 4-HOC₆H₄CO₂Me for 1 hr. and hydrolysis with HI-AcOH gives 1.9 g. 4-hydroxytetraphenylmethane-3-carboxylic acid, m. 232°; heating above the m. p. gives 4-HOC₆H₄CPh₃; Ac deriv., m. 210°; boiling with Br in AcOH gives the 5-Br deriv., m. 239°; these compds. are insol. in aq. alkalis. HNO₃ in AcOH gives the 5-NO₂ deriv., light yellow, m. 226°, which is readily sol. in dil. NaOH. Ph₃COPCl₂ and PhOH, heated at 120°, give 87% of 4-HOC₆H₄CPh₃; with *m*-MeC₆H₄OH there results 4(2),2(4)-HOMEc₆H₄CPh₃ and Ph₃CH, *p*-MeC₆H₄OH gives Ph₃CH and a small amt. of the *ds-p*-tolyl ester of triphenylmethylphosphorous acid, m. 179-80°. 4-Acetoxy-3-methyltetraphenylmethane, m. 150°. *o*-MeC₆H₄OMe (9 g.) and 6 g. Ph₃COH in 60 cc. AcOH and 12 g. H₂SO₄ give 8.56 g. 4-methoxy-3-methyltetraphenylmethane, m. 165°, also prepd. by direct methylation of the 4-IIO deriv.; Br in AcOH gives the 3-Br deriv., m. 180°. A study of the stability of various 4-HOC₆H₄CPh₃ derivs. towards H₂SO₄ and HI-AcOH is reported; the stability is altered markedly by the presence of substituent groups; the influence of a substituent is dependent both on its chem. nature and on its position in the mol.

C. J. WEST

Action of sodium triphenylmethyl upon trimethymethoxyammonium iodide and of triphenylmethyl halides upon trimethylamine. L. W. JONES AND M. W. SEYMOUR. *J. Am. Chem. Soc.* 50, 1150-4 (1928).---Ph₃CNa and Me₃N(OMe)I probably give as the primary product Me₃N(OMe)CPh₃, which decomps. into Me₃N, Ph₃CH and HCHO, which react to give Ph₃CCH₂OH. All attempts to add Ph₃C halides to Me₃N or MeI to Ph₃CNMe₂ were unsuccessful.

C. J. WEST

Basic triphenylmethane dyes. K. BRAND (I) WITH A. MODERSOHN; (II) WITH GERTRUD SCHUCK. *J. prakt. Chem.* 118, 97-122, 123-137 (1928).---Further evidence that the color changes observed when solns. of crystal violet or malachite green are gradually acidified are due to progressive conversion of the Me₂N groups into non-auxochromic dimethylammonium ions, is furnished by the study of the corresponding methylated quaternary salts. The Me ether of (Me₂NC₆H₄)₂COH yields with 1 mol. Me₂SO₄ a monomethosulfate, m. 234-6°, decomps. from 227°; the corresponding MeI deriv. is hydrolyzed by boiling dil. AcOH to iodine green; with 2 mols. of Me₂SO₄, there results a mixt. of products from which was obtained on 1 occasion an impure dimethiodide, which, after hydrolysis and removal of a little iodine green, gave a yellow aq. and an orange HCl soln.; with 3 mols. Me₂SO₄, a trimethosulfate, m. 223-4° (decompn.). The corresponding trimethoperchlorate, m. 303-4° (decompn.), is hydrolyzed by dil. acid to the colorless substance (I), C(C₆H₄NMe₂ClO₄)₂OH, m. 291-2° (decompn.), which gives with concd. mineral acids carbonium salts similar in color and stability to those of Ph₃COH. When the Me ether (II) of (Me₂NC₆H₄)₂PhCOH is successively treated with Me₂SO₄ (1 mol.) and NaClO₄, it affords a methoperchlorate, m. 167-8°, which is converted by boiling HClO₄ into the orange-red compd. (III), PhC(C₆H₄NMe₂)₂ClO₄·ClO₄·H₂O, m. 253-4° (decompn.). This is hydrolyzed by H₂O to the colorless methoperchlorate of (Me₂NC₆H₄)₂PhCOH. The dimethoperchlorate, m. 295-6°, of II, is hydrolyzed by dil. acid to the dimethoperchlorate (IV), m. 287-8°, of (Me₂NC₆H₄)₂PhCOH, which gives halochromic solns. similar to those of Ph₃COH. The methosulfate,

decomps. 246° , and the *methoperchlorate* (V), m. $217-8^{\circ}$ (decompn.), of (*p*-Me₂NC₆H₄)-Ph₂COH give yellow solns. in concd. mineral acids, which are decolorized by H₂O. The carbinol is converted by (CO₂H)₂ into a mixt. of the colorless oxalate with an orange salt (VI) and by boiling MeOH into its *Me ether*, m. $90-1^{\circ}$, which forms a *methosulfate*, m. $159-64^{\circ}$, and a *methoperchlorate*, m. 274° . The ordinary Zeisel method is not applicable to Ph₂CH derivs. contg. 2 or more Me₂N groups since the latter also yields MeI under these conditions. Correct results are, however, obtained by heating the substances with HI at 100° . Although iodine green gives no ppt. with neutral AgNO₃, it is quant. converted by NaClO₄ into the corresponding *diperchlorate*. Cond. measurements with iodine green, tetramethyldiaminotriphenylmethane-MeI, crystal violet and I, III, IV and V above indicate that in each case all the acid radicals are ionogenic. Accordingly, formulas of polyacid salts of Ph₂CH dyes included within the coordination complex are probably incorrect. The above carbonium salts fall into 4 groups of decreasing stability, containing 3, 2, 1 and 0 Me₂N groups. The colors violet, green, orange-red and orange-yellow, are independent of the no. of Me₂N groups present and are similar to those for the corresponding polyacids of crystal violet. C. J. WEST

Dioximes. XLVI. G. PONZIO AND C. CERRINA. *Gazz. chim. ital.* **58**, 26-35 (1928); cf. C. A. **22**, 578. The present work deals with the action of NH₄OH on diacylglyoxime peroxides and describes a new series of dioximes, viz., *acylaminoglyoximes*, of the general type RCOC(:NOH)C(:NOH)NH₂. These exist in 2 forms, of which that with the higher m. p. is obtained by heating with dil. AcOH the form with the lower m. p. They are dehydrogenated in acid soln. to the corresponding peroxides, which with SnCl₂ lose O and can be regarded as furoxans: RCOC(:NOH)C(:NOH)NH₂ → RCOC.N.O.N(:O).CNH₂ → RCOC.N.O.N:C.NH₂. This dehydrogenation can-

not be effected with the usual reagents for dioximes with no NH₂ group, but is readily accomplished with Br water and represents a *new method of prepn. of peroxides*. Dibenzoylglyoxime peroxide (I) (cf. C. A. **21**, 1099; **22**, 578) (10 g.) added slowly with cooling to 6 N NH₄OH (35 cc.), let stand 24 hrs., filtered, the filtrate acidified with dil. H₂SO₄, refiltered, satd. aq. AcONa added, filtered, washed with water and purified by resoln. in dil. H₂SO₄ and pptn. with AcOH or by resoln. in NH₄OH and pptn. by AcOH, gives 7 g. of *α-benzoylaminoglyoxime monohydrate*, BzC(:NOH)C(:NOH)-NH₂.H₂O (II), straw-color, m. 127° (decompn.), gives an intense wine-red color with aq. FeCl₃; its solns. in NH₄OH, KOH and NaOH are yellow; it gives in NH₄OH with AgNO₃ a *Ag salt*, C₆H₅O₂N₃Ag, yellow, explodes around 130° ; it ppts. in dil. EtOH with Ni(OAc)₂ a *Ni deriv.*, yellowish, decompd. by dil. AcOH, and in dil. EtOH with Cu(OAc)₂ a *Cu deriv.*, dark green, stable toward dil. AcOH. In 10% NaOH, II forms with BzCl a *di-Bz deriv.* BzC(:NOBz)C(:NOBz)NH₂, m. $158-9^{\circ}$. Heated with 15% AcOH for some hrs. on a water bath, II isomerizes to *β-benzoylaminoglyoxime*, BzC(:NOH)C(:NOH)NH₂ (III), m. 187° (decompn.), which is purified by addn. of dil. NaOH, filtration, addn. of dil. AcOH to the filtrate, and recrystn. from boiling water, its solns. in NH₄OH, KOH and NaOH are yellow; it gives a brown-red color with aq. FeCl₃, with Ni(OAc)₂ ppts. a *Ni deriv.*, yellowish, and with Cu(OAc)₂ ppts. a *Cu deriv.*, dark green. Heated with 2 N NH₄OH on the water bath, III is gradually transformed to Bz(C₂N₂O)NH₂. BzCl added to III in 20% NaOH gives a *di-Bz deriv.*, BzC(:NOBz)C(:NOBz)NH₂, m. 198° . Br water (Cl, CrO₃ and KMnO₄ are less desirable) added to II in 10% H₂SO₄ and the ppt. recrystd. from EtOH, yields *benzoylaminoglyoxime peroxide*, Bz(C₂N₂O₂)NH₂ (IV), golden yellow, m. 145° (decompn.). SnCl₂ (5 g.) in glacial AcOH (40 g.) and HCl (4 g. of d. 1.19) heated gently with IV (1.5 g.) in glacial AcOH (20 cc.) and dild. with water ppts. *benzoylaminofurazan*, Bz(C₂N₂O)NH₂ (V), m. 135° , also prepd. by treating I with cold Ac₂O or by heating for some hrs. on the water bath either II or III with 2 N NH₄OH; heated with BzCl it forms a *Bz deriv.*, Bz(C₂N₂O)NHBz, m. $139-40^{\circ}$, hydrolyzed by dil. HCl. The compd. obtained by Holleman by treating I with NH₄OH (cf. *Rec. trav. chim.* **6**, 78 (1887); **11**, 265(1892)) and regarded by him and by Boeseken (*Rec. trav. chim.* **16**, 297(1897)) and by B. and van Lennep (C. A. **6**, 2745) as another compd. was really V. With the method for prepg. II was prepd. from di-*p*-tolylglyoxime *α-p-tolylaminoglyoxime monohydrate* (VI), straw-color, m. 114° (decompn.), gives a wine-red color with aq. FeCl₃, gives with Ni(OAc)₂ a *Ni deriv.*, yellowish, decompd. by dil. AcOH, and with Cu(OAc)₂ a *Cu deriv.*, dark green, stable toward dil. AcOH. Heated as before with 15% AcOH, VI forms *β-p-tolylaminoglyoxime*, m. 188° (decompn.), gives yellow solns. in NH₄OH and alk. hydroxides. Br water and VI yield *p-tolylaminoglyoxime peroxide*, yellow, m. 145° (decompn.), reduced by SnCl₂ to *p-tolylaminofurazan*, m. 165° . The latter is also formed by heating VI with 2 N NH₄OH and crystg. from C₆H₆.

It is the compd. obtained by Boeseken (*loc. cit.*) but considered to be 3-*p*-toluyl-5-aminoazoxime. *p*-Anisoylamino-furazan, m. 144°, is the compd. prepd. by Böeseken and regarded as 3-*p*-anisoyl-5-aminoazoxime. C. C. DAVIS

Relative ease of formation of rings. II. JULIUS V. BRAUN. *Ber.* 61B, 441-3 (1928); cf. *C. A.* 22, 1153; Leuchs, *C. A.* 22, 1352.—Like L., v. B. has found that when ring closure is effected (with 1 mol. AlCl_3 in CS_2) in $\text{PhCH}_2\text{CH}_2\text{CH}(\text{CH}_2\text{Ph})\text{COCl}$ (yellow oil, b_{15} 198-202°), a 6-, not a 5-membered ring is formed, the product (yellow oil, b_{15} 220-5° and soon solidifying (yield, 60%); *oxime*, m. 119°), being *ac*- β -benzyl-tetralone, since the product of its reduction by Clemmensen's method, *ac*- β -benzyl-tetralin, b. 194-5°, gives C_{10}H_8 when its vapors are passed in a CO_2 atm. over PbO heated to dark redness. Similarly, *benzylsuccinyl chloride*, light yellow oil, $b_{0.5}$ 115-7° (in the vacuum of a H_2O pump it decomps. slightly), with AlCl_3 gives 60-5% (if not more than 10 g. of the chloride is used at 1 time) of 1-tetralone-3-carboxylic acid, m. 144°, b_{15} 218-20°, also formed from benzylsuccinic anhydride and AlCl_3 ; *Et ester*, b_{15} 175-7°; *semicarbazone*, m. 264°. Reduction of the acid gives *ac*- β -tetralincarboxylic acid, b_{15} 168-70°, m. 97°. C. A. R.

Action of chlorosulfonic acid on α - and β -naphthylamines. A. CORBELLINI *Giorn. chim. ind. applicata* 9, 355-7 (1927); *Brit. Chem. Abstracts* 1927A, 1179.— α and β -Naphthylamine sulfates are sulfonated by ClSO_3H , the chief products being those obtained by the use of other sulfonating agents. Thus with the α -compd. the main products are the 4- and 5- SO_3H acids, which are also formed by the action of fuming H_2SO_4 , whereas β - $\text{C}_{10}\text{H}_7\text{NH}_2$ gives the 5- and 8- SO_3H acids in proportions similar to those formed by the action of either H_2SO_4 or fuming H_2SO_4 . C. C. DAVIS

Identification of organomagnesium halides by crystalline derivatives prepared from α -naphthyl isocyanate. HENRY GILMAN AND MARGARET FURRY. *J. Am. Chem. Soc.* 50, 1214-6 (1928).—Reactive organometallic compds. may be conveniently identified by the formation of α -naphthalides from α - $\text{C}_{10}\text{H}_7\text{NCO}$. The following new α -naphthalides were obtained from the proper RMgX : *hexahydrobenzo*, m. 188°; *phenylaceto*, m. 166°; *cinnamyl*, m. 217°; *p-tolu*, m. 173°; α -*naphtho*, m. 236°. If an excess of the Grignard reagent is used, the formation of the sparingly sol. urea is avoided. C. J. WEST

Polymerization of indene, cinnamalfuorene and some derivatives of indene. G. S. WHITBY AND MORRIS KATZ. *J. Am. Chem. Soc.* 50, 1160-71 (1928).—Indene is converted into high polymers by the catalytic action of SbCl_5 and SnCl_4 ; the products are heterogeneous. The highest polymer isolated was represented by a fraction with a mol. wt. corresponding to $(\text{C}_9\text{H}_8)_{20}$. The polymeric products obtained by heating indene are lower, the higher the temp. used. These products, too, are heterogeneous. There is a clear relationship between the m. p. and mol. wt. of polymers of indene. All of the polyindenes, no matter what their mol. wt., contain 1 double bond per mol. Conclusion: The polymerization of indene proceeds step-wise by the addn., involving the wandering of H, of successive mols. of the monomer, leading to products of the formula $\text{CH}_2\text{C}_6\text{H}_4\text{CH}_2\text{CH}-\left[\text{CH}_2\text{C}_6\text{H}_4\text{CH}_2\text{CH}-\right]_n\text{C}_6\text{H}_4\text{CH}_2\text{CH}$. Cinnamal-

fuorene yields high polymers when treated with SbCl_5 or SnCl_4 , the products being mixts. Heating at 240-50° also causes it to polymerize. Cinnamalindene and benzalindene also can be polymerized by heat and by catalysts. Hydroxybenzylbenzalindene can be polymerized by SbCl_5 . C. J. WEST

Synthesis of meso-alkyl and meso-arylanthracene derivatives. III. EDWARD DE BARRY BARNETT AND J. W. COOK. *J. Chem. Soc.* 1928, 566-72; cf. *C. A.* 21, 3191.— PhCH_2MgCl and 1,5-dichloro-9-benzylantrone (I) give 1,5-dichloro-9,10-dibenzyl-9,10-dihydroanthranol, m. 197°; I and PhMgBr give 1,5-dichloro-10-phenyl-9-benzyl-9,10-dihydro-10-anthranol, m. 167°. The dehydration or the product from MeMgI by heating 1-3 hrs. with AcOH contg. a little HCl or H_2SO_4 gives 1,5-dichloro-9-benzyl-10-methylene-9,10-dihydroanthracene, m. 123°; the 10-benzylidene deriv., m. 158°. The glacial AcOH soln. of the crude dihydroanthranol obtained from Me_2CHMgBr kept overnight at the ordinary temp. after a little HCl had been added gives the yellow 1,5-dichloro-9-benzyl-10-isopropylantracene, m. 138°, which exhibits a green fluorescence in soln. By the action of Grignard solns. on 9,9-diphenyl- and 9,9-dibenzylantrone there were obtained: 9,9-Diphenyl-10-methylene-9,10-dihydroanthracene, m. 192°; 10-benzylidene deriv., m. 254-5°. 9,9-diphenyl-10-benzyl-9,10-dihydro-10-anthranol, m. 228-30°; 10-Me deriv., m. 175°. 10-Phenyl-9,9-dibenzyl-9,10-dihydro-10-anthranol, m. 189°; 9,9,10-tribenzyl-9,10-dihydroanthranol, hygroscopic, m. 140°. 9,10-Dibenzylantracene, m. 245°. 1,5-Dichloroanthrone, PhCH_2Cl and KOH boiled 2 hrs. give 1,5-dichloro-9-benzylantrone, m. 169°; EtOH-KOH gives a red soln., but the compd. cannot

be methylated and is recovered after heating 12 hrs. with Ac_2O and picoline bases. The compd. is recovered unchanged after boiling with HI and red P in AcOH of with Zn and NH_4OH but Zn and $\text{EtOH}\cdot\text{NH}_3$ give 1,5-dichloro-9-benzyl-9,10-dihydro-10-anthranol, m. 179°. 1-Chloro-10,10-dibenzylanthrone, m. 233°, from 1-chloro-9-anthrone, PhCH_2Cl and KOH; with PhMgBr it gives 1-chloro-9-phenyl-10,10-dibenzyl-9,10-dihydro-9-anthranol, m. 260°. The isomeric 1-chloro-10-anthrone gave only resinous products, as did 2-chloro-9-anthrone.

C. J. WEST

Correction regarding methylanthracenes. E. BÖRNSTEIN. *Ber.* 61B, 443(1928).—In B.'s paper on the Fritzsche reagent (*C. A.* 21, 1115), the symbols α and β as applied to the isomeric methylanthracenes on p. 2812, lines 11 and 12 from the bottom, and p. 2814, lines 6 and 8 from the bottom, should be interchanged.

C. A. R.

Stereochemistry of tervalent nitrogen. J. G. JACKSON AND JAMES KENNER. *J. Chem. Soc.* 1928, 573–81.—At the present time the evidence in favor of a non-planar configuration of compds. of tervalent N is to be seen in the dipolarity of the NH_3 mol., which confers on it the capacity of participation in metal-ammine formation; the existence of quinuclidine; a difference in the readiness with which the 2 forms of 4,5-dimethoxy-4,5-dihydroglyoxalone are converted into 5-methoxy-4,5-diphenylisoglyoxalone; and the isomerism of methylisopelletierine with *dl*-methylconhydrinone. Apart from the last instance, the search for isomers demanded by a non-planar configuration has been unsuccessful and it would therefore appear that in general the non-planar readily passes into a planar form, from which the original or its enantiomorph may be regenerated or else that the normal configuration is plane. Preliminary studies were made on β -phenylglutaric acid which, with H_2SO_4 at 150°, gives 1-ketohydrindene-3-acetic acid, m. 151°; semicarbazone, m. 268° (decompn.); *Me* ester, m. 65° (semicarbazone, m. 152°; 2-isonitroso deriv., m. 167° (decompn.)); *Et* ester, b₁₅ 194–200° (semicarbazone, m. 131–2°; 2-isonitroso deriv., m. 193° (decompn.)). β -Phenylglutaryl chloride, b₁₅ 170–90°, m. 46°; with AlCl_3 it gives the above acid, but if impure petroleum ether is used, there results some ω -3-hydrindonylaceto phenone, yellow, m. 78°; disemicarbazone, m. 233° (decompn.); dioxime, crystals with 1.5 H_2O , m. 179°. Detailed directions are given for the prepn. of anthranilodiacetic acid, from which on heating with NaOH at 150° there results indoxylacetic acid; Me_2SO_4 gives the *O*-*Me* deriv., m. 141–2°, crystals with 1 H_2O . In the fusion of Na indoxylacetate with NaNH_2 there is formed a small quantity of the compd. $\text{C}_{17}\text{H}_{15}\text{O}_2\text{N}_2$, m. 163°.

C. J. WEST

Molecular symmetry of acetonilpyrrole. S. B. HENDRICKS. *J. Am. Chem. Soc.* 50, 1205–8(1928).—Laue and spectrum photographs have been obtained and analyzed from crystals of acetonilpyrrole. The unit of structure contg. 4 $\text{C}_{12}\text{H}_{10}\text{N}_4$ mols. has the dimensions $a_0 = b_0 = 10.09$ A. U., $c_0 = 23.85$ A. U. The space group is 4C-2 or 4C-4, the mols. being in the general positions and thus not necessarily having an element of symmetry. The mol. wt. is twice that corresponding to the previously assigned formula. A detn. of the mol. wt. by a differential vapor pressure method gave a value in agreement with the formula $\text{C}_{24}\text{H}_{20}\text{N}_4$.

C. J. WEST

Derivatives of 1,3-dithiolan and of 1,3-dithian. J. C. A. CHIVERS AND SAMUEL SMILES. *J. Chem. Soc.* 1928, 697–702.—Benzyl disulfide and deoxybenzoin, boiled with AcOK in EtOH for $\frac{1}{2}$ hrs., give the mercaptol of benzil, isolated as the dioxide, $\text{C}_{15}\text{H}_{14}\text{O}_2\text{S}_2$, m. 167°; with $\text{CH}_2(\text{CO}_2\text{Et})_2$ it gives, after hydrolysis, $\text{PhCH}_2\text{SCH}_2\text{CO}_2\text{H}$. Ethane- α,β -di-*p*-toluenethiolsulfonate and deoxybenzoin, condensed by AcOK in EtOH, give 2-benzoyl-2-phenyl-1,3-dithiolan; with $\text{CH}_2(\text{CO}_2\text{Et})_2$ there results, after hydrolysis, 1,3-dithiolan-2-carboxylic acid, m. 90° (dibromide, rapidly decomps.; the diiodide is more stable but still could not be purified), and a small quantity of ethylenedithiolacetic acid, m. 107°. Propane- α,γ -di-*p*-toluenethiolsulfonate, m. 65–7°; with deoxybenzoin it gives 2-benzoyl-2-phenyl-1,3-dithian, m. 99–100°, and with $\text{CH}_2(\text{CO}_2\text{Et})_2$, 1,3-dithian-2-carboxylic acid, m. 115–6° (*di-I* deriv.). Pentane- α,ϵ -di-*p*-toluenethiolsulfonate is a liquid, which could not be analyzed; with $\text{CH}_2(\text{CO}_2\text{Et})_2$ and hydrolysis, there results pentane- α,ϵ -dithiolacetic acid, m. 91–2°.

C. J. WEST

Pseudo bases and their salts in the isoxazole series. E. P. KOHLER AND A. H. BLATT. *J. Am. Chem. Soc.* 50, 1217–26(1928).—Triphenylisoxazole (10 g.) and 30 g. Me_2SO_4 , heated until soln. results and then treated with HCl and then with FeCl_3 , gives the FeCl_3 double salt, $\text{C}_{27}\text{H}_{18}\text{ONFeCl}_4$, S-yellow, m. 162°. 2-Methyl-3,4-diphenylisoxazolone and PhMgBr in Et_2O , stirred 1 hr. at room temp. and then boiled until the dark green oil changes to a yellow powder and finally decompd. with HBr , give α,β -diphenylbenzalacetophenone; from the aq. layer there seps. the bromide, $\text{C}_{20}\text{H}_{18}\text{ONBr}$, yellow, which loses MeBr at comparatively low temps. and then m. 209–10°; perbromide, orange, m. 152°; if the MeOH filtrates from the perbromide are dild. with Et_2O , there seps. a colorless bromide, $\text{C}_{22}\text{H}_{18}\text{ONBr}$, which decomps. at

comparatively low temps. and turns yellow in the light; the solubilities of the yellow and white bromides appear to be the same and both form the same FeCl_3 salt and the same perbromide. *Picrate*, yellow, m. 174° . When 5% Na in MeOH is added to the yellow bromide there results the *Me ether*, $\text{PhC}:\text{CPh}:\text{O NMe}.\text{CPhOMe}$, m. 135° (de-

compn.), the HCl soln. with FeCl_3 gives the above Fe salt, m. 162° ; the *Et ether*, m. 118° . The pseudo base is an oil that rapidly changes to other substances. The anhydro compd., $\text{PhCBz}:\text{CPhN}:\text{CH}_2$, results in about 50% yield in the formation of the pseudo base, it m. $140-1^\circ$ and rapidly turns yellow in the air; acids are incapable of regenerating the salts from the anhydro compd. With PhMgBr it gives the compd. $\text{PhCBz}:\text{CPhNHCH}_2\text{Ph}$, m. 134° , whose constitution is established by hydrolysis and the action of O_2 . MeOH gives the compd. $\text{PhCBz}:\text{CPhNHCH}_2\text{OMe}$, m. 104° . The *picric acid addn. product*, yellow, m. 184° . C. J. WEST

Condensation of certain β -ketonic esters with *o*-hydroxymonostyryl ketones. ROWLAND HILL. *J. Chem. Soc.* 1928, 256-9.—2-Hydroxystyryl Me ketone (5 g.) (I), 7.5 g. $\text{AcCHMeCO}_2\text{Et}$ and EtONa (from 1.7 g. Na) give 3.5 g. 4-acetonyl 2,3-dimethyl-1,4-benzopyran, m. 141° ; similarly 2-hydroxystyryl Ph ketone (II) gives the 4-phenacyl deriv., m. 179° . I and $\text{AcCHPhCO}_2\text{Et}$ give 4-acetonyl-3-phenyl-2-methyl-1,4-benzopyran, m. $186-7^\circ$, while II gives the 4-phenacyl deriv., m. $219-21^\circ$. No evidence of a reaction was discovered with $\text{EtO}_2\text{CCOCH}_2\text{CO}_2\text{Et}$, $\text{NCCCH}_2\text{CO}_2\text{Et}$ or $\text{CH}_2(\text{CO}_2\text{Et})_2$. II and $\text{CH}_2(\text{CO}_2\text{Et})_2$ after 10 weeks in EtOH-EtONa gave only coumarin- α -carboxylic acid, from the decompn. product of II (*o*- $\text{HO}:\text{C}_6\text{H}_4\text{CHO}$). C. J. WEST

Behavior of dixanthylene on heating. A. SCHONBERG AND O. SCHÜTZ. *Ber.* 61B, 478-9 (1928).—According to Wizinger (*C. A.* 21, 2893) the color changes of bianthrone (I) on heating depend on the C O groups. Now, dixanthylene (II), which is I in which the C O groups are replaced by O, shows similar color phenomena; the crystals, faintly yellow at room temp., are entirely colorless in liquid air and green at 280° and the melt is dark blue-green, the soln. in boiling *o*- $\text{C}_6\text{H}_4(\text{CO}_2\text{Me})_2$ (282°) is deep blue-green and on cooling the now yellow, somewhat fluorescent soln. deposits unchanged II. Surely the similar behavior of I and II must result from the same cause, which does not agree with W.'s hypothesis. C. A. R.

Hydrogenation of cyclic compounds under pressure in presence of osmium and other catalysts. V. S. SADIKOV AND A. K. MIKHAILOV. *J. Chem. Soc.* 1928, 438-48.—Comparative measurements are reported of the effect of Pt, Pd, Ir and Os, on the hydrogenation of $\text{C}_8\text{H}_7\text{N}$ and quinoline under pressure; the Ipat'ev app. was used and readings are reported for every 15 min. Pt (20% on asbestos) at 320° causes rapid hydrogenation of quinoline, which quickly slackens because of fatigue of the catalyst; the absorption proceeds discontinuously, the curve showing undulations. Pd (20% on asbestos) produces a more uniform and extensive hydrogenation of quinoline; after a short induction period (15 min.), at the optimal temp., absorption starts and soon attains a max. of 5 atm. in 15 min., followed by oscillations from 3 to 2 atm. in 15 min. The powerful catalytic effect of Os, which is effective in a concn. of only 1% on asbestos, is due to the ease of formation of its oxide in contact with the air, or when exposed to the action of H_2O_2 . For 20% Os-asbestos at 300° , a rate of 10.8 atm./hr. (5.6 atm./hr. in a 2nd expt.) was found, the addn. of only 1% CeO_2 caused considerable initial acceleration and increased intensity. Although CeO_2 , when distributed over asbestos to the extent of 20%, will facilitate the hydrogenation of quinoline, giving as much as 88% of the tetrahydro deriv., yet, in the absence of any catalyzing metal, it is incapable of hydrogenating $\text{C}_8\text{H}_7\text{N}$, C_{10}H_8 or C_6H_6 ; similarly it is unable to effect further reduction of tetrahydro- and hexahydroquinoline, whereas this is easily effected on the addn. of Os or Ni. Thus, although Os and Ce jointly produce intense hydrogenation, neither of these alone is capable of giving such an effect. C_6H_6 is not so readily hydrogenated as $\text{C}_8\text{H}_7\text{N}$ with 20% Os on asbestos, the max. in the 1st case being 8 atm. and in the 2nd, 19 atm.; however in the course of the 1st run (4.75 hrs.) in each case an almost equal no. of atms. is absorbed per hr. The addn. of 1% CeO_2 is followed by a marked lowering of the rate of hydrogenation of $\text{C}_8\text{H}_7\text{N}$. These results support the assumption that the activity of the catalyst depends upon some sort of assocn. with the substance undergoing hydrogenation. They also give convincing evidence of the discontinuous character of the activity of the catalyst, which is most clearly exhibited when the easily oxidizable Os is used in presence of CeO_2 as a promoter. Oscillations of activity are evidently closely allied with the cooperation of O, which regenerates the catalyst; the latter, during the process of hydrogenation, experiences a fatigue which is inherent in the nature of the catalytic process. C. J. WEST

• **By-products in the pressure hydrogenation of pyridine.** V. S. SADIKOV AND A. K.

MIKHAILOV. *Ber.* 61B, 421-7(1928).—It has been shown (*C. A.* 21, 3364) that C_6H_5N can be reduced under pressure by the Ipat'ev method if, instead of NiO, Pd or Ir or Os on asbestos is used as the catalyst. Piperidine is obtained in yields of up to 70%; a part of the C_6H_5N is decompd. with loss of NH_3 and another part forms high-boiling hydrogenated by-products of alkaloidal nature. Two such by-products were isolated in the hydrogenation with 20% Os-asbestos a compd. $C_9H_{11}N$ (I), probably *N*-methyl- β -propylpiperidine (*N*-methylconiine), and α, α' -dimethyl- β -propyl-*N, N'*-dipiperidyl (II), $C_{15}H_{30}N_2$. I (yield, 7%), b. 195-200°, d. 0.8415, mol. wt. 151, gives with $K_4Fe(CN)_6$ in acids a bluish H_2O -insol. compd. (III) whose compn., however (Fe 11.99-12.02, N 24.70%) agrees better with the formula $(C_8H_{17}N)_2 \cdot H_4Fe(CN)_6$ than with $2I \cdot H_4Fe(CN)_6$; presumably, the *N*-Me group is split off and 2 of the resulting residues combine through their N atoms to *N*- β' -conyl- β -coniine, which then yields III. Picrate of I, m. 106-7°. When evapd. with an excess of HCl I gives a propylpiperidine-HCl, m. 200°, very sol. in and partly decompd. by H_2O . With MeI I gives a methiodide, probably $2I \cdot MeI$, m. 81°. The formation of I probably results from the decompn. of a C_8H_9N ring into NH_3 , Me and Pr in the hydrogenation and subsequent alkylation of a 2nd ring by the split products. II (yield, 11%), b. 295-300°, d. 0.9088, mol. wt. 232, hydroferrocyanide, $II \cdot H_4Fe(CN)_6$; methiodide, $II \cdot 2MeI$, m. 269-70°. Evapn. of II with HCl gives a compd. $C_{13}H_{26}N_2 \cdot 2HCl$ (IV), m. 258°. From II and picric acid was obtained a substance with C 47.06, H 5.32, N 10.53%, mol. wt. (Rast) 632-739, but on attempting to regenerate II from it by treating with NaOH and distg. with steam, decompn. took place and the small quantity of volatile product gave a HCl salt, m. 157°, with 25.20% Cl (calcd. for IV, 25.17%), which yielded a picrate with a m. p. (191°) different from that of the original picrate. Addn. of 1% CeO_2 to the 20% Os catalyst accelerates the hydrogenation to an unusual extent and gives 34-60% piperidine, 55.80% I and 9-10% II; there can hardly be any doubt that II is formed from I and that its yield depends on the length of heating. If the hydrogenation is carried out in an autoclave provided with a side tube which can be cooled during the heating so that the easily volatile products are protected from further hydrogenation (*C. A.* 22, 1336) the relative yields of the various products are different; 106 g. C_6H_5N heated 36 hrs at 280° with 14 g. of the Os-Ce catalyst (previously used 5 times and reactivated every time with H_2O_2) gave 80.64% piperidine, 3.30% I and 10.20% II; in another expt. where the heating was continued 77 hrs. the yields of I and II were 8.9 and 49.30%, resp. C. A. R.

α -Dimethylaminopyridine and its derivatives. A. F. CHICHBABIN AND I. L. KNUNTANZ. *Ber.* 61B, 427-34(1928).— α - $C_6H_4NNMe_2$ (I) can be obtained quite smoothly in 40-50% yield by treating the Na deriv. of α - $C_6H_4NNH_2$ with Me_2SO_4 , converting the $C_6H_4NNH_2$ and C_6H_4NNHMe in the resulting mixt. into their Ac derivs. with Ac_2O and sepg. the I by fractional distn. I differs from $PhNMe_2$ especially in that it forms no NO deriv. with HNO_3 . Neither does it couple to azo dyes with diazo compds. On the other hand, it is easily nitrated, the 1st product, which can be obtained in 90% yield, being β' -nitro- α -dimethylaminopyridine (II). The most careful search failed to reveal the presence of an isomer. Further nitration gives a dinitro compd. (III), presumably the β, β' -deriv. Reduction of II with Sn and HCl (*C. A.* 21, 1986) gives up to 80% of the β' -amino deriv. (IV), which forms a di-HCl salt quite stable in the air but the free base changes very readily in the air, especially in soln.; it can form diazo compds. with the properties of aromatic diazo compds. and coupling with phenols and amines to azo dyes. With KI the diazotized IV readily yields β' -iodo- α -dimethylaminopyridine (V) and with HBr by the Sandmeyer method the analogous Br deriv. (VI), which is also formed along with the β, β' -di-Br deriv. (VII) by direct bromination of I and is identical with that obtained by methylation of α, β' - $C_6H_3N(NH_2)(NH_2)Br$. Attempts to prep. α, α' - $C_6H_3N(NH_2)NMe_2$ by amination of I with $NaNH_2$ led to the formation of α, α' - $C_6H_3N(NH_2)_2$; probably there is first formed α - $C_6H_4NNH_2$ which then with a 2nd mol. of $NaNH_2$ gives the Na salt of the $C_6H_3N(NH_2)_2$; considerable Me_2NH is formed in the reaction. II, yellow, m. 154-5°. III, m. 125-6°. IV, m. 55-6°, sol. in concd. H_2SO_4 with violet color; di-HCl salt, m. 225-6°; $SnCl_2$ compd., m. 148-50°. V, m. 55°. VI, m. 42-3°, has a strong characteristic odor. VII picrate, m. 185-6°. C. A. R.

Friedel and Crafts' reaction in the pyridine series. C. M. JEPHCOTT. *J. Am. Chem. Soc.* 50, 1189-92(1928).— $C_6H_4(CO)_2O$ with $AlCl_3$ and various addn. compds. of C_6H_5N and of quinoline showed no reaction between the $C_6H_4(CO)_2O$ and the addn. compds. Quinolinic anhydride with $AlCl_3$ and $C_{10}H_8$, acenaphthene and Ph_2 , resp., gave only the corresponding picolinic acid derivs. and no benzoylpicolinic acid except in the case of Ph_2 ; β -naphthoylpicolinic acid (1,2)(I), m. 145°; Me ester, m. 80-2°;

HCl salt, m. 172-3°; *hydrate*, m. 109°. α -Naphthoylpicolinic acid (1,2), m. 155°; *HCl salt*, m. 179-80°; *Me ester*, m. 100-1°. 4-Acenaphthoylpicolinic acid (1,2), m. 168-9°; *HCl salt*, m. 175°; *Me ester*, m. 113-4°; *hydrate*, m. 121°. *p*-Phenylbenzoylpicolinic acid (1,2), m. 170-1°. *Me* quinolinate with SOCl_2 and then with C_6H_5 and AlCl_3 gives benzoylnicotinic acid (II), m. 285°; *Me ester*, m. 87°. Benzoylpicolinyl chloride, C_6H_5 and AlCl_3 give dibenzoylpyridine (1,2), m. 186-7°; the *tolylbenzoyl deriv.*, m. 190-3°. *p*-Tolylpyridophthalide, m. 144°, results by reducing *p*-tolylpicolinic acid with Zn in NH_4OH . Reduction of I gives β -naphthoylpyridophthalide, m. 127°, while II gives the lactone of β -carboxyhydroxy- α -pyridylphenylcarbinol, m. 128°. Phenylpyridophthalide with C_6H_5 and AlCl_3 gives diphenylmethylpicolinic acid (1,2), m. 153°; *Me ester*, m. 109°; *phenyltolyl deriv.*, m. 161°. Heating diphenylmethylpicolinic acid at 170° gives β -pyridyldiphenylmethane, m. 78-9°.

C. J. WEST

Quinoline derivatives. VII. Derivatives of 2-phenyl-4-aminoquinoline. HANNS JOHN AND E. WÜNSCHE. *J. prakt. Chem.* 118, 303-10 (1928); cf. *C. A.* 21, 914.—2-Phenyl-4-chloroquinoline (I), m. 64°, results through the diazo reaction from the 2-amino deriv. in concd. HCl . I (0.6 g.) and 8 cc. of a 5% EtOH soln. of $(\text{Me}_2\text{CHCH}_2\text{CH}_2)_2\text{NH}$ at 150-60° for 8 hrs. give 0.35 g. of the 4-diisoomylamino deriv., m. 61°; 4-anilino deriv., m. 182°; 4-*p*-toluidino deriv., m. 173°; 4-*m*-xylylidino deriv., m. 151° (*picrate*, m. 237°); 4-*ps*-cumidino deriv., m. 188°; 4- α -Naphthylamino deriv., m. 177-8° (*picrate*, m. 246°); 4- β -naphthylamino deriv., m. 185° (*picrate*, m. 219°); 4-benzylamino deriv., m. 147° (*picrate*, m. 241°); 4-hydrazino deriv., m. 143° (*Ac deriv.*, m. 184-5°), condensation product with BzH , $\text{C}_{22}\text{H}_{17}\text{N}_3$, yellow, m. 151°, whose *picrate*, yellow, m. 256° (decompn.); the condensation product with PhAc , pale green-yellow, m. 195-6° (*picrate*, yellow, m. 112°). Di-[2-phenyl-4-quinolyl]amine, from I and the 2-NH₂ deriv., 3 hrs. at 250°, m. 253.5°. Qual. descriptions of the HCl salt, sulfate, HgCl_2 salt, chromate and ferrocyanide and the reaction with I-KI are given for most of these derivs.

C. J. WEST

Some arsenical derivatives of quinoline. S. BERLINGOZZI. *Ann. chim. applicata* 18, 31-6 (1928).—The combination of hydroxyquinoline with diazo compds. (cf. B., *C. A.* 21, 2474) suggested the prepn. of analogous compds. from arsenic acid. The products have the compn. *p*-(HO)₂OAsC₆H₄N:N(C₆H₄N)(OH)R and are not readily sol. in org. solvents, so that they must be purified through their alk. salts. Such compds. are of interest because of their potential therapeutic value. NaNO_2 (1.1 g.) in water (20 cc.) added slowly with agitation to *p*-H₂NC₆H₄AsO(OH)₂ (4 g.) in ice-cold *N* HCl (78 cc.), let stand 15 min., poured into 2-methyl-4-hydroxyquinoline (2.4 g.) in *N* KOH (95 cc.), let stand 0.5 hr., acidified with AcOH , satd. with NaCl , filtered, washed with cold water, and the ppt. purified by soln. in *N* KOH , acidification with AcOH , and recrystn. from boiling EtOH , yields 2-methyl-3-azo-4-hydroxyquinoline-*p*-phenylarsonic acid, brown, does not m. below 300°, gives an intense ruby-red with concd. H_2SO_4 . In the same way 8-hydroxyquinoline yields 5-azo-8-hydroxyquinoline-*p*-phenylarsonic acid, chocolate, has properties like the preceding deriv. Similarly 2-phenyl-3-hydroxyquinoline yields 2-phenyl-4-azo-3-hydroxy-*p*-phenylarsonic acid, carmine-red, has similar properties to the preceding derivs., except that concd. H_2SO_4 forms a brilliant red with violet-blue by reflection. 2-Methyl-3-hydroxyquinoline yields 2-methyl-4-azo-3-hydroxy-*p*-phenylarsonic acid, blood-red, gives a brown color with concd. H_2SO_4 .

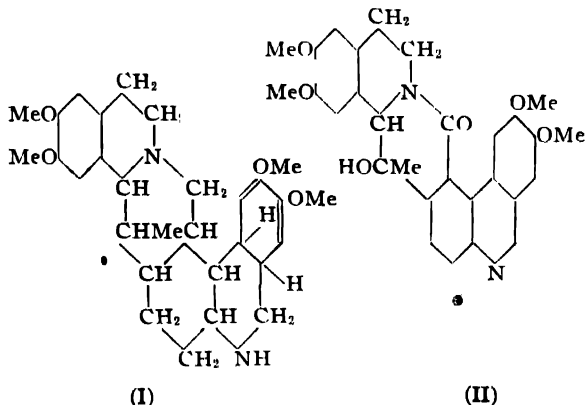

C. C. DAVIS

Acridines. IV. Preparation of hydroxyacridines and different 5-position acridine derivatives. H. JENSEN AND F. RETHWISCH. *J. Am. Chem. Soc.* 50, 1144-50 (1928), cf. *C. A.* 21, 1815.—In the prepn. of the following acridine derivs. *o*-H₂NC₆H₄CHO, a slight excess of the corresponding halogen deriv. of C_6H_5 , Cu powder and Na_2CO_3 in PhNO_2 were refluxed for 3 hrs. at 220°; the hydrolysis to the HO deriv. was effected by HI and traces of red P. 3(7)-Ethoxyacridine, yellow, m. 99° (*picrate*, yellow, does not m. 250°; 1(9)-MeO deriv., light yellow, m. 130-1° (*picrate*, orange-red, decomp. 250°); 1(9)-HO deriv., yellow, m. 116.5° (*picrate*, red m. 216°); 5-methylacridine, slightly yellow, m. 114° (*picrate*, yellow, m. 213-4°); 5,3(7)-dimethylacridine, cream, m. 90° (*picrate*, yellow, darkens 215°, m. 225°); 3(7)-nitro-5-methyl deriv., brown-yellow, does not m. 300°; 1(9)-nitro-5-phenyl deriv., yellow, m. 189-90°; 3(7)-ethoxy-5-phenylacridine, yellow, m. 105-7°. The condensation product, $\text{C}_{14}\text{H}_{11}\text{O}_2\text{N}$, of *o*-H₂NC₆H₄CHO and *o*-BzC₆H₄OMe, light yellow, m. 99°. 2-Acetyl-4'-nitrodiphenylamine, yellow, m. 152°. 2,5-Cl(O₂N)₂C₆H₃Ac and PhNH_2 give the compd. $\text{C}_{14}\text{H}_{11}\text{O}_2\text{N}$, light yellow, m. 125°. Et acridine-5-carboxylate, yellow, m. 78° (*picrate*, yellow, m. 226°; *HCl salt*, yellow, m. 250°); *Me ester*, slightly yellow, m. 126.5-7.5° (*picrate*, yellow, m. 229-30°; *HCl salt*, yellow, does not m. 250°).

C. J. WEST

Synthesis in the phenazine series. HAMILTON MCCOMBIE, H. A. SCARBOROUGH AND WM. A. WATERS. *J. Chem. Soc.* 1928, 353-9.—1-Methylphenazine (I), pale yellow, m. 108°, results in small yields from 2,3-(H₂N)₂C₆H₃Me and *o*-C₆H₄O₂ in Et₂O or by reducing 2-nitro-2'-methyldiphenylamine (orange-yellow, m. 76°; in 10% yield from *o*-ClC₆H₄NO₂, *o*-MeC₆H₄NH₂ and AcONa 20 hrs. at 220-40°) with SnCl₂ and HCl to the 2-amino deriv., m. 64°, which is heated with 4 times its wt. of PbO at 200-40°; the chloroplatinate of I, orange, decomps. above 200°. 2-Chlorophenazine, yellow, m. 139°, results by heating 4-ClC₆H₄(2-H₂NC₆H₄)NH with PbO. 4'-Bromo-2-nitrodiphenylamine, red, m. 167° (10-20% yield from *o*-ClC₆H₄NO₂, *p*-BrC₆H₄NH₂ and AcONa) the 2-NH₂ deriv., m. 128°, gives on heating with PbO 2-bromophenazine, yellow, m. 150°. 2-Nitro-4'-methoxydiphenylamine, orange-red prisms, m. 89°, *a*:*b*:*c* = 1.008:1:-0.799, *n* 1.73-1.74 for red light; other crystallographic data are given. The 2-NH₂ deriv., m. 78°, gives with PbO 2-methoxyphenazine, yellow, m. 126°; chloroplatinate, orange, gradually decomps. above 250°. 2-Nitro-2'-methoxydiphenylamine, red, m. 83°; the 2-NH₂ deriv., m. 58°; heating with PbO gave only phenazine; other methods of ring closure gave no trace of a phenazine deriv. Since 2-methoxyphenazine is not identical with hemipyocyanine, a hydrolysis product of pyocyanine, 1 possible formula for this compd. is eliminated. The yield of the phenazine derivs. is always of the order of 5%, so that a suitable synthesis has as yet not been developed. 2,2'-H₂NC₆H₄-(HO₂CC₆H₄)NH, m. 204°, yields a HCl salt, needles, decomps. about 240°; the free acid, heated 1 hr. at 250°, gives 4-aminoacridone(?), m. 255°; concd. H₂SO₄ appears to give a similar substance. C. J. WESS

Alkaloids of ipecacuanha. H. STAUB. *Helv. Chim. Acta* 10, 826-37(1927); cf. Späth and Leithe, *C. A.* 21, 1816; Brindley and Pyman, *C. A.* 21, 2698.—Emetine-HBr, C₂₉H₄₀O₄N₂·2HBr (cf. Carr and Pyman, *C. A.* 8, 3418), becomes yellow at 210° and m. 248° to an orange liquid. Oxidation of emetine with Br (cf. Carr and Pyman, *C. A.* 8, 3418) yields dehydroemetine bromide, C₂₉H₃₈O₄N₂Br (methiodide, +5H₂O, m. 199° after sintering at 174°), which crystallizes with 2, 3, or 6H₂O, according to the solvent used for crystn., and is anhyd. from acetone. Careful oxidation of dehydroemetine bromide with alk. KMnO₄ yields hydroxyketodehydroemetine, C₂₉H₂₈O₆N₂, m. above 305°, a "substance D," C₂₉H₃₄O₁₀N₂, decomps. 244° after darkening at 220°, and *m*-hemipinimide.

Formula I is suggested for emetine and II for hydroxyketodehydroemetine. B. C. A.

Condensation of certain aldehydes with ketones of the morphine group. J. M. GULLAND. *J. Chem. Soc.* 1928, 702-6.—Dihydrocodeinone (2 g.) and 8-aminopiperonal (1.1 g.) with Na (1 g.) in EtOH give 2.2 g. dianhydro-6-aminopiperonal-dihydrocodeinone, m. 270-71.5°, which gives a colorless soln. (without fluorescence) in concd. H₂SO₄; this behavior, with other examples previously reported, would indicate that the quinuclidine bases of this type, in which the attached groups form the larger part of the mol., do not necessarily yield fluorescent solns. Methiodide, pale yellow, which becomes orange at 200°, decomps. about 260°. BzH and hydroxydihydrothebainone in EtOH-KOH give the benzylidene deriv., yellow, m. 188°; attempts to prep. a quinoline deriv. by condensing with 6-aminopiperonal were fruitless. Thebainone and BzH give a benzylidene deriv. (I), canary-yellow, m. 233°; EtOH-FeCl₃ gives a brilliant green color; concd. HCl or H₂SO₄ gives a deep red color, discharged on diln. with H₂O; methiodide,

yellow, m. 195–7° (decompn.). *Piperonylidenebainone*, yellow, m. 176°; concd. HCl or H₂SO₄ gives a deep reddish purple soln. Reduction of I with H and PdCl₂ gives a mixt. of *benzylidenebainone A*, m. 229°, which seps. first from EtOH; Na salt, orange; concd. HCl gives an orange halochromic color; H₂SO₄, a bright red; *semicarbazone*, m. 155–60°; the *B isomer*, m. 179°, seps. as plates or as needles with 0.5 EtOH; both forms show the same halochromic forms as the *A isomer*; *semicarbazone*, m. 140–5°; *oxime*, m. 152°. *Benzylidenebainol*, faintly yellow, m. 100–2°; concd. H₂SO₄ gives an orange-red, concd. HCl a yellow color, discharged on addn. of H₂O.

C. J. WEST

Synthetic experiments on the aporphine alkaloids. I. Synthesis of 5,6-dimethoxyaporphine. J. M. GULLAND AND R. D. HAWORTH. *J. Chem. Soc.* 1928, 581–91. *o*-O₂NC₆H₄COCl (from 45 g. acid) and 45 g. veratrylethylamine in 250 cc. C₆H₆ give a buff-colored ppt., which, decompd. with 10% NaOH, gives 73 g. 2'-nitrophenylaceto-β-3,4-dimethoxyphenylethylamide, m. 112°; concd. H₂SO₄ sulfonates the amide, giving an orange soln. completely miscible with H₂O; with PCl₅ in CHCl₃ at room temp. after 24 hrs., 4 g. amide gives 3.5 g. 2'-nitro-6,7-dimethoxy-1-benzyl-3,4-dihydroisoquinoline, orange, m. 132°; HCl salt, pale yellow, m. 228° (decompn.); Ac₂O gives a pale yellow soln.; methiodide, pale S-yellow, m. 208°. NH₄OH gives a deep red soln. and an Et₂O-sol., red, amorphous solid; alk. fusion gives *m*-O₂NC₆H₄Me and 6,7-dimethoxy-2-methyl-3,4-dihydroisoquinoline, reduction in MeOH with Zn and 10% H₂SO₄ gives 2-[4',5'-dimethoxy-2'-β-methylaminoethyl]phenylindole, crystg. with 1EtOH, m. 85° and then 132°; it does not give the carbylamine reaction but shows characteristic indole reactions; HCl salt, crystg. with 1EtOH, melts about 105°, resolidifies and then melts at an indefinite temp., *mono-Ac deriv.*, m. 138°. With HCl and NaNO₂ the base gives the 3-oximino deriv., m. 178°; dil. HCl gives a strawberry-colored soln., NaOH a pale yellow soln.; PhOH and concd. H₂SO₄ give a yellow color but the characteristic NO reaction is absent. The above methiodide with Zn and HCl gives 2'-amino-6,7-dimethoxy-1-benzyl-2-methyltetrahydroisoquinoline (I), oily; di-HCl salt, m. 243–4° (decompn.); the diazo soln., pale orange, gives with β-C₁₀H₇OH a crimson-yellow dye, *mono-Ac deriv.*, m. 153–4°; from the mother liquor of the above base there sepd. the di-HCl salt, m. 186° (decompn.), of 2-[4',5'-dimethoxy-2'-β-methylaminoethyl]phenyl-dihydroindole, oily, it gives no color with a pine shaving or with *p*-Me₂NC₆H₄CHO, the nitrosamine is a light brown oil. The base I is converted into 5,6-dimethoxyaporphine, m. 136–7°, by diazotizing it in 2 N H₂SO₄ and adding Cu powder or by diazotizing it in a mixt. of MeOH and 2 N H₂SO₄ and heating the soln. on the H₂O bath; the yield is only 10–15% of the theory, the chief by products being the dilaisanosine deriv and the phenolic base, the former predominating in the 1st method, the latter in the 2nd. The base gives a colorless soln. in concd. H₂SO₄, a pinkish purple color with Erdmann's reagent, a deep bluish purple with Frohde's reagent, and a green color, rapidly turning brown, with Mandelin's reagent. HCl salt, m. 258° decompn.; methiodide, m. 223°.

C. J. WEST

Stereoisomerism in polycyclic systems. IV. Two stereoisomerides of 2,3,4,5,11,13-hexahydroquinindene. WM H. PERKIN, JR. AND S. G. P. PLANT. *J. Chem. Soc.* 1928, 639–46; cf. C. A. 22, 780. The reduction of 2,3-dihydroquinindene with Sn and HCl by boiling on the steam bath for 5 hrs gives a mixt. of 2,3,4,5,12,13-hexahydroquinindene(A) (I) and (B) (II) in the ratio of 1:3; these are sepd. through the 5-Bz deriv.; the 5-Bz deriv. of I seps. from EtOH and m. 174°, recrystn. of the 2nd crop from Me₂CO gives the 5-Bz deriv. of II, m. 161°. Hydrolysis of these derivs gives I, m. 67° (5-Ac deriv., m. 102°, *picrate*, yellow, m. 193°), and II, m. 72–84° (5-Ac deriv., m. 87°; *picrate*, orange, m. 158°). The electrolytic reduction gives II and I in the ratio of 12:1. Considerations of strain and of the relative amts. of the 2 forms produced lead to no certain indication as to which is the *cis*- and which the *trans*-modification.

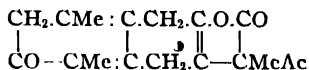

C. J. WEST

Purification of brucine. FELIX SAUNDERS. *J. Am. Chem. Soc.* 50, 2331 (1928). The soln. of brucine-HCl is treated with 20% of its vol. of EtOH and the soln. made definitely alk. with NH₄OH; pptn. is complete in 1 week.

C. J. WEST

Oxidation of santonin. II. On the rotatory power of some oxidation products of santonin. S. S. MEDVEDEV AND E. N. ALEKSEVA. *Trans. Karpov Inst. Chem.* 1926, No. 5, 57–61; cf. C. A. 21, 2476.—Santoninic acid must be considered as a product of partial dehydration, i. e., as dehydrosantoninic acid. To prove the similarity of structure and configuration of santoninic, santonin and santonin acids their optical powers have been compared. It has been found, as could be expected in case their configuration is similar, that the rotatory powers increase in the following order: santoninic → santonin → santonin acid. The actual figures obtained (in alc.) were as follows:

Santoninic acid $[\alpha]_D -26.5^\circ$, santonic acid -70.0° , santenonic acid -125.5° . The concn. of the solns. had almost no influence on the rotation figures. Santenonic acid, on being heated *in vacuo*, loses 2 mols. of water and becomes an unsatd. lactone $C_{11}H_{16}O_3$, santonene, $[\alpha]_D -280.9^\circ$. Santonene has been acetylated; the optical activity of the product is -1507° in alc. and -1500° in $CHCl_3$, for the line D of the Na flame. This extremely high optical activity, which is the 2nd greatest among all known org. compds., shows that acetylsantonene must have the formula

where, in the lactone ring, an at. group is present which enhances optical activity.

BERNARD NELSON

Saponins and allied compounds. XX. Ursolic acid. 2. The action of acetic anhydride on ursolic acid. A. W. VAN DER HAAR. *Rec. trav. chim.* **47**, 585-90 (1928); cf. *C. A.* **22**, 424.—Studies previously carried out by II. on the action of Ac_2O on CO_2H acids have shown (*C. A.* **22**, 1342) that mixed anhydrides are not formed but that compds. are obtained consisting of the anhydride of the CO_2H acid with 1 mol. of Ac_2O of crystn. With the sapogenin of sugar beets, $C_{30}H_{48}(OH)CO_2H$, the same result was obtained, the OH group being acetylated at the same time (*C. A.* **22**, 424). Therefore the expts. carried out previously with ursolic acid (*C. A.* **18**, 2511), which has the same formula $C_{30}H_{48}(OH)CO_2H$, as the sapogenin from sugar beets, were repeated and it was found that this acid was converted by means of Ac_2O into *diacetylursolic anhydride* contg. 1 mol. of Ac_2O of crystn., $\alpha_D^{16} 62.5^\circ$. This compd. m. $200-1^\circ$ in the Ac_2O of crystn., which evaps. at higher temps. with formation of *diacetylursolic anhydride*, m. 320.2° . On boiling a soln. of diacetylursolic anhydride with 1 mol. of Ac_2O of crystn. in alc. *acetylursolic acid*, m. $279-80^\circ$, is obtained. In connection with this result the facts communicated in (*C. A.* **18**, 2511; **19**, 73, 74) are to be corrected and to be replaced by those obtained in this investigation.

C. F. VAN DUIN

Bromoporphyrin I and tetramethylhematoporphyrin iron salt. II. HANS FISCHER AND GEORG HUMMEL. *Z. physiol. Chem.* **175**, 75-90 (1928).—Bromination of tetramethylhematoporphyrin Fe salt in $CHCl_3$ gives the Fe salt of the same bromoporphyrin I that is obtained by treating hematoporphyrin in AcOH with Br. The reaction consists in a breaking off of the hydroxyvinyl group and substitution of Br on both side chain and pyrrole nucleus. Oxidation of this brominated Fe salt with CrO_3 yields bromocitraconimide, m. 178° . Removal of the Fe by heating with HBr-AcOH gives bromoporphyrin I; this was further identified by prepn. of its Me ester, which showed no depression of m. p. when mixed with the known substance. The same substance was obtained by treatment of the brominated Fe salt with HI and red P and esterification of the product, and by treatment with cold concd. H_2SO_4 and subsequent esterification. The ester forms a complex Fe salt when treated with KBr, $Fe(OAc)_3$ and AcOH, and this is identical with the ester obtained by bromination of the tetramethylhematoporphyrin Fe salt. Oxidation of the ester in H_2SO_4 by CrO_3 gives bromocitraconimide and hemateic acid. Bromoporphyrin I is remarkably stable. It withstands 3 hrs. heating at 140° with 5% KOH, 3 hrs. at 180° with 5% KOMe in MeOH and 2 hrs. at 180° with HBr-AcOH. Bromination of tetramethylhematoporphyrin in AcOH yields a cryst. perbromide, which rapidly loses Br but not completely, as shown by formation of $BrCH_2Ac$ when treated with MeAc, the final product being the ester of bromoporphyrin I. Tetramethylhematoporphyrin may be obtained by addn. of MeOH to hemin by means of HCl as well as H_2SO_4 but in smaller yield. Protoporphyrin reacts much less readily with MeOH-HCl than does hemin, indicating a difference in their resp. side chains. Oxidation of protoporphyrin by alk. $KMnO_4$ gave evidence of the formation of a new porphyrin.

A. W. DOX

Halogeinated proteins. IX. Chloroovoprotein. ALB. J. J. VANDEVLEDE. *Rec. trav. chim.* **47**, 458-63 (1928); cf. *C. A.* **22**, 88.—*Chloroovoprotein* with 10.06% N and 17.5% Cl was obtained as a gray powder, almost entirely sol. in water and in alkalies, by the prolonged action of Cl in CCl_4 on ovoprotein, the max. wt., 24.1 g. from 20 g. of ovoprotein, being reached only after 9 months. The action of water, KOH soln. and EtOH on this substance at room temp. has been studied. On treating 2 g. chloroovoprotein with 20 cc. water, after one day 11.5% and after 15 days 6.5% has not dissolved, the insol. part showing the same compn., N 12.6% and Cl 10.3%, in both cases. The soln. contains after 1 day 0.0172 g. organically combined Cl but after 15 days all the Cl is present in the ionogenic state. Two g. of chloroovoprotein on treatment with 20 cc. N KOH dissolves completely in the course of 1 day; on addn. of 25 cc. N AcOH

a ppt. of 0.7 g. is obtained after 1 day and of 0.5 g. after 15 days. Both ppts. show again the same compn., N 13.0% and Cl 10.1%, the soln. in both cases contg. all the Cl in the ionogenic state. With 2 g. of chloroövoalbumin and 20 cc. EtOH 0.80 and 0.88 g. dissolve after 1 and 15 days, resp., the residues showing the same compn., N 12.0% and Cl 11.7%. After 1 day the soln. contains 0.1412 g., of ionogenic Cl and 0.0696 g. organically combined Cl, these figures being 0.1667 and 0.0523 g., resp. after 15 days. A comparison with the bromoövoalbumin described previously (C. A. 18, 2134) shows that chloro- and bromoövoalbumin have the same compn. Attempts to prep. a chloropeptone corresponding to the bromopeptone, already described (C. A. 18, 2501) were unsuccessful, the absorption of the Cl being slow and the substance becoming sticky so that the contact with the Cl becomes much impeded. Three halogenated caseins were obtained by the action of Cl, Br and I on casein from centrifuge milk, the compn. of these substances being: chlorocasein, N 12.2%, Cl 11.6%; bromocasein N 12.1%, Br 21.3%; iodocasein, N 12.14%, I 19.8%. It is still to be remarked that all the halogenated proteins obtained by the action of halogens in CCl_4 on dry, powd. proteins contain more halogen than those obtained by wet treatment.

C. F. VAN DUIN

Sterol group. II. Formation of ψ -cholestene and cholestenone by the dry distillation of cholesterol. I. M. HEILBRON AND W. A. SEXTON. *J. Chem. Soc.* 1928, 347-51; cf. C. A. 22, 1362.—The dry distn. of cholesterol at atm. pressure gives, in addn. to H_2O and a complex mixt. of low-boiling hydrocarbons, cholestenone and ψ -cholestene. The formation of the latter is the result of 2 distinct reactions: dehydration of part of the cholesterol to cholesterilene and dehydrogenation of a further part to cholestenone, the H evolved in the latter reaction being utilized for the hydrogenation of the cholesterilene. The 2nd reaction takes place more readily than the 1st.

C. J. WEST

The colloidal and elastic properties of poly vinyl acetate (WHITBY, *et al.*) 30. Some derivatives of β,γ -dimethylbutadiene (MACALLUM, WHITBY) 30. A new tetramethylbutadiene (MACALLUM, WHITBY) 30. Spectrographic study of cyanamide. Ultra-violet absorption spectra of cyanamide, dipropylcyanamide and dipropylcarbodiimide (FRANSEN) 3. Pb carbonate and acetate (Brit. pat. 273,660) 18. Catalysis under reduced pressures (GRIGNARD) 2. Decomposition of diacetone alcohol by weaker bases (ÄKERLÖF) 2. Electrolysis of anhydrous formic acid (BAUR) 2.

Organic arsenic compounds. A. BINZ and C. RÄTH. U. S. 1,667,237, April 24. See Brit. 255,839 (C. A. 21, 2907).

Condensation product of olefins with hydrocarbons of the naphthalene series. R. MICHEL. U. S. 1,667,214, April 24. Olefins such as C_2H_4 , or a gas contg. C_2H_4 and its homologs are caused to react upon C_{10}H_8 , tetrahydronaphthalene or other hydrocarbons of the C_{10}H_8 series, in the presence of AlCl_3 or other catalytically active metal halide, under pressure and at temps. above 50° (suitably about 100 – 200°). The products formed are of an oily nature and may be used as motor fuels or as intermediates.

Stable diazo preparations. I. G. FARBERNIND. A.-G. Brit. 273,352, Jan. 25, 1926. Aromatic diazo compds. which have been sepd. in solid form (except *o*-diazophenol aryl and alkyl ethers and the neutral 1,5-naphthalenedisulfonic acid diazonium salts of unsulfonated substituted aromatic amines) are mixed with metal salts of aryl-sulfonic acids. The metal salts of benzenemono- and disulfonic acids, naphthalene di- and polysulfonic acids, benzylsulfonic acid and tetrahydronaphthalenesulfonic acid are especially suitable. Cu or Al salts or alkali chromates also may be added. Several examples are given.

Catalyzer for methanol synthesis. T. E. LEFORT. Can. 276,300, Dec. 13, 1927. The catalyzer consists of a finely ground mixt. of Zn and Bi_2O_3 in the proportion of 3 mols. Zn to 1 mol. Bi_2O_3 .

Acetic acid and anhydride. HOLZVERKOHLUNGS-INDUSTRIE AKT.-GES. Brit. 274,076, July 6, 1926. In the prepn. of concd. HOAc or Ac_2O from aq. HOAc, the latter is esterified, *e. g.*, with EtOH, and the vapor of the ester is subjected to a high temp. ("such as 50 – 700° ") to produce HOAc and an unsatd. hydrocarbon such as C_2H_4 while avoiding the presence of Fe and Fe oxide. Catalysts may be used such as Cu, Ag, Ag phosphate and phosphates of alkali or of bivalent or trivalent metals.

Concentrating acetic acid or similar acids. SOC. ANON. DES DISTILLERIES DES DEUX-SEVRES. Brit. 273,744, July 1, 1926. Aq. acid solns. are extd. with an acetic

acid ester or mixts. of such esters and the ext. is distd. to sep. first an aq. ester, then the rest of the ester and finally the anhyd. acid; a 10% HOAc soln. may be treated with EtOAc or a 5% butyric acid soln. may be treated with butyl acetate.

Acetaldehyde and acetic acid from ethyl alcohol. S. GOLDSCHMIDT. U. S. 1,666,447, April 17. Ag is used as catalyst in oxidizing EtOH with air at temps. of 380–440°.

Ketene, acetic acid and acetic anhydride. H. DREYFUS. Brit. 273,822, June 26, 1925. Ketene is produced by subjecting AcH vapor to a high temp., preferably in the presence of a dehydrogenating catalyst such as Ni, Cu or Zn at 150–300° and at atm. pressure, although temps. up to 500° and pressures of 5–50 atm. may be employed, especially if a catalyst is not used. The ketene may be collected in the gaseous state and used in acetylation processes such as in the manuf. of cellulose acetate, or may be used to form HOAc or Ac₂O. The AcH used as starting material may be obtained as described in Brit. 273,810 (following abstr.) and the H necessary for that method may be that evolved in the ketene-forming reaction.

Recovering waste acetic acid. H. DREYFUS. Brit. 273,810, June 26, 1925. Waste or dil. HOAc such as is obtained in the manuf. of cellulose acetate is subjected to reduction to produce AcH, which is sep'd., and may be converted into glacial HOAc or other conc'd. or anhyd. products. The reduction may be effected by gases contg. H, with or without CO, in the presence of catalysts such as Ni, Fe, Zn, Sn, Pb, Ag, Pt, Pd and Cu and materials such as pumice, glass wool and NaCl also may be used. A temp. of 250–300° is suitable when Ni and H are used, but a temp. of 400° is used with glass wool.

Reduction of arsonic acids. A. BINZ. U. S. 1,667,238, April 24. 2-Hydroxy-5-pyridinearsonic acid or other arsonic acids which do not condense with addn. products of sulfoxylic acid are treated with such addn. products, e. g., with Na acetone sulfoxylate, to effect their reduction, e. g., to produce 2,6-dihydroxy-3,5-arsenopyridine.

Alkyl ethers of 3'-nitro-4'-hydroxy-*o*-benzoylbenzoic acid. I. GUBELMANN, H. J. WEILAND and O. STALLMANN. Brit. 273,342, June 28, 1926. 3'-Nitro-4'-halogen-*o*-benzoylbenzoic acid or its alkali salts is treated with an aliphatic alc. such as MeOH or EtOH in the presence of NaOH or other alk. substance and after heating for some time the reaction mass may be treated with HCl and fractionally distd.

Formic acid. G. H. BUCHANAN and J. L. OSBORNE. U. S. 1,666,437, April 17. Formic acid is added to Ca formate or other alk. earth formate and NaCl, and an acid such as H₂SO₄ is added which is capable of effecting decompn.; the formic acid liberated is then distd. and collected. The preliminary addn. of formic acid to the reaction mixt. serves to facilitate mixing and permits return of dil. formic acid for concn.

Sulfonic acids. J. THOMAS, H. A. E. DRESCHER and SCOTTISH DYES, LTD. Brit. 273,347, Dec. 24, 1925. Halogen-2-benzoylbenzoic acids (other than 3'-nitro-4'-halogen-2-benzoylbenzoic acids) are treated in the form of their salts with a sulfite or bisulfite at temps. above 100° to effect replacement of the halogen by the sulfonic group; if the parent material contains more than one halogen atom only part of the halogen may be replaced. Several examples are given.

Ketonecarboxylic acids. I. G. FARBENIND. A.-G. Brit. 273,321, June 24, 1926. Maleic anhydride is condensed with hydrocarbons such as C₁₀H₈, acenaphthene, 1-methylnaphthalene, α - or β -naphthol, anthracene or like compds. having free peri-positions, in the presence of acid condensing agents such as AlCl₃, Na Al chloride or FeCl₃, suitably in the presence of a solvent such as PhNO₂. There are first formed, especially with a solvent of low b. p., open-chain carboxylic acids, which on further condensation yield cyclic ketonecarboxylic acids.

Cyclic ketones. I. G. FARBENIND. A.-G. Brit. 274,095, July 8, 1926. The process of Brit. 273,321 (cf. preceding abstract) is modified by replacing the maleic anhydride by dicarboxylic anhydrides derived from it by addn. at the double bond of H or other substance such as Cl, Br, HCl or HBr. Open-chain ketonecarboxylic acids may be produced as intermediate products. Several examples are given.

Naphthalene-1,4,5,8-tetracarboxylic acid. I. G. FARBENIND. A.-G. Brit. 274,103, July 9, 1926. Naphthalene-1,4,5,8-tetracarboxylic acid is made by oxidizing the cyclic ketonic compds. which may be produced as described in Brit. 274,095 (preceding abstr.) from acenaphthene and a dicarboxylic anhydride derived from maleic anhydride by addn. at the double bond. The oxidation may be effected in an acid or alk. medium with a dichromate or permanganate.

Anthraquinonyl- α -ketones. I. G. FARBENIND. A.-G. Brit. 273,774, July 5, 1926. Anthraquinonyl- α -ketones are made by oxidation of benzanthrone having an alkyl, carboxyl, or nitrile group in the Bz-1 or Bz-2 position or having alkyl groups in both the Bz-1 and Bz-2 positions. Chromic acid together with glacial HOAc may be used

for the oxidation. Examples are given for the production of 1-acetylanthraquinone, anthraquinonyl methyl diketone and similar products Cf. C. A. 22, 1595, 1783.

Condensation products of alkylphenols with ketones. CHEMISCHE FABRIK AUF AKTIEN, VORM. F. SCHERING. Brit. 273,684, June 29, 1926. Alkylphenols are condensed with ketones in the presence of a condensing agent such as HCl at a temp. below 100° (suitably at 30–40° for 2 days with *m*- or *p*-cresol and acetone) to form polymerized products which are capable of acylation.

Aminophenol derivatives. CHEMISCHE FABRIK GRÜNAU LANDSHOFF & MEYER AKT.-GES. Brit. 274,175, April 10, 1926. *N*-Monoalkyl-*p*-aminophenols are made by hydrolyzing *O*-alkyl-*N*-alkylacyl-*p*-aminophenols with H₂SO₄ under conditions of time, temp. and strength and quantity of acid which prevent formation of sulfonated derivs. Methylphenacetin may be heated with 6 equivs of 50% H₂SO₄ for 3 hrs. at 139° or with 3 equivs. of 70% acid for 4.5 hrs. at 146°.

Phenol derivatives. CHEMISCHE FABRIK AUF AKTIEN VORM. F. SCHERING. Brit. 274,439, July 14, 1926. Alkylphenols and cyclohexanols are obtained by catalytic hydrogenation; e. g., *p*-dihydroxydiphenylmethane yields *p*-ethylphenol and phenol by hydrogenation under pressure, with a Ni catalyst contg. Bi, while with a Ni catalyst contg. Mn 4-ethylcyclohexanol and cyclohexanol are obtained; similarly, *p*-dihydroxydiphenylmethane gives either *p*-cresol and phenol or 4-methylcyclohexanol and cyclohexanol; *p*-dihydroxytriphenylmethane yields *p*-benzylphenol and phenol with a Ni catalyst contg. Bi Cf. C. A. 21, 2704.

Reducing phenol with hydrogen. A. IRINYI. Brit. 273,493, July 8, 1926. Reaction between phenol vapor and a reducing gas such as H at a high temp. (suitably 750°) for producing C₆H₆ is effected by heating the gasified phenol and the reaction gas separately to the required temp., and then bringing them together. An app. is described.

Hydrogenating phenolic compounds. CHEMISCHE FABRIK AUF AKTIEN VORM. F. SCHERING. Brit. 273,685, June 29, 1926. Alkylisopropylphenols or the corresponding cyclohexanols are obtained by treating alkylisopropylphenols with H₂, preferably at an elevated temp. and under pressure. Examples are given of the manuf. of thymol, menthol, 4-methyl-6-isopropylphenol and 4-methyl-6-isopropylcyclohexanol. The alkylisopropylphenols may be made by the process of Brit. 273,686 (following abstract).

Alkylisopropylphenols, etc. CHEMISCHE FABRIK AUF AKTIEN VORM. F. SCHERING. Brit. 273,686, June 29, 1926. Condensation products of alkylphenols and ketones (which may be made by the process described in Brit. 273,684) are heated to 280–320° to effect depolymerization. Examples are given of the production of dimethylcoumarans and 3-methyl-6-isopropylphenol.

Alkyl derivatives of diphenolisatin. A. BLANKART. U. S. 1,667,239, April 24. Diphenolisatin is treated with Me₂SO₄ or other alkylating agents to obtain products which crystallize, are neutral, insol. in water, alkali and acids but readily sol. in usual org. solvents.

Amines. BRITISH DYESTUFFS CORPORATION, LTD., R. W. EVERATT and F. H. RODD. Brit. 273,923, Aug. 25, 1926. Dialkyl aromatic amines are sepd from monoalkyl aromatic amines by treating the mixt with phosgene in the presence of water to convert the monoalkyl amine into urea chloride; an alkali is added to neutralize any amine hydrochlorides formed when the proportion of monoalkyl amine in the mixt is as much as 25–30%.

Chlorinated aromatic amines. T. VOLTZ. U. S. 1,667,336, April 24. In the manuf. of tetrachloroaniline or other chlorinated aromatic amines, a hydroaromatic C₆H₅ deriv. contg. N in the form of a ketimino group and having in the same hydroaromatic nucleus most of the H atoms substituted by Cl, e. g., hexachlorochloroketiminotetrahydrobenzene, is treated with a reducing agent such as Na₂S in MeOH at a moderate temp. and while so far as possible excluding water and strong acids.

Alkylene diguanidines. M. HEYN. Brit. 274,259, June 18, 1926. See Can. 276,107 (C. A. 22, 1595).

Alkali fusion. V. R. KOKATNUR. U. S. 1,667,480, April 24. In effecting substantially anhyd. fusions such as production of indanthrene blue R, an inert hydrocarbon diluent such as kerosene is used and the quantity of alkali employed is not more than about twice the quantity theoretically required for the reaction.

Aldol and crotonaldehyde. O. SILBERRAD. Brit. 273,776, Nov. 15, 1926. Aldol is made by gradual addn. of AcH to a Ba(OH)₂ sludge while cooling; the reaction product is neutralized by oxalic, acetic or other "weak" acid and the aldol may be dist. off and converted into crotonaldehyde.

Paraformaldehyde. E. KUSS. U. S. 1,666,708, April 17. MeOH substantially

free from water is catalytically oxidized to CH_2O by an O-contg. gas, the reaction gases are cooled so as to condense a mixt. of CH_2O and water vapor and the resulting liquid is concd. by means of the uncondensed gases and the concd. soln. is allowed to solidify.

Thymol. E. K. NELSON. U. S. 1,666,342, April 17. California laurel oil is distd. and the vapors are passed through a tube heated to 280° ; thymol is sepd. from the distillate by a soln. of caustic alkali.

Diacylisoithiocarbamide S-alkyl ethers. H. SCHOTTÉ. U. S. 1,667,053, April 24. An acyl chloride such as benzoyl chloride, *p*-nitrobenzoyl chloride or acetyl chloride is caused to react on the soln. of a salt of a S-alkylisoithiocarbamide in a weak org. base such as pyridine. Dibenzoyl-S-ethylisoithiocarbamide, m. $111-12^\circ$, is insol. in water and is difficultly sol. in alc. and more easily sol. in ether. The corresponding dinitrobenzoate melts (with foaming) at about 216° . The diacetate is an oily substance. S-methyl- and S,N-dimethylisoithiocarbamide hydroiodide may also be used as starting materials for obtaining analogous derivs. which may serve as intermediates for the production of *pharmaceutical* and other *preps.*

Anthraquinone derivatives. BRITISH DYE STUFFS CORPORATION, LTD., A. SHEPHERDSON and A. J. HAILWOOD. Brit. 274,226, April 26, 1926. 1-Nitroanthraquinone-8 sulfonic acid is reduced in neutral or alk. soln. with less reducing agent (e. g., Na sulfide, Zn dust and NH_4Cl or glucose) than would be required for reduction to the amino compd. The product, probably 1-hydroxylaminoanthraquinone-8-sulfonic acid, yields indanthronedisulfonic acid on heating with alkali. The sulfonic groups can be split off from the indanthronedisulfonic acid, e. g., by electrolytic reduction in a divided cell as described in Brit. 273,043 (C. A. 22, 1736); as the disulfonic acid is first reduced to the leuco compd. the latter may be prepd. by reduction with hyposulfite prior to the electrolytic reduction. Various details are given.

Homologs of naphthalene. I. G. FARBENIND. A.-G. Brit. 273,665, June 30, 1926. The process described in Brit. 265,601 (C. A. 22, 433) is modified by substituting for C_2H_4 olefins or gases contg. olefins such as oil gas or gas from cracking operations. The product may be used as a *motor fuel*. The olefins may be absorbed with C_{10}H_8 in successive stages as the homologs of C_2H_4 react more easily than C_2H_4 itself.

Condensation product of naphthalene or its derivatives. R. MICHEL. Can. 276,270, Dec. 13, 1928. A condensation product of C_{10}H_8 or of hydrogenated naphthalene is manufd. by heating together C_{10}H_8 or its hydrogenated deriv. and Al_2Cl_6 under pressure at a temp. not below 50° , and distg. the mixt.

Imino-1-hydroxy-2-naphthoquinones. R. LANTZ and A. WAHL. U. S. 1,666,241, April 17. These compds. are produced by oxidizing 1,2,4-aminonaphtholsulfonic acid in the presence of primary aromatic amines such as aniline, *o*-toluidine, *o*-anisidine, *p*-chloroaniline or *p*-phenylenediamine.

1-Phenyl-3-methyl-5-pyrazolone. I. G. FARBENIND. A.-G. Brit. 274,366, Feb. 5, 1927. 1-Phenyl-3-methyl-5-pyrazolidone is treated, in aq. acid soln., with O or an O-contg. gas in the presence of a heavy-metal salt such as Cu chloride, which may be assoc. with FeCl_3 .

Ozonides. A. S. RAMAGE. Brit. 273,832, April 13, 1926. Olefinic material is treated with ozone or ozonized air, preferably at temps. $30-40^\circ$ below the b. p. to obtain various products suitable for use as turpentine substitutes, motor fuels, substitutes for linseed oil in paints or resin substitutes. An app. is described.

Vinyl acetate. E. BAUM, H. DEUTSCH, W. O. HERRMANN and M. MUGDAN. U. S. 1,666,482, April 17. C_2H_2 and HOAc vapor are brought into contact with metal salts such as Cd acetate at temps. above the b. p. of the HOAc.

PAUL E. HOWE

A—GENERAL

FRANK P. UNDERHILL

Artificial albumin cells. L. A. HERRERA. *Atti accad. Lincei* [6], 7, 32-5 (1928).—The appearance in Colpoids prepd. from ovalbumin of granular strings which on standing approach protoplasm in certain respects (cf. *Rend. accad. Lincei* [6], 4, 343 (1926)) suggested the treatment of ovalbumin with various reagents to det. whether further imitations of cellular protoplasms could be obtained. By allowing grains of ovalbumin to fall from a considerable height (e. g., 3.8 mm.) through a sieve on to fuming HNO_3 , concd. H_2SO_4 or concd. HCl, cells are formed which macroscopically and micro-

scopically have a reticular structure. This structure depends upon an emulsion of the acid with the ovalbumin. With concd. H_2SO_4 , the structural units after washing, dyeing and mounting resembled microscopic amebas, with vacuoles and very fine granular pseudopods and with nucleated cells. No movement was evident. A cellular membrane of hexagonal structure is formed by compressing egg albumin and 50% H_2SO_4 , letting stand, washing, staining, treating with xylene and mounting. The cells with no visible nuclei and the vacuoles compose a structure closely resembling plant tissue, particularly that of *Pelargonium inquinans*. With the Duchartre technic evidence of chromosomes was obtained. C. C. DAVIS

Plant proteases. X. The mode of action of yeast polypeptidase. WOLFGANG GRASSMANN and HANNS DYCKERHOFF. *Z. physiol. Chem.* 175, 18-37(1928).—A simpler method for prep. polypeptidase free from dipeptidase, without recourse to the adsorption procedure, consists in autolyzing the yeast in the presence of NH_4OH , pptg. with $AcOH$, dissolving the ppt. in NH_4OH and removing the protein degradation products by dialysis against running water. • Polypeptidase withstands this NH_4OH treatment while the dipeptidase is completely destroyed. Expts. with the tripeptides, leucylglycylglycine and glycylglycylleucine show that the amino acid carrying the free NH_2 group is split off quant., leaving the residual dipeptide intact, whereupon the hydrolysis comes to an abrupt standstill. This highly sp. enzymic action contrasts sharply with partial alk. hydrolysis which in each case yields 2 amino acids and 2 dipeptides. Peptide derivs with a substituted NH_2 group are not attacked by the enzyme. Neither benzoyldiglycylglycine nor β -naphthalenesulfonylglycyltyrosine showed any cleavage. The 2 tetrapeptides, leucylglycylglycine and triglycylglycine, behave in a similar manner, splitting off the terminal amino acid, leucine and glycine, resp. With leucylglycylglycine the hydrolysis stops with the splitting off of leucine, and the failure of the enzyme to effect further cleavage of the residual tripeptide is due merely to the strongly inhibitory action of the liberated leucine. The reaction does not consist in a cleavage of the tetrapeptide into 2 dipeptides as was previously supposed. The enzyme has less affinity for glycine polypeptides than for those contg. also leucine, and the former are therefore much less susceptible to the inhibitory action of leucine. Glycine polypeptides are more resistant to enzymic hydrolysis, although less resistant to alk. hydrolysis as shown by Abderhalden. A. W. DOX

Cozymase in ripening plant organs. HANS V. EULER and SVEN STEFFENBURG. *Z. physiol. Chem.* 175, 38-51(1928).—In a no. of higher fungi, e. g., *Armillaria melleus*, *Hygrophorus chlorophanus*, *Clavaria cristata*, *Polyporus ungulatus*, *Lactarius rufus*, as well as in leaves of green plants, e. g., *Vicia faba*, *Vaccinium vitis idaea*, cozymase was demonstrated, by means of the micro-fermentation method with washed dried yeast, as an indispensable factor in the anaerobic part of the carbohydrate respiration. In addn. to cozymase, a substance or group of substances occurs which inhibits the action of the zymase system. It is thermostable and dialyzable through collodion, and thus sharply distinguishable from the inhibitory substance of carbohydrate degradation in muscle. In the flesh of the apple the cozymase content is extremely low or else the cozymase action is suppressed by inhibitory substances of this nature. Since the tissue respire vigorously and consumes O , a valid assumption is that the respiration depends less on sugars than on other substances such as plant acids. A. W. DOX

Mutase. HANS V. EULER and EDV. BRUNIS. *Z. physiol. Chem.* 175, 52-67(1928).—For the prep. of aldehyde-mutase from liver press juice, pptn. by $EtOH$ is unsuitable because of its tendency to destroy the enzyme. Fractional pptn. by $MeAc$, however, yields an enzyme of about twice the initial purity. Adsorption on $Al(OH)_3$ does not occur at pH 6.6 or 8.5, and kaolin and $UO_2(NO_3)_2$ are likewise unsatisfactory adsorbents. Liver ext. causes dismutation of aldehydes (Cannizzaro reaction) and also decolorization of methylene blue. The 2 reactions might be attributed to the same enzyme if it is assumed that the donor action of the zymophosphate in the methylene blue reduction gives rise to a cleavage product which undergoes dismutation in the same manner as an aldehyde or an intramol. rearrangement. Conversely, a dismutation product might have the property of reducing methylene blue. However, the 2 reactions show no parallelism even in the presence of excess of cozymase and H-donors. No evidence is adduced in support of the identity of aldehyde-mutase and redoxase, but on the other hand the expts. do not disprove their possible identity. The presence of cozymase is required for both reactions. A. W. DOX

Condensation of sugars with proteins. S. P. L. SØRENSEN and L. L. LØRBER. *Wochschr. Brau.* 44, 484(1927).—Condensation of sugars and proteins does not occur in uncoagulated egg albumin, but with coagulated albumin there was evidence of condensation. C. N. FREY

A new test for ergothioneine upon which is based a method for its estimation in simple solution and in blood filtrates. GEORGE HUNTER. *Biochem. J.* 22, 4-10 (1928).—The test depends upon the use of diazotized sulfanilic acid with the development of a red color. It can be applied quantitatively. BENJAMIN HARROW

Isolation of a second sterol from yeast-fat. IDA SMEDLEY-MACLEAN. *Biochem. J.* 22, 22-6 (1928).—The author has isolated a white sterol, which she calls *zymosterol*, m. 108-9°, and having the formula, $C_{27}H_{46}O$. It is dextro-rotatory. The *zymosterol* is closely related to ergosterol. BENJAMIN HARROW

Structure and enzyme reaction. III. The system polysaccharide-amylase-protein. S. J. PRZYLECKI AND HEDWIGA NIEDZWIECKA. *Biochem. J.* 22, 34-42 (1928); cf. *C. A.* 22, 248.—The velocity of reaction in the system polysaccharide-amylase-protein gel is regulated by the concn. of unadsorbed substrate. Uncoagulated egg white present as a sol in this system does not retard hydrolysis. Retardation of reaction depends upon the state of dispersion of the adsorbed enzyme. Adsorption of amylase upon protein does not affect its activity, while the action of alcs. is confined to elution of the polysaccharide. These results are identical with those obtained with charcoal as the adsorbent (see *C. A.* 22, 248). Starch and glycogen, present in cells in small quantities, are mainly adsorbed upon proteins, which are present to the extent of 10% in the cell fluid. The concn. of these polysaccharides in the solvent is probably less than 20% of their total amt. BENJAMIN HARROW

Biological significance of the unsaponifiable matter of oils. III. Fish-liver oils. H. J. CHANNON. *Biochem. J.* 22, 51-9 (1928).—In the liver oils of the Selachii, the higher the percentage of unsaponifiable matter in a given oil, the lower is the percentage of sterol in that fraction. Outside of the Squalidae family, squalene was not detected in the oils studied. See *C. A.* 20, 2506. BENJAMIN HARROW

Note on the unsaponifiable matter from the stomach oil of *Scymnorhinus lichia*. F. D. KAMM. *Biochem. J.* 22, 77-9 (1928).—In the unsapon. matter there was found squalene 1000 g. and residue 45 g., the two together representing 50.6% of the original oil. BENJAMIN HARROW

Studies on xanthine oxidase. X. The action of light. FREDERICK BERNHEIM AND MALCOLM DIXON. *Biochem. J.* 22, 113-24 (1928).—Light accelerates the reduction of methylene blue by the xanthine oxidase, but only if traces of oxygen are present. Preliminary exposures of the oxidase soln. or the methylene blue to light and oxygen produces an acceleration of the reaction if the exposure is for a short period, and a destruction of the enzyme if exposed for longer periods. Small quantities of H_2O_2 accelerate the reactions and larger quantities cause destruction of the enzyme. B. H.

Urinary proteins not originating in blood. W. A. THOMAS, K. W. SCHLEGEL AND EDMUND ANDREWS. *Arch. Internal Med.* 41, 445-8 (1928); cf. *C. A.* 19, 108.—Artificial uremia was produced in dogs by injecting hypertonic salt solns. into animals made acid by the absorption of autogenous edema fluid. Protein-contg. urine was also produced by etherization. In both series the urine contained in the early stages a foreign protein; after a short time serum proteins also appeared in the urine. For the differentiation Hektoen and Welker's immunological method was used. MARY JACOBSEN

Tonomeiotic action of proteins and theory of the action of tonomeiotic substances generally. ENR. BOTTAZZI. *Arch. sci. biol.* (Italy) 10, 456-501 (1927).—A discussion of results published by B. and others, with 76 references. Proteins, soaps, saponins, etc. lower the surface tension of the solvent only when present in mol. dispersion (true soln.). The surface activity occasionally observed in hydrosols is attributable to a content in molecularly dispersed substance. Only the undissoc. mols. are surface-active; the ions are not at all or only slightly active. The max. surface activity of proteins is coincident with the isoelec. point and may serve for the detection of the latter. The higher surface activity of undissoc. mols. as compared with the ions is a result of their lower degree of hydration and consequently lower affinity for the solvent (Haftdruck), which favors their accumulation on the surface of the soln. M. J.

The phenol origin of melanins. PIETRO SACCARDI. *Biochim. terap. sper.* 15, 17-25 (1928); cf. *C. A.* 20, 2176, 3302 and *Arch. farmacol. sper. sci. affini* 1926, 3302.—Animal melanins seem to be derived from pyrrole rather than from tyrosine (I) or hydroxytyrosine (II). The subcutaneous injection of a satd. slightly alk. soln. of either I or II into rabbits resulted in a positive diazo reaction of the urine and a red discoloration on exposure to air, but unlike pathol. melanuria or injections of pyrrole or natural melanins it did not cause the appearance of Thormaelen's reaction or a brown color and ppt. with air or oxidizing agents. Nor did these compds. or tyrosine black (prepd. with potato tyrosinase) cause trichodermia around the site of injection. According to Galleraui the spectrophotometric curve of the oxidation product of *sepia melanin*

with peracetic acid stands between that of pyrrole black and sepia melanin but does not in the least resemble the melanins of I or II. Pyrrole black resembles the natural melanins more closely with regard to N content and its phys. properties, especially its low soly. in water and acids. Other statements in favor of the tyrosine theory are discussed and dismissed. Neither the decomn. products of pyrrole black nor those of tyrosine black have been obtained from natural melanins. Raper's hypothesis of pyrrole formation from I over 5-6-hydroxyindole is made improbable by Gallerani's findings. Possibly the red oxidation products of adrenaline and I are of a dihydroxyindole nature and I never goes beyond this stage in the organism. The resemblance of the spectrophotometric curves of adrenaline and pyrrole melanins suggests that melanin is formed in the body from commonly occurring substances by a rather simple process.

MARY JACOBSEN

Porphyrins. A. A. HIJMAN VAN DEN BERGH AND MISS HIJMAN. *Verslag Akad. Wetenschappen Amsterdam* **36**, 1096-102 (1927), cf. Bommer, *Klin. Wochschr.* No. **36**, (1927).—The soft pasty scrapings from the teeth and tongue a few hrs. after a meal of bread and milk were dissolved in glacial AcOH-AcOEt (1:4) and shaken out with 5% HCl. The HCl ext. gave a red fluorescence in filtered ultra-violet light and the spectrum of *coproporphyrin* (I) and not that of the porphyrin formed from blood pigment by bacteria *in vitro* or found in intestinal bleeding. Tooth and tongue scrapings and tartar invariably gave this reaction regardless of the nature of the diet. The intensity was the same near the gum margin and at the distal end. Red fluorescence was observed once in the tartar of horses. I can, therefore, not be derived from the blood pigments or the chlorophyll of the food or from blood oozing from the gums. Microscopically the scrapings contained no food elements but consisted of a dense mesh of threads (*Leptothrix*?) in which granules (spores?) and bacteria were embedded. Of the 5 bacterial and 12 mold strains cultured from the scrapings only 1 mold showed red fluorescence but the substance was not extractable with 5% HCl. The I content of the saliva is relatively high but insufficient to be considered as the only source. Both milk and bread contain I. The content may be increased by incubation in the presence of each other. A further increase is caused by extn. of the incubated mixt. with AcOH-AcOEt, and HCl. The latter fact suggests that the reactions taking place in the mouth and on extn. are similar. It seems improbable that the I content of bread is attributable to the few surviving yeast cells, although considerable quantities of I were recovered from baker's yeast after 48 hrs. incubation with tap water. A moderate fluorescence of the mixt. was observed after 72 hrs., indicating a decrease of I on further autolysis. The fate of oral I in the digestive tract deserves further investigation, especially with a view to the errors which it may cause in the detection of occult blood by Snapper's method.

MARY JACOBSEN

The behavior of sodium and barium amalgam electrodes in solutions of certain amphoteric substances. P. L. KIRK AND C. L. A. SCHMIDT. *J. Biol. Chem.* **76**, 115-36 (1928); cf. Greenberg, *C. A.* **21**, 2910.—Although the behavior of Na and Ba electrodes is abnormal, definite and reproducible results can be obtained in dil. amalgam solns. Measurements on the Na salts of 3 amino acids [glycine and glutamic and aspartic acids (mono- and di-Na salts)] gave the same type of curve as NaCl, indicating that they all behave as strong electrolytes. Similar results were obtained with Ba salts. Na caseinate apparently behaves as a strong electrolyte with the casein ion, affecting the ionic strength as if it were univalent within the range of alky. studied. Ba caseinate is abnormal in its behavior and the results suggest the possibility of the formation of a complex.

A. P. LOTHROP

A spectrophotometric study of certain equilibria involving the oxidation of hemoglobin to methemoglobin. J. B. CONANT AND N. D. SCOTT. *J. Biol. Chem.* **76**, 207-22 (1928); cf. *C. A.* **20**, 3462.—The reversibility of the hemoglobin-methemoglobin system has been rigorously proven by a method independent of the use of electrodes or an electrochem. cell, namely the spectrophotometric method. Dctn. of the approx. value of n in the electrochem. equations by a spectrophotometric study of the reaction between hemoglobin and 1-naphthol-2-sulfonate-indophenol gave results similar to those obtained by a gasometric study of the reaction between carboxyhemoglobin and $K_4Fe(CN)_6$ in pure CO. The value for n is not that predicted on the basis of a simple reaction and a mol. wt. of 16,700 (1 Fe atom) or 66,000 (4 Fe atoms). The exact value cannot be stated but is probably approx. 2. A discussion of the anomaly will be presented later.

A. P. LOTHROP

Amylase in the blood serum and urine of various animals. G. LO MONACO AND R. MICALE. *Boll. soc. ital. biol. sper.* **2**, 215-8 (1927).—The amylase content in the blood serum and urine of the pig, dog, rabbit, chicken and bovine was detd. The amt.

varied for each individual animal; there was no relation between the amt. of amylase in the serum and that in the urine.

PETER MASUCCI

The reticular-endothelial system. G. DI GUGLIELMO. *Boll. soc. ital. biol. sper.* 2, 937-64(1927).—A review of the prevalent methods of research and the general lines of investigation in the study of the reticular-endothelial (R. E.) system. The conditions which govern the phenomenon of granule formation in the cells of the R. E. system are discussed under (a) properties of substances injected, (b) method of introduction, (c) time elapsed between injection and sectioning, (d) species of animal, (e) the physiologic and pathologic condition of the cells. Intra-vitam staining and phagocytosis are explained in terms of colloid chemistry. The anatomy and functional activity of the R. E. system are elaborated under (1) metabolism of fats and lipoids, (2) metabolism of iron, (3) biligeneses, (4) protein metabolism and (5) blood metabolism. P. M.

The survival of human leucocytes. C. FORTI. *Boll. soc. ital. biol. sper.* 2, 982-4 (1927).—Samples of leucocytes taken from 3 individuals were placed at various temps. and examd. at various intervals of time. At low temp. the leucocytes retained their amoeboid movement longer, e. g., samples kept between 0° and 4° showed that more than half of the leucocytes were still active after 39 days, whereas 2 samples kept at 37° showed no movement at the end of 10 days.

PETER MASUCCI

The manifold influence of potassium cyanide on living cells. M. S. RESNITSCHENKO. *Biochem. Z.* 191, 345-54(1927).—Protoplasm reacts to cyanide in several ways. At first there is a phase of increased O₂ consumption, the "paradoxical phase," followed soon by a diminution. After this rapid decrease the oxidation remains unaltered over a long period of time. The preliminary increase in oxidation is directly proportional to the KCN concn. and the subsequent lowering is inversely proportional to the concn.

S. MORGULIS

Ultra-violet and extinction. H. T. MARSHALL. *Am. Nat.* 62, 165-86(1928).—M. suggests some of the causes which may produce deficiencies in ultra-violet radiations in geological time. The possible effects of ultra-violet deficiency on animal life are discussed with special reference to extinction during certain geologic eras. L. W. R.

Biogeochemical studies. II. Maximum velocity of the transmission of life in the biospheres. V. VERNADSKII. *Bull. Acad. Sci. Union Rep. Soviet Social* 1927, 241-54. (In French).—In a previous paper it was demonstrated from energy considerations of bacteria that *v* [vitesse de la transmission de la vie] is about equal to the velocity of sound in air. The subject is further developed on the basis of size of bacteria, Brownian movements and bacterial respiration and metabolism. (Cf. following abstr.)

L. W. RIGGS

The bacteriophage and the velocity of transmission of life in the biosphere. V. VERNADSKII. *Rev. gen. sci.* 39, 136-42(1928); cf. preceding abstr.—The dimensions and inherent forces of atoms, electrons, bacteria and bacteriophages form the basis of a dynamic study. The velocity of transmission of life through the agency of the bacteriophage is greater than the velocity of sound in air.

L. W. RIGGS

Denaturation of proteins. IV. Effect of denaturation on antigenic properties of egg albumin. HSIEN WU, CARL TENBROECK AND CHIEN PIEN LI. *Chinese J. Physiol.* 1, 277-96(1927); cf. *C. A.* 22, 437.—The antigenic power of egg albumin is much decreased by denaturation. The original specificity of the albumin is destroyed and a new specificity is created when albumin is denatured. Some denatured albumins retain a trace of the original specificity. Egg albumin denatured by heat, alc., acid or alkali are closely related immunologically. **V. Factors controlling coagulation of proteins by shaking.** HSIEN WU AND S. M. LING. *Ibid* 407-30.—Unlike coagulation by heat or alc., mech. coagulation is not separable into 2 stages, denaturation and agglutination. The size of the bottle influences the rate of coagulation; thus with bottles of the same shape coagulation was more rapid in a 250-cc. bottle than in a 125-cc. or 500-cc. Foams had little or no effect. The rate of mech. coagulation is decreased by surface active substances and increased by salts and nonelectrolytes which have no marked influence on surface tension. The influence of these added substances is greater on hemoglobin than on egg albumin. The *p_H* for max. coagulation of egg albumin is 4.8, the isoelec. point of this protein. Those of oxyhemoglobin and methemoglobin in salt-free sols. lie between 6.7 and 6.8, but the point is shifted to the alk. side by the addn. of salt. In buffered sols. the amt. of coagulation is a linear function of time and is independent of the concn. of the protein. The temp. coeff. of coagulation for egg albumin between 25° and 38° is only 1.09 for 10°. Egg albumin and hemoglobin coagulated by shaking cannot revert to the natural protein. Coagulated hemoglobin dissolved in dil. alkali gave no spectrum of hemoglobin and on reduction with sulfite gave the spectrum of hemochromogen. There was no evidence of the liberation of non-protein substances as a result of mech. coagulation.

Serum proteins and conalbumins are not coagulated by shaking. The process of coagulation may be pictured as follows. The surface of the soln. is covered by a layer of denatured protein. By shaking, this layer is "rolled up" and removed, and a new layer of denatured albumin is formed. The thickness of the layer on the surface has been estd. and found to correspond to that of a monomolecular layer. **Separation of ovalbumin from conalbumin.** *Ibid* 431-4.—Ovalbumin is coagulated by shaking, while conalbumin is not. Conalbumin constitutes about 0.1 of the total albumin of egg white. **VI. Effect of denaturation on the digestibility of ovalbumin by pepsin and trypsin.** KUO-HAO LIN, HSIEN WU AND TUNG-TOU CHEN. *Ibid* 2, 107-30(1928).—The relative rates of digestion by pepsin and by trypsin of crystd. egg albumin and of the same protein denatured by dil. acid, dil. alkali, heating in the presence of small amts. of acid or alkali, by alc. and by shaking, were detd. over a range of acidity so as to include the max. point in each case. Natural and denatured ovalbumins were digested by pepsin or trypsin at different rates and at different optimal acidities. The digestibility of natural albumin by pepsin is the same as that of most of the denatured albumins studied. This is interpreted to mean that denaturation does not affect those linkages in the protein mol. which are attacked by pepsin. The rate of digestion of natural albumin by trypsin is exceeded by those of all denatured albumins studied. It is therefore probable that the fundamental process of denaturation is of the same nature as some of the early changes in tryptic digestion.

Protoplasm and glutathione. A. GIROUD. *Compt. rend. soc. biol.* **98**, 376-7 (1928).

Relations between the nucleolus, chondriome and glutathione. PH. JOYE-LAVERGNE. *Compt. rend. soc. biol.* **98**, 567-9(1928).

Oxido-reduction potential of mammalian cells. E. AUBEL, E. AUBERTIN AND P. MAURIAC. *Compt. rend. soc. biol.* **98**, 589-92(1928).—Liver, kidney and muscle cells of the guinea pig, rabbit and dog have the same r_H , which is a function, within certain limits, of the O content of the medium. It varies from an r_H of 11 to 12 in anaerobiosis to an r_H of 20 in aerobiosis. This last value is the same as that found by Needham for eggs of the sea urchin, and by Rapkine and Wurmser in the salivary glands of Chironomes.

The proteoclastic activity of flour (CAIRUE, BAILLY) **12**. A new base from beef muscle (LINNEWER) **10**. Bromoporphyrin I and tetramethylhematoporphyrin iron salt (FISCHER, HUMMEL) **10**.

B—METHODS AND APPARATUS

STANLEY R. BENEDICT

Micro-determination of chlorides in biological liquids and organs. F. TSCHOPP. *Mikrochem.* **5**, 161-5(1927).—For liquids, 1 cc. is treated with 10 cc. of 0.02 N AgNO₃ soln., 1 cc. of 15% trichloroacetic acid soln. (to coagulate the protein), and 1 cc. of HNO₃ (d 1.4) and the mixt. is diluted to 25 cc. After 30 min. the liquid is filtered through a dry paper and the excess of Ag in 20 cc. of the filtrate is titrated with 0.02 N KI, 1 cc. of fuming HNO₃ and 3 cc. of starch soln. being used as indicator. For solids, 1 g. is heated with 10 cc. of the AgNO₃ soln., 5 cc. of HNO₃ and 2 cc. of "perhydrol" in a micro-Kjeldahl app. until dissoln. is complete, and, after diln. to 25 cc., 20 cc. of the filtrate are titrated as before.

Determination of the different fat fractions of feces. G. GUASSARDO. *Pediatrics, Rivista* **35**, 1106(1927).—G.'s method (not described) permits the detn. of neutral fat, fat, free fatty acids, alkali and alkali-Fe soaps. Feces are used directly. M. J.

The detection of yeast by the yeast-gum reaction in the presence of hydrolytic decomposition products of animal protein and animal organs. H. KRAUT. *Z. Untersuch. Lebensm.* **54**, 446-9(1927).—Details are given for the detection of yeast gum in the presence of animal decompn. products. The therapeutic prepn. "Eatan" contains no yeast ext.

The detection of urobilin in organic fluids with special reference to blood serum. C. GIORDANO AND L. GRIVA. *Boll. soc. ital. biol. sper.* **2**, 734-6(1927).—A new method

WILLIAM J. HUSA

has been devised for detecting urobilin in blood serum; the simplicity and sensitivity make it adaptable for clinical uses. Collodion membranes allow urobilin to pass through but retain bilirubin and proteins. Dil. 5 cc. blood with 5 cc. distd. H_2O . Dialyze the soln. in a Bechold ultrafiltration app., using a collodion membrane and a pressure of 53–60 mm. Hg. The dialyzate contains urobilin, which can be detd. by any appropriate method. PETER MASUCCI

The technic of the biological protein differentiation procedure. A. BRÜNING AND B. KRAFT. *Z. Untersuch. Lebensm.* **54**, 347–52(1927).—B. and K. describe a semi-micro method for the precipitin reaction. WILLIAM J. HUSA

Crystalline urease. II. J. B. SUMNER AND D. B. HAND. *J. Biol. Chem.* **76**, 149–62(1928), cf. *C. A.* **20**, 3704.—An improved method for the detn. of urease activity is described. Convincing evidence that the urease is identical with the octahedral protein crystals and not an adsorbed impurity is furnished by the increase in activity on recrystn. and by the small and variable amts. of urease carried down in the crystn. of concanavalin B from an alc. ext. of jack-bean meal. In 1 expt. a suspension of washed crystals of concanavalin B had a urease activity of 1600 units per g. as compared with 129,000 units in a recrystd. urease prepn. Samples of jack-bean meal vary decidedly in urease content and crystals can only be obtained from the poor samples of meal at present available by acidifying the Me_2CO ext. with $AcOH$. Urease obtained by this procedure is comparatively impure. $KI.HgI_2$ is very potent in causing inactivation of urease and also effectively prevents the formation of the octahedral crystals. Traces of Pb in H_2O distd. through a block-tin condenser are responsible for the destructive action on urease which occurs when a urease soln. is highly dild. as H_2O distd. from glass is not destructive and H_2S renders the H_2O harmless. Gum arabic and egg albumin protect the cryst. urease completely from this destructive action. Gum arabic is the only substance which has been found to give 100% protection over several hrs. and no protector tested yielded a urease strength greater than that of the cryst. urease alone. A. P. L.

Pepsin cleavage. S. P. L. SØRENSEN AND LYDIA KATSCHIONI-WALTER. *Z. physiol. Chem.* **174**, 251–75(1928).—In peptic digestion of proteins CO_2H groups are liberated in excess of NH_2 groups according to Steudel, and in equal proportions according to Waldschmidt-Leitz. By the careful elimination of possible errors in such detns. S. and K.-W. find the ratio 1:1 for CO_2H and NH_2 liberated in peptic digestion of casein, gelatin and gliadin. Detn. of CO_2H was performed by formol titration and by Willstätter's titration in alc. soln. and detn. of NH_2 by the Van Slyke method and by Linderstrøm-Lang's titration in $MeAc$ soln. with naphthyl red as indicator. In each case the 2 methods gave results in close agreement. This evidence supports the view that peptic digestion, like tryptic and ereptic digestion, consists in the breaking of acid-amide linkages in the protein mol. **Comment on the indicator question.** K. LINDERSTRØM-LANG. *Ibid* 275–7.—In the titration of NH_2 groups by 0.1 $N HCl$ in the presence of $MeAc$, the naphthyl red indicator can be replaced by Lund's 2,4,2',4',2''-pentamethoxytriphenylcarbinol, which has a color change from colorless to reddish violet and an intensity equiv. to that of phenolphthalein. Where no control is used the new indicator is even preferable to naphthyl red. A. W. DOX

Contribution to the investigations on blood-stains. P. KARPOV. *Bull. Univ. Asie Centrale* No. **16**, 152–3(1927).—To ext. blood-stains for chem. examn., Taraneck's reagent (a physiol. $NaCl$ soln. contg. 0.25% Na_2CO_3) and Grigoriev's reagent (20% alc. contg. 0.1% Na_2CO_3) are recommended. The latter is suitable on materials such as Fe_2O_3 chalk, etc. K. modifies the VanDeen test as follows. The blood-contg. soln. is mixed with 1–3 drops of tincture of guaiac and 1 drop of ozonized turpentine. It is then shaken with $AmOH$, which becomes blue. For the microscopical detection of blood, the Bokarius method of forming hemin and hemochromogen crystals is best. K. obtained the best halogenhematin crystals with blood in $AcOH$ soln. in the presence of either the halogens or their compds., $CHCl_3$, CHI_3 . The formation of hemochromogen crystals was modified by using a soln. of Na_2S with pyridine as a reducing agent instead of $(NH_4)_2S$. Crystals by this method are formed more quickly and are more stable. By using Na_2SO_4 the crystals have better form and are colored darker. R. C. E.

Preserving specimens of animals and plants. F. HOCHSTETTER and G. SCHMEIDEL. *Brit.* **274**, 314, Oct. 4, 1926. Specimens are dehydrated with alc., soaked in C_6H_6 or other suitable hydrocarbon solvent and then impregnated with molten paraffin which is allowed to solidify in the tissues. A fixing soln. such as alc. and $CHCl_3$ with or without $HOAc$, or CH_2O , or phenolic substances may also be used.

C—BACTERIOLOGY

A. K. BALIS

Growth of molds on cobaltamine salts. K. KINOSHITA. *Acta Phytochim.* 3, 31-50(1927).—Cultures of *Aspergillus niger*, *A. oryzae*, and *Penicillium glaucum* have been made using various cobaltamine salts as the source of N; the N content in each case was adjusted to a const. value. In all cases growth was very much less than for the control expts. in which NH_4NO_3 and KNO_3 were used. In the few salts which produced appreciable growth the mycellium contained a high percentage of Co. During growth under these conditions *A. oryzae* converts 33% of the sucrose of the culture soln. into kojic acid; *A. niger* under the same conditions produces large amts. of acid. It is concluded that these effects are due to the lack of easily assimilated N, since *A. niger* when grown in a culture soln. with only small amts. of NH_4NO_3 produces citric, malic, succinic, tartaric and oxalic acids. B. C. A.

Metabolism of *Aspergillus oryzae*. I. I. H. TAMIYA. *Acta Phytochim.* 3, 51-173 (1927).—The conditions for the growth of *A. oryzae* have been investigated with regard to the p_H of the culture medium, and to the rate of acid formation by the mold. The accumulation of kojic acid in the culture medium (detd. by colorimetric titration with FeCl_3) increased the p_H but slightly; the observed increase is therefore due to the removal of the cations of the medium by the mold. When NH_4NO_3 is used as the source of N the NH_4 ions are consumed more rapidly than the NO_3 ions; at a certain p_H (3.4) the latter begin to be consumed with a corresponding reduction in acidity. Growth can take place in cultures of this mold between the limits of p_H 2.1 and 8.6, and is a max. at 3.5 and 7.0. At the min., p_H 5.5, the formation of kojic acid is maximal. Free org. acids inhibit the growth of the organism, although their salts accelerate growth: oxalic, citric and kojic acids are most active, then follow tartaric, lactic, acetic and formic acids. The kojic acid formation is rapidly diminished by the addn. of oxalic, citric, formic, HCl and HNO_3 acids, while H_2SO_4 produces a slight increase; the production is also increased by the addn. of tartaric acid at a low p_H , and by the addn. of phosphoric, lactic and pyruvic acids in a medium with a p_H corresponding with the so-called isoelectric point of plasma protein, 5-6. B. C. A.

Studies on the transformations of iron in nature. II. The importance of micro-organisms in the solution and precipitation of iron. R. I. STARKEY AND H. O. HALVORSON. *Soil Science* 24, 381-402(1927); cf. *C A* 22, 1742.—The pptn. of Fe from soln. is not wholly dependent upon the so-called "iron bacteria" (i. e., those which utilize ferrous Fe as a source of energy), but can be effected by a large no. of organisms acting in a variety of ways. Organisms which decompose org. compds. of Fe and therefore produce more Fe ions, and also organisms which change the environment, as by producing alkali or increasing the O₂ pressure, also are important factors. The pptn. of ferric Fe does not necessarily indicate that it has been recently oxidized, and oxidation of Fe may or may not result in pptn. of ferric Fe, depending upon other conditions. R. BRADFELD

The occurrence of vitamin D (bios) in fermentation vinegar. ALEXANDER JANKE AND HANS LACROIT. *Biochem. Z.* 190, 67-74(1927).—The term vitamin D is used in the sense of Funk's original designation. The addn. of concentrates from fermentation vinegar to mineral nutritive solns. stimulates the growth of yeast. In expts. with single-cell cultures the acceleration was 20 times as compared to control expts. In great amts., however, the concentrates have an inhibitory effect and at 5% suspend germination entirely. The substance affecting growth is not injured by 2 hrs.' heating in an autoclave at 2 atm. It is adsorbable on fuller's earth, and can be leached out by a 1% NH_4OH . The ash either from the concentrate or from the NH_3 soln. of the adsorbate is inactive. The concentrate added directly to distd. water cannot serve to promote multiplication of yeast but must be used in conjunction with a nutritive soln. Apparently these growth-stimulating substances come from metabolizing acetic acid bacteria. Acetic acid prepd. by chem. methods shares none of these properties with the fermentation acetic acid. S. MORGULIS

The effect of *Bacterium lactis aerogenes* and *Bacterium coli* on hexosemonophosphoric acid. NAOMI KAGEURA. *Biochem. Z.* 190, 181-7(1927).—Both Na and Ca salts of hexosemonophosphate under practically anaerobic conditions yield considerable amts. of lactic acid when acted on by *B. lactis* or *coli*. S. MORGULIS

The antiseptic effect of phenol and of *p*-chlorophenol in solvents of different dielectric constants. W. E. ENGELHARDT. *Biochem. Z.* 190, 217-25(1927).—In phenols no connection was found between their disinfecting action and the dielec. const. of the solvent, but the antiseptic power of *p*-chlorophenol appears only in solvents of high

dielec. const. This is attributed to the greater dissociation of the *p*-chlorophenol. The facts further show that the antiseptic power of dissociable substances is a function of the degree of dissociation.

Phytochemical reduction accomplished with the aid of bacteria. S. MORGULIS
CARL NEUBERG
AND ERNST SIMON. *Biochem. Z.* 190, 226-31(1927).—The reduction by bacteria of *p*-xyloquinone to *p*-xylohydroquinone and of isovaleraldehyde to amyl alcohol has been explicitly demonstrated.

The effect of mercurochrome-220 soluble on the growth of *Bacillus pyocyaneus*. S. MORGULIS
I. S. WRIGHT. *Arch. Surg.* 15, 958-61(1927).—Mercurochrome has little effect on *B. pyocyaneus* in blood or agar even when exposed to large amts. for many hours. It is very effective under like conditions. Both mercurochrome and I destroy *Staph. aureus* under similar conditions.

The influence of osmotic pressure on the typhoid-colon group of bacteria with special reference to agglutination. JOHN T. MYERS
TRAUGATT WAHLFEIL. *Centr. Bakt. Parasitenk. I Abt.* 105, 15-32(1927).—Hypertonic NaCl solns. are more harmful to the colon than to the typhoid bacillus. Colloids such as normal of immune serum, or the split products of egg albumin, at an optimum concn. will protect bacteria against hypertonic NaCl or urea solns. Immune serum is the most effective. The protective effect is greater at a distance from the isolec. point.

The requirements of the influenza bacillus in anaerobic cultures, with special reference to the "X" and "V" factors. JOHN T. MYERS
ILONA KOPP. *Centr. Bakt. Parasitenk. I Abt.* 105, 54-6(1927).—The influenza bacillus can grow under anaerobic conditions without hemoglobin. The "X" factor is necessary in anaerobic cultures to protect against the injurious effects of O.

Study of microbial proteolysis by a new method. JOHN T. MYERS
J. WEISSFEILER. *Centr. Bakt. Parasitenk. I Abt.* 105, 275-81(1928).—The best medium for proteolytic studies is coagulated horse serum or egg white plus isotonic BaCl₂ soln. It is simple, uniform and gives comparable results.

Lipoid culture media for bacteria. JOHN T. MYERS
L. SURÁNYI. *Centr. Bakt. Parasitenk. I Abt.* 105, 303-5(1928); cf. *C. A.* 22, 1610.—Gonococci as well as other fragile organisms will grow even when freshly isolated, on plain agar without human protein, if cholesterol or lecithin is added. Whether the lipid serves as a food or produces the requisite physiochem. conditions is unknown.

A new method for determining the colon count in water. JOHN T. MYERS
L. V. WIKULLU. *Centr. Bakt. Parasitenk. I Abt.* 104, 460-3(1927).—To each 100 cc. of melted agar add: 0.1 g. of *m*-phenylenediamine sulfate, previously dissolved and kept in 3 cc. water, several hrs or until it assumed a yellowish brown color, then neutralized with 0.5 cc. of *N*/1 NaOH; 1 g. lactose; 1 g. KNO₃ and 10 cc. of a 1% soln. of metachrome yellow R. D. (Grübler). Adjust the *p*_H between 6.4 and 6.8. Gram-positive but not Gram-negative organisms are inhibited. Colon colonies produce a brown color. The fermentation of lactose produces acid, the nitrate is reduced to nitrate and Bismarck brown is produced.

New indigenous (Hannover) varieties of *Rhizopus* capable of fermenting sugars. JOHN T. MYERS
WALTER NILL. *Centr. Bakt. Parasitenk. II Abt.* 72, 21-38(1927).—Three varieties of *Rhizopus* were isolated from grain and meal. They differ morphologically from known species. They fermented sugars very actively. *Rhizopus* 1 produced acetaldehyde as well as alc. The fermentation of galactose and mannose wks weak, and that of glucose, fructose, saccharose and maltose strong, while inulin and lactose were not attacked.

The predominating microbial flora of the pulp storage vats in potato starch plants in Holland. A contribution to the knowledge of lactic acid bacteria. JOHN T. MYERS
B. ELEMA. *Centr. Bakt. Parasitenk. II Abt.* 72, 66-101(1927).

The metabolic activities of the bacteria of sewage-irrigated fields at low temperatures. JOHN T. MYERS
L. RUBENTSCHIK. *Centr. Bakt. Parasitenk. II Abt.* 72, 101-28(1927).—Aerobic and anaerobic putrefaction urea fermentation, denitrification and the first stage of nitrification, can occur at temps. between 0° and 3°. At such temps. the rate is slow. The temp. coeff. is lower than predicted by the van't Hoff rule. A no. of pure cultures were isolated from fields and described as to rate of growth, pigment production, gelatin liquefaction, milk peptonization, urea destruction, formation of NH₃, H₂S, the reduction of N₂O₃ to N₂O, and decolorization of methylene blue.

The varieties of *Citromyces* and the formation of citric acid. JOHN T. MYERS
C. WEHMER. *Centr. Bakt. Parasitenk. II Abt.* 73, 161-2(1928).

An obligate halophilic thiosulfuric acid bacterium. JOHN T. MYERS
A. A. SASLAWSKY. *Centr. Bakt. Parasitenk. II Abt.* 72, 236-42(1927).—An organism was isolated from the black

slime of the Liman estuary which could oxidize the S compds. in the slime, such as H_2S , sulfides and thiosulfates. It was an obligate halophile, being active only in the presence of 2.0 to 22.0% NaCl. In Beijerinck's medium the oxidation of thiosulfates is incomplete
JOHN T. MYERS

Can bacteria reduce phosphates? F. LIEBERT. *Centr. Bakt. Parasitenk. II Abt.* 72, 369-74(1927). - Thermochem. data indicate that bacteria cannot derive energy from the reduction of phosphates, in the presence of mannitol. Contrary to the findings of Rudakov, qual reactions failed to detect the products of phosphate reduction.
JOHN T. MYERS

Quantitative investigations on the difference between the growth of bacteria and fungi, and the concentration of several neutral salts. WILHELM ESTAR. *Centr. Bakt. Parasitenk. II Abt.* 72, 411-43(1927). - Different organisms are affected quite differently by varying concns of neutral salts. No correlating principles were found. J. T. M.

Nitrogen fixation and the conclusions to be drawn from the morphology of the nodule bacteria. HEINRICH PFEIFFER. *Centr. Bakt. Parasitenk. II Abt.* 73, 28-57(1928). - In plants inoculated with *B. radicola*, the root nodules are more numerous but smaller than in uninoculated plants. Disappearance of the hunger stage and the beginning of N assimilation on the part of the plant are not synchronous. The formation of toxic substances seems to cause degeneration in the nodules, but no relationship appears between toxin formation and slowing of growth with bacteroid formation.
JOHN T. MYERS

The nitrite test as applied to bacterial cultures. G. I. WALLACE AND S. L. NEAVE. *J. Bact.* 14, 377-84(1927). - In high nitrite concns the color resulting in the standard nitrite test is destroyed by destruction of the amino group of the naphthylamine. High nitrite concns are favored by peptones contg S and small quantities of NO_2 escape detection in the presence of H_2S . Dimethyl α -naphthylamine gives a stable reagent of high sensitivity and produces a permanent NO_2 color; hence it is better than α -naphthylamine.
JOHN T. MYERS

The China blue-aurin cellulose medium for the physiological study of cellulose destroyers. J. R. SANBORN. *J. Bact.* 14, 395-7(1927). - One and 5 tenths percent agar is dissolved in the following pptd raw cotton, 500 cc, nutrient medium (cf. C. A. 20, 3480), China blue-aurin indicator (equal parts of 0.5% aq. China blue and 1% rosolic acid in alc.). Organisms which decomp cellulose with acid production form a blue zone around the colony.
JOHN T. MYERS

A comparative study of six different strains of the organism commonly concerned in large-scale production of butyl alcohol and acetone by the biological process. E. R. WEYER AND L. F. RETTGER. *J. Bact.* 14, 399-424(1927). No qual differences in physiol. properties were noted in the 6 strains. The organism is powerfully diastatic, saccharolytic and proteolytic. All the common and most of the rare sugars are sources of available C. A complex source of N such as proteins or peptones is necessary. NH_4 salts will not support growth, nor will simple amino acids. The organism is quite susceptible to ordinary antiseptics, but not to butyl resorcinol.
JOHN T. MYERS

Microbial thermogenesis. II. Heat production in moist organic materials with special reference to the part played by microorganisms. L. H. JAMES, LEO F. RETTGER AND CHARLES THOM. *J. Bact.* 15, 117-41(1928). - Moistened corn meal and cracked corn heated to 62° when aerated with O_2 . Oats and wheat heated to a less extent under the same conditions. Hay heated to 60°, and stable manure to about 73°. The total N content in the corn remained practically const during the period of heat production. NH_4 increased, indicating that the loss of org. N was appreciable, though the NH_4 was not removed from the flask. There was a marked loss in dry wt. during the heat production, about 75% of which was accounted for by loss in carbohydrate. J. T. M.

Antiseptic and infertilizing actions of some essences of mint, and of their principal constituents. A. MOREL, A. ROCHAIX AND L. SEVELINGE. *Compt. rend. soc. biol.* 98, 47-9(1928); cf. C. A. 21, 3646. - Eleven preps or constituents of peppermint essence were tested for their antiseptic action by contact and by the action of their vapors on the bacillus of Eberth, staphylococcus, *Proteus vulgaris* and *Proteus* X19, and for their infertilizing action by contact on the same organisms. The actions are not pronounced but are more marked against *Proteus* than against the other organisms. Crystd. menthol (Codex) is somewhat more active than the other products. Terpenes extd. from Japan essence are least active. Ketonic constituents of mint are weak in antiseptic action. Menthone has little infertilizing action but pulegone and piperitone have the strongest infertilizing action of any of the substances examd.
L. W. RIGGS

D—BOTANY

THOMAS G. PHILLIPS

The alleged ephedrine action of two California species of Ephedra. B. E. READ AND C. T. FENG. *Proc. Soc. Exptl. Biol. Med.* **24**, 819-21 (1927).—The chem. assay and testing, as compared with known exts. of specimens of Peking Ephedra contg. ephedrine, showed absolutely no ephedrine in the sample of *E. californica* Wats, nor was there anything more than possibly an exceedingly small trace in *E. nevadensis*, Wats. Both species gave no rise in blood pressure as did the preps. from Peking Ephedra. The results formerly obtained with infusions of Ephedra were probably due to the presence of simple colloids, and certainly not to basic substances related to ephedrine, unless there is exceedingly great seasonal variation in the alkaloidal content of this plant. C. V. B.

Inhibiting effect of acetates and acetic acid on living cells of Nitella. M. IRWIN. *Proc. Soc. Exptl. Biol. Med.* **24**, 935-6 (1927).—Some of these expts seem to indicate that though a decrease in rate of penetration of a basic dye into the vacuole may take place at the same time the p_H value of the sap is decreased, such results do not necessarily discredit the theory that a basic dye enters the vacuole much more readily in form of free base than in the form of salt. If one assumes that the inhibiting effect of acetic acid on the protoplasm exceeds the accelerating effect on the vacuolar sap, and that the rate of penetration of dye into the vacuole is controlled in this case by the diffusion of dye in the form of free base from protoplasm into the vacuole, then a decrease in the p_H value or some other alteration in the protoplasm corresponding to a decrease in the p_H value of the sap might bring about a decrease in the rate of penetration of the dye into the vacuole. C. V. B.

Systematics of the genus Rhamnus with special reference to the occurrence of emodin. FRITZ HEPELER. *Arch. Pharm.* **266**, 152-73 (1928).—The treatment is largely botanical with consideration of the factors affecting ecological restrictions and systematic relationship. W. O. E.

The constituents of Typha angustata Bory et Chaub. MASAO FUKUDA. *Bull. Chem. Soc. Japan* **3**, 53-6 (1928).—The pollen of *Typha angustata* has been extd. with hot alc., evapd. and extd. with petroleum ether. The petroleum ether-sol. fraction was characterized as palmitic acid. The insol. part gives the flavone reaction with Mg and HCl, and reduces Fehling soln. after hydrolysis with H_2SO_4 , indicating the presence of a flavone glucoside. A treatment of the insol. part with boiling H_2O , then with $(AcO)_2Pb$ failed to give a crystalline glucoside; the amorphous mass obtained was hydrolyzed with H_2SO_4 ; the ppt. washed with H_2O seems to be isorhamnetin; *d*-glucose was detected in the filtrate. Synthetic isorhamnetin has been prepd. by Robinson's method (C. A. **21**, 93). Its Ac deriv. is identical with the deriv. of the above hydrolyzed product. A. I. HENNE

The general presence of sodium in plants. GABRIEL BERTRAND AND MME. M. ROSENBLATT. *Bull. soc. chim.* **43**, 368-71 (1928).—See C. A. **22**, 1176. E. H.

Genesis of starch in cereals. The sugars of the leaves and stems of rice. H. BELVAL. *Compt. rend.* **186**, 781-3 (1928); cf. C. A. **16**, 3316; **17**, 1270, 3041, 3693; **20**, 2348.—Plants were collected at intervals of 16 to 33 days, beginning June 16 and ending Nov. 8. The leaf blades (A) were analyzed separately from the sheath and stems (B). The rotatory power before hydrolysis remained nearly const. at $+60^\circ$ in (A), but increased from $+34^\circ$ to $+50^\circ$ in (B). The rotatory power after hydrolysis generally gained slightly in (A) from -17° to -19° or -20° , but remained about const. in (B) at -18° . Reducing sugars increased from 0.13 to 0.24 in (A), and from 0.12 to 0.50 in (B). Sucrose gained in (A) from 1.03 to 1.42 and in (B) from 0.30 to 1.79. The increase was generally steady except that the figures for Aug. 4 were less than those for July 19. These variations appear to be largely dependent on the water content of the vegetable tissue. L. W. RIGGS

A new plant containing maltose, Schizopepon fargesii Gagnepain. H. COLIN AND R. FRANQUET. *Compt. rend.* **186**, 890-1 (1928); cf. Bridel, C. A. **19**, 843; Gillot, C. A. **19**, 2064.—This climbing plant of the order Cucurbitaceae is known under the incorrect name *Actinostemma paniculatum* Maxim. It is of Chinese origin and is remarkable for its roset-shaped tubers which contain large reserves of starch and reducing sugars. The adult tubers in Oct. contained hexose 0.13, sucrose 0.14, maltose 6.87 and starch 12.64%. By Dec. the hexose content of the tubers was 4.33, sucrose 2.37, maltose 2.96% and starch 8.08. In the following March during germination the hexose content was 1.05, sucrose a trace, maltose 0 and starch 1.35%. L. W. RIGGS

Liberation of free iodine in marine algae. PIERRE DANGEARD. *Compt. rend.* **186**,

892-4(1928).—Several species of *Fucus*, *Laminaria* and certain other marine algae give an immediate blue color when placed in contact with starch paper. Other species give the blue color only after some hrs. of contact. The sharpness of this test varies with the age of the plants and season of the year. The production of I is attributed to a special activity of the peripheric cortical cells. L. W. RIGGS

Flora of the thermal monosulfated waters of Baréges. PIERRE FOURMONT. *Compt. rend. soc. biol.* 98, 588-9(1928); cf. Robine and Dejussieu, *C. A.* 22, 1816. L. W. RIGGS

Biochemical differences between sexes in mucors. IV. Enzymes which act upon carbohydrates and their derivatives. SOPHIA SATINA AND A. F. BLAKESLEE. *Proc. Nat. Acad. Sci.* 14, 229-35(1928); cf. *C. A.* 21, 2015.—Comparative tests were made with 24 (+) and (—) *Mucor* races (included in 10 species and 8 genera) to det. the possibility of a given carbohydrase being present in one sex and not in the other. No such qual. differences between the sexes were discovered. Trehalase, maltase and emulsin were present in all the tested species; amylase and glycogenase in all except one. Lactase was found in races of 4 species and sucrose and inulase were found in races of 2 species only. Among the species tested, *Cunninghamella* appeared to contain the greatest no. of carbohydrases. Species of the genus *Mucor* and *Parasitella* contained the fewest. In addn. to glucose used as control, the relative value for *Mucor* development of 10 carbohydrates and their derivs., including di- and polysaccharides, glucosides and a carbohydrate alc., can be shown approx. by the following order: trehalose, maltose, salicin, amygdalin, starch, glycogen, mannitol, lactose, sucrose and inulin. Amygdalin, however, yields HCN and ultimately kills the fungus. L. W. RIGGS

Relation of boron to the growth of the tomato plant. F. S. JOHNSTON AND W. H. DORE. *Science* 67, 324-5(1928).—The appearance of the plants as well as actual measurements and analyses show that B is abs. essential to the normal growth of the tomato plant. Plants grown without sufficient B fail to remove sugar from their leaves, develop a purplish color in the leaves and show an extreme brittleness in the leaf petiole. The results obtained by Brechley and Warrington (cf. *C. A.* 21, 1475) in growing the bean in solns. deficient in B are to some extent confirmed by these tests. L. W. RIGGS

The plant species in cultivated pasture land. MARTIN ELLINGBÖ. *Meldinger Norges Landbruks.* 6, 1-151(1926).—Chem. analyses are given of a great number of different plants. C. A. ROBAK

Nitrogenous metabolism of *Pyrus malus* L. I. Influence of temperature of desiccation on water-soluble nitrogenous constituents and separation of water-soluble protein from non-protein constituents. WALTER THOMAS. *Plant Physiology* 2, 55-66(1927).—Desiccation in ventilated ovens at 50°, 60° and 70° resulted in relatively small decreases in the sol. cytoplasmic proteins, but increases in the non-protein constituents. From the effect of temp. on both coagulation and proteolysis, a temp. of 60° appears to be the optimum for the desiccation of the tissues of this species. The method of direct extn. with water (*C. A.* 18, 2184) produced less disturbance in the protein and non-protein fractions due to post-mortem changes, than methods involving the use of cytolytic agents (*C. A.* 17, 791). Colloidal Fe(OH)₃ in these expts. proved superior to the reagents in general use for the sepn. of the simple and conjugate proteins from their hydrolytic products. It gave a sharp sepn. of proteins from their decompn products including the proteoses; moreover, no absorption of amino acids occurred.

II. The distribution of nitrogen in the insoluble cytoplasmic proteins. *Ibid* 67-70.—The distribution of N in samples of leaves from apple trees taken at (1) the early period of bud formation, (2) the stage of active max. growth and (3) the period of chlorophyll degeneration, as detd. by the Van Slyke method (*C. A.* 9, 3263), showed that little (if any) qual. change in the nature of the insol. leaf proteins occurred during development. The results are consistent with the idea that a single protein and not a mixt. of several exist in the leaves of this species. The bearing of these results on the carbohydrate-N relations of plants is pointed out.

Does the pea plant fix atmospheric nitrogen? DEAN BURK. *Plant Physiology* 2, 83-90(1927); cf. *C. A.* 19, 1290.—The Dwarf variety of *Pisum sativum* when grown in culture solns. with and without nitrate, and under sterile conditions up to the time of planting, showed upon statistical treatment of the data a small loss of N. This loss is due, in part, to excretion of N into the culture soln. It is concluded that the plants lost enough N to hide any evidence of fixation. WALTER THOMAS

The action of ethylene in accelerating the blanching of celery. W. B. MACK. *Plant Physiology* 2, 103(1927).—Preliminary studies showed that treatment of celery with ethylene in various concns. increased the respiration and hastened both blanching and the breakdown of the plant tissues. In the presence of very high concns. of CO₂ no blanching occurred under treatment with ethylene. WALTER THOMAS

The hydrocyanic acid question. **XXI. Alkaloid- and hydrocyanic acid-bearing plants, a parallel.** L. ROSENTHALER. *Pharm. Acta Helv.* 2, 207-10(1927); cf. G. A. 21, 2051.—Of about 400 HCN-bearing plants, none contains alkaloids; as a rule, HCN and alkaloids seem to exclude each other. This suggests for both a common origin, mainly connected with protein metabolism. In the chem. synthesis of protein from amino acids by the plant, any excess of amino acid is converted into substances harmless to metabolism. It depends on the plant system, *i. e.*, heredity, whether HCN compds. or alkaloids are produced. Thus, *e. g.*, phenylalanine can be converted either into ephedrine or into $BzH.HCN$. Other analogies are seen in the seasonal formation and subsequent disappearance of HCN compds. of alkaloids during biol. processes in the plant, *e. g.*, budding, and the ripening or germinating of seeds. The behavior of both classes of plants towards nitrogenous plant food also shows analogy. Parallel to alkaloids as waste products, HCN was noted in fallen leaves of *Sambucus nigra* L. (0.012% HCN); fallen cherry laurel leaves are devoid of HCN. S. WALDBOTT

Effect of delayed harvesting on quality of wheat (BRACKEN, BAILEY) 12. The determination of polysaccharides (APPLEMAN, *et al.*) 7.

PHILIP B. HAWK

Scientific investigation of vitamins. STREUDER. *Pharm. Monatsh.* 9, 59-61(1928).—An address. W. O. F.

The effect of different forms of diet on the ketone body and sugar content in diabetes mellitus. O. PUCSKO. *Wiener Arch. inn. Med.* 15, 123-30(1928).—The effect of various diets on the ketone body content of the blood and urine in diabetics was studied. The older diabetic diets rich in protein but poor in carbohydrates were followed by higher ketone body content in blood and urine than the newer diets in which both carbohydrates and proteins are restricted and fat is added to give the necessary calory value. Vegetable protein caused a transitory rise in ketone bodies in the blood but on continued use brought the ketone body content to a lower level than animal protein. Restriction of calories, independent of the nature of the diet, had a favorable effect on the metabolism of diabetics. HARRIET F. HOLMES

Some aspects of recent research in nutrition. F. E. CORRIE. *Fertiliser, Feeding Stuffs and Farm Supplies J.* 13, 173-4(1928).—A general discussion. K. D. J.

The amount of vitamin A in different varieties of Batatas. B. C. P. JANSEN AND W. F. DONATH. *Mededeel. Dienst Volksgezondheid Nederland. Indië* 17, 120-5(1928).—In accordance with the conclusions drawn from testing maize and other foods, it has also been proved that the yellow and orange varieties of *Batatas* are rich in vitamin A, whereas the white variety contains little or none. The amt. of protein in all the tested kinds of batata was very small, ranging from 0.5 to 1.6%. J. A. KENNEDY

Vitamins in canned foods. E. F. KOHMAN, W. H. EDDY AND NELLIE HALLIDAY. *Ind. Eng. Chem.* 20, 202-4(1928).—Strawberries, like tomatoes, are a rich source of vitamin C. The daily feeding required for protection against scurvy and normal growth of the guinea pig is between 2 and 3 g. Commercially canned strawberries considerably over a yr. after canning have a vitamin C content similar to that of raw strawberries. Since strawberries contain considerable O, it is indicated that the exhaust plays an important part in making it possible to can them with no apparent loss in vitamin C. Strawberries are only one-fortieth as rich in vitamin A and about $1/4$ as rich in vitamin B as tomatoes. J. A. KENNEDY

The amount of vitamin A in Indian fruits. B. C. P. JANSEN AND W. F. DONATH. *Mededeel. Dienst Volksgezondheid Nederland. Indië* 17, 126-37(1928).—Lacking in vitamin A were mangosteen, ramboetan, doekoe, pineapple, custard-apple, djamboe bol, djerok nipis and white doerian. Considerable amts. of the vitamin are present in nangka and djerok delima. Djamboe monjet, djerok manis, djerok garoet, yellow doerian, ripe mango, green (unripe) mango, kebembem and palm oil (stoneless) contain less of this vitamin. J. A. KENNEDY

Inorganic constituents of the blood plasma of dogs after removal of the hypophysis. P. MAZZOCCO. *Rev. soc. argentina biol.* **3**, 213-6(1927).—The content of NaCl, inorg. P, Ca, Mg, K and Na in the plasma of dogs from which the hypophysis has been removed is normal. B. C. A.

The amount of the metabolism as a function of the height. Study of the biometric theory. GEORGES THISSIER. *Ann. physiol. physicochim. biol.* **4**, 1-23(1928).

H. J. DEUEL, JR.

The reciprocal relation of gastric processes and the reaction of the blood. I. Normal acidity. G. HOLLER AND J. BLOCH. *Wiener klin. Wochschr.* **40**, 1221-3(1927).—Cl index is defined as 100 HCl/NaCl. For the normal stomach this index is 40 to 50 after a test meal of water and 50 to 65 after a test meal of 200 cc. of 1% caffeine. Blood Cl falls during digestion and in a post-absorptive state varies between 320 and 370 mg. %o. The blood is slightly more alk. during digestion; the shift in acid-base equilibrium is slight because of the well-buffered character of the system. **II. Investigations of secretory activity of the stomach in pathological conditions.** *Ibid* 1247-9.—Cl index, p_{H} , blood BICCO_3 and free HCl were detd. after test meals of 200 cc. of 1% caffeine soln. in cases of duodenal ulcer, subacute gastroenteritis, lues, pernicious anemia and in secondary anemia associated with chronic pancreatitis. **III. The pathogenesis and therapy of gastric and duodenal ulcer.** *Ibid* 1249-51.—Alkali therapy relieves symptoms but has no etiological value. Gastric hyperacidity and blood acidosis are believed to be secondary to a deep-seated alteration of the secreting mechanism of the stomach. D. B. DILL.

The question of the occurrence of a lactacidogen-like substance in glands. II. F. KRAUSE. *Z. physiol. Chem.* **173**, 235-44(1928).—In the functioning parotid gland of the dog no more H_3PO_4 is present than in the resting gland. On the contrary, a distinct decrease was invariably observed, amounting to as much as 15%. The lactic acid content, however, remains const. If the decrease in H_3PO_4 is only an apparent decrease due to the greater blood circulation in the functioning gland, then the unchanged lactic acid content represents an actual increase. Attempts to prep. hexosemonophosphoric acid from pancreas and salivary glands by the Embden-Zimmermann method were unsuccessful. Muscle pulp has the power of splitting off H_3PO_4 from the filtrate of the resting gland, after pptg. with $\text{HgCl}_2\text{-HCl}$ and neutralizing. The amt. may be as much as 50% of the total P present. Glandular pulp, but not muscle pulp, is known to split off H_3PO_4 from nucleic acid. The precursor of the H_3PO_4 in the gland must therefore be something else than nucleic acid. Whether or not the substance is a hexosephosphoric acid remains undecided in view of the failure to isolate such a substance from the gland. A. W. DOX.

Normal deposition of minerals in the bones of dairy calves. J. H. KRUGER AND S. I. BECHDEL. *J. Dairy Sci.* **11**, 24-34(1928).—Green bone analyses of ribs, femurs, humeri and frontal bones of 7 Holstein male calves (90, 120, 150 and 3 at 180 days old) are given. The P and Ca content remained about const. Water decreased and fat, ash and org. matter increased with the age of the bone. The ratio of ash to org. matter is a good rachitic index of bone condition. RUSSELL C. ERM.

The composition of human milk. G. D. ELDON. *Analyst* **53**, 78-82(1928).—The analysis of 529 samples taken from 86 women shows that the compn. of human milk depends so much upon the stage of lactation that av. figures can be of little value. For the first week of lactation, the milk averages 2.86% fat and 9.01% of solids-not-fat. Then, during the first month, the fat increases to 3.58% and the solids-not-fat decreases to 8.58%. Later the milk becomes a trifle more watery. Early in lactation, the I value of the fat is 35.9 the Reichert value is 3.4, the Polenski value is 1.9 and the Kirschner value is 2.0. W. T. H.

Muscular activity in man from the engineering aspect. A. V. HILL. *Science Progress* **22**, 630-40(1928).—A discussion of the biochemistry and biophysics of muscular activity. JOSEPH S. HEPBURN.

Alterations of the sexual hormone content in the blood of woman. H. HIRSCH. *Arch. Gynäkol.* **133**, 173-81(1928).—The content in sexual hormone in the blood of the mature non-pregnant woman shows cyclic alterations. The hormone content begins to rise in the middle of the intermenstrual period, increases until the last day before menstruation and decreases rapidly after the onset of menstruation. In pregnancy the hormone remains present in the blood and increases until the end of pregnancy. In the puerperium it gradually falls and after the 13th day is no longer to be found in

the blood. The concn. of the hormone is 3-6 times as great in the menstrual as in the circulating blood. Menstruation is a result of the fall in hormone content of the blood brought about by change in the function of the corpus luteum. HARRIET F. HOLMES

Conditions of activity in endocrine glands. XXII. Adrenaline secretion on exposure to cold, together with a possible explanation of hibernation. S. W. BRITTON. *Am. J. Physiol.* **84**, 119-31(1928); cf. *C. A.* **21**, 1671.—In cats with the adrenal glands intact and which had been made hypoglycemic by insulin, exposure to cold resulted in shivering and a rise of blood sugar to normal or above. After destruction of adrenal medulla and treatment with insulin exposure to cold did not cause a return to the normal blood sugar level nor shivering. The bearing of these facts on hibernation is discussed.

J. F. LYMAN

The thyroid gland and the sensitivity of animals to insulin. S. W. BRITTON AND W. K. MYERS. *Am. J. Physiol.* **84**, 132-40(1928).—After removal of the thyroid (parathyroids intact) cats were hypersensitive to insulin for a period of 10 to 20 days followed by complete recovery of the normal resistance. Ablation of adrenal medulla in a thyroidless animal resulted in an extreme and persistent reduction of the normal ability to withstand insulin. After thyroid removal, and during the period of increased sensitivity to insulin, posterior pituitary ext. was very effective in abolishing insulin convulsions. Adrenaline rapidly relieved insulin shock in thyro-medulliadrenalectomized animals. Depression of glycogen storage was not demonstrable.

J. F. LYMAN

Medulliadrenal secretion and carbohydrate metabolism. S. W. BRITTON, E. M. K. GEILING AND H. O. CALVERY. *Am. J. Physiol.* **84**, 141-56(1928).—In the absence of the normal adrenaline secretion the organism suffers a severe and persistent lowered ability to counteract the effects of small quantities of insulin.

J. F. LYMAN

Blood and cerebrospinal fluid changes after intravenous injection of hypertonic solutions. J. M. KINSMAN, R. G. SPURLING AND F. JELSMA. *Am. J. Physiol.* **84**, 165-75(1928).—After the intravenous injection of hypertonic NaCl or glucose solns. there was an immediate fall in the sp. gr. of the whole blood and serum due to the transfer of water from the tissues into the blood. There was a temporary rise in the cerebrospinal fluid pressure which was followed by a consistent fall, varying in degree with the amt. and hypertonicity of the solns. injected.

J. F. LYMAN

The influence of cerebral blood flow on respiration. I. The respiratory responses to changes in cerebral blood flow. C. F. SCHMIDT. *Am. J. Physiol.* **84**, 202-22(1928).—The cerebral blood vessels are under chem. control. They are dilated by CO_2 , anoxemia, acid, heat and cerebral anemia and constricted by excess O_2 , alkali and cold. **II. The gaseous metabolism in the brain.** *Ibid* 223-41.—The apparent O_2 consumption of the brain varied directly with respiratory activity except during CO_2 inhalation. **III. The interplay of factors concerned in the regulation of respiration.** *Ibid* 242-59.—The chief function of the entire respiratory mechanism is the maintenance within the center of a const. concn. of stimulant material, the nature of which cannot be detd. at present.

J. F. LYMAN

The influence of the vagus on the islets of Langerhans. III. Vagotomy. G. A. CLARK. *J. Physiol.* **64**, 229-32(1927); cf. *C. A.* **20**, 3496.—Cutting the right vagus above or below the diaphragm in cats under amnytal anesthesia produced an immediate fall in blood sugar, probably due to the removal of tonic inhibitory impulses which control insulin secretion.

J. F. LYMAN

The internal secretions of the ovary. V. The estrus-inhibiting function of the corpus luteum. A. S. PARKES AND C. W. BELLERBY. *J. Physiol.* **64**, 233-45(1927); cf. *C. A.* **21**, 2140.—An estrus-inhibiting ext. was obtained from solid corpora lutea as follows: the fresh tissues (usually about 200 g.) were ground with anhyd. Na_2SO_4 and then let stand not over 24 hrs. in ether. The filtered ext. was evapd. *in vacuo* and the oil obtained either injected as such or emulsified in 0.5% NaHCO_3 soln. The effective amt. of oil was about 0.2 cc. per day per mouse. The active substance is unstable and is best prepd. fresh each day from the ether soln., which itself rather rapidly loses activity.

J. F. LYMAN

Histochemical findings in the renal gland with particular reference to sodium chloride. A. DEFRISE. *Boll. soc. ital. biol. sper.* **2**, 521-5(1927).—D. made a histochemical study on the distribution and behavior of NaCl in the renal gland of *Mus musculus albus*. He used a modified Leschke technic; the pptd. AgCl in the tissues was reduced by an acid solution of AgNO_3 . A detailed histological picture is given followed by a long theory on renal function.

PETER MASUCCI

The digestive function of the glands of the pigeon's crop. II. F. DULZERRO. *Boll. soc. ital. biol. sper.* **2**, 575-7(1927).—The glands of the pigeon's crop contain only two digestive enzymes, both able to act on carbohydrates, one an amylase and the other

a sucrase. The function of the crop glands appears to be analogous to the salivary glands. **PETER MASUCCI**

The presence of lipoids among the normal constituents of the enteric secretion. A. CLEMENTI. *Boll. soc. ital. biol. sper.* 2, 584-6(1927).—Lipoids are const. components of the enteric secretion of dogs; they are a normal product of the secretory activity of the glandular cells of the small intestine. A part, at least, of the lipoids found in feces by numerous authors is of intestinal secretory origin. **PETER MASUCCI**

The action of carbon dioxide and oxygen on the general and coronary blood vessels. F. PESERICO. *Boll. soc. ital. biol. sper.* 2, 609-11(1927).—P. compared the action of O_2 and CO_2 of the blood on the coronary circle and the isolated leg of the same animal. He was able to confirm the results of Hilton and Eicholtz, namely, that the coronary vessels react more intensely to anoxemia than to hypercapnia. **PETER MASUCCI**

Loosely bound copper and iron in blood serum. OTTO WARBURG AND H. A. KREBS. *Biochem. Z.* 190, 143-9(1927); cf. *C. A.* 21, 3640, 3941.—By "loosely bound" Cu and Fe are understood such elements which can be detd. by the cysteine method without previous ashing. The total Cu content of 4 diff sera before and after ashing was 7.1×10^{-3} and 6.9×10^{-3} mg., resp. It follows, therefore, that the loosely bound Cu represents the total Cu of serum. The av. human serum contains 1.7×10^{-3} mg Cu and 0.7×10^{-3} mg. Fe (loosely bound). Intravenous injections of Cu rapidly disappear. When 0.5 mg. Cu as $CuSO_4$ was injected into the caudal vein of 160-g. rats the Cu of the serum returned to the normal level in 6 hrs. **S. MORGULIS**

The amount of fibrinogen and its relation to the lability of plasma. K. SAMSON. *Biochem. Z.* 191, 320-33(1927).—Frequently there is a parallelism between the sedimentation reaction and the amt. of fibrinogen. The significance of cases where this parallelism is missing is pointed out. **S. MORGULIS**

Index of refraction of the vitreous humor of the chick embryo. KUMATARO GONDO. *J. Biochem. (Japan)* 8, 85-95(1927).—The vitreous humor of the chick embryo does not change from the sixth incubation day to the adult condition (av. 1.3449). On the contrary, the n of the blood increases during embryonic development. **S. M.**

The bilirubin formation in the surviving normal spleen. LUTAKA KOMORI AND CHUJI IWAO. *J. Biochem. (Japan)* 8, 195-204(1927).—Perfusion of the spleen with defibrinated, partly laked blood for 2-4 hrs. allows one to demonstrate bile pigment and bilirubin formation in the perfusion fluid. Bacteria play no part in this reaction. **S. MORGULIS**

Uric acid formation. GYATARO NAITO AND TOKIO NISHIOKA. *J. Biochem. (Japan)* 8, 225-33(1927).—The oral administration of urea causes an increased uric acid excretion in man. This increase is attributed to an accelerated synthesis since the discontinuance of the administration results in the immediate return to the normal value. **S. MORGULIS**

The nitrogen metabolism of eunuchs. T. C. SHEN AND K. H. LIN. *Chinese J. Physiol.* 1, 109-22(1927).—The detns. were made by standard methods. There was no appreciable difference between the N excretion in the urine of eunuchs and that of normal man. Only 1 eunuch in a series of 9 had creatine in the urine. This does not confirm the idea that creatinuria is characteristic of eunuchs castrated before puberty. One eunuch showed considerable variations of daily creatinine output, which is contrary to Folin's law of constancy of urinary creatinine. Cf. following abstr. **L. W. RIGGS**

Creatinuria and castration. TSUN CHIE SHEN. *Chinese J. Physiol.* 1, 363-6(1927); cf. preceding abstr.—Expts. with dogs and albino rats failed to show any relationship between creatine metabolism and the male genital glands. **L. W. R.**

Changes in the blood constituents accompanying gastric secretion. II. Blood volume (hemoglobin, oxygen capacity, relative volume and total solids). TSANG GI NI AND AN CHANG LIU. *Chinese J. Physiol.* 1, 199-212(1927); cf. *C. A.* 20, 1838.—Prolonged gastric secretion, induced by repeated injections of histamine, is accompanied by an increase in the percentage of hemoglobin, O capacity and relative cell vol. of the blood, when much of the secretion is lost (collected) and not reabsorbed. In normal animals there may be no change, any alteration in blood vol. being attributable either to the effect of histamine alone or to delays in reabsorption of secreted juice. Thus there is no exact parallel between blood vol. and gastric secretion. In general there was a decrease of blood vol. when the loss of gastric juice was excessive. Under normal conditions of gastric secretion in the intact animal, it is supposed that a movement of water occurs in a circle, blood, stomach, intestine, blood at such a rate that the blood vol. and proportions are but little changed. After gastric secretion over a long period

accompanied by external loss, the balance between the rate of loss and rate of income from the tissues will det. the blood vol. L. W. RIGGS

Role of the platelets in blood clotting. C. A. MILLS. *Chinese J. Physiol.* 1, 235-44(1927); cf. C. A. 20, 2698-9; 21, 596, 2479.—Expts. with dog blood indicate that mammalian blood platelets contain active tissue fibrinogen and free cephalin. They do not contain prothrombin or thrombin. It is the tissue fibrinogen content of the platelets that accounts for their ability to cause clot retraction. By their content of tissue fibrinogen and free cephalin, blood platelets are brought into line with cellular cytoplasm in all parts of the body. The platelets initiate clotting by liberating tissue fibrinogen, and stimulate the later phases of clotting by supplying active cephalin. **Influence of electric current and peptone on blood platelets and the onset of clotting.** *Ibid* 245-8.—Passage of an elec. current through blood plasma contg. platelets accelerates clotting whether the blood be freshly drawn, or citrated and recalcified. With platelet-free plasma no such effect is seen. Witte peptone, dissolved in 0.9% NaCl, markedly retards clotting of freshly drawn blood, or of citrated and recalcified blood or plasma, so long as platelet are present. Peptone is without such effect when platelets are absent. Peptone is without effect after the platelets have disintegrated in plasma, or when tissue fibrinogen is added to platelet-free plasma. The elec. current acts by hastening platelet disintegration, and the inhibitory effect of peptone *in vitro* is an inhibition of platelet disintegration. The clotting properties of pure blood and of pure plasma. *Ibid* 249-62.—Expts. were made with the blood or plasma of the dog, goose and chicken. Pure platelet-free plasma of the goose is spontaneously coagulable, although clotting is very much delayed. Clotting of such plasma is mildly accelerated by contact with glass, more so by diln. with water, rise in temp., addn. of AcOH or CaCl₂, and most of all by addn. of tissue fibrinogen. Diln. with saline has little or no effect. The stimulation of clotting by CaCl₂ addn. does not indicate a deficiency of Ca in the plasma, since it clots equally with tissue fibrinogen, with or without addnl. CaCl₂. Thrombin clots such pure plasma in the same fashion as it does citrated or oxalated plasma. It is held that the fibrinogen of such plasma is in the same state as in the circulating blood. Either tissue fibrinogen or thrombin, when sufficiently active, will clot pure plasma *in vitro* and *in vivo*. The pure plasma contains an abundance of prothrombin and also free cephalin and antithrombin. It, therefore, contains everything necessary for thrombin clotting. On cooling pure citrated dog plasma, platelet-free, a ppt. was obtained which also contained the same clotting factors as were found in the plasma. Although plasma is shown to be spontaneously coagulable, it is held that all physiol. clotting is initiated by tissue fibrinogen. In pure blood this comes from platelet disintegration, while in blood escaping through a wound an addnl. supply is obtained from the tissue juices and injured cells. The stability of circulating blood is not due to the presence of any inhibitory substance, but to a mol. association of the clotting factors which prevents their reaction. Any step which leads to their dissociation leads to an acceleration of clotting. L. W. RIGGS

Variations in the coagulability of the blood after food ingestion. C. A. MILLS AND H. NECHLEO. *Chinese J. Physiol.* 2, 19-24(1928).—Tests with man and dogs show that the coagulability of the blood increases after meals. This is not due to the presence of food in the digestive tract, since carbohydrate and fat foods are without effect. Nor can it be due to the larger lymphatic return to the blood during absorption, since the absorption of fat, as shown by milky serum, produces no change. Of the foodstuffs, protein alone appears able to shorten the clotting time. Since similar effects on the blood coagulability are caused by violent exercise, it is suggested that blood changes are intimately associated with changes in the body metabolism. **Relation of blood coagulability to body metabolism and to the specific dynamic action of food.** *Ibid* 25-32.—Protein food alone, or in mixed meals, causes a marked shortening in the blood clotting time and a const. rise in metabolism, that is, exerts a notable sp. dynamic action. Glycocol, which is known to possess the highest sp. dynamic action of all amino acids, affects the clotting time of the blood in the same manner as does a protein meal. It is not the increase of the combustion processes of the body which affects the clotting time, but some as yet unknown factor, possibly connected with amino acids. L. W. R.

Significance of the threshold of excretion of the mineral phosphates. L. BRULL. *Compt. rend. soc. biol.* 98, 325-7(1928); cf. C. A. 22, 272.—The threshold of excretion of mineral phosphates, and its variations are the renal expression of the relative proportion of filterable and non-filterable phosphates in the plasma. L. W. RIGGS

Nature of the sugar materials of the blood. H. BERRY. *Compt. rend. soc. biol.* 98, 431-3(1928). L. W. RIGGS

Suprarenal glands and glutathione. LÉON BINET AND A. GIROUD. *Compt. rend.*

soc. biol. **98**, 434(1928). —The nitroprussiate reaction with dogs and guinea pigs showed that the cortical zone of the suprarenal glands was much richer in glutathione. In the young guinea pig it was the most internal part of the cortical zone which gave the most intense reaction for glutathione. L. W. RIGGS

Absorption of animal fats by the pleura. SERHAN I. BRATIANO AND CONSTANCE S. BRATIANU. *Compt. rend. soc. biol.* **98**, 461-2(1928); cf. Binet and Verne, *C. A.* **19**, 3542, **20**, 451, 1862 —From 2 to 3 cc. of rabbit fat or pork fat at the m. p. was aseptically injected into the pleural cavity of 19 rabbits, and the animals were killed from 8 hrs. to 19 days after the injection. The fats were rapidly absorbed without apparent injury. The results are described histologically. L. W. RIGGS

Relations between the internal and external secretions of the pancreas. EDUARDO COELHO AND J. C. OLIVEIRA. *Compt. rend. soc. biol.* **98**, 477-9(1928) — Although the results of observations with 20 subjects were contradictory, it was concluded that in general the excitation of the external secretion of the pancreas causes simultaneously an increase in the internal secretion, that is, a state of hyperinsulinemia represented by a diminution of sugar in the blood. L. W. RIGGS

Glutathione and keratin. A. GIROUD AND H. BULLIARD. *Compt. rend. soc. biol.* **98**, 500(1928) — This histologic study indicates that the development of keratin is preceded by an accumulation of glutathione, and the disappearance of the accumulated glutathione corresponds with the appearance of the horny substance. Perhaps the glutathione is the source of the S groups which are fixed in the keratin. L. W. R.

Role of the suprarenal capsules in thermoregulation. X. CHAIKOVITCH, V. ARNOVITZ, JEVITCH AND (MLLE.) M. VICHNITZ. *Compt. rend. soc. biol.* **98**, 511-3(1928) — Intracardiac injections of milk in normal rabbits and in rabbits with the suprarenals partly or entirely removed indicated that the suprarenals have an influence on the heat regulation of the body. L. W. RIGGS

Ammonia and real acidity of the urine. MICHEL POLONOVSKI AND PAUL BOULANGER. *Compt. rend. soc. biol.* **98**, 522-4(1928) — A discussion of Hasselbalch's formula is given. L. W. RIGGS

Influence of mineralization on the osmotic pressure of albumin in the blood and on the albumin-globulin quotient. I. BLUM, P. GRABAR AND J. WEILL. *Compt. rend. soc. biol.* **98**, 530-2(1928), cf. *C. A.* **22**, 1799 — The variations of the osmotic pressure of the albumins in the blood are conditioned by the changes in the Na and Cl content of the plasma. The ratio albumin/globulin is equally influenced by the presence of these elements. While the osmotic pressure and albumin/globulin ratio are coordinated and conditioned by the same cause, they are not dependent on each other. L. W. R.

Urethan hyperglucemia in rabbits deprived of suprarenals. HIROSHI TACHI AND SOZO HIRAYAMA. *Tôhoku J. Exptl. Med.* **10**, 190-7(1928), cf. *C. A.* **20**, 3041; **21**, 766, 777 — Long-standing suprarenalectomized, also doubly splanchnectomized, rabbits react to urethan by a practically equal increase of the blood sugar concn. L. W. R.

Fate of infused sugar with special reference to the absorption of sugar by tissue cells. IV. **Total carbon content in muscle tissue after intravenous injection of glucose.** TOSHIO KUROKAWA. *Tôhoku J. Exptl. Med.* **10**, 198-208(1928), cf. *C. A.* **21**, 954, **22**, 1617 — After repeated injection of hypertonic sugar soln the muscles of rabbits gain in dry matter. This is partly by loss of tissue juices which are reduced by the hypertonic sugar, and partly by the taking up of the infused sugar by the tissues. This is proved by the presence of the tissues of the sugar in a modified form, the decrease in the H₂O content, the increase in total C and the increase of the C/N ratio. Insulin appears to have no influence in the muscle absorption of infused sugar. V. **Does the modified sugar combine with the tissue albumins?** *Ibid.* 209-14 — The absorbed sugar is not combined with tissue albumins, but is readily extd. by water. L. W. R.

Physiological and pharmacological behavior of surviving red and white muscle from the rabbit at different temperatures. TOHORU KITANO. *Arch. exptl. Path. Pharmacol.* **127**, 69-92(1927) — At lower temps. (18-19°) the period of contraction of rabbit muscle, both red and white, is considerably prolonged, and as the temp. is elevated to the normal (39°) this period is shortened. The contraction curve of white muscle at 18-19° is the same as that of the red muscle at 39°. At lower temps. the elastic properties of muscle are diminished, the plastic are intensified. Acetylcholine is inert, upon both red and white muscle at low or high temps., while veratrine is inactive upon white muscle at low temps., although its typical effect becomes more and more marked as the temp. is elevated. Alcohol, chloral hydrate, salicylamide, and urethan manifest their narcotizing effect much more intensely at the higher than at lower temps. In its initial reversible stage the contraction of muscle by narcotics is independent of the effect of the narcotics upon irritability. K. paralysis is favored by low temps. with both types

of muscle. Apparently all of these effects are assocd. with a reduction in permeability consequent to cooling and an increase in permeability attendant upon warming.

G. H. S.

Localization of the diuresis center. GYULA MIHES AND HANS MOLITOR. *Arch. expl. Path. Pharmacol.* **127**, 319-34(1928).—The regulation of the water metabolism of rabbits or dogs can be impaired or destroyed by damage to particular areas of the hypothalamus with an electric cautery. Animals so treated show a decreased urine elimination, and in them hypophysis ext. does not inhibit and caffeine does not increase diuresis.

G. H. S.

Fate of blood sugar in the toad's kidney. MAKOTO HOSoya. *Proc. Imp. Acad. (Japan)* **3**, 632-4(1927).—The threshold for blood sugar is in the glomerular capsule and sugar in excess in the blood above the threshold appears in the urine only through the glomerulus.

G—PATHOLOGY

H. GIDION WELLS

The biochemical race-index of the Egyptians. A. T. SHOUSA. *J. Egyptian Med. Assoc.* **11**, 4 11(1928).—The macroscopic (test tube) agglutination method was used. On a total of 417 Egyptians, 24.2% were found to belong to Gr. I (Jansky); 32.6% to Gr. II, 29.2% to Gr. III, and 13.9% to Gr. IV (Jansky). This gives a racial index of 1.07.

J. A. KENNEDY

Toxin and anatoxin of diphtheria. V. KULIKOV AND P. SMIRNOV. *Ann. Inst. Pasteur* **41**, 1166 74(1927).—See C. A. **22**, 808.

H. G.

The acidosis of pregnancy, its regulation and its connection with carbohydrate-fat metabolism. H. R. SCHMIDT AND T. WINGEN. *Arch. Gynakol.* **133**, 127 42(1928).—In pregnancy, particularly in the last half, the organism shows a great need for carbohydrates. As the carbohydrates of the food and the glycogen reserve of the liver are not always sufficient to meet this need, there is an increased movement of fat to the liver where it is converted to glycogen. As this conversion does not always take place smoothly, acid intermediate products are formed and enter the blood stream. In the blood, in an effort to maintain a const. H-ion concn., these acid substances are neutralized by alkalies and other buffer substances. As part of the blood alkali is diverted to neutralize these stronger acid products, there is less alkali reserve available for the CO₂, and so the CO₂-binding power is decreased as shown by a decrease in alveolar CO₂ tension. This whole process varies greatly according to the degree in which carbohydrate is lacking and may not occur if the carbohydrate metabolism is sufficient.

H. F. H.

The alcohol extract reaction of Lüttge and v. Mertz. H. RUPP. *Arch. Gynakol.* **133**, 143-9(1928). One hundred and eighty sera were treated with alc. ext. of carcinoma of the uterus and placenta, according to the original method of Lüttge and v. Mertz. One hundred sera were from pregnant women, 28 from cases of carcinoma of the uterus, 5 from cases in which carcinoma of the uterus had been treated by operations or irradiation, and the other sera were normal or from women with other diseases. The gravid sera gave a positive reaction with placenta ext. in 94% of the cases and with carcinoma ext. in 65%. The carcinoma sera gave a positive reaction with carcinoma ext. in 89% and with placenta ext. in 64% of the cases. Sera from febrile and inflammatory conditions also tended to give positive reactions. While the reaction is not specific, it may be used to advantage in some cases, for instance, to indicate whether there is a recurrence of carcinoma after operation or irradiation.

HARRIET F. HOLMES

Serological studies in the group of the spore-bearing anaerobes. I. The qualitative analysis of the bacterial antigens of *B. edematis maligni* (vibrio septique) and *B. tetani*. A. FELIX AND M. ROBERTSON. *Brit. J. Exptl. Path.* **9**, 6-18(1928).—The existence of two kinds of antigen, stable and labile, in *B. edematis maligni* and *B. tetani* has been demonstrated by agglutination, agglutinin-absorption and immunization. The phys. and chem. properties of the two kinds of antigen are analogous to those known in aerobic species which possess the double type of antigen. Purely stabilotropic immune sera have strong complement-binding properties. Immune sera which contain both labilotropic and stabilotropic agglutinins do not develop a stronger complement-binding action than immune sera with an equal content of stabilotropic agglutinins; it does not alter the degree of complement-fixation whether labile agglutinins, even in very great quantities, are present or not. Immune sera which contain both labile and stable agglutinins lose entirely their power of binding complement if the stable agglutinins are removed (by absorption with bacilli heated to 100°) in spite of the fact that the content of labile agglutinins remains completely unchanged.

H. F. H.

The relation of basal metabolism to the endocrine function of the testicle. W. LOEWENSTEIN AND O. SCHWARZ. *Wiener Arch. inn. Med.*, 15, 95-122(1928).—Detn. of basal metabolism is not at present of value in the diagnosis of a disturbance of function of the testicle or for the biologic analysis of sexual derangement. HARRIET F. HOLMES

Analysis of the mechanism of hyperallantoinuria following puncture of the fourth ventricle. ANGEL ESTABLER Y COSTA AND CHARLES KAYSER. *Compt. rend.* 186, 535-7(1928); cf. *C. A.* 22, 1391, and following abstr. L. W. RIGGS

Hyperallantoinuria in the polyurias of diabetes insipidus in man. ANGEL ESTABLER Y COSTA. *Compt. rend.* 186, 650-2(1928).—The allantoin was detd. by a modification of the Wiechowski procedure whereby the Hg compd. was decompd. by H_2S and $1/2$ of the resulting liquid served for the detn. of urea by the xanthhydrol method and the other half was hydrolyzed by HCl for 2 hrs. in the autoclave under 5 atm. when all of the N of urea and 92% of the N of allantoin are transformed into NH_3 . Polyuria in 2 healthy subjects, caused by simple ingestion of water was accompanied by an increase of 104 and 336%, resp., of allantoin in 24 hrs. In a subject with cirrhosis of the liver, caused by injections of novasurol, the allantoin increased from 21.2 to 292 mg. per 24 hrs. In a case of diabetes insipidus the vol. of urine was 7470 cc and the allantoin reached 452 mg. in 24 hrs. or 2160% as compared with a normal excretion of 20 mg. Cf. preceding abstr. L. W. RIGGS

Glutathione content of sarcoma and of normal tissues. J. LECLOUX, R. VIVARIO AND J. FIRKET. *Compt. rend. soc. biol.* 97, 1823-5(1927).—Sarcomatous tissue contains more glutathione than other tissues, except the liver, spleen and kidneys, which in general contain 2-3 times as much glutathione as sarcoma. The necrotic central part of a sarcoma contains on the av. about $1/2$ as much glutathione as the peripheral portion. The glutathione content seems to have some relation to the degree of cellular activity. L. W. RIGGS

Evolution of albuminuria in experimental nephritis by uranium nitrate in the dog. MARCEL GARNIER, E. SCHULMANN AND J. MAREK. *Compt. rend. soc. biol.* 98, 285-7(1928).—Uranium albuminuria is evolved separately from other phenomena detd. by the nephritis. It precedes the other phenomena, decreasing as it progresses. For doses of uranium nitrate less than lethal, the albuminuria is directly proportional to the quantity injected. For doses 5 to 15 times the lethal quantity the albuminuria is, on the contrary, less accentuated and of short duration. L. W. RIGGS

Secretion of adrenaline in the course of shock caused by the intravenous injection of peptone. A. TOURNADE AND H. HERMANN. *Compt. rend. soc. biol.* 98, 342-3(1928).—By the method of suprarenal-jugular venous anastomosis of 2 dogs it appears that after an injection of Witte peptone the secretion of adrenaline passes into 2 inverse phases: it is at first impeded and after 1 to 6 min. is intensified. L. W. RIGGS

Alkaline reserve and calcemia in pellagra. L. BALLIF AND I. GHERSCOVICI. *Compt. rend. soc. biol.* 98, 393-5(1928).—In 47 grave cases of pellagra the alk. reserve was below 65, the mean normal figure, in 22 cases it was below 50, in 5 cases below 40 and in 6 cases it was above 65. The diminution of urinary pH was parallel with these figures. Administration of 10 g. of $NaHCO_3$ in acute cases had little effect on the alk. reserve or urinary pH . In 10 cases the Ca was above normal. L. W. RIGGS

Calcium and magnesium content of the brain of hyperthyroidized animals. C. I. PARHON AND M. KAHANE. *Compt. rend. soc. biol.* 98, 403-4(1928).—The Ca and Mg have a slight tendency to diminish in the brains of 4 species of hyperthyroidized lab. animals examd. as compared with controls. There was no parallelism in the variations of Ca and Mg. L. W. RIGGS

Cholesterolemia in chronic nephritis. I. GAVRILA AND C. BERARIU. *Compt. rend. soc. biol.* 98, 415-6(1928).—In most cases of chronic nephritis there is a cholesterolemia. No relation appears to exist between the cholesterolemia and azotemia, chloruremia or the level of arterial pressure. L. W. RIGGS

Importance of a determination of chlorides in the cerebrospinal fluid in the diagnosis of tuberculous meningitis. MARCEL LÉVY-BRUHL AND YVONNE GARREAU. *Compt. rend. soc. biol.* 98, 487-9(1928).—The Cl content is lowered, generally below 6.3 g. in tuberculous meningitis. The normal figure ranges from 7.3 to 7.4 and in non-tuberculous meningitic affections is from 6.5 to 7.0. L. W. RIGGS

Hypoglycemia in scleroderma. W. T. LONGCOPE. *J. Am. Med. Assoc.* 90, 1-7(1928).—The metabolism in 8 cases was studied with reference to the function of glands of internal secretion. Attacks of mental confusion and delirium occurred after short periods of fasting. These attacks were associated with hypoglycemia. In other cases of generalized scleroderma the blood sugar as well as other chem. constituents of the blood did not deviate from the normal. In 3 cases the basal metabolic rate tended

to fall below normal and the administration of thyroid was followed by symptomatic improvement. L. W. RIGGS

Calcium content of the blood serum in connection with senile cataract and the causes of senile cataract. B. PELLÁTHY AND I. PELLÁTHY. *Magyar Orvosi Arch.* 29, 32-6(1928).—In a study of 48 cases of senile cataract the blood Ca was within the limits observed in normal controls. The suggestion of a hypofunction of the parathyroids occurring with senile cataract was not confirmed. L. W. RIGGS

Carbon dioxide tension in tissues in relation to cancerous cells. J. C. MOTTRAM. *Nature* 121, 420-1(1928).—Abnormal cell division not only follows irradiation, but has been observed under other abnormal conditions, among them high concns. of CO_2 . L. W. RIGGS

Mechanism of hyperglucemia caused by venesection. HIROSHI TACHI. *Tôhoku J. Exptl. Med.* 10, 96-176(1928); cf. *C. A.* 20, 2699.—The withdrawal of about $\frac{1}{7}$ of the blood of rabbits caused no appreciable change in the sugar concn. of the blood or urine, but the withdrawal of about $\frac{1}{4}$ of the total blood was followed by an increase in the sugar content of blood and urine. The total amt. of blood withdrawn at one time or by repeated venesections at short intervals detcs. the hyperglucemia. The same results follow whether the blood is drawn from artery or vein. The intensity of the hyperglucemia is greater in winter and spring than during the remainder of the year. Severing the splanchnics on both sides retards the appearance of the hyperglucemia. L. W. RIGGS

H—PHARMACOLOGY

A. N. RICHARDS

Relative toxicity of halogen derivatives of chaulmoogra. B. F. READ. *Chinese J. Physiol.* 1, 345-54(1927).—The satd. dihalogeno-ethyl esters of chaulmoogra have a lethal dose similar to that of the unsatd. Et esters. The diiodoester produces albuminuria, but the dibromoethyl ester, in contrast to chaulmoogra esters, does not produce emesis, local irritation or hypersensitivity and suggests further investigation as a therapeutic in leprosy. These halogen-substituted esters produce a large increase in the urinary neutral S content and no appreciable increase in the urinary ethereal sulfate content. B. C. A

Treatment of pulmonary tuberculosis with metal salts according to Walbum. Cadmium. N. LUNDE. *Z. Tuberk.* 48, 285-98(1927).—Metal salts cause an increased formation of antitoxin as well as bacteriolysins in the body, this being especially true of Cd. The optimal dose is variable for the individual and, therefore, the use of small doses is essential with a careful study of the temp. and reactions on the part of the glandular system, the pleura or peritoneum as well as weight control. H. J. CORPER

New medicants and nutrients in the treatment of tuberculosis for the year 1926. GEORG SCHRODER. *Z. Tuberk.* 48, 316-24(1927). H. J. CORPER

Pharmacological researches on the intravenous injection of sodium permanganate. L. SABBATANI. *Atti accad. Lincei* [6], 7, 113-4(1928).—When NaMnO_4 is injected directly in the vein of the rabbit, it acts immediately on the plasma, on the blood cells and on the vascular endotheliu. The greater part is fixed by the red corpuscles, depriving them of their oxidizing power, and causing immediate hemolysis, hemoglobinemia, hemoglobinuria and anemia, all in degrees more or less proportional to the dose. NaMnO_4 is also reduced to MnO_2 , which behaves in the ordinary manner of colloidal MnO_2 . This second action is not evident in small doses, but with larger doses it becomes proportionately greater, and lethal doses of NaMnO_4 owe their action chiefly to the slower but general toxic action of MnO_2 . The min. lethal dose of NaMnO_4 and of MnO_2 is in each case about 0.00023 g.-mol. per kg. of rabbit. The hemolytic action *in vitro* of NaMnO_4 was confirmed; 1 washed red corpuscle of the rabbit required 7.9×10^{-10} g.-mol. of NaMnO_4 for hemolysis and 3540×10^{-10} g.-mol. for complete "mineralization." Also in *Boll. soc. ital. biol. sper.* 2, 1042-3(1927). C. C. DAVIS

Action of formaldehyde on the vegetative nervous system. J. GAUTRELET AND OLIMPIA VECHIN. *Ann. physiol. physicochim. biol.* 4, 129-80(1928). H. J. D., JR.

Medicinal action of *Capsella bursa pastoris*, and also of its parasites *Cystopus candidus* and *Peronospora parasitica*. W. HARSTEN. *Arch. Pharm.* 266, 133-51(1928).—An exptl. study showing among other results that the parasite *Cystopus candidus* is transferable from *Capsella bursa pastoris* to many other crucifers, as *Brassica napus*, *Sisymbrium sinapistrum*, *Cheiranthus cheiri*, etc. An ext. from the dried healthy *Capsella bursa pastoris* exerts a strong action on the uterus of a virgin guinea pig. The action of the ext. from the infected drug is no stronger than that produced by healthy shepherd's purse. Thus it is seen that the fungi *Cystopus candidus* and *Peronospora parasitica*

lica exert no specific action on the uterus. This action on the uterus is not alone due to the K content of *Capsella*. The expressed juice of the fresh green plant produces a contractive effect on the uterus, not greater, however, than that produced by the dried drug. The aq. exts. of lung-free *Arabis alba* and *Thlaspi arvense* are likewise able to induce contraction in the longitudinal musculature of the uterus, although in less degree than that produced by *Capsella* exts. W O E

Sugar substitutes and insulin substitutes in the treatment of diabetes mellitus. P. WOLFF. *Arch. Pharm.* **206**, 233-41 (1928). A discussion including a bibliography of the subject. W O E

The active constituent of glukhorment. II. HEDWIG LANGECKER. *Klin. Wochschr.* **7**, 159-61 (1928), cf. Dale and Dudley, *C. A.* **22**, 1621.—The active constituent of glukhorment is synthalin. The nitrate and carbonate of synthalin (or glukhorment) are sol. in H₂O, are cryst. and can be used for isolation and identification. The m. ps. of a number of synthalin salts are: nitrate 147-9°, carbonate 184-5°, sulfate 279-83° and chloride 205°. The sulfate is not very sol., the chloride is sol. and the acetate readily sol. in water. MILTON HANKE

The reaction to oils and fats in the lung. H. PINKERTON. *Arch. Path. Lab. Med.* **5**, 380-410 (1928).—Free fatty acids derived from certain animal oils produce caseation necrosis in the lung tissue. The degree of damage and resulting fibrosis produced by an oil in the lung depends largely on the amount of free fatty acid originally present and on the rapidity with which hydrolysis progresses. The almost complete lack of reaction to the neutral vegetable oils in the lung is probably due to the absence of enzyme capable of hydrolyzing the oil. The simple neutral vegetable oils (such as poppy and sesame oil) appear to be most suitable for introduction into the lungs for röntgenologic purposes. Cod-liver oil and rabbit fat undergo a change in the lungs and become acid-fast. They also become sol. in the ordinary fat solvents. This, as well as the similar action of K₂Cr₂O₇ on certain fats, is probably due to oxidation. HARRIET F. HOLMES

The influence of insulin on the ketone body content of the blood in diabetes mellitus. O. PUCSKO. *Wiener Arch. inn. Med.* **15**, 131-40 (1928). A study was made of the effect of subcutaneous and intravenous injections of insulin on the ketone body content in the blood and urine of diabetics. After subcutaneous injection of insulin a fall in ketone bodies was noted in the blood 1.5 hrs. after the injection. The maximal fall is after 4-6 hrs. while there was no further action after 40 hrs. After intravenous injection of insulin the acetone and β hydroxybutyric acid reach the lowest point in 1/2 hour, but the action is not long continued. There is a certain correlation between the ketone body content of blood and urine in that an increased ketone body content of the urine is preceded by an increased ketone body content of the blood. HARRIET F. HOLMES

Sublingual absorption of drugs. Morphine. DAVID DAVIS and DAVID AYMAN. *Arch. Internal Med.* **41**, 231-3 (1928).—No appreciable absorption took place in 7 healthy subjects when 10-15 mg. morphine H₂SO₄ was left under the tongue for 10 min. It may be concluded that drugs generally are hardly absorbed by the sublingual mucosa. MARY JACOBSEN

Chemical changes in the blood in mercuric chloride poisoning. Mechanism and significance of hypochloremia. H. M. TRUSLER, W. S. FISHER and C. L. RICHARDSON. *Arch. Internal Med.* **41**, 231-43 (1928).—Intravenous injection of HgCl₂ (dogs) causes hypochloremia through loss of NaCl in vomiting. The latter results in gastric tetany in spite of the concurrent relative acidosis. Tetany is, therefore, not caused by alkalosis. Restoration of the blood NaCl level relieves and prevents tetany without otherwise affecting the course of poisoning. NaCl, 2% intravenously, may be of value by forcing excretion from the kidney. MARY JACOBSEN

The influence of alkalies on the secretion and composition of gastric juice. III. The effect of sodium bicarbonate on the response to histamine. T. E. BOYD. *Arch. Internal Med.* **41**, 244-8 (1928), cf. *C. A.* **19**, 1885.—The response to histamine (Pavlov pouch dogs) is not altered by up to 1 g./kg. of 2.5% NaHCO₃, but is reduced by 1 g. of a 5% soln. (probably through dehydration) and definitely diminished by 2 g./kg. regardless of the water allowance. The response of the gastric mucosa to histamine is not diminished by 1 hr.'s treatment with 2.5 and 5% NaHCO₃. MARY JACOBSEN

Synthalin—its use in the treatment of diabetes. A. I. RINGER, S. BILOON, M. M. HARRIS and A. LANDY. *Arch. Internal Med.* **41**, 453-71 (1928).—Synthalin was given in 2 mild, 1 moderately severe and 1 severe case of diabetes. The sugar output was reduced, the ketonuria subsided. The N excretion was reduced, probably because of the protein-sparing effect of utilized carbohydrate. The effect on the blood sugar was variable, a definite decrease was obtained in 1 case. In rabbits hypoglycemia was produced by 0.1 g. administered orally or 25 mg. administered subcutaneously and relieved

by dextrose. The disadvantages of synthalin are: slow action and side-effects (nausea, vomiting, diarrhea) in certain patients who, however, may develop tolerance. M. J.

Specific action of "Tasch," an antitubercular medicament, on the guinea pig. A. SARTORY, R. SARTORY AND J. MEYER. *Bull. sci. pharmacol.* **35**, 161-9(1928).—"Tasch" is an abbreviation for "tuberculin-antibody-Scheitlin," a proprietary substance which according to Scheitlin contains a small quantity of Koch tuberculin, antituberculous serum obtained by a modified Behring technic and $1,2,3\text{-C}_6\text{H}_3\text{SO}_3\text{H.OH.OCH}_3$. The medicament is absorbed in the intestines, and when administered in intermittent doses causes thermic reactions somewhat analogous to those characteristic of the tuberculin test. L. W. RIGGS

Effect of ephedrine on the nasal mucous membranes. TSE KING AND CHUB-YUNG PAK. *Chinese J. Physiol.* **1**, 445-54(1927).—Changes in the vol. of the nasal cavity in dogs after treatment with ephedrine as compared with other drugs was studied by Tschalussow's nasal plethysmograph method, and by a newly devised method for local application. Intravenous injection of ephedrine caused a strong and sustained constriction of the nasal vessels and a large increase in the vol. of the nasal cavity. This effect lasts much longer than that obtained with adrenaline. Local application of ephedrine solns. caused a marked vasoconstriction of the nasal mucous membranes lasting more than 1 hr. In this respect ephedrine has a stronger and more lasting effect than cocaine. Ephedrine is absorbed easily and quickly from the nasal mucous membranes. Large repeated doses of ephedrine should not be given. The addn. of 0.5% K_2SO_4 to remove any reflex irritation in hypersensitive cases, in no way interferes with the effectiveness of a 2% soln. of ephedrine. Such a mixt. was more efficient than a 5% soln. of cocaine. L. W. RIGGS

Comparative study of the blood-pressor action of ephedrine, pseudoephedrine and adrenaline. CHUB-YUNG PAK AND B. E. READ. *Chinese J. Physiol.* **2**, 1-18(1928).—Expts. with cats and dogs led to the following results. The 3 chemically allied substances, ephedrine, pseudoephedrine and adrenaline, are similar in their pressor effects but differ in the mechanism of their action. The pressor action of ephedrine is attributed both to the stimulation of the sympathetic constrictor endings and the smooth muscles of blood vessels, as it persists after ergotoxine, though the rise in blood pressure is much less than before ergotoxine. Also, the pressor action is neither sensitized nor completely abolished by cocaine. The pressor action of pseudoephedrine is chiefly musculotropic as it still causes a marked rise of blood pressure after ergotoxine and there is complete abolition of its pressor action by cocaine. L. W. RIGGS

Perfusion experiments with pseudoephedrine and ephedrine. CHUB-YUNG PAK AND B. E. READ. *Chinese J. Physiol.* **2**, 97-106(1928). The perfusion of the leg vessels or heart of frogs or toads gave the following results: Peripheral dilatation of the vessels by pseudoephedrine is demonstrable with a concn. of 0.5%. Concns. of 0.005% show this effect only after prolonged action. Low concn. of pseudoephedrine always gives a long preliminary decrease in venous flow, but a mixt. of pseudoephedrine and ephedrine in the natural proportion of 1 to 4 parts shows an increase of several hundred %. Perfusion of the toad's heart demonstrates the stimulating effect of pseudoephedrine upon the muscle. The depressing effect of 0.005% ephedrine was confirmed. Their combined action showed that while pseudoephedrine may increase the rate of ephedrine, indicating some added stimulation to the accelerator nerve, changes in the amplitude are not sufficiently clear to assume simple summation of their muscular effects. The general conclusion is that their combined action is greater than an additive effect. L. W. RIGGS

Biologic estimation of the quantities of cardioactive glucosides fixed by the frog heart. E. ROTHLIN AND TH. OLIVARO. *Compt. rend.* **186**, 901-2(1928).—Tests were made with 3 preps. of squill "scillarène A," a cryst. glucoside $\text{C}_{36}\text{H}_{52}\text{O}_{13}$, "scillarène B," an amorphous complex contg. probably a mixt. of 2 glucosides, and a natural glucosidic complex which is indicated by "Sq. 1005." The min. quantities of these substances necessary to arrest the isolated heart of *Rana temporaria* were 1 in 900,000, 1 in 1,300,000 and 1 in 1,000,000, resp. On this basis the wts. would be 0.55, 0.38 and 0.50 mg., resp. But the quantities of the drug adsorbed during the tests were 0.265, 0.435 and 0.315 mg., resp. These differences of absorption by the heart of the 3 preps. are attributed to the different physico-chem. properties of the preps. With 0.5 to 3 cc. of liquid, intoxication of the heart depends more on the concn. than on the abs. quantity of glucoside present. L. W. RIGGS

Influence of the administration of thyroïdin on experimental tuberculosis. A. HANNS. *Compt. rend. soc. biol.* **97**, 1717(1927).—The administration of thyroïdin was without influence on the evolution of exptl. tuberculosis in guinea pigs. L. W. R.

Irradiated ergosterol in experimental tetany. C. I. URECHIA AND G. POPOVICIU. *Compt. rend. soc. biol.* **98**, 405-7(1928).—Irradiated ergosterol gave no results in parathyropectomy tetany, nor did it influence the abnormalities of Ca and P metabolism in any const. fashion or prolong life. L. W. RIGGS

Anti-infection action of an extract of bottom yeast, lipoids and ergosterin. ALB. BENOIT. *Compt. rend. soc. biol.* **98**, 525-6(1928). L. W. RIGGS

Action of strontium on veratrine contracture. E. MILHERIO. *Compt. rend. soc. biol.* **98**, 548-9(1928); cf. C. A. **22**, 270, 272.—Expts. were made by immersing the gastrocnemius muscle of the frog in the soln. to be tested. Sr acts definitely on veratrine contracture, its action varying somewhat inversely with the concn. of the veratrine L. W. RIGGS

Mechanism of the rigor produced by monobromoacetic acid. MIGUEL OZORIO DE ALMEIDA AND THALES MARTINS. *Compt. rend. soc. biol.* **98**, 629-30(1928); cf. C. A. **22**, 1799.—The perfusion of muscles with solns contg. $\text{CH}_2\text{BrCO}_2\text{H}$ in sufficient concn causes rigor without contractions. The acid remains fixed in the muscles and is not removed by prolonged washing. Previous exercise of the muscles promotes the appearance of the rigidity. **Action of sucrose on the appearance of rigor by monobromoacetic acid.** *Ibid* 634-6 —The presence of sucrose hastens and increases the rigor produced by $\text{CH}_2\text{BrCO}_2\text{H}$. L. W. RIGGS

Hematopoietic effect of nuclear extractives in experimental anemia and in human anemia. OLOF LARSELL, N. W. JONES, B. I. PHILLIPS AND H. T. NOKES. *J. Am. Med. Assoc.* **90**, 75-8(1928); cf. C. A. **21**, 3974.—Nucleoprotein from beef liver serves as a hematopoietic stimulant. There is some evidence that nucleoprotein administered with Na salts of nucleic acids has a more marked effect in hematopoietic stimulation than either of these substances alone. L. W. RIGGS

The effects of anesthetics on hepatic function. S. M. ROSENTHAL AND WESLEY BOURNE. *J. Am. Med. Assoc.* **90**, 377-9(1928).—Brief periods of CHCl_3 anesthesia produce immediate and delayed toxic effects on the liver; 30 min. of CHCl_3 anesthesia causes injury that requires 8 days for functional recovery. Disturbance of function could be shown with the bromosulfalein test long after pigment metabolism had returned to normal. Et_2O produces a transitory impairment of function. Recovery is usually complete in 24 hrs. N_2O and C_2H_4 administered through a mask produced no disturbance, but given in a closed chamber with poor oxygenation caused immediate and delayed toxic effects on the liver. Cyanosis in itself increases the toxicity of anesthetics on the liver. C_2H_4 would seem to be the anesthetic of choice for operation in severe liver disease. L. W. RIGGS

Influence on the metabolism of striped muscle by the direct action of insulin. (A study of the mechanism of action of insulin.) KOTARO KIMURA AND HIROJI TAKAHASHI. *Tôhoku J. Exptl. Med.* **10**, 215-47(1928) —Expts. were made with the dog gastrocnemius *in situ*, with arteries and veins ligated so that the blood through a single artery and vein could be studied before and after the injection of insulin into the artery. Insulin lowers the O consumption of the muscle and diminishes the sugar content of the blood circulating through the muscle. This disappearance of sugar from the blood is without any oxidative process, but is through the arrest of cell activity by the direct action of the insulin on the muscle cells. Insulin increases the hemoglobin content of the blood while it diminishes the serum globulin and vol. of the corpuscles. The changes in serum-NaCl content are irregular. Insulin has a similar but less pronounced action upon muscles with a degenerated or cut-off nerve supply. L. W. RIGGS

R. A. GORTNER

The molecular concentration of the blood of some fresh water mollusks. Role of carbonates. MARCEL DUVAL. *Ann. physiol. physicochim. biol.* **4**, 27-43(1928); cf. C. A. **22**, 1193.—The blood concn. of fresh water mollusks is considerably greater than that of the water. With the *Anodonta* it has a value of $\Delta = -0.10^\circ$ to -0.13° while with 2 gasteropoda (*Lymnaea* and *Planorbis*) it amounts to $\Delta = -0.21^\circ$ to 0.25° . The blood NaCl varied in the *Anodonta* between 0.1 and 0.065% in most cases but was found

as low as 0.0088%. The blood NaCl in the *Lymnee* was between 0.167 and 0.225% and in the *Planorbe* between 0.160 and 0.184%. The blood of the fresh water mollusks contains a very large amt. of bicarbonates, much greater than that found in marine animals. The CO₂ content per 100 cc. blood was *Anodonte*, 29-34 vol. %; *Lymnee*, 45-58 vol. %; and *Planorbe*, 55-78 vol. %. While in the marine invertebrates the Cl content may comprise almost 90% of the mol. concn. of the blood and the CO₂ does not exceed 1.5%, in the fresh water mollusks the CO₂ content may be greater than that of the chlorides. The relative amts. were as follows: *Anodonte*, Cl (32-42%), CO₂ (39-50%); *Lymnee*, Cl (51-57%), CO₂ (36-46%); and *Planorbe*, Cl (44-53%), CO₂ (46-59%). The Cl and CO₂ accounts for almost the total salt concn. of the blood. The increase of saline in the outside medium causes an increase in the mol. concn. of the blood but this rise is augmented at a slower rate than in the external medium. When the external medium reaches a certain concn., the blood becomes isotonic with it and further increase in the external medium results in a like increase in the blood concn.

Digestion in the cockroach. III. Digestion of proteins and fats. V. B. WIGGLESWORTH. *Biochem. J.* 22, 150-61(1928); cf. *C. A.* 22, 461. A trypsin, an erepsin and a lipase are present, and pepsin is absent. BENJAMIN HARROW.

12—FOODS

F. C. BLANCK AND H. A. LEPPER

The preservation of food. LOUIS GERSHENFELD. *Am. J. Pharm.* 100, 201-32 (1928).—A popular lecture. W. G. GAESSLER.

Impurities in coloring matters used in food. E. F. ARMSTRONG, et al. *Analyst* 53, 217-8(1928).—Pending the enactment of a legal limit, it is recommended that a pure color used in foodstuffs should not contain more than 5 parts of As₂O₃ per million. Colors used at not more than 3-fold diln. should not contain more than 3 parts per million. Colors dild. to a greater extent may contain 1 4 parts of As₂O₃ per million. W. T. H.

The chemical analysis of nutritive preparations. ERNST KOMM AND RUDOLF MÜLLER. *Z. Untersuch. Lebensm.* 55, 53-9(1928).—Detailed analytical data are given on the nutritive prepn. "Provita." WILLIAM J. HUSA.

The official closing of samples. F. SPRINKMEYER. *Z. Untersuch. Lebensm.* 55, 65-8(1928).—A discussion of the closure and selling of samples taken for testing. WILLIAM J. HUSA.

The differential baking test. I. E. WERNER AND RALPH S. HERMAN. *The Northwestern Miller* 5, 1216(1928).—The authors describe a method which they have used successfully in judging the stability of a flour. Two loaves are made identically the same, except that in the dough mix in one of them there is added 1 mg. of KBrO₃. This small quantity of an oxidizing agent produces differences in the finished loaf that to the trained expert signifies certain inherent qualities in the flour. L. H. BAILEY.

Standard experimental baking test. M. J. BLISH. *Cereal Chemistry* 5, 158-61 (1928).—This report is the outcome of the March meeting of the Committee on Standardization of the Experimental Baking Test of the American Association of Cereal Chemists. A basic formula is given as well as a description of the mixing, fermentation, molding and panning, proof and baking. Additional and supplementary procedure is given. Specifications are given for the special equipment needed. A method for recording and reporting results is being prepd. L. H. BAILEY.

Influence of size and shape of pan on the baking test. J. P. LEWIS AND W. O. WHITCOMB. *Cereal Chemistry* 5, 146-58(1928).—The shape of the pan exerts a marked influence on the size and quality of the loaf in both strong and weak flours. The proof period varies with different types of pans. It does not correspond closely with volume or height of loaf or quality of bread. The deeper produce the taller but not the larger loaves. Area of top of pan has a closer relationship to the size of the loaf than has any other dimension. The deep type of pan produces a smaller loaf of somewhat poorer quality than the shallow type. Hence a flour that will produce a good loaf in a deep pan can be depended upon to perform well in the bakeshop where the shallow type of pan is used. The testing lab. pan should of necessity be of a different type from that

of the commercial bakeshop. It seems desirable that some uniform type of pan be adopted for laboratory tests. L. H. BAILEY

The different chemical components of the crust and of the soft part of wheat bread of Rome. LUIGI SETTIMI. *Ann. chim. applicata* **18**, 19-31(1928).—Analysis of carbohydrates, proteins, fats, lipoids, P substances and inorg. substances in flours and in the crust and soft part of breads prep'd. from the flours lead to certain general conclusions. The carbohydrates and proteins, the chief components, differ in chem. compn. in the crust and in the soft part. In bread-making, more than 50% of the starch is transformed into sol. starch, dextrin, maltose and glucose, rendering it easier for the organism to complete the change into glucose, the final assimilative product. More starch is transformed in the crust than in the soft part and therefore the crust is the more digestible part. In bread-making, part of the proteins are transformed into albumoses and peptones, and since they are intermediate products between proteins and assimilative amino acids, bread-making renders more easily digestible the proteins of the flour. In the crust these changes are more extensive than in the soft part, so that here again the crust has a higher nutritive value than the soft part. The fats and phytosterols in flour are not altered during the bread-making. The phosphatides in the crust and soft part are in smaller quantity than in the flour. The crust contains less NaCl than does the soft part; otherwise the more components are the same. C. C. D.

1927—Cake flour report of the American Institute of Baking. C. B. MORISON. *The Journal* **1**, No. 1, 16-9(1927) — Results are given of the examn. of 36 samples of cake flour. The flour came from 10 states. The opinions of com. cake bakers of these flours are given in the report. L. H. BAILEY

Testing flour by the iodine absorption method. N. A. TROPIMUK. *Die Muehle; Am. Miller* **56**, 56(1928); cf. *C. A.* **21**, 969.—To 5 g. flour, add, while shaking, gradually 200 cc. of water. Shake for 3 min., and filter after it has been exposed to room temp. for 1/2 hr. Then mix 50 cc. of the filtrate with 2 cc. of starch paste (0.5%) which has been kept sterile, and titrate with a 0.01 N I soln. in KI, until the blue coloring has been maintained for about 20 min. The quantity of I absorbed is given in cc. 0.1 N I soln. for 100 g. of dry-flour substance. For potatoes it was 0, rice 70, millet 70, wheat 109, barley 131, rye 165, oats 178, buckwheat 230, beans 703, peas 798. The figures vary some with different grades of the same kind of flour but there is always a distinct difference between the kinds of flour from those seeds with 2 lobes and those with one lobe, the former having a very high and the latter a lower I consumption. **Differentiating flours by the rapidity of sedimentation.** T. puts 1 g. flour in a test tube of 2-3 cm. diam., mixes it with 5 cc. water, and shakes the soln. once more after a further addn. of 7 cc. water. Ten cc. of this soln. is brought with the use of a pipet into a graduated cylinder (graduated in mm.), of 9.5 mm. diam. and 150-60 mm. high. The rapidity of sedimentation is then observed. It is most rapid in potato flour, less rapid in millet and rice flour, and slower in buckwheat, wheat, barley, oat, rye and bean flour. This difference enables one to prove the addns. of at least 10% of rye flour, 15% of oat flour and 20% of barley flour to wheat flour. L. H. BAILEY

A study of the proteoclastic activity of flour. ANDREW CAIRUS AND C. H. BAILEY. *Cereal Chemistry* **5**, 79-104(1928) — Eight chem. methods for measuring progressive proteolysis in flour suspensions were studied. Two of the methods, (1) pptn. of protein with $\text{CCl}_3\text{CO}_2\text{H}$, and (2) detn. of total water-sol. N appeared to be of limited value. The SnCl_4 pptn. method was somewhat cumbersome and the results of replicate detns. were more variable than with the $\text{Cu}(\text{OH})_2$ and tungstate methods. The last 2 methods, while somewhat laborious, appeared to give acceptable results. Foreman's titration method is rapid, which proved to be best suited for the measurement of proteolysis in flour. Detn. of amino N by the Van Slyke method was useful but somewhat more laborious than the Sørensen method. The extent of proteolysis which occurs when suspensions of high-grade flour milled from sound wheat are digested for 48 hrs. at 37° is slight when measured in terms of the amino N which appears in the digest. Ash content as a measure of the degree of refinement or grade of flour is positively correlated with the rate of proteolysis. The coeff. of correlation of ash content with amino N was $+0.84$ P. E. ± 0.0195 . In general, no relation between proteolytic activity of flour and wheat variety or region in which wheat was produced could be discerned. Sprouted wheat flour evidences a very high proteoclastic activity, but the presence of 1, 2 or 3% of such flour milled from wheat sprouted under careful control, in mixt. with flour milled from sound wheat, modified the rate of proteolysis to an inappreciable extent. Decreases in the viscosity of incubated flour suspensions are associated with increases in the proteoclastic activity of the flour used in prepg. the suspensions. Because of the difficulties inherent in the viscosity detn. as a precise measure-

ment, this method will require further study and standardization before it will be acceptable as a basis for distinguishing small variations in the proteoclastic activity of different flour samples. It is difficult to det. the significance of the small variations in the activity of flour proteases as these are registered in the baking properties of dough. In highly refined or patent flours milled from sound wheat, it is probable that the total effect of proteolysis on the baking strength in the course of ordinary fermentation is small. With low-grade flours the effect may be appreciable, and the same is doubtless true of flours milled from sprouted grain when the percentage of sprouted kernels in the wheat mixt is large. A prepn which exhibited protease activity was obtained from an ext. of patent flour when the ppt resulting from the addn. of saffranine was collected and digested with a suitable protein prepn. This is believed to demonstrate the presence of protease in flour.

L. H. BAILEY

Wheat and flour studies. XIV. Factors influencing the viscosity of flour-water suspensions. 3. Effect of small quantities of carbon dioxide in water used for the extraction of electrolytes. ARNOLD H. JOHNSON AND B. L. HERRINGTON. *Cereal Chemistry* 5, 105-15 (1928); cf. *C. A.* 22, 1196.—Viscosities of acidulated flour-water suspensions extd. with water contg. CO₂ were higher than those of similar suspensions extd. with neutral distd. water. Differences in viscosity between such suspensions increased as the quantities of the respective waters used for extn. increased. No greater quantities of electrolytes were extd. with CO₂-contg. water than with neutral water. Differences in H-ion concn. existed between the exts. obtained with CO₂-contg. water and those obtained with neutral water, but these differences did not afford a satisfactory explanation for the differences in viscosity which result. Greater quantities of protein were extd. when non-aerated water was used than when aerated water was used. As the removal of the protein effected higher viscosities, it appears that certain of the proteins of wheat flour operated to depress the viscosity of acidulated suspensions in which they were present.

L. H. BAILEY

Testing of New Zealand-grown wheats. II. Quality of flours. F. J. A. BROGAN. *New Zealand J. Agr.* 35, 289-94 (1927).—Analyses of a no. of varieties of New Zealand wheats are tabulated.

K. D. JACOB

Effect of delayed harvesting on quality of wheat. A. F. BRACKEN AND C. H. BAILEY. *Cereal Chemistry* 5, 128-45 (1928).—The study of wt., vol. and d. of Kanred wheat harvested at ten day intervals after ripening shows that the wt. of a kernel does not change when dried to a uniform moisture content after wetting, but that the decreased wt. to a measured vol. is due to an increased vol. of the kernel. These detns. also tend to bring out the fact that high d. is associated with high protein content, and the wheat with low density and low protein content showed a greater increase in vol. after being wet than wheat of higher protein content and higher d. The opaqueness of grain which had been wet was observed to be due to air spaces developed through the cracking of the kernel, and this condition in turn explains the reason for the increase in vol. Cracking would also allow for lines of weakness in the wheat which make it difficult to thresh such grain without a high percentage of broken kernels. Titratable acidity and H-ion concn. showed no change as a result of delayed harvesting. The diastatic activity for both the whole wheat meal and the flour was the same within reasonable limits of variation for the whole series of cuttings. Microscopic study of starch grains, in addition, gave no indication of diastatic activity. Through a measurement of the epithelial cells of several wheat kernels, no increase in length was observed; thus the possibility of diastatic or proteoclastic activity is partly precluded. If any deterioration were indicated as a result of prolonged harvesting it would be expressed in a greater soly of the protein material. Detns. of total N, water-sol. N Sn-non-precipitable and Cu nonprecipitable N gave no indication of this sort of change. The baking studies, the final criterion on the problem, gave proof that wheat which had remained unharvested in the field for 50 days after ripe, subjected to alternate wetting and drying showed no indication of deterioration as detd. by loaf vol. and loaf texture. Dark hard wheat of the Turkey Red type does not deteriorate in quality upon standing uncut in the field when subjected to alternate wetting and drying in spite of the fact that the grains bleach and lose weight per measured volume.

L. H. BAILEY

Effect of severe weathering on certain properties of wheat. W. O. WHITCOMB AND A. H. JOHNSON. *Cereal Chemistry* 5, 117-28 (1928).—The grade of wheat was lowered and the color impaired by exposure to weather in all cases considered. More damaged kernels occurred in wheats subjected to alternate freezing and thawing than in wheats subjected to continuous cold, the quantity increasing as the exposure progressed. Dark kernels, test wt. per bu., and wt. per kernel all decreased as weathering progressed. Germination was lowered to a greater degree by weathering than was

any other factor considered. The protein content remained practically const. after the initial reduction, which took place during the first two months of weathering. The ash of wheats decreased during weathering while that of flours milled from them increased. The H-ion concns. of flours milled from weathered wheats were the same as those of flours milled from normal wheats. The loaf vol. of bread produced from wheats exposed to different degrees of weathering showed no significant variation. The first sample threshed produced bread of large loaf vol. but the protein content of the wheat was correspondingly high. The color and texture of bread produced from weathered wheat in 1925 was equal to that from normal wheat, while in 1926 it was slightly inferior. The quality of the gluten produced from weathered wheat was equal to that from normal wheat as judged by the protein gluten ratio, the phys. properties of gluten, and the viscosity test. The proteoclastic activity of flour milled from weathered wheat was the same as that milled from normal wheat, as detd. by either the formal titration or the Van Slyke amino nitrogen method.

L. H. BAILEY

The nutritive value of maize and its various preparations in Java. B. C. P. JANSEN AND W. F. DONATH. *Mededeel. Dienst Volksgezondheid Nederland. Indië* 17, 92-119 (1928).—The compn. and nutritive value of a number of kinds of maize were examd. The compn. did not vary much. The anti-beriberi vitamin % was also about the same in order to compensate for the vitamin deficiency of one part of washed polished rice in expts. with pigeons, one or two parts of the different kinds of maize were needed, sometimes a little more. Yellow or colored maize contains much more vitamin A than the white variety. The nutritive values of the different maize preps. appeared to be very different. Various methods of prepn. for use as food are considered.

J. A. KENNEDY

Determination of salt in margarine. D. W. STUART. *Analyst* 53, 212-3 (1928). Melt 3 g. in a 150-cc. Erlenmeyer flask and add 10 cc. of acetone and a few drops of chromate indicator. Titrate with 0.1 N AgNO₃.

W. T. H.

Use of Janus green in the reductase test for milk. A. R. TANKARD. *Analyst* 53, 213 (1928).—In the account of Soep's comparative tests for the substitution of Janus green for methylene blue (cf. C. A. 22, 1810) the order of classification by Christian sen appears to have been reversed. A comparison of the 2 tests with 35 samples of milk shows that there is little choice between the tests with respect to bacterial quality of milk. Bacterial count made on milk showing reduction in either test usually gives lower values than is indicated by the scales used, although such milk is invariably unsatisfactory.

W. T. H.

The hygienic evaluation of the biological properties of milk. M. A. DYCHINO AND O. M. BRISKIN. *Z. Untersuch. Lebensm.* 54, 438-46 (1927).—The heating of milk in the usual manner for the purpose of reducing its bacterial content injures its biological properties (by destruction of catalase, reductase, peroxidase, etc.) and injures its quality. The process, widely used in Russia, of heating to 60-70° causes fusion of the fat globules into larger drops of higher fat content but does not essentially alter the chem. or biological properties of the milk, this process is similar to the American process of gentle pasteurization for 1/2 hr. at 60-70°.

WILLIAM J. HUSA

Action of cold on the fats of milk. G. QUAGLIARIELLO. *Atti accad. Lincei* [6], 7, 75-8 (1928).—When milk (not homogenized) is cooled to 10° and then warmed, the surface tension is lowered (cf. C. A. 11, 3345 and Burri and Nussbaumer, C. A. 4, 625). The fat globules contain a preponderance of insol. triglycerides of higher fatty acids intimately mixed with a small proportion of triglycerides of lower fatty acids which are somewhat sol. in water. When the temp. is lowered, the former solidify and contract so that the latter pass into the interglobular liquid. When the milk is warm again the triglycerides of the higher acids fuse, but those of the lower acids which passed into soln. remain dissolved, and lower the surface tension. To verify this explanation, the surface tension and the triglycerides of the lower fatty acids in normal milk and in milk previously chilled to 0°, from both of which most of the fat had been removed by centrifuging, were detd. The analyses show such an increase in the glycerides of the lower acids after the chilling process that there is no doubt that the lowered surface tension is a result of the dissolution of these fats from the original fat globules. This is also supported by the fact that when the 2 samples were centrifuged, the normal milk gave a yellow homogeneous compact solid mass, whereas from the previously chilled milk there sepd. 2 layers, a yellow liquid fat layer and a white solid fat layer.

C. C. DAVIS

An indicator paper for the study of the acids of milk. A. TAPERNOUX. *Compt. rend. soc. biol.* 98, No. 9, Séance Feb. 20, Lyon, 621-2 (1928).—A paper was prepd. by washing filter paper to neutrality and satg. it with an aq.-alc. soln. of methyl red 1 to 1000. The prepd. paper has a yellow color and must be protected from acid or alk.

vapors. Its color change is comprised between p_H 4.4 and 6.2. In fresh milk of the cow its color does not change unless the acidity exceeds 20 to 21 (Dornic). In more acid milk the color changes to orange or orange red. L. W. RIGGS

Is the fat-free dry substance of decisive importance for detection of a diluted milk? C. E. KLAMER. *Z. Untersuch. Lebensm.* 55, 45-7(1928).—K. concludes that the detn. of f-p. lowering in milk is the final criterion as to the presence of added water.

WILLIAM J. HUSA

Investigations on the skimming of milk, with a special view to the testing of the efficiency of different separators. R. MORK. *Meldinger Norges Landbruks.* 7, 1-60 (1927).—Eighty-four tests have been made with 6 diff. types of separators. For detg. the fat content, sp. gr. and viscosity the usual methods were employed. For detg. the medium vol. of the fat globules and the no. of globules per cu. mm. various methods were tried, as well as the direct measurement of a great no. of globules and the counting of the globules in a fixed vol. The fat content in skim milk appeared to be unsuitable for characterizing the skimming process, since great variations were obtained in the results under const. skimming conditions when various kinds of milk of different characteristics were used. The variations found in sp. gr. and viscosity of the milk plasma could have only a small influence on the skimming process. A marked relation was found between high numbers of fat globules in the whole milk and high fat contents in the skim milk, however with several important exceptions. The av. vol. of the fat globules in skim milk is fairly const. for the same separator and the same skimming conditions regardless of the whole milk used. Milk from cows in the last stage of lactation giving a fat content in the skim milk of 0.360% and that from cows in the first stage of lactation giving a fat content of 0.090% under the same conditions showed the same av. vol. of globules in the skim milk. The method of measuring the fat globules sufficed for differentiating clearly very small differences in skimming efficiency.

C. A. ROBAK

The milk cows having diseases of the udder. J. KRENN. *Z. Untersuch. Lebensm.* 55, 47-9(1928).—The milk of cows having diseases of the udder resembles diluted milk in some respects, but the high content of chlorides indicates its pathol. nature.

WILLIAM J. HUSA

Fat losses in buttermilk. W. B. COMBS. *World's Butter Review* 2, No. 3, 9-10, 20(1928).—The fat content of buttermilk varies seasonally; it is greatest in the spring. When cream is churned soon after pasteurizing without giving the fat globules time to solidify, fat losses are great. Sepg. buttermilk pays only when the fat content exceeds 0.6% by the BuOH test. The Mojonner (Rose-Gottlieb) fat estn. agrees fairly well with the BuOH but is decidedly higher than Babcock on buttermilk. F. L. S.-J.

Study of bakery products containing butter. C. BAUMANN. *Z. Untersuch. Lebensm.* 54, 487-8(1927).—Analytical data are given on 38 samples of bakery products.

WILLIAM J. HUSA

Fresh and cold-storage eggs. C. BIDAULT. *Rev. hyg. med.* 50, 178-85(1928).—The use of an atm. of 94-95% N in cold-storage rooms held at 0° is displacing other methods in France. In eggs from 2 to 10 days after laying at ordinary temps., the ovalbumin crystd. readily; from 11 to 20 days it crystd. irregularly, while after 20 days it could not be made to crystallize at all. This period coincided with the loss of germ-inative power in the eggs. In cold-storage eggs held 9 months at 0-0.2° at a humidity of 85-90, very few ovalbumin crystals were observed while after 11 months none was found. Many of the eggs also contained viable bacteria. The point is emphasized that if freshly laid eggs are used to put in cold storage, a good, edible product will result. C. R. F. •

The determination of lecithin phosphoric acid in egg liquors. J. GROSSFELD. *Z. Untersuch. Lebensm.* 54, 450-62(1927).—Details are given of a simplified procedure for the detn. of lecithin H_3PO_4 in egg cognac and similar products. W. J. H.

The heat effects in ripening fruit. GEORG HOFBAUER. *Mitt. staatl. tech. Versuchsanst. (Wien)*, 16, 119-23(1927).—The sp. heat of green bananas as detd. in a small specially constructed calorimeter was 0.72 (0.72 cal. to raise the temp. of 1 kg. 1°). The heat elimination of the fruit during ripening was studied with a single bunch in the small calorimeter and with large amts. in the storage rooms. In the latter case, the heat elimination was detd. by measurement of the temp. of the ingoing and outgoing air, the rate of air circulation and the temp. of the fruit. By the first method the heat output per kg. bananas per hr. was on an av. 0.32 cal. and by the second procedure it was found to be on an av. 0.28 cal. H. J. DRUEL, JR.

Preservation of whole fruit with sulfur dioxide. J. M. ARTHUR AND M. S. BENJAMIN. *Agr. Gaz. N. S. Wales* 38, 873-5(1927).—Uncooked, whole grapes and plums were preserved in good condition for 3 months by bottling in 0.08% solns. of SO_2 . The

natural flavors were retained but a certain amt. of bleaching of the natural colors resulted, and a slight acidity was developed. In most cases these undesirable properties could be partly eliminated by cooking the fruit after the bottles were opened.

Analysis of "fruit and apple" preserves. C. F. MUTTELET *J. pharm. chim.* **7**, 109-13 (1928) — Replv to Lasausse (*C. A.* **22**, 828). LASAUSSE *Ibid.* 175 6. Rejoinder S. WALDROTT

A calorimeter for the determination of the heat developed by fruit. EZER GRIFFITHS *Proc. Phys. Soc. London* **40**, 46 53 (1928). — A calorimeter is described for measuring the heat evolved by apples during the senescence stage. A differential arrangement was used in which one container was filled with apples and the other with dummy apples of the same thermal capacity made of thin-walled glass spheres filled with moistened glass wool. The containers were enclosed in a metal box thermally insulated and set up in a const. temp. room. The differential resistance thermometers were composed of 2 sets of 8 glass tubes which were uniformly distributed throughout the space occupied by the apples and by the dummies. Each tube contained 10 yds of Ni wire uniformly wound along the full length of the tube and the 8 tubes of each set were connected in series to form 1 thermometer. The 2 thermometers were connected to a slide wire bridge on which 1 cm. movement along the wire corresponded to a difference of 0.003° between the thermometers. Air circulation was controlled to maintain at will an atm. contg. 2 to 10% CO₂ around the apples. The moisture content was detd. by a dew point app. and a correction applied for the heat absorbed in evapg. water from the apples. At 20° sound apples generated heat at the rate of 0.012 cal./sec./kg. of apples.

H. M. McLAUGHLIN

Contribution to the colloid chemistry of fruit juices. A study on the conditions for the making of jelly from apple juice. JOHS LINDEMAN, *Meldinger Norges Landbruks* **7**, 157 297 (1927). — Samples of apple juice were prepd. from 3 kinds of apples by cutting the fruit in 4-6 pieces, placing 1 kg. in a covered glass without addn. of H₂O, placing on a water bath, heating to boiling and keeping the water boiling for 1.5 hrs., pressing in a fruit press and filtering. The clear juice was poured into bottles, covered with cotton-wool and sterilized. The yield of juice per kg. differs considerably with the point of time of the sampling and with the kinds of apples. The acidity was detd. by measuring the H-ion concn. either electrometrically by means of the quinhydrone electrode or in a colorimeter. In order to get a colorless juice for colorimetric detns. the sample was placed in a Schleicher & Schull parchment case 8 cm. long by 2.5 cm. in diam., this in turn being placed in a narrow beaker with distd. H₂O at the same level as the sample. After 24 hrs. the H-ion concn. in the dialyzate was practically the same as in the original sample. The acidity decreases during the ripening period and also during storage of unripe fruits. It is not influenced by an addn. of 0.5-2.0 vol. of H₂O. Even after acidulating the sample with some HCl the *p*_H is only very little influenced by a small addn. of H₂O. It is not influenced by heating on a water bath or by addn. of sugar. The *p*_H of the jelly is like that of the juice from which it is made. The total amt. of reducing sugar was detd. in all the samples. No direct detn. was made of the pectin content. The power of jelly formation was detd. in the following way. 10 cc. of the juice was poured into small test tubes and a measured amt. of sugar was added and dissolved by stirring with a glass rod. The tubes were placed for 30 min. in a boiling water bath and then without the glass rods for 24 hrs. in a water bath of 18°. Then it was observed if there had been formed a jelly or not. A great number of tests were made for detg. the influence of numerous different factors upon the power of jelly formation, the general principle being to det. the least quantity of sugar required under the test conditions for obtaining a jelly. The results are given in tables. An app. similar to that described by S. E. Sheppard and S. S. Sweet (*C. A.* **17**, 2205) for detg. the elasticity of jellies was worked out. A definite relation of the elasticity to the *p*_H of the jelly was observed with an optimum between *p*_H = 1.8 and 2.2. Generally a small addn. of acid reduces the amt. of sugar required. Since HCl is cheaper and much more efficient than citric acid the use of HCl is recommended, the more so because the taste of HCl cannot be detected, which is not completely true of the citric acid.

C. A. ROBAK

A few experimental considerations on the utilization of the soy bean for human nutrition. ROMOLO VENTURI, *Biochem. terap. sper.* **14**, 393-9 (1927); cf. *C. A.* **22**, 1197. — The soy bean does not possess the lauded advantages as a wheat substitute. It requires for cultivation the same conditions as wheat but gives lower yields. The flour can be used for bread only after a costly extn. of the oils. The extd. flour contains a prolamine, the enzymic decompn. products of which impart to the bread a disagree-

able odor and taste. The absence of polysaccharides precludes leavening, but secondary fermentations are caused by yeast. The higher protein content hardly makes up for the lower carbohydrate content as compared with wheat, the loss in calories being 1000 per kg. The economic future of the soy bean lies in a different field: The oil is excellent for soap making. The flour which is practically free from carbohydrates and rich in globulins which do not form purine bases is a valuable raw material for therapeutic foods, especially diabetic bread. The straw has a higher nutritive value than cereal straw. Its mixt. with the extn. residue of the flour is superior to hay. The milk has a high nutritive value and may replace the flour potion for calves and pigs. For analytical and agricultural details see the original.

MARY JACOBSEN

Remarks on the note of Venturi on the utilization of the soy bean as human food. V. DUCCHESCHI. *Biochim. terap. sper.* **14**, 400-2(1927); cf. *C. A.* **22**, 1197.—The main purpose of soy-bean cultivation is a saving of the high cost of importation from the East. It is to be raised mainly in the colonies in land not yet under cultivation. The cultivation in Italy is still in the exptl. stage and does not warrant definite conclusions. All cultures suffer from a deficiency in *B. radicicola*, which is responsible for the low yield, the lowered protein content and the consumption of N fertilizer. The selection of proper seed will do away with all these difficulties. In spite of the extn. costs soy flour is cheaper than wheat flour because the oil fetches a high price on the food market. The caloric value is 4880 when calcd. for the extd. flour, that of wheat is 4454. The chief protein of soy flour is not a phosphoprotein. Neither the presence of a prolamine nor the disagreeable odor or taste has been confirmed by other authors. The nutritive value of the milk has been exaggerated by V.

MARY JACOBSEN

The separation of honey. J. FIEBE. *Z. Untersuch. Lebensm.* **55**, 64-5(1928).—A further report is made on the compn. of the white layer on honey (cf. *C. A.* **21**, 462).

WILLIAM J. HUSA

The p_H of honey and artificial honey. J. FIEBE AND W. KORDATZKI. *Z. Untersuch. Lebensm.* **55**, 59-63(1928).—The p_H of honey ranges from 3.8 to 4.3, the usual figure being 3.9, while for artificial honey it ranges from 3 to 4, the usual figure being 3.2.

The loss of mineral matter of potatoes by the usual culinary preparation. RAGNAR BERG. *Z. Untersuch. Lebensm.* **54**, 314(1927).—Comments on the article by Griebel and Miermeister (*C. A.* **21**, 2341).

WILLIAM J. HUSA

Determination of vaseline oil in coffee. D. MAROTTA AND M. E. ALESSANDRINI. *Ann. chim. applicata* **18**, 37-9(1928).—The method is claimed to be the first reliable one for detg. the quantities of oil (0.5% or less) ordinarily found in com. products. Ext. 3 times 100 g. of the roasted coffee with 70-80-cc. portions of petr. ether (b. 60-70°), filter, wash with petr. ether, evap., add 1 g. of powdered NaOH, and 10-15 cc. of 30% H_2O_2 in 2-cc. portions, cooling to prevent frothing but finally warming, add 50 cc. of alc. KOH (12 g. KOH per 100 cc.), reflux for 1.5 hrs. (agitating), add 50 cc. of water, ext. with Et_2O , wash the Et_2O ext. with water until no longer alk., add a little anhyd. Na_2SO_4 , let stand 1 hr., filter, wash the residue with anhyd. Et_2O , evap., add 5-10 cc. of glacial AcOH to the oil, heat 15 min. on the water bath, introduce in a measuring tube, agitate, warm 15 min. at 60-70°, let stand, read the vol. of vaseline oil within 0.05 cc., adding a correction factor of 0.1 cc. With the d. of vaseline oil, the % in the coffee is calcd.

C. C. DAVIS

The detection and determination of *p*-hydroxymethyl benzoate in foods. F. WEISS. *Z. Untersuch. Lebensm.* **55**, 24-31(1928). *p*-Hydroxymethyl benzoate is sold under the names of "solbrol" and "mpagin" as a preservative for foods, oils and pharmaceuticals. It may be completely shaken out from fat-free foods and in amts. sufficient for detection from fatty foods. A part of the ester may also be sepd. from fats and oils by steam distn. The phenol group may be detected by Millon's reagent and the CH_2 group by a CH_2OH reaction.

WILLIAM J. HUSA

The keeping qualities of sausage made from frozen meat. OSKAR ACKLIN. *Z. Untersuch. Lebensm.* **55**, 31-44(1928).—Comparative expts. were made on the keeping qualities of sausage made from frozen meat and from fresh meat, the sausage being stored at an av. temp. of 15° and av. relative humidity of 60%. Tests of O_2 consumption, methylene blue reduction, condition of the sausage fat, etc., yielded no fundamental differences.

WILLIAM J. HUSA

● **Horseradish and horseradish products.** KONRAD AMBERGER AND KARL HEPP. *Z. Untersuch. Lebensm.* **54**, 435-8(1927).—Analytical data are given on various samples of horseradish and horseradish products.

WILLIAM J. HUSA

The occurrence of starch in hazelnuts. C. GRIEBEL. *Z. Untersuch. Lebensm.* **54**, 477-81(1927).—Although hazelnuts are ordinarily considered as free from starch, the

presence of sparsely occurring starch grains is demonstrated; larger amts. occur in nuts which are not fully ripened. WILLIAM J. HUSA

The determination of stone cells in cacao products. E. ALPERS. *Z. Untersuch. Lebensm.* **54**, 462-6(1927).—The stone cells in cacao products are deformed and broken up by grinding, consequently in drawing conclusions from the no. of stone cells it must be remembered that the observed no. of stone cells is dependent on the fineness to which the cacao product has been ground. WILLIAM J. HUSA

Paper wrappers and their effect upon physical and chemical properties of horticultural products. H. C. BROWN Mich. Agr. Expt. Sta., *Tech. Bull.* **87**, 1-29(1928).—Waxed papers are effective in reducing moisture loss or increase. They limit ventilation and encourage spoilage of perishable products at high temps. Parchment and so-called whalehide papers were highly resistant to disintegration in water and are suitable for use in contact with ice as in lining lettuce, celery and spinach crates. Both parchment and whalehide papers admit air through the pores for ventilation of the fruits or vegetables yet they protect against excessive moisture losses. Depression of the f. p. by the cryoscope and detn. of total sol. solids by the refractometer afforded a rapid measure of quality and checked fairly closely the chem. analyses. Total sugars in sweet corn and peas but not grapes were quickly reduced in quantity at high temps. Papers did not prevent this loss, the only remedy found being low-temp. storage at 0°. High temps. change the sugar in peas first to an acid-hydrolyzable substance, then to starch. In sweet corn there was no intermediate stage in the transformation of the sugar. Waxed papers or high humidity did not affect the p_H or acidity of tomatoes. High humidity caused poor color and flavor. Paraffin-coated tomatoes developed no red color. Vine-ripened tomatoes were always superior in quality to others. Both sunlight and ultra-violet light passed freely through Celoglass, Vitrex, Flex-o-glass and waxed papers, to a limited extent through parchment, but was wholly excluded by whalehide papers. A bibliography of 29 references is appended. C. R. FELLERS

The digestibility of the mineral matter of feeding stuffs. W. L. DAVIES. *Fertiliser, Feeding Stuffs and Farm Supplies J.* **12**, 831-3(1927).—The importance of the inorg. constituents of feeding stuffs is discussed with particular reference to their effect on the nutrition of animals under various conditions. K. D. JACOB

Apparent digestibility as affected by length of trial and by certain variations in the ration. B. H. SCHNEIDER AND H. B. ELLENBERGER. Vt. Agr. Expt. Sta., *Bull.* **270**, 1-48(1927).—Av. coeffs. of digestibility should not be used to compute digestible nutrients when comparing rations dissimilar in quantity, in make-up or in proportions of the various nutrients if a high degree of accuracy is desired. All feeding trials should be accompanied by digestion trials. With milking cows, digestion trials should not be less than 8 days in length nor less than 20 days under conditions found in maintenance trials wherein the quantity of feces is small. C. R. FELLERS

The milk production value of feeding-stuffs made from fish. IV. Herring meal. H. ISAACHSEN AND O. ULVÆSLI. *Meldinger Norges Landbruks.* **6**, 369-404(1926).—Herring meal (which in Norway is never called fish meal) is produced chiefly in 2 varieties (A) with low content of NaCl, made from whole slightly salted herring by boiling, pressing, drying and grinding, (B) rich in NaCl, principally obtained from rather strongly salted herring but usually with some addn. of herring waste from the canning factories and salting works. Feeding expts. were carried out with both kinds, of the av. compn. (A) 91.6% dry matter, 12.5% ash, 64.9 crude protein, 57.8 digestible pure protein, 11.3% fat, calcd. feed value 0.69 kg. to 1 feed unit (f. u.), (B) 90.4% dry matter, 21.9% ash, 63.6 crude protein, 43.4 digestible pure protein, 11.4% fat, calcd. feed value 0.83 kg. to 1 f. u. (by 1 f. u. is understood the production value in milk of 1 kg. standard barley when the need for pure protein is satisfied in the ration. The net energy of 1 f. u. is about 1900 cal.). The feeding expts. with (A) were carried out during 2 years with 18-19 pairs of milking cows in group expt., i. e., after a preliminary period identical for both groups one of the test groups was given fodder with herring meal instead of the earthen cake of the first period, while the other group still received earthen cake. The av. value of the meal was found to be 0.715 kg. to 1 f. u. The fat content of the milk was irregularly affected in the various test animals, but as an av. the meal reduced the fat content by 0.11%, an amt. which does not much exceed the error limit. The digestibility was detd. with 4 sheep, the av. coeffs. being for org. matter 91, protein 88, fat 99. Similar expts. were carried out with (B), on 16-18 pairs of milking cows, the av. production value of the meal being detd. to 0.82 kg. to 1 f. u. The fat content of the milk was not affected by the herring meal. The digestibility was detd. with 2 sheep, the coeffs. being for org. matter 91, protein 90, fat 98. **V. Fish meal.** *Ibid* **7**, 77-95(1927).—Norwegian fish meal is made from the air-dried heads and spinal col-

umns of cod (waste in klip-fish production). Tests were carried out in 2 series (1) with 10 pairs of milking cows, 2 groups of 10 each (2) with 16 pairs. After a preliminary period identical for both groups one of the test groups was given fish meal instead of the cotton cake of the first period, while the other group still received cotton cake. In a subsequent 3rd period the test animals were all given the same food with cotton cake. The fish meal used in the first expt. (I) was of an atypical compn. with a far too low content of proteins and too high contents of fat and ash, most likely having been adulterated with liver meal and bone meal. It contained (av. of 8 samples) 88.5% dry matter, 40.5 protein, 37.9 digestible protein, 5.2 fat, 39.1 ash, 5.9 NaCl. The second lot (II) was of normal compn. contg. as an av. of 10 samples 98.6% dry matter, 56.3 protein, 53.4 digestible protein, 1.6 fat, 29.7 ash, 1.9 NaCl. The production value of (I) was found to be 1.1 kg. to 1 f. u., a figure considered too high by the authors. The value of (II) was 1.15 kg. to 1 f. u. On the basis of the production values of the 2 lots of meal as found by the expts. and the coeffs. of digestibility detd. by the authors by sep. expts. they have calcd. the value at 110 for (I) and 86 for (II), the first figure being considered too high. The percentage of fat in the milk was not affected by the fish meal diet. The digestibility of (II) was detd. with 4 sheep in 8 exptl. periods. The results were somewhat varying, but on the basis of the best agreeing periods the coeff. of 90 for protein and 95 for fat may be regarded as suitable av. figures. C. A. ROBAX

Effect of feeding cacao meal to milking cows. R. D. APLIN AND H. B. ELLENBERGER. Vt. Agr. Expt. Sta., *Bull.* 272, 1-20 (1927).—The apparent digestibility of all classes of nutrients in cacao meal except fat was unusually low. Cacao meal in the rations of milking cows promptly increased the fat test but also reduced the milk yield so that the gain in fat production was small. The theobromine content was mainly responsible for the increased fat test and lowered milk yield. The caffeine content produced no noticeable effect on either fat test or milk yield. Cacao meal fed to dairy cows increased the m. p. of the butter fat from 1.75 to 4.9° and produced a firmer body. C. R. FELLERS

Feeding cacao meal to hogs. R. D. APLIN. Vt. Agr. Expt. Sta., *Bull.* 271, 1-10 (1927).—Cacao meal is not a suitable ingredient of hog or pig rations. It is unpalatable, causes litters of weak, undersized pigs when fed to pregnant sows, fails to produce economical gains and exerts a toxic effect on young pigs. C. R. FELLERS

SMITH, ERNEST ELLSWORTH: **Aluminum Compounds in Food.** Including digest on the influence of aluminum compounds on the nutrition and health of man. New York: P. B. Hoeber, Inc. 378 pp. \$7, net.

Foods. E. H. MILES and G. REILLY. Brit. 274,051, July 8, 1926. Juice of "dietetic vegetable material" such as lettuce or cabbage is mixed with that of "preservative vegetable material" such as carrots, parsnips or beets, the mixed juices are heated until hydrolyzation of the sucrose is well advanced and concn. is then effected. The heating does not exceed 1 hr. at 80°. Cf. C. A. 21, 3094. •

Preserving foods with calcium iodate. C. T. J. VAUTIN and W. G. WHIFFEN. Brit. 274,164, April 6, 1926. An alk. earth iodate, preferably Ca iodate, is used for preserving milk, cream, butter, margarine, eggs, fish, meat, fruit preserves or other foods by direct application as a soln. or powder or by satg. wrapping or packing material with the iodate. NaCl may be added to iodate solns. to facilitate forming more concd. solns.

Preserving eggs, etc. S. FOWLER and E. EDSEER. Brit. 274,200, April 16, 1926. A liquid preferably consisting of a soln. of wool fat or other cholesterol-contg. wax in C_2HCl_3 or other volatile solvent which renders the soln. non-inflammable is used for coating the shells of eggs. Preservation of other materials such as cheese, apples, flowers and leaves is also mentioned.

Preserving vegetable materials. J. B. BUTLER and J. J. DRUMM. U. S. 1,666,551, April 17. Peas, spinach or other vegetable materials are impregnated with a soln. of Na_2HPO_4 of a pH between 7.0 and 8.3, which serves to preserve the natural green color in canning.

Malted milk products. L. A. THOMPSON. U. S. 1,666,633, April 17. In forming "nuggets" of flavored malted milk, with pores or voids within the "nuggets," a binder

such as gum tragacanth is used and the "nuggets" may be tumbled with a dry flavoring powder to cause it to permeate the pores and coat their walls. The product is readily sol. and suitable for prepg. beverages.

Treating ingredients of jams and jellies with ultra-violet rays for sterilizing them and increasing their food value. D. MCKINLAY. Brit. 273,578, Dec. 14, 1926.

Mayonnaise. A. K. EPSTEIN and M. C. REYNOLDS. U. S. 1,664,775, April 3. An inert gas such as CO₂ or N₂ is dispersed in an emulsion including edible oils and egg material at normal temp., in excess of the quantity of gas which is sol. in the material.

Ice crystals. S. C. CARNEY. U. S. 1,664,850, April 3. Ice particles, which may carry flavoring exts. or other substances for making beverages, are exposed to CO₂ under pressure and formed into a compressed mass.

T. S. CARSWELL

Heat transfer for oils and water in pipes. F. H. MORRIS and W. G. WHITMAN. *Ind. Eng. Chem.* 20, 234-40(1928).—The basic equation has been shown to be $hD/k = \phi(Du/\nu) \psi(cz/k)$, where h is the liquid film coeff., D = pipe diam., k = thermal cond. of liquid, u = av. velocity of liquid, ρ = density of liquid, ν = viscosity of liquid, c = sp. heat of liquid. Most of the past work has been on water and has shown that the last term may be neglected. A term for end turbulence has often been added. M. and W. worked on a single piece of 1/2" standard iron pipe (inside diam. 0.62 in.) in a jacket 10 ft. 1.5 m. long. Only one length was used, so corrections for end turbulence could not be detd. The inside pipe extended about 1 ft. outside the jacket at each end, to eliminate the effect of end turbulence. Full data are given for 118 expts. These covered values of u from 0.9 to 20, of z from 0.5 to 110, of h from 40 to 1500 and included both heating and cooling. For heating, $\psi(cz/k)$ was found to be $(cz/k)^{0.37}$. For cooling approx. the same value was obtained, though the results are less consistent. A plot is given of $Du^{1/2}$ vs. $(hD/k) / (cz/k)^{0.4}$ for heating, from which the value of h can be detd., since all the other values are known. A similar plot for cooling shows that the value of h may be taken as 75% of that for heating. All the properties of the fluid are taken at the mean temp. of the mass of the fluid, instead of at the temp. of the stagnant film as in previous work.

W. L. BADGER

Removal of rust from pipe systems by an acid solvent. F. N. SPELLER, E. L. CHAPPELL and R. P. RUSSELL. *Trans. Am. Inst. Chem. Eng.* 19, 165-71(1927). A description of the initial applications of a new method of removing rust and other substances from pipe systems. It is probably equally applicable to the removal of rust from condensers, boilers, heaters and other fabricated systems. It is accomplished by dissolving the rust in acid rendered inert toward the metal by the addn. of inhibitors. The problem includes the retardation of further corrosion as well as the removal of accumulated corrosion products. When the dissolved O₂ is removed from hot water, corrosion ceases and previously accumulated products loosen and are removed. Solvent renewal is often necessary to prevent stoppage. Strong HCl plus an inhibitor to protect the steel is used. The rate of attack of solvent is about 10 times as great on wrought iron as on steel and about 20 times as great on malleable iron as on steel, but causes no injury due to the inhibitor. Soln. is necessary; not just loosening. The general plan of cleaning operation is illustrated by diagram. Rust removal required about 5-6 hrs. with the acid strength employed.

Preparation of pure water without distillation: electroösmosis. PAUL PATIN. *Chimie et industrie* 19, 205-13 (1928).—A description is given of the construction and operation of a lab. app. and of a com. app. for the electroösmotic purification of water. A product equal in purity to ordinary distd. water, or even to redistd. water, is obtained at much lower cost than by distn. WILLIAM J. HUSA

New chlorine preparations for the sterilization of drinking water. W. E. HILGERS. *Gesundh. Ing.* 51, 177-84 (1928).—Various Cl preps. were tested with respect to their A. PAPINEAU-COUTURE

power to sterilize water. "Kaporit," calcium hypochlorite contg. 60-75% of active Cl, was first tested. Using a sample made by infecting pure water with a filtered culture of bacteria a reduction from 55,290 per cc. to 0 per cc. was obtained with 0.2 mg. Cl and 20 minutes' reaction time and other results were equally as good. Another Cl prepn. under the name "Jergichlor" which is NaClO was tried. The results obtained were quite satisfactory. Cl water was used in the form of an ampoule under the name "Aquapuro" with good results. Still another Cl prepn. is the chloramine tablet. These are suitable for sterilization in the field where the water is fairly clear. With a high org. content the action is greatly retarded. Sterilization with these tablets is slower than with Cl water. (The results of these tests are given in various tables.) The efficiency of the various Cl prepn. is a function of the quality of the water, the total number of bacteria, the miscibility in water and the stability or rate of evolution of chlorine. Control of a drinking water by detn. of free Cl is not sufficient but bacteriological detns should also accompany it.

WAYNE L. DENMAN

A colorimetric method for the determination of iron in water. P. LEHMANN AND A. REUSS. *Z. Untersuch. Lebensm.* **54**, 374-6(1927).—A method for detn. of Fe in water is based on the formation of $\text{Fe}(\text{CNS})_3$.

WILLIAM J. HUSA

Iron and manganese in water. HEINRICH THIELE. *Gas. u. Wasserfach* **71**, 289-90(1928).—The occurrence of Fe and Mn in water and their removal are discussed. The removal of iron and manganese by filtration is facilitated by certain organisms such as *Leptothrix*, *Crenothrix*, *Galionella*, etc. If sufficient air is not available to oxidize the iron or manganese, oxidizing agents must be added, such as MnO_2 pptd. on the filtering material or mixed with it. Fe and Mn can also be removed by active charcoal.

R. W. RYAN

A stable standard scale for the determination of nitrites in waters. R. DANET. *J. pharm. chim.* **7**, 113-4(1928).—Dissolve 0.1 g. fuchsin S in 1 l. of H_2O , and put into 4 10-cc tubes, resp., 0.3 cc., 0.6, 0.9, 1.2 cc. of this soln., fill up to 10 cc. with camphorated H_2O contg. 1% AcOH and seal with paraffined corks. To det. nitrites in H_2O mix in a similar 10-cc. tube 10 cc. H_2O , 1 cc. each of solns. of $\text{C}_6\text{H}_4(\text{NH}_2)\text{SO}_3\text{H}$ and $\text{C}_{10}\text{H}_7\text{NH}_2$, allow to stand 20-30 min. and compare with the standards, observing transversely. The 4 tubes correspond closely to H_2O contg., resp., 0.5 mg., 1.0, 1.5, 2 mg. of NaNO_2 per l.

S. WALDBOTT

Volumetric determination of sulfate in water. A. BAHRDT. *Chem.-Ztg.* **52**, 163-4(1928); cf. *C. A.* **21**, 1506.—Polemical.

FOSTER DEE SNELL

Volumetric determination of sulfate in water. M. KEHREN AND H. STOMMEL. *Chem.-Ztg.* **52**, 164(1928); cf. *C. A.* **22**, 654.—Polemical.

Utilization of heat for the preparation of boiler feed water. H. BALCKE. *Gesundh. Ing.* **51**, 209-16(1928).—Tests were carried out with Fe plates suspended in water solns. of various salts. These detns. were made in a small boiler which is illustrated. The formation of scale due to the various salts which cause hardness in water is shown in a series of photomicrographs. The first series of pictures is the result of expt. with water whose sulfate concn. is 3 times its carbonate concn. and to which Fe and silicates have been added. The test pieces first showed a deposit of rhombohedral needles of CaCO_3 . By further evapn. MgCO_3 seps. With continued scale formation CaSO_4 is deposited in blunt broken up needle or broad lamellar forms. If the CaCO_3 is deposited in large aunts the deposition of CaSiO_3 takes place at the same time. The boiler tubes become coated with a thin layer which is impervious to the transfer of heat. If the amt. of CaCO_3 is slight pure silicates sepd. in roset and pisiform formations. Photomicrographs of O and CO_2 corrosion are shown. With O the action is local and considerable pitting takes place. With CO_2 the metal appears to become porous and white deposits of CaCO_3 are visible. Cl in small quantities is harmless but in high concns. it is very active. These test show that a feed water should be free of scale-forming constituents and dissolved O. Since most plants return their condensate as feed water it is highly advantageous to use distd. water for replacing the loss within the plants. Various evapg. and heat exchanging systems for this purpose are shown and described.

WAYNE L. DENMAN

Occurrence of living organisms in water mains. R. KOLKOWITZ. *Gas u. Wasserfach* **71**, 268-9(1928).—A growth of algae and protozoa was found in a curved pipe near the outlet of a centrifugal pump handling river water at a pressure of 10 atm. Alternate compression and release of pressure appeared to have no injurious effect. R. W. R.

Purification of waste water from lignite-distillation plants. DIETRICH WITT AND FRITZ SCHUSTER. *Gas u. Wasserfach* **71**, 241 4(1928).—Attempts were made to purify a tarry turbid effluent from a lignite-distn. plant, which contained 0.06% $\text{C}_6\text{H}_5\text{OH}$, 49 g. H_2S , per cu. m. and required 3600 mg. KMnO_4 per l.; by aerating, adding $\text{Ca}(\text{OH})_2$

and filtering, adding ground clinker, lignite and alum, and peat and alum, with or without electrolysis in each case. The two latter methods, without electrolysis, gave clear nearly odorless effluents after 5 and 3 days, resp. The method of purification finally adopted was to pass the water over low-temp. (Schwelkok) coke to remove H_2S , then acidify slightly with flue gases, and pass the water over a fresh filter composed of washed coke. The latter filter is used as the pre-filter as soon as it becomes ineffective. For this water 4.6% coke was used and a rate of 1 g. water per g. of coke per hour was maintained on the second filter. The effluent had only a very slight odor, gave only a slight turbidity with Br water, required only 475 mg. $KMnO_4$ per liter and remained colorless even after standing in air.

R. W. RYAN

Local developments at Llandudno (Wales). W. T. WARD. *Munic. Eng. Sanit. Record* 80, 511-2(1927).—Roads, sewerage, water supply, etc., are described. The water supply, derived from 2 natural lakes, capacity 156,000,000 gal. is of excellent quality, and contains less than 1 degree of hardness. The water in all the lakes in this district is pure and soft and is used without filtration.

C. H. BADGER

New sewerage and sewage disposal works at Bushey (England). ANON. *Munic. Eng. Sanit. Record* 80, 512(1927).—Improvement and alterations and the treatment of sewage are described. Accommodation is provided for 4 months' sludge. The digested sludge is drawn off periodically and is ploughed into the land or put on the sludge drying beds.

C. H. BADGER

Birmingham (England) drainage board jubilee. Opening of new extensions. ANON. *Munic. Eng. Sanit. Record* 80, 353(1927).—Mention is made of a 150-b. h. p. engine run with gas generated from sewage sludge by the agency of microorganisms. The bio-aeration plant employs activated sludge to give partial treatment to 7,500,000 gal. sewage per day, permitting the treated fluid to be applied to the bacteria beds at double the ordinary rate. This is the first large-scale plant employing activated sludge as an auxiliary to final treatment in the bacteria beds.

C. H. BADGER

Some Doncaster (England) developments. F. OSCAR KIRBY. *Munic. Eng. Sanit. Record* 80, 443(1927).—Sewage which now gravitates on to 100 acres of land without treatment will be screened and treated, dispensing with the use of the land. An incinerator and salvage plant for refuse disposal will do away with 2 refuse tips.

C. H. BADGER

Swindon's (England) sewage disposal works. ANON. *Munic. Eng. Sanit. Record* 80, 403(1927).—Lime and copperas are used as precipitants in the proportion of 5 parts per 100,000.

C. H. BADGER

Southerly sewage treatment works, Cleveland, Ohio. G. B. GASCOIGNE. *Ohio Conference on Sewage Treatment, First Ann. Rept. 1927*, 11-2.—Works designed to serve 280,000 people at 125 gal. per capita provide bar screens, grit chambers, Imhoff tanks, dosing tanks, trickling filters and settling tanks with final discharge to the Cuyahoga River. Sludge goes from the settling tanks to Imhoff tanks or drying beds and from the Imhoff tanks to drying beds. Final waste is to be buried or stored on waste land. Complete treatment is necessary as the river has a minimum flow of less than 50 cu. ft. per sec.

FOSTER DEE SNEEL

Contribution to the economic operation of sewage treatment plants of the two-storied type. *Preuss. Gesundh. Ing.* 51, 186-7(1928).—Treatment plants of the two-storied type are divided into 2 classes. (1) those in which the settling compartment lies on the free water surface, and (2) those in which it lies below the water surface. Plants of the second class are considered to be the best. In the first class the cross section of the settling space varies with the quantity of sewage treated while in the second class the area is const. for all quantities of sewage. The coeff. of friction increase faster with increasing area in those of the second class. An example of the first class is the "Emscher" basin while a typical representative of the second class is the "OMS" basin.

WAYNE L. DENMAN

House refuse problem: storage, collection and disposal. T. DOUGLAS. *Munic. Eng. Sanit. Record* 80, 428, 454(1927).—General discussion.

C. H. BADGER

The purification of swimming bath water. Inspection of installation at Hornsey Baths (England). ANON. *Munic. Eng. Sanit. Record* 80, 478(1927).—The purification plant includes centrifugal pumps, filters, aerator, heater, etc. $Al_2(SO_4)_3$, soda and Cl are used. The soda is added to prevent the water from becoming acid. The plant which cost £6500 is said to be the largest and most modern of its kind in the country. Water can be used 18 to 24 months.

C. H. BADGER

Germicidal properties of the mixture of kerosene and coconut oil. ZACARIAS DE JESUS. *Philippine Agr.* 16, 521-9(1928).—Coconut oil as prep. in the Philippines becomes increasingly germicidal with age. A mixt. of equal vols. of kerosene and co-

conut oil has a higher germicidal power than either one separately or mixts. in other proportions. A. L. MEHRING

Tunnery and leather factory sewage and its purification (SCHULZE-FOSTER) 29. Apparatus for aerating and screening sewage (U. S. pat. 1,666,164) 1. Apparatus for purifying and sterilizing water (U. S. pat. 1,667,439) 1.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

Recent advances in science: *Pedology*. G. W. ROBINSON. *Science Progress* 22, 597-604(1928).—Review of recent work on soils and their chemistry. J. S. H.

The mechanical analysis of tropical soils. J. CHARLTON. *Agr. Research Inst. Pusa, Bull.* 172, 9 pp.(1927).—Addn. of varying quantities of H_2O_2 to destroy org. matter did not increase the amt. of clay as detd. in tropical paddy soils by the NH_3 -extn. method. With non-paddy soils definitely higher results were obtained when H_2O_2 was used in detg. the clay fractions when the soils were shaken for 4 hrs. With heavy tropical soils higher percentages of clay were found when the samples were shaken for 24 hrs., instead of 4 hrs., and the use of H_2O_2 was not necessary when the detns. were made at 25°. Practically complete dispersion of 20 g. samples of soil was obtained in 24 hrs. with 5 to 20 cc. of NH_4OH (d. 0.88) per l. of soil- H_2O mixt. Hyperol, a solid compd. of H_2O_2 and urea, was slightly more efficient than H_2O_2 alone for obtaining max. dispersion of clay and losses of SiO_2 and Fe_2O_3 by soln were smaller when the former was used. K. D. JACOB

Practical value of soil experiments. HELLMERS. *Z. Pflanzenernähr. Düngung Bodenkd.* 6B, 366-73(1927).—A discussion of the necessity of more than one type of expt. to characterize a soil and its requirements for fertilizer. P. R. DAWSON

Changes in reaction with the aging of soil samples. B. AARNIO AND A. SALMINEN. *Trans. 2nd Comm. Internat. Soc. Soil Sci.* 1927B, 30-3.—Detns. of the p_{H} value of soils must be made with fresh field samples. Drying of soils in the lab. largely increases their active acidity. This is particularly the case with soils rich in humus. B. C. A.

Phosphate in the soil solution as affected by reaction and cation concentrations. I. J. H. TRAKLE. *Soil Science* 25, 143-62(1928).—Fe phosphate is least sol. under acid conditions corresponding to p_{H} 3. Under less acid conditions $\text{Fe}(\text{OH})_3$ is pptd. at the expense of FePO_4 with the liberation of PO_4 ions. Mn and Al phosphates are least sol. under slightly acid conditions. Ca phosphate is insol. under alk. conditions. The main factors in the depression of the soly. of Ca phosphate are: (1) the Ca ion and (2) excess Ca ion in the presence of OH ion. OH ion alone probably causes the formation of a basic PO_4 with the liberation of some PO_4 ions. Comparison of the soly. of various PO_4 ions in pure solns. with the concns. found in the soil soln. suggests that the chem. properties of the compds. account for the behavior of soil PO_4 . Adsorption of PO_4 is unimportant, if it occurs at all in soils. Ca is the base most important in controlling the PO_4 -ion concn., in neutral soils of the type studied. Org. forms of P may constitute an important part of the total P of the displaced soln. from certain soils, but not from others. E. F. SNYDER

Preliminary report on some experiments regarding the determination of the acidity and the lime requirement of soils. JOHS. LINDEMAN. *Meldinger Norges Landbruks.* 6, 302-12(1926).—The measuring of the H-ion concn. of soils by means of the quinhydrone

electrode generally gives accurate results in accordance with results obtained with the H electrode. The results are not reliable in liquids contg. Fe in the form of ions or even as hydroxide. A series of detns. with the quinhydrone electrode in colloidal solns. of Fe hydroxide gave results wholly different from the actual values. Some expts. with an Sb electrode described by I. M. Kolthoff and B. D. Hartong, (*C. A.* 19, 1388) show that this electrode is well suited for H-ion detn. in soils and gives accurate results particularly within the intervals of p_H 2.0–6.5 and 9.0–12.0. The relation of the H-ion concn. to the amt. of water present in or added to the sample is illustrated by a series of expts. C. A. RODAK

Soil acidity. S. ODÉN. *Trans. 2nd Comm. Internat. Soc. Soil Sci.* 1927B, 10–29.—The action of acids on clay consists of the neutralization of OH ions on the surface of the particles, together with the aggregation of particles, whereby part of the surface becomes protected from the action of the acid, and finally direct dissoln. of mineral particles. The rate and extent of these 3 processes are largely dependent on the H-ion concn. of the fluid and on the phys. conditions of the mixt. With high H-ion concn. the coagulating effect predominates and at low concns. neutralization is the main effect. The complete neutralization of OH ions is not instantaneous, and this is assumed to be due to the platied or spongy nature of the clay-particle surface and to the consequent lapse of time required for the diffusion of neutralizing ions to the interior. B. C. A.

The nature of base exchange and soil acidity. H. W. KERR. *J. Am. Soc. Agron.* 20, 309–35(1928).—It seemed reasonable to believe that the great speed of the exchange reactions of soils could also be explained as due to the open structure or colloidal nature of the exchange complex involved, and on this purely chem. basis a mass action equation for the heterogeneous equil. was formulated. The org. matter of soils possessed a high base exchange capacity. Evidence was adduced in support of the presence of zeolitic materials in the soil. From the natural and artificial zeolites tested the free aluminosilicic acids were prepd. These were colloidal in nature. The H-ion concns. of the suspensions were approx. proportional to the amts. of solid material in suspension. Thus, acids need not be in true soln. in order to give rise to acid p_H values when detns. are made electrometrically. The effect of the soil-water ratio, differences between the p_H values for suspensions and filtrates, and many other difficulties are cleared up. All these studies emphasize the fact that the difference between the chem. behavior of materials in the colloidal state and those in true soln. is one of degree only and not of kind. E. F. SNYDER

Portable calomel electrode for the determination of p_H values in the field. P. KAMERMAN. *J. S. African Chem. Inst.* 10, 32–5(1927).—In the portable calomel electrode described, special devices to prevent the contact of the calomel with the Pt are detailed. Trials showed that the instrument was reliable for the detn. of the p_H value of soils, and gave results within 0.1 of those obtained by using a standard instrument. B. C. A.

The p_H value of some Texas soils and its relation to the incidence of certain woody plant species. A. H. BERKMAN. *Soil Science* 25, 133–42(1928).—In general the results obtained in this investigation seem to indicate that the soil reaction exerts a selective influence on plant species, but more data taken at different seasons of the year and over a period of years are necessary before definite conclusions can be drawn. E. F. SNYDER

The volume weight of soils as a physical characteristic of the soil profile. A. F. LEBEDEV. *Soil Science* 25, 207–11(1928).—The wt. of a unit of soil with an undisturbed structure, dried at 105–110°, is the vol. wt. of the soil. A method is described for detg. the vol. wts. as they occur in the soil profile. A thin steel tube with slots is inserted in the soil without turning. When this is withdrawn and the excess of soil cut away a thin undisturbed section may be accurately obtained. Working diagrams are given. Vol. wts. of 2 Russian soils are given, showing variations at 5-cm. intervals to a depth of 200 cm. Max. vol. wt. variations are about 30 and 45%. Vol. wts. are of importance in tracing the translocation of soil material in the profile and should be considered in estg. nutrient resources. M. S. ANDERSON

The effect of dehydration of soils upon their colloid constituents. I. J. L. STEENKAMP. *Soil Science* 25, 163–82(1928).—It would appear that dehydration can produce 2 effects: namely, an increase in the unsatd. clay acids, and an increase in the exchangeable bases present. This latter effect will tend to counteract the effect of the former. E. F. SNYDER

Ordinary presence of barium and probably strontium in arable soil. GABRIEL BERTRAND AND L. SILBERSTEIN. *Bull. soc. chim.* 43, 372–4(1928).—See *C. A.* 22, 1425. E. H.

Crop variation. IV. Experimental determination of the value of top dressings with cereals. T. EDEN AND R. A. FISHER. *J. Agr. Sci.* 17, 548-62(1927).—Carefully controlled field expts. were conducted to compare the effect on the yield of winter oats of single and double applications of equiv. amts. of N in the form of $(\text{NH}_4)_2\text{SO}_4$ and NH_4Cl , at 2 different dates (March 15th and June 5th). The results indicated that a significant response in the yield of grain was limited to the quantity of N top-dressing, the effects of kind and time of application being negligible. The advantage shown by double dressing in yield of straw was confined to the early application; no differences in the effects of sulfate and chloride were noted. P. R. DAWSON

Comparative investigations on the content of root-soluble nutrients (phosphorus pentoxide and potassium oxide) in the surface soil and subsoil of various soil-types. M. KLING AND O. ENGELS. *Z. Pflanzenernahr. Dungung Bodenk.* 7B, 127-39(1928).—Data are presented on the results of detns. of P_2O_5 and K_2O by the Neubauer method on a wide variety of soils. With some exceptions, the subsoil in general contains less of these nutrients than the surface soil. The relationship between the contents of the 2 levels is, however, very variable. Detns. made on the surface soil furnish no indication of the subsoil content. Of the soils studied approx. 75.5% were to be classed as deficient in P_2O_5 , and about 29.9% as deficient in K_2O , 8 mg. and 24 mg., resp., per 100 g. of soil being taken as limiting values. P. R. DAWSON

Accumulation of nitrogen in grass lands in India. H. E. ANNETT AND A. R. P. AYER. *J. India* 22, 382(1927).—The N content of surface and subsoils in cultivated fields was lower than that in adjacent soils that were overgrown with grass but which were formerly under cultivation. K. D. JACOB

Production of available phosphates from Isume phosphorite. I. G. ROZIDESTVENSKI. *Ukrainskii Khim. Zhurnal* 2, 179-94(1926).—In order to convert the H_3PO_4 present in Isume phosphorite into a form easily assimilable by a method other than conversion into a superphosphate, the material was treated with portions of a soln of 1% H_2SO_4 and N HCl . Lime was extd. each time, first in smaller, then in larger, quantities; H_3PO_4 was similarly extd., the amt. present in each extn. depending on the concn. of H_2SO_4 . Further replacement of the HCl by various salts (e. g., NaCl , KCl or MgCl_2) showed that the amt. of lime extd. depended on the nature of the salt used in the solvent. Vegetational expts. indicated that treatment of the phosphorite with a mixt. contg. 0.5 N H_2SO_4 , 0.15 N NaCl and 0.1 N MgCl_2 gave the best increase (36.6%) in the crop of barley. B. C. A.

Fixation of nitrogen by *Bacterium aerogenes* and related species. C. E. SKINNER. *Soil Science* 25, 195-205(1928).—Of 23 strains of *B. aerogenes*, isolated from soil, flour, and water, only 2 or possibly 3 were found which fixed atm. N, when grown in routine N-free media. Other strains, although they grew luxuriantly, did so without fixing any N detected by conventional methods. Some strains of *B. radiobacter* were found which did not fix N. *B. cloacae* was found in soil more frequently than *B. aerogenes* but none of the former fixed N. M. S. ANDERSON

***Actinomyces acidophilus* N. Sp. —a group of actinomycetes isolated from the soil.** H. L. JENSEN. *Soil Science* 25, 225-33(1928).—Four strains of *Acidophilus actinomycetes* were isolated from 3 humus soils whose pH values varied from 3.4 to 4.1. They represent a new species group, to which the name *Actinomyces acidophilus* is given. They are morphologically typical actinomycetes, but are sharply differentiated from all other actinomycetes by their ability to live only in acid media. M. S. ANDERSON

A new soil sampler. A. KOPP. *Soil Science* 25, 237(1928).—A soil sampler is described which will remove a core to a depth of 1 m. undisturbed. M. S. A.

Soil bacteria that decompose certain aromatic compounds. P. H. H. GRAY AND H. G. THORNTON. *Centr. Bakt. Parasitenk. II Abt.* 73, 74-96(1928).—Many types of soil bacteria were isolated that can decompose the aromatic compds., phenol, *m*-cresol and naphthalene which are used as soil sterilizing agents. Several of them can also utilize one or more of the following: *o*-cresol, *p*-cresol, phloroglucinol and resorcinol. One organism can utilize toluene. Pure cultures of the bacteria use these compds. as sole sources of energy in mineral salt media contg. inorg. N. Organisms without spores grew in media contg. 0.1% phenol but were killed by 0.2%. The bacteria are widely distributed in Great Britain, and have been found in soil from Norway, the Tyrol and South Atlantic Islands. They rarely occur in unfertilized soil. The organisms of this type fall into 7 genera and 25 species. When soil is treated with phenol, an increased bacterial population ensues, composed largely of *Mycobacterium sphaeroides* n. sp., which decomposes phenol in pure culture. JOHN T. MYERS

The presence of *Thiobacillus thiooxidans* in Danish soil. H. L. JENSEN. *Centr. Bakt. Parasitenk. II Abt.* 72, 242-6(1927). JOHN T. MYERS

The influence of calcium cyanamide on the bacterial life in the soil. JOSEF KUHN AND OTTO DRECKSEL. *Z. Pflanzenernähr. Düngung Bodenk.* **7B**, 105-18(1928).—Expts. demonstrate that CaCN_2 has a specific stimulating effect on soil bacteria. This effect is not a consequence of the formation of free HCN nor is it due to the CaO content. It is to be ascribed to the action of CaCN_2 as a chem. mixt. whereby the principal constituents exert a reciprocal effect. The favorable effect upon bacteria is lessened by acidity, but is favored by a neutral condition or alkali of the soil. P. R. DAWSON

Corn variety and fertilizer experiments. W. B. ROGERS AND J. D. WARNER. S. Car. Agr. Expt. Sta., *Bull.* **248**, 1-38(1928).—Expts. conducted on 7 types of soil showed superphosphate had but little effect upon the yield of corn. The amt. of NH_3 largely detd. the yield. Only light sandy soils responded at all to applications of potash. C. R. FELLERS

Experiments with fertilizers in combating wheat smut. W. STRAIB. *Fortschritte Landw.* **3**, 110-4(1928).—In expts. on dusting winter wheat seed, 20 g. of CaCN_2 per kg. of seed afforded complete protection against smut; even 5 g. caused appreciable reduction in infection. Superphosphate also showed a marked effect, but the results with lime dust were contradictory. With spring wheat the results were less favorable. However, under German agricultural conditions,* the use of such fertilizer materials as protective dusts is not economical as compared with other more effective dusting agents. P. R. DAWSON

Effect of lime on the availability of phosphorus in superphosphate. H. C. HARRIS. *J. Am. Soc. Agron.* **20**, 381-93(1928).—Mixing lime and superphosphate before applying them to the soil is not detrimental to the yields of most kinds of plants but may be to some. E. F. SNYDER

Experiments on the influence of potash, with varying nitrogen supply, on the yield and quality of barley in 1926. H. WIESSMANN AND K. BURGER. *Z. Pflanzenernähr. Düngung Bodenk.* **6B**, 408-17(1927).—Applications of K proved profitable where moderate supplies of N were available in the soil. Heavy applications of $(\text{NH}_4)_2\text{SO}_4$ were not profitable, either alone or in conjunction with K fertilizers. Neither N nor K fertilizers appeared to influence the protein content of the grain. P. R. DAWSON

Stimulation experiments (with plants). J. H. ABERSON. *Z. Pflanzenernähr. Düngung Bodenk.* **6B**, 405-7(1927).—In a series of plot expts. with oats, peas and beets no stimulating effects were observed where small quantities of Mg and Mn compds were applied in conjunction with balanced inorg. fertilizers. P. R. DAWSON

Experiments with stimulating substances (on plants). E. HASELHOFF AND W. ELBERT. *Landw. Vers. Sta.* **106**, 285-322(1927).—A summary of the results shows that the chem. stimulants employed in general have not exerted an action furthering the growth of plants or increasing the yields. E. F. SNYDER

Blossom color and nitrogen fertilization. M. v. WRANGELL AND H. v. BRONSART. *Naturwissenschaften* **16**, 169-72(1928).—No appreciable effect of N fertilization on flower color was noticeable; the increased green shade of leaves (intense metabolism) merely causes an apparent contrast effect. B. J. C. VAN DER HOEVEN

Sulfur. Its use in horticulture. THEODORE PARKER. *Fertiliser, Feeding Stuffs and Farm Supplies J.* **13**, 225-7(1928).—The fungicidal toxicity of lime S sprays diminishes as the polysulfides decompose and free S is deposited. S is toxic to fungi not only through actual contact but also through volatile vapor phases. Adhesion to leaf surfaces and floating capacity are directly dependent on the fineness of the S. In a series of tests the best results in these respects were obtained with specially prepd. dusting sulfurs, 91 to 93% of which would pass a 300-mesh sieve. K. D. JACOB

The blackberry pest. Chemical investigations. E. F. NORTHCROFT. *New Zealand J. Agr.* **35**, 369-82(1927).—Expts. were made with many solid, gaseous and liquid poisons for the control of blackberry bushes. The best results were obtained by spraying with 1.5% solns. of Na_3AsO_3 and As_2O_3 , resp., the former being more efficient. The Na_3AsO_3 content of soils around sprayed bushes was reduced from 0.68 to 0.04% in 1 year by natural leaching and draining. One part of As_2O_3 to 0.8 part of NaOH was the best ratio for the control of both the young shoots and the woody older growths of bushes. K. D. JACOB

Experimental potato trials. J. T. RAMSAY. *J. Dept. Agr. Victoria* **26**, 8-14(1928).—Treatment with 10% soln. of NaNO_3 prior to planting, had no effect on the yield of potatoes grown on soil high in N. K. D. JACOB

Spraying versus dusting to control potato-leaf hopper in commercial potato fields in Wisconsin. J. F. DUDLEY, JR., AND C. L. FLUKE, JR. *Wis. Agr. Expt. Sta., Research Bull.* **82**, 1-16(1928).—A 4-yr. expt. showed the av. yield of all the check plots was 136.4 bu. per acre as against 163.1 for the dusted and 167.9 for the sprayed plots.

The Bordeaux mixt. used for spraying consisted of 4 lb. CuSO_4 , 5 lb. Ca(OH)_2 and 50 gal. H_2O and Cu-lime dust contained 20-25% monohydrated CuSO_4 mixed with hydrated lime and filler. The cost of dusting was very slightly more than spraying but dusting was more rapid and convenient. C. R. FELLERS

Seed treatments for the control of seedling blight in cereals. P. M. SIMMONDS AND G. A. SCOTT. *Sci. Agr.* 8, 502-11(1928).—Greenhouse expts. were carried out to det. the value of seed treatments of cereals against natural soil infection and artificial inoculations with *Fusarium culmorum* and *Helminthosporium sativum*. Semesan, ger-misan, uspulun and Dupont No. 12, all mercurial preps., showed a distinct protective influence to the seedlings while CH_2O and S were unsatisfactory. C. R. FELLERS

Preventing insect damage to stored seed grain. W. P. FLINT AND J. C. FRANKEN-FELD. *J. Econ. Entomol.* 21, 143-7(1928).—A mixt. of 0.5 fluid oz. crude creosote and 1 lb. Ca(OH)_2 when mixed with wheat in the proportion of 0.25 oz. per lb. of seed gave almost complete protection from insect damage. CaSiF_6 was equally effective but is poisonous to higher animals. C. H. RICHARDSON

Organic mercury compounds for the control of insects in stored seeds. J. L. HORSFALL. *J. Econ. Entomol.* 21, 147-50(1928).—Several com. org. Hg compds, which are now used to control seed-borne fungi, are effective in preventing damage to beans by bean weevils and to corn by the Angoumois grain moth. C. H. R.

The preparation of a special light sodium fluosilicate and its use as a boll-weevil poison. H. W. WALKER. *J. Econ. Entomol.* 21, 156-64(1928).— Na_2SiF_6 of the same d. as Ca arsenate and contg. not less than 80% Na_2SiF_6 is obtained as a by-product of the manuf. of acid phosphate. Its toxicity to the Mexican boll weevil equals that of Ca arsenate but it does not adhere so well to the cotton plant under field conditions. The addn. of an adhesive (starch, glue, cascien, sirup, etc.) will probably remedy this defect. The material causes no economic damage to the cotton plant. C. H. R.

The preparation of special calcium arsenates containing less than 40% arsenic as arsenic pentoxide and their use as boll weevil poisons. H. W. WALKER. *J. Econ. Entomol.* 21, 165-73(1928).—A specially prepd. Ca arsenate contg. 20% As as As_2O_5 was about as effective as com. Ca arsenate contg. 40% As as As_2O_5 in the control of the Mexican boll weevil. It is prepd. by heating As_2O_3 and pptd. chalk in the presence of excess air at 650° for 15-60 min. The effective content of As as As_2O_5 in this prepn. is 10-20%. Ca arsenate contg. any desired % of As as As_2O_5 up to 57.6% (theoretical for $\text{Ca}_3(\text{AsO}_4)_2$) can be prepd. by this method. Other arsenates may also be obtained by using carbonates, and in some cases sulfates, of the desired base. This special Ca arsenate does not injure the cotton plant. C. H. RICHARDSON

A preliminary report on the toxic value of fluosilicates and arsenicals as tested on the plum curculio. O. I. SNAPP. *J. Econ. Entomol.* 21, 175-8(1928).—The order of toxicity of a no. of compds was: $\text{Na}_2\text{SiF}_6 > \text{PbHAsO}_4 > \text{Ba arsenate} > \text{Ca}_3(\text{AsO}_4)_2 > \text{Zn arsenate} > \text{Mg arsenate} > \text{Mn arsenate} > \text{Al arsenate} > \text{Na}_2\text{SiF}_6 + \text{lime} > \text{scorodite (native Fe arsenate)}$. Na_2SiF_6 was very toxic to peach foliage and fruit; $\text{PbHAsO}_4 + \text{lime}$ was the safest to use under these conditions. C. H. RICHARDSON

Some notes on the Mexican bean beetle problem. N. F. HOWARD. *J. Econ. Entomol.* 21, 178-82(1928).—Mg arsenate or Ca arsenate and lime are superior to Na_2SiF_6 for the control of this insect. The As residues on beans treated with the arsenical mentioned are too small to offer a menace to human health. C. H. R.

Some observations upon the biology and control of the potato leafhopper. D. M. DELONG. *J. Econ. Entomol.* 21, 183-8(1928).—Most satisfactory results were obtained with Ca(CN)_2 applied as a dust and a pyrethrum ext. applied in a spray. C. H. R.

Notes on amyl salicylate as an attractant to the tobacco hornworm moth. A. C. MORGAN AND S. C. LYON. *J. Econ. Entomol.* 21, 189-91(1928).—Amyl salicylate and amyl benzoate are very attractive to these moths. C. H. R.

Chemical dust seed treatments for dent corn. J. R. HOLBERT, C. S. REDDY AND BENJAMIN KOEHLER. *U. S. Dept. Agr. Circ.* 34, 1-5(1928).—Expts. are reported showing increases in acre yield resulting from the treatment of well-selected but untested seed, from 1 to 3.4 bu. per acre, the mean increases being from 2.1 to 5.4 bu. per acre. The treatment by dust is designed primarily to kill certain seed-borne parasites without injuring the seed. Hg is the toxic agent in these dusts, one of which contains 4% of hydroxymercurinitrophenol sulfate, another 12% of hydroxymercuricresol and a third consists of 3.5% metallic Hg. These dusts are poisonous and the use of dust masks while dusting seed is recommended. C. R. FELLERS

Treatments against grape worms; arsenical products—dusts. P. VIALA AND P. MARSAIS. *Rev. vit.* 68, 217-9(1928).—A summary of the properties of various As preps., with suggestions as to concns. to be used, precautions, etc. P. R. D.

Chlorosis. G. KUHNHOLTZ-LORDAT. *Prog. agr.* vii. 89, 310-2(1928).—A description and discussion of the several "forms" of chlorosis, due to lime, Mn, Fe, S, lack of N and climatic conditions. P. R. DAYSON

Some preliminary notes on the use of sodium arsenite dust and spray in the control of the Mormon cricket (*Anabrus simplex* Halde) and the lesser migratory grasshopper (*Melanoplus atlantis* Riley). R. L. SHOTWELL and F. T. COWAN. *J. Econ. Entomol.* 21, 222-30(1928).— Na_3AsO_3 as a dust or a spray has great possibilities for the control of these insects. C. H. R.

The relative toxicities of arsenicals and fluorine compounds to various organisms. S. MARCOVITCH. *J. Econ. Entomol.* 21, 108-14(1928).—Larvae of the mosquito, *Culex quinquefasciatus*, were used to study the speed of toxic action of a no. of compds. The results are expressed by the equation, $K = (1/t) \log (1/\text{concn.})$, in which t is the survival time and K a const. expressing toxicity numerically. The K value for Na_2SiF_6 is 32.1; for Na_2AsO_3 9.6; for Na_2AsO_4 3.5; and for NaF 3.0. The following order of toxicity was obtained for another series of compds: $\text{Na}_2\text{SiF}_6 > \text{PbF}_2 > \text{Cu}(\text{CuO} \cdot \text{As}_2\text{O}_3)_2, (\text{C}_4\text{H}_7\text{O}_2)_2 > \text{BaF}_2 > \text{PbHAsO}_4 > \text{CuF}_2 > \text{Ca arsenate} > \text{SrF}_2 > \text{CaF}_2$. Na_2SiF_6 was more toxic than Na_2AsO_3 to grasshoppers, *Melanoplus femur-rubrum*, and cutworms, *Feltia ducens*. For some other invertebrates (*Lumbricus terrestris*, *Paramecium caudatum*, *Euglena* sp.) the order of toxicity for 3 compds was: $\text{Na}_2\text{SiF}_6 > \text{NaF} > \text{Na}_2\text{AsO}_3$. The min. fatal dose for rabbits by mouth was: NaF , 0.5 g. per kg.; Na_2SiF_6 , 0.12 g. per kg.; K_2AsO_3 , 14 mg. per kg. The toxic doses for man are, therefore, NaF 30 g., Na_2SiF_6 7.2 g. and K_2AsO_3 0.84. The effect of the daily administration of small doses is discussed. C. H. RICHARDSON

Testing commercial insecticides. L. HASEMAN. *J. Econ. Entomol.* 21, 115-7(1928). C. H. R.

Fish oil as an adhesive in control of the grape-berry and codling moths. H. L. DOZIER. *J. Econ. Entomol.* 21, 121-5(1928).—Fish oil has great possibilities as an adhesive in spray mixts contg. Pb arsenate, Bordeaux mixt. and dry lime-sulfur. It is not recommended for the late sprays. C. H. R.

Analyses of sprayed apples for lead and arsenic. A. HARTZELL and F. WILCOXON. *J. Econ. Entomol.* 21, 125-30(1928).—After spraying apple trees with 5 applications of Pb arsenate (4 lbs to 150 gals. water) in 1927, the following values in mg. per kg. fruit were obtained. Pb 0.155 to 1.80, av. 0.912; As as As_2O_3 , 0.042 to 0.193, av. 0.099. Compared with the results reported for 1926 (cf. Hartzell and Wilcoxon, *C. A.* 21, 3251) the As residue was smaller, correlated with a heavier rainfall. The ratio, Pb:As found in 1927, was considerably higher than expected from the compn. of the Pb arsenate used. This is probably due to the action of atm. agencies upon the Pb arsenate, resulting in more As than of Pb being dissolved and washed away. C. H. R.

Results of three years' work with dust sprays in Missouri. K. C. SULLIVAN. *J. Econ. Entomol.* 21, 131-4(1928).—Dusts consisting of S and Pb arsenate, of lime, Cu and Pb arsenate, and a Cu dust were tested in comparison with liquid sprays on apple trees infested with codling moth, brown rot and apple scab. The cost of dusts is greater than that of sprays, but labor costs favor the dusts. Because of inferior adherent qualities, dusts require twice as many applications as sprays. Dusts failed to control apple diseases as well as sprays. They may be economically employed, however, as supplements for sprays in codling-moth control. C. H. RICHARDSON

Fumigation tests with certain chlorides. R. C. ROARK and R. T. COTTON. *J. Econ. Entomol.* 21, 135-42(1928).—Twenty-one aliphatic chlorides were tested against insects which attack stored products. A mixt. of 3 vols. $(\text{CH}_2\text{Cl})_2$ and 1 vol. CCl_4 was most promising as a general fumigant. Although more toxic than $(\text{CH}_2\text{Cl})_2$, Me_2CCl requires a larger proportion of CCl_4 to render the mixt. free of fire hazard, and it tends to break down and attack metals. C_2HCl_3 is non-inflammable and fairly toxic at temps. above 26° . Expts. showed that none of the compds. used seriously affected the germination of wheat at the concns. employed. C. H. RICHARDSON

The constitution and the properties of some of the most used antiperonosporic agents. U. PRATOLONGO and M. P. ALLAN. *Giorn. chim. ind. applicata* 10, 3-7(1928).—A preliminary note. The constitution of Bordeaux mixt. has never been known exactly. The reactions described by Pickering (*C. A.* 2, 963) and by Wöber (*C. A.* 15, 2954) were confirmed when aq. $\text{Ca}(\text{OH})_2$ was first added to aq. CuSO_4 , but with excess $\text{Ca}(\text{OH})_2$ no decapic compd. could be identified, and expts. indicated that the solid phase was of the compn. described by Wöber. The soly. of $\text{CuSO}_4 \cdot 3\text{Cu}(\text{OH})_2$ in water at room temp. was 0.75 mg. (of Cu) per l., the satd. soln. having p_H 6.8. In water contg. CO_2 (1 atm. pressure) the soly. was 100 mg. (of Cu) per l. with p_H 4.4. When the aq. soln. was acidified by H_2SO_4 to p_H 5.8 and 3.6, the soly. became 50 and 250 mg. (of Cu),

resp., per 1. The soly. of $[\text{CuSO}_4 \cdot 4\text{Cu}(\text{OH})_2] \cdot 3\text{Ca}(\text{OH})_2$ in water at room temp. was 0.75 mg. (of Cu) per 1., the satd. solu. having p_H 7.0. In water contg. CO_2 (atm. pressure) the soly. was 100 mg. (of Cu) per 1. with p_H 4.4. When the aq. soln. was acidified by H_2SO_4 to p_H 6.0 and 4.6, the soly. became 50 and 150 mg. (of Cu) per 1. The compn. of Caffaro paste and of Caffaro powder, much used in Italy, are $3\text{CuO} \cdot \text{CuCl}_2$ and $3\text{CuO} \cdot \text{CaCl}_2 \cdot 4\text{H}_2\text{O}$. The former is therefore identical with the mineral atacamite. The soly. of each depends to a large extent upon the p_H value and therefore upon the presence of CO_2 . In water or in water satd. with air the soly. of $3\text{CuO} \cdot \text{CuCl}_2$ was only 1 mg. (Cu) per 1., but in water contg. CO_2 (1 atm.) it was 25 mg. (Cu) per 1. In water acidified with H_2SO_4 to p_H 6.4, 5.8 and 4.4, it was 12.5, 75 and 100 mg. (Cu), resp., per 1. In water at 20° , whether or not satd. with air, the soly. of $3\text{CuO} \cdot \text{CaCl}_2 \cdot 4\text{H}_2\text{O}$ was less than 1 mg. (Cu) per 1., but in water contg. CO_2 (1 atm.) it became 123 mg. (Cu) per 1. In water acidified to p_H 5.4 and 4.4, it was 25 and 175 mg. (Cu), resp., per 1. The constitution assigned by Fraipont to his important product, i. e., $\text{CuCO}_3 \cdot \text{Cu}(\text{OH})_2$, was confirmed. In water at 20° its soly. was less than 0.1 mg. (Cu) per 1., but in water contg. CO_2 (1 atm.) it became 12.5 mg. (Cu) per 1. In water acidified to p_H 6 and 3.8, the soly. was 25 and 250 mg. (Cu), resp., per 1. The soly. data on the 5 compds. are shown in detail in tabular and graphical form. Soly. under different conditions of acidity (CO_2) is of great importance in relation to the efficacy of the compds. as antiperonosporic agents. The soly. of none of these compds. is such as to render them caustic toward plant tissue. The soly. is, however, great enough to make them efficacious without being so great that they are soon removed by rain. A comparison of the soly. of these compds. and the quantity present in fodder with the conditions of acidity prevailing during digestion and the av. tolerance of domestic animals for Cu (5-10 mg per day for months) indicates that fodder from leaves treated with any of the compds. is practically harmless.

C. C. DAVIS

Volumetric estimation of C and CO_2 in rock products (Pirr) 7.

16-- THE FERMENTATION INDUSTRIES

C. N. FREY

Transformation of the α -bitter acid of hops in boiling in aqueous solutions of various reactions and the nature of the products formed. W. WINDISCH, P. KOLBACH AND R. SCHLEICHER. *Wochschr. Brau.* **44**, 453-9, 473-8, 485-90, 497-502 (1927).—The decoupling of humulone when boiled in acid and alk. solns. was studied. The formation of hard resin insol. in petroleum ether or hexane is an oxidation product. This product is not formed when air is excluded. The transformation of humulone to soft resins takes place when air is not present. The reaction is monomol. The product is an intermediate in the conversion of humulone to humulinic acid by boiling with alkali. The soft resin may consist of 2 substances.

C. N. FREY

The action of iodine on yeast. W. WINDISCH. *Wochschr. Brau.* **44**, 516-7 (1927).—The behavior of I with yeast follows the Arndt-Schulz law.* The protoplasm may be stimulated by small addns. but is destroyed by large ones. I stimulates only the velocity of reproduction and does not affect the assimilation of yeast, which may account for the high tolerance for I.

C. N. FREY

- Influence of storage temperature of yeast under water on fermentation, reproduction and acid formation in wort.** F. STOCKHAUSEN AND F. WINDISCH. *Wochschr. Brau.* **44**, 478-81 (1927).—A bottom yeast was kept 3 days under H_2O at 1° , 4° , 7° and 18° . The yeasts were then fermented at 13 - 15° . The lower storage temp. gave more vigorous fermentation and reproduction during the first days in the vat. After 9 days, the end of fermentation, all were alike.

C. N. FREY

Fixation of intermediate products of alcoholic and lactic fermentation. S. KOSTYCHEV AND S. SOLDATENKOV. *Wochschr. Brau.* **44**, 414-5 (1927).—Semicarbazide when added to fermenting sugar solns. forms methylglyoxal-disemicarbazone, indicating that methylglyoxal is an intermediate product. When added to a lactic fermentation a larger amt. of pyruvic acid semicarbazone is formed, showing that pyruvic acid may also be an intermediate product.

C. N. FREY

The mechanism of vinegar fermentation. CURT LUKOW. *Centr. Bakt. Parasitenk. II Abt.* **72**, 39-66 (1927).—A concise but quite complete review of the subject.

JOHN T. MYERS

The citric acid content of grape musts and wines. A. HREIDUSCHKA AND C. PYRIKL.

Z. Untersuch. Lebensm. **54**, 466-73 (1927).—Data are given on the citric acid content of various samples of grape musts and wines. WILLIAM J. HUSA

The carbonyl number of wines. H. STRACHE AND A. BRANDL. *Z. Untersuch. Lebensm.* **55**, 50-3 (1928).—A measure of the amt. of compds. contg. the carbonyl group is obtained for wines by application of the reaction of such compds. with phenylhydrazine. WILLIAM J. HUSA

The occurrence of vanillin in wine distillate spirits and blended spirits. G. REIF. *Z. Untersuch. Lebensm.* **54**, 90-101 (1927).—Compds. exist in wine distillate which give the same color reactions as vanillin. Therefore the only sure way of detection and detn. of vanillin in wine distillates is to use a method in which vanillin is finally isolated by sublimation. In wine distillate phenolic substances are present in amt. proportional to the depth of the brown color. Vanillin in wine distillates comes from the wood of the wine casks, the amts per l. being as follows. wine distillates 0.2 mg., spirits 0.1 mg., blended spirit none, except in one case, in which 0.05 mg. was found.

A comparative study of six different strains of the organism commonly concerned in large-scale production of butyl alcohol and acetone (WEYER, RETTGER) 11C.

Apparatus for vinegar manufacture. F. NOLDIN. Brit. 274,328, Nov. 1, 1926.

Beer. HANSEKA AKT.-GES. and L. NATHAN. Brit. 274,225, April 26, 1926. Fermentation is effected in 2 stages at temps of 3-6° and of 10-25°, resp. Other details are specified and an app. is described.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Determination of ephedrine mixtures by the biuret reaction. C. T. FENG. *Chinese J. Physiol.* **1**, 397-406 (1927).—The ether-sol. violet pigment obtained by performing the biuret reaction on solns. of ephedrine and ψ -ephedrine has been adapted as the basis of a colorimetric method for the detn. of these 2 substances. The method is extended to the detn. of the relative proportions of mixts. of the 2 alkaloids in soln. since it has been found that together they give less color than the same amt. of either of them when present alone. Examn. of the residue left by evapn. of the ethereal soln. of the violet pigment leads to the differentiation of ephedrine in soln. from ψ -ephedrine; the former leaves a gelatinous residue, the latter rhombic, violet crystals. B. C. A.

The preparation of a solution of sulfur in oil for injection. H. W. VAN URK. *Pharm. Weekblad* **65**, 310-3 (1928).—For the treatment of dementia paralytica by intramuscular injection of S, a sterile soln. of 1% S in olive oil should be preferable to the colloidal S preps. which contain protein. A. W. DOX

Examination of oleum caryophyllorum. H. W. VAN URK. *Pharm. Weekblad* **65**, 345-9 (1928).—A sample of oil of cloves which failed to give the usual cryst. sepn. of a Na deriv. of eugenol when treated with an equal vol. NaOH gave with $\frac{1}{6}$ vol. NaOH a sepn. of crystals m. 90-2° which had a vanillin odor and showed the vanillin reaction with phloroglucinol and HCl. A. W. DOX

The essential oil from *Agathis australis* (Kauri pine). J. R. HOSKING. *Rec. trav. chim.* **47**, 578-84 (1928).—On distn. with water the leaves of *Agathis australis* yield 0.16% of an essential oil when collected in Dec. and Jan. and 0.05% when collected in June. The oil obtained in Dec. and Jan. showed the following consts.: d_4^{25} 0.9340, n_D^{25} 1.4952, $[\alpha]_{D_4}^{25}$ 24.41°, acid no. 0.39, ester no. 3.9, ester no. of the acetylated oil 15.9. On treatment with 2% NaOH a trace of a phenolic substance and 3% of resin were obtained and with NaHSO₃ 0.2% of citronellal, identified as α -citronellyl- β -naphthochinonic acid, m. 223°. On distn. of the oil the following fractions were collected: (1) 155-8° (762 mm.), 60.6%; (2) 158-61° (762 mm.), 4%; (3) 161-6° (762 mm.), 0.5%; (4) 65-90° (11 mm.), 2.6%; (5) 90-120° (11 mm.), 0.7%; (6) 120-39° (11 mm.), 8.7%; (7) 139-70° (11 mm.), 1.0%; (8) 170-90° (11 mm.), 14.1%; (9) 170-90° (1 mm.) 1.2%; (10) > 190° (1 mm.), 3%. Fraction 1 consists of d - α -pinene, d_4^{25} 0.8582, n_D^{25} 1.4634, $[\alpha]_{D_4}^{25}$ 13.28°; nitrosochloride, m. 114°; pinenenitrolbenzylamine, m. 122°; the fractions 2 and 3 contain d -camphene which was converted into isoborneol, m. 204°. In fraction 4 the presence of dipentene (tetrabromide, m. 120°), d -limonene (tetrabromide m. 106°) and of cineole (oxidation to cineolic acid, m. 195°) could be demonstrated. The

higher-boiling parts of the fractions 5 and 6 were added to fraction 7; the lower-boiling fractions consist of *d-borneol*, m. 200°, and of *bornyl acetate*. Fraction 7 was refractionated several times, finally 2 fractions being obtained, viz., (a) b_9 125-6°, d_4^{25} 0.9131, n_D^{25} 1.5014, $[\alpha]_{5461}^{25}$ -35.25°; (b) b_9 127-9°, d_4^{25} 0.9137, n_D^{25} 1.5062, $[\alpha]_{5461}^{25}$ -38.45°. Both these fractions on dehydrogenation with S (cf. *Helv. Chim. Acta* 4, 505 (1921)) gave *cadalene* and on treatment with HCl were converted into *cadinene-di-HCl*, m. 119°. The fractions 8 and 9 were refractionated several times over Na and thus yielded a viscous, blue oil, consisting of a *diterpene* $C_{20}H_{32}$, b_{10} 184-6°, b_1 140-2°, d_4^{20} 0.9686, n_D^{20} 1.5244, n_D^{25} 1.5208, $[\alpha]_{5461}^{25}$ -1.11°. On treatment with HCl in AcOH a *HCl salt* $C_{20}H_{33}Cl$, m. 110-1°, was obtained, which with a 10% alc. KOH soln. yielded a diterpene, called *kaurene*, m. 57-8°, which was converted quant. into the *HCl salt* m. 110-1°, mentioned above, by means of HCl. From the original viscous oil, b_{10} 184-6° the hydrocarbon also crystallizes on cooling to -15° while from the mother liquors of the prepn. of *kaurene-HCl* only the same HCl salt in a somewhat less pure state could be obtained. Fraction 10 on redistn. yielded 8 g. of impure *kaurene*, the residue consisting of a resinous mass which was not investigated further. H. thus concludes that the essential oil of *Agathis australis* (Dec and Jan.) contains 64% *d- α -pinene*, 13% *kaurene*, 7% *l-cadinene*, 3.2% *d-borneol*, 1.4% *bornyl acetate*, 1.0% *dipentene* + *d-limonene*, 0.7% *d-camphene*, 0.6% *cineole*, 0.2% *citronellal* and 3% *resin*. The oil obtained from the leaves, collected in June, in a yield of 0.05% contains 75% *d-pinene*, 6% *kaurene* and 3.5% *l-cadinene*. C. F. VAN DUIN

Preparation and stability of iodine tincture. P. BOHRISCH. *Apoth. Ztg.* 43, 436-40 (1928).—An exptl. study showing that the official Ger. method cannot be relied upon to yield correct values, the latter being invariably too high. To rectify such failure it will be necessary to modify the official method by adding 0.2 g. $MnSO_4$, or by recourse to some more dependable method, as, e. g., the procedures of Berg, Matthies and Brause, v. Bruchhausen and Stempel, Herzog and Schulze with modification of Runge. In detg. free I the addn. of KI is unnecessary. The stability of the official Ger. prepn. is excellent. So far as true results are concerned KBr may be substituted for KI; furthermore, the stability remains equally satisfactory when 70% alc. is used instead of the prescribed 90%. Finally, the prepn. keeps best in completely filled containers of brown glass. W. O. E.

Pharmacognostic studies of official German drugs. A. v. LINGELSHEIM. *Arch. Pharm.* 266, 218-31 (1928).—The drugs specifically studied and discussed are aloe, benzoin, crocus, jugsans, colombo, ononis, fenugreek, jesityry. W. O. E.

Stability of benzaldehyde cyanohydrin. G. BÜMMING. *Arch. Pharm.* 266, 231-2 (1928).—Since it has been shown that the HCN content of Bz HCN decreases with the lapse of time, the suggestion is made that only moderate quantities of the H_2O contg. it be prepd. at any one time. W. O. E.

Hydroferro- and hydroferricyanides of the alkaloids. II. W. M. CUMMING AND D. G. BROWN. *J. Soc. Chem. Ind.* 47, 84-6T (1928); cf. *C. A.* 19, 977.—Prior to microscopical examn. it is advisable to keep the pptd. salts in contact with the mother liquor as frequently they assume the cryst. form after a time. In order to make the tests more sensitive, a small micro-filter was designed applicable to filtering a drop of the reacting medium. As before, only a selection of the photomicrographs is given in this paper. Among the alkaloids examd. were sparteine, cinchonidine, hydrastine, nicotine, pilocarpine, piperine, codeine, morphine, narceine, ecgonine, caffeine and theobromine. W. O. E.

Constituents of some Indian essential oils. XXIII. Essential oil from the fruits of Piper cubeba Linn. B. S. RAO, V. P. SHINTRE AND J. L. SIMONSEN. *J. Soc. Chem. Ind.* 47, 92-4T (1928).—Steam distn. of the fruits gave a 7.4% yield of oil having the following compn.: *d-sabinene* 33, *d- Δ^4 -carene* and 1,4-cineole 12, *d- Δ^1 -terpinen-4-ol* and other alcs. 11, sesquiterpenes mainly *l-cadinene* 14, sesquiterpene alcs. 17, unidentified 13%. W. O. E.

Adsorption and its importance in medicine. ERICH HERRMANN. *Pharm. Monatsh.* 9, 59 (1928).—The differences in conception of absorption and adsorption are discussed, notably as related to the medicinal application of adsorbents. W. O. E.

Alkaloid from false angostura bark. J. TRÖGER. *Pharm. Zentralh.* 69, 209-17 (1928).—In examg. the ext. of an undetd. (false) angostura bark there was isolated a new amphiprotic base, $C_{21}H_{25}N_2O_3$, m. 167°, apparently isomeric with yohimbine and quebrachine. The perchlorate, $C_{21}H_{24}N_2O_3 \cdot HClO_4$; methiodide, $C_{21}H_{26}N_2O_3 \cdot CH_3I$ (still solid at 255°); ethiodide, m. about 275°, were prepd. W. O. E.

Liquor aluminii acetici D.A.-B. 6. H. MATTHES. *Pharm. Ztg.* 73, 422(1928).—A critical commentary on the official Ger. method of prepn. W. O. E.

Detection of arsenic by sodium hypophosphite solution. G. JOACHIMOGLU AND J. ZELTNER. *Pharm. Ztg.* 73, 422(1928).—It is shown that in As-free tablets contg. starch or sugar the Na hypophosphite test may lead to the conclusion that As is present, because of the dark color produced by the reagent. In order to avoid any uncertainty in the matter, the tablets should first be ashed prior to application of the test.

W. O. E.

Small apparatus for the preparation of aqua recentior destillata. E. RUPP. *Apoth. Ztg.* 43, 420-1(1928).—The entire app. consist essentially of an Erlenmeyer flask as distg. flask, a short vertical Allihn condenser, the lower delivery end carrying a glass hood large enough to project over the neck of the receiving bottle. The connecting one-piece still head has at the condenser end a bulbous exit to fit into the upper end of the condenser, thus dispensing with any cork connection, while the receiving end consists of an elongated spray trap (lower end cylindrical and contracted to a small opening and having 3 vertical slits for entry of vapors) partially filled with short glass beads of thin tubing. Connection of spray trap with distg. flask is effected by a suitable perforated stopper.

Simple device for filling ampuls. E. BENOIT. *Pharm. Ztg.* 73, 439-40(1928).

W. O. E.

Lukutates. ANON. *Pharm. Ztg.* 73, 453-4(1928).—A further discussion relative to the fruit entering into the composition of this product. W. O. E.

Liquor aluminii acetici D.A.-B. 6. OTTO SCHMATOLLA. *Pharm. Ztg.* 73, 455(1928).—Polemical with respect to a recent paper by Matthes on the same subject.

W. O. E.

Detection of calcium in aluminum salts via D.A.-B. 6. GUSTAV. BRAUSE. *Pharm. Ztg.* 73, 454-5(1928).—A critical commentary. W. O. E.

Preserving action of nipagin and its homologs on pharmaceutical preparations. E. BÖHM AND H. JEGLIŃSKI. *Pharm. Ztg.* 73, 480-1(1928).—A study has been made of the relative antiseptic values of nipagin (Me *p*-hydroxybenzoate), Me nipagin, microbin, boric acid, thymol, Na benzoate, benzoic and salicylic acids as applied to pharmaceutical sirups, malt exts., succus liquiritiae and ungt. glycerini.

W. O. E.

Essential oil from the leaves of *Caesalpinia sappan* L. P. VAN ROMBURGH. *Proc. Acad. Sci. Amsterdam* 30, 840-3(1927).—The oil obtained in a 0.25% yield in 1902 showed d_{20}^{20} 0.841 (compared with d_{20}^{20} 0.825 for a sample distd. some 6 yrs. earlier), and $[\alpha]_D^{20}$ 76° in a 20-cm. tube. While the product had the odor of phellandrene, its low *d*. raised some doubt as to that substance being the principal ingredient. About 1/3 of the oil distd. at 65-70°/20 mm. and had d_{20}^{20} 0.813. A 2nd distn. over Na did not change the boiling pt. materially, the *d*. remaining the same, $[\alpha]_D^{20}$ being 59°59' in a 10-cm. tube, and n_D^{20} 1.473. The fraction was designated "hydrocarbon Caes" and had the compn. C₁₀H₁₆. Like phellandrene it gave a cryst. nitrite, m. 112°, thus agreeing with the melting point of *d*- α -phellandrene. Indications point also to the presence of a 2nd hydrocarbon, possibly oscimene.

W. O. E.

The content of ethereal oils in Middle Asiatic plants. M. I. KURBATOV. *Bull. Univ. Asie Centrale (Tachkent)* 1927, 217-37.—The ethereal oils of 45 plants, native to Central Asia, were studied with the view of prepg. them in large quantities and using them in perfume manuf. Detailed tabular results are given. RUSSELL C. ERS

Methods of extracting volatile oils from plant material and the production of such oils in the United States. A. F. STEVENS. U. S. Dept. of Agr., *Tech. Bull.* 16, 1-35 (1928).—A full description of the methods of oil extn. are given under the heads, volatile solvents, warm liquid fats, cold solid fats, expression and steam distn. The design and construction of stills and their operation are discussed together with a description of the methods used commercially in the U. S. for the production of the following oils: turpentine, safflower, wintergreen, sweet birch, witch-hazel, erigeron, eucalyptus, pennyroyal, peppermint, spearmint, Japanese peppermint, American wormseed, wormwood, tansy, dill, lemon, orange, apricot, bitter almond, cedarwood and hop. C. R. F.

The alkaloids of *Ceanothus americanus*. II. A. H. CLARK. *Am. J. Pharm.* 100, 240-2(1928); cf. C. A. 20, 1688.—The alkaloid is slow to ext. with org. solvents. The fatty material extd. with petroleum ether absorbs I; it had a sapon. value of 136 for one lot and 155 for another. A non-alkaloidal substance, m. 175°, was obtained along with this fat. Numerous lots of crude alkaloid have been obtained by simple extn. with alc. and also by continuous extn. in C.'s app. (C. A. 21, 1725). In both cases this was done with and without previous extn. with petroleum ether. Exts. were obtained from the alk. (drug moistened with lime, Na₂CO₃, NaOH, NH₄OH, etc.) drug

by percolation or continuous extn. with alc. and also acetone. No marked improvement in the yield or quality of the alkaloid was secured. No marked progress has been made in the study of the alkaloids. A very pure "gallo-tannic" acid was obtained. It is insol. in ordinary org. solvents, sparingly in cold H₂O but very sol. in hot H₂O. It crystallized from hot H₂O in needle-like crystals, m. above 220° (decompn.). This substance reduced Fehling soln., AgNO₃, Au and Pt solns. and gives a ppt. with I soln. and phosphomolybdic acid, the latter accompanied with a deep blue color. It ppts. Pb(OAc)₂ soln., the mixt. becoming red upon addition of NaOH soln. FeCl₃ gives a beautiful purple color, very permanent and becoming more intense upon standing.

W. G. GAESSLER

Tests for impurities in ether. Part I. Test for peroxides. G. MIDDLETON AND F. C. HYMAS. *Analyst* 53, 201-9(1928).—The following tests for ether peroxide and for H₂O₂ were studied and in this list each method is less sensitive than those mentioned before it. UO₂(NO₃)₂ test, CrO₃ test, Ce(NO₃)₃ test, Fe[Fe(CN)₆] test, Fe(OH)₂ test, Tollens Ag(NH₃)₂⁺ test, alk. KMnO₄ test, Co(OH)₂ test, H₃VO₄ test, *o*-tolidine-peroxidase test, K₂CdI₄ test, Ti⁺⁺⁺ test, K₂CdI₄ and starch test, KI test, KI and AcOH test, Stannous reduced phenolphthalein test, leucomechylgreen test, KI and starch test and the Fe(CNS)₂ test. The first test mentioned requires the presence of 20 parts per million of H₂O₂ and over 170 parts of ether peroxide, the last-mentioned test requires only 0.02 part per million of ether peroxide. The technic of the Fe(CNS)₂ test is improved and it is recommended for official adoption. A colorimetric limit to the permissible quantity of peroxide is also proposed.

W. T. H.

Determination of carvone in dill oil. J. REILLY AND F. J. DRUMM. *Analyst* 53, 209-11(1928).—A new method for the evaluation of carvone in dill oil depends upon the formation of its semicarbazone. To a cooled soln. of 6 g. semicarbazide hydrochloride in 15 cc. of water, add a soln. of 19 g. oil in 120 cc. of alc. and 6 g. of fused NaOAc in 10 cc. of hot water. After 24 hrs. dil. to 840 cc. with water, allow to stand for a short time, filter off the ppt. and dry in a vacuum over H₂SO₄. About 97% of the theoretical yield is obtained. Results obtained by this method agree with those obtained by the neutral sulfite method and are about 1% lower than those obtained by oxime titration.

W. T. H.

Reports of the essential oil sub-committee to the standing committee on uniformity of analytical methods. JOHN ALLEN, *et al.* *Analyst* 53, 214-6(1928); cf. C. A. 21, 4019.—Details are given for the *detn. of the acetylizable constituents in essential oils* with respect to the method of acetylation and the method of effecting the hydrolysis and for the *detn. of phenols in essential oils*.

W. T. H.

The behavior of ψ -cocaine bitartrate (psicaine) and cocaine hydrochloride toward a few reagents. MARIA FERRARIS. *Boll. chim. farm.* 66, 577-80(1927).—Psicaine is pptd. by most alkaloid reagents with the exception of HgCl₂. Unlike cocaine-HCl it does not react with KI, KOH, borax, Na₂AsO₄, KMnO₄, ZnSO₄, Cu salts, protargol and AgNO₃. It gives a copious ppt. with Pb acetate, turns slightly yellow when triturated with HgCl and gives only a faint BzOI₂ odor with alc. and KOH. The C₁₄H₁₆O₆ reactions may also be used for the differentiation.

MARY JACOBSEN

The determination of the solubility of digitoxin. KARAM SAMAN. *J. Egyptian Med. Assocn.* 11, 16-21(1928).—Frogs were pithed and the hearts perfused *in situ*. The quantity of perfused liquid was estd. by the use of Condon's magnet tipper controlled by direct measurement. A known amt. of the recrystd. digitoxin was dissolved in the least possible quantity of alc. and then dild. to the required vol. with Ringer soln. Digitoxin in satd. soln. arrests the frog heart within limits of time and vol. fixed at 5-25 min. and 20-100 cc. In the case of the time curve the soly. of digitoxin at 18.5° was 1/122,000 and in the case of the vol. curve it was 1/121,000.

J. A. KENNEDY

Content of stramonium in alkaloids. W. PLOSKI. *Bull. intern. acad. Polonaise* 1927B, 397-401.—Five series of expts. in which *Datura stramonium* J. v. *inermis* was grown without fertilizer, with K and P, and with K, P and N, the latter as NH₄NO₃ in 3 concns., proved that the fertilizer has no influence on the percentage of alkaloid calcd. on the dry matter in leaves, stems or roots.

L. W. RIGGS

Limits of determination of alkaloids in codex preparations. R. DEBREULLE. *Bull. sci. pharmacol.* 35, 169-74(1928).—The general procedure was to add to a measured quantity of the alkaloidal prepn. 5 to 10 cc. of 1% HCl and a measured amt. of neutral K iodomercurate (Mayer), agitate and after a few min. of contact filter. On a further addn. of K iodomercurate to the filtrate a ppt. should form. In this manner 18 alkaloidal preps. of the Codex were tested and coeffs. of pptn. were detd.

L. W. RIGGS

Digitine of Nativelle. P. BOURCET AND G. DUGUÉ. *Bull. sci. pharmacol.* 35, 175-6(1928); cf. C. A. 22, 1652.

L. W. RIGGS

Comparison of Ephedra equisetina and Ephedra sinica and their seasonal content of ephedrine. CHIH-TUNG FENG AND B. E. READ. *Chinese J. Physiol.* **2**, 87-96 (1928).—Assays of *E. equisetina* and *E. sinica* show 1.75 and 1.32%, resp., as the alkaloidal content, also the former contains greater relative and greater abs. amts. of ephedrine than the latter. Monthly assays show a progressive increase in the content of ephedrine in these 2 species, so that from spring to autumn there is an increase of about 200%. This supports the old Chinese custom of collecting this drug in the autumn. L. W. R.

Sclareol, the principal constituent of the absolute essence of clary sage. Y. VOLMAR AND A. JERMSTAD. *Compt. rend.* **186**, 783-5 (1928); cf. *C. A.* **22**, 1827.—This fraction of the abs. essence of *Salvia sclarea* L. is sep'd. from boiling petroleic ether as colorless cryst. needles, odorless and tasteless, m. 104-105°, boiling without decomn. at 182° under 1 mm., insol. in water and alkalies, sol. in the usual org. solvents, formula $C_{34}H_{52}O_4$, α_D^{20} in abs. alc soln. -6.12°. Sclareol is a polyatomic, non-sat'd. tertiary alc resembling the phytosterols and cholesterol. In $CHCl_3$ soln it gives a cherry red color with CCl_3CO_2H , a red color with conc'd H_2SO_4 and a green color with a mixt. of Ac_2O and conc'd. H_2SO_4 . Its soln. in anhyd. acetone when oxidized by permanganate gives (1) a non-acid substance m. 97°, formula $C_{17}H_{30}O_2$. This substance in air and light quickly changes to a resinous mass. (2) A cryst. acid, m. 160.5°, insol. in H_2O , sol. in org. solvents, inactive to polarized light, formula $C_{45}H_{76}O_7 \cdot CO_2H$, name *sclareolic acid*. Oxidation of sclareol by CrO_3 yields a different substance from sclareolic acid, which is non-acid, cryst., m. 125°, formula $C_{18}H_{30}O_2$. L. W. RIGGS

Variations in the alkaloidal content of the lupine under the influence of fertilizers. ALBERT GUILLAUME. *Compt. rend.* **186**, 888-90 (1928).—Expts. were made with *Lupinus mutabilis* without fertilizers (control), and with $MgSiO_3$, $MnSO_4$, KCl , NH_4 phosphate and $MgCO_3$ taken singly and with a complete fertilizer. The plants were collected while in flower. The increase in alkaloidal content was not parallel to the increase in vegetable tissue and therefore is not a function of plant growth. $MgSiO_3$ had slight effect and is not to be considered a fertilizer. K increased the wt. of vegetable tissue but decreased the alkaloidal content. Plants grown in an atm. contg. more CO_2 than air, but not exceeding 6%, showed no particular changes in alkaloidal content. If instead of calcg. the alkaloid as a percentage of dry wt., it is reckoned as wt. per stalk, the increase caused by $MgCO_3$ alone and by a complete fertilizer are, resp., 3.1 and 7.0 times that of the control. L. W. RIGGS

Quinine sulfate and its storage. C. EDWARD SAGE. *Pharm. J.* **119**, 264-5 (1927).—On exposing the salt $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 7.5H_2O$ (Brit. Pharm.) or $7H_2O$ (U. S. P.) to air, its quinine content increases on account of loss of H_2O which ceases when $2H_2O$ (4.6%) is reached. The anhyd. salt absorbs H_2O to the same limit. Still, as the manuf. of a stable salt of definite compn. is difficult, the purchase of the fresh salt for immediate use is recommended. S. WALDBOTT

Synthalin. A. W. EDWARDS. *Pharm. J.* **119**, 293-4 (1927).—A survey of the history of synthalin and its pharmacological action. Cf. *C. A.* **21**, 772, 1307, 3084, 2332, etc. S. WALDBOTT

Biochemistry and pharmacy, a scheme of biochemical training for pharmacists. FRANK WOKES. *Pharm. J.* **119**, 307-9, 331-2 (1927).—A synoptical outline and suggestions for such a course. S. WALDBOTT

A colorimetric estimation of coal-tar disinfectants. J. RAE. *Pharm. J.* **119**, 332 (1927).—The method, based on the reaction between HNO_2 and phenols, renders distn. unnecessary. Mix in a test glass an aq. soln. (1 in 200) of cresol disinfectant 1 cc., $NaNO_2$ (10% soln.) 1 cc., dil. H_2SO_4 (Brit. Pharm.) 1 cc.; allow to react for 15 min. agitating occasionally; add 5 cc., KOH soln.; then 50 cc. H_2O ; mix and filter off 50 cc. into a Nessler tube. Compare the color with that of a standard, i. e., a 1 in 1000 aq. soln. of *o*- or *p*-cresol. Treat 1 cc. in the same manner as the dil. disinfectant, using (without filtering) 50 cc. for comparison of color. Each cc. is equiv. to 0.4% of cresols in the original undil. disinfectant. S. WALDBOTT

The ephedrine content of Chinese Ephedra. B. E. READ AND C. T. FENG. *Pharm. J.* **119**, 356-7 (1927); cf. *C. A.* **21**, 3424.—No ephedrine (A) is contained in the root of "ma huang" (Fujii, *J. Oriental Medicine* **4**, 6 (1925)). The berries are non-poisonous, contg. but a negligible trace of a basic substance (< 0.017% by titration, < 0.0041% by the biuret color test). Blood-pressure tests also showed absence of a potent substance in ext. of the berries, while ext. of "ma huang" (B) contg. the equiv. of 1 mg. of $HCl-A$, had as strong an effect as that of 1 mg. of pure $HCl-A$. A graph is given of the results. Sep. assays of the entire stems, nodes and internodes of B gave: total alkaloids by titration, resp., 1.255, 0.413, 1.321%; parts of A per 1000 by biuret test: 848, 800, 850; parts of pseudo-A per 1000: 152, 200, 150. Since pseudo-A dilates

blood vessels while *A* causes contraction, the larger quantity of pseudo-*A* occurring in the nodes explains the Chinese preference of the internodes, for fear of the diaphoretic effect of *B*. S. WALDBOTT

Thomas Anderson Henry, Hanbury Medallist. ANON. *Pharm. J.* 119, 375-6 (1927).—Biography, with portrait, and list of publications. S. WALDBOTT

The contribution of the Pharmaceutical Society (of Great Britain) to education and research. T. A. HENRY. *Pharm. J.* 119, 378-82; *Chemist and Druggist* 107, 461-4 (1927).—An address. S. WALDBOTT

A further note on *extractum belladonnae liquidum*, *Brit. Pharm.* J. H. FRANKLIN. *Pharm. J.* 119, 395(1927); F. J. TODD. *Ibid* 450; cf. T., C. A. 21, 4023.—F.'s contention (cf. C. A. 21, 3424) that 100 parts of drug could be completely exhausted with the *Brit. Pharm.* menstruum upon collecting 85 fluid parts of percolate is confirmed in a new extn. of 100 lbs. of belladonna root. In the 1st 34 fluid parts, 92.6%, in a total of 80 fluid parts, 96.7% of the total alkaloids was recovered. The low results obtained by T. were probably caused by too rapid percolation. S. WALDBOTT

The extraction of ergot. I. Liquid extract of ergot. W. H. LINNELL and DOROTHY G. RANDLE. *Pharm. J.* 119, 423-7(1927).—By varying the conditions in the prepn. of 28 different exts., a method of prepn. was sought, which would insure the presence of the active principle as detd. by the Broom and Clark test (C. A. 17, 3749). Distd. H_2O and EtOH of different strengths are inefficient as extractive media. The addn. of $Ca(OH)_2$ does not increase the activity of the prepn., but the addn. of citric and tartaric acids greatly increases the efficiency of the extn. To prep. exts. of ergot stronger than 1 in 2 is unnecessary. A 50 or 60% alc. medium acidified totally with not less than 0.5% tartaric acid is advised, the prepn. of a "weak percolate" with unacidified menstruum is not necessary. Of the methods of extn. adopted by 9 pharmacopeias, only those of the U. S. P. and the Netherlands *Pharm.* yield fairly active preps. A new method of prepn. will be recommended pending conclusions as to the stability or keeping qualities of the exts. prepd. S. WALDBOTT

The centenary of E. Merck, Darmstadt. ANON. *Pharm. J.* 119, 430-1(1927).—An historical and descriptive account of the development of the firm. S. WALDBOTT

Mercuric potassium iodide tablets. "ANALYST." *Pharm. J.* 119, 450; R. J. STRATTON. *Ibid* 479; J. C. PENMAN and J. HOOD. *Ibid* 576; A. J. JONES. *Ibid* 479(1927); cf. C. A. 14, 2049.—Confusion is caused by the lack of a uniform definition of the ratio 1:1000 (8.75 grains per pint of H_2O) of these tablets. Logically, as is the case with most com. samples, 8.75 grains should refer to the wt. of the (sol.) salt $HgI_2 \cdot 2KI$ (4); the *Brit. Pharm. Codex* 1923 refers 8.75 grains to HgI_2 , and again, this wt. has been assigned to the (insol.) salt $HgI_2 \cdot KI \cdot 1.5H_2O$, by others to the anhyd. salt. By legal requirement (Great Britain), the actual quantity of *A* or of HgI_2 in the tablet must be stated on the label. S. WALDBOTT

British Pharmacopeia, 1914; further notes and criticisms. J. H. FRANKLIN. *Pharm. J.* 119, 454-5(1927); cf. C. A. 21, 1522.—*Liquor bismuthi et ammonii citratis* develops a thick fungus growth on standing; a preservative should be added. In *spiritus ammoniac aromaticus*, a simpler mode of adjustment to vol. is suggested, as well as some latitude to allow for slight losses of NH_3 or NH_4HCO_3 . The EtOH content of *vinum aurantii* should be from 14 to 15.4% by vol. for better preservation. S. W.

Analysis of jalap. H. E. DALE. *Pharm. J.* 119, 516-7(1927).—Put into a Wilkie extn. bulb (a 150-cc. separator bulb with tap cut off and the end drawn out into a tube plugged with cotton) 10 g. of powd. jalap and 50 cc. cold EtOH. Close with a cork and set the app. in a water oven together with a vessel to collect the percolate. Continue percolation until the percolate is no longer pptd. by H_2O . Make up the vol. to 100 cc. with EtOH, filter and evap. 50 cc. in a beaker to dryness on a water bath. Free the resin from EtOH completely by heat, then put the beaker into H_2O at 65° and add 15 cc. H_2O at 65°. Stir well for 2 min., put the beaker into cold H_2O , filter the washings, repeat, washing the resin with 15, 15, 15 cc. H_2O at 65°, cool and decant upon the filter. Dissolve the resin in 15 cc. EtOH, pour the soln. upon the filter, collect in a tared beaker. Transfer the resin completely from the beaker with hot EtOH, 10, 10, 5 cc., finally wash the filter paper with EtOH, evap., dry and weigh. The method yields concordant results and permits the judging of the resin content of jalap. S. WALDBOTT

The Harrison Memorial Lecture. F. S. PECK. *Pharm. J.* 119, 518-22(1927).—"The Educative Value of Harrison's Work in Pharmacy." Cf. C. A. 13, 247, 3280. S. WALDBOTT

The constituents of crude drugs. IV. Alkaloids. J. E. DRIVER and G. E.

TREASE. *Pharm. J.* 119, 545-8(1927); cf. *C. A.* 21, 4023.—The phys. and chem. properties and known structural formulas of the alkaloids of hemlock, Solanaceae, coca, cinchona, *Strychnos*, opium, ergot and the xanthine bases are reviewed. A table summarizes the botanical origin and percentage limits of the main alkaloidal constituents of 37 drugs. V. **Tannins and related substances.** *Ibid* 120, 148-9(1928).—A concise review of the properties, chem. compn. and classification of the various tannins and phenolic derivs., with a table of the botanical origin and percentage of tannic and phenolic constituents of 11 tannin-bearing drugs. S. WALDBOTT

The structure of common synthetic drugs. ANON. *Pharm. J.* 119, 550-2(1927).—The chem. origin, structure and physiol. functions of certain *antiseptics*, e. g., iodol, chloramine-T, aspirin, malachite green, of *narcotics*, e. g., chloritone, sulfonal, cocaine, of *antipyretics*, e. g., antipyrine, and of *organo-metallic compds.* are concisely stated. S. WALDBOTT

The new chemical research laboratory of the School of Pharmacy of the Pharmaceutical Society. W. H. LINNELL. *Pharm. J.* 119, 555-6(1927).—An illustrated descriptive account. S. WALDBOTT

Determination of morphine when present in small quantities. HARRY BRINDLE. *Pharm. J.* 119, 608-9(1927).—The Nicholls method (*C. A.* 17, 850) also adopted by Caines (*C. A.* 21, 4022) is recommended in preference to the Brit. Pharm. method. However, any free KOH or $\text{Ca}(\text{OH})_2$ present must be neutralized before the NH_3 is added. In the presence of KOH, only 10-14% of added morphine (*A*) was recovered; when KOH was neutralized, 96.4% of *A* was recovered in 3 extns. To det. pure *A* in quantities > 0.02 g., titrate with 0.02 *N* H_2SO_4 and back with 0.02 *N* KOH (methyl red). If *A* is < 0.02 g., use the colorimetric KIO_3 method (Georges, *Analyst* 31, 265 (1906)). Since a very slight variation in the concn. of the reagents considerably affects the color intensity, prepn. of the standard color and the solns. of *A* under identical conditions is important. Take of the sample to be tested a quantity contg. about 2 mg. of *A*, add 1 cc. of *N* H_2SO_4 , then H_2O to definite vol. (10 cc. to 20 cc.). Add 1 cc. of satd. KIO_3 soln., after 5 min. add 0.5 cc. strong NH_3 soln. Allow to stand for 5 min., then compare the color with that of a standard soln. of *A* prepd. in exactly the same way, using the same concns. of KIO_3 , H_2SO_4 and NH_3 . The colorimetric method is accurate to 5%, also the volumetric method when only 0.01 g. of *A* is taken. Its sensitivity increases with the quantity of *A* taken. S. WALDBOTT

The emetine reaction of ipecacuanha preparations. ÁRPÁD WOLLMANN. *Pharm. Acta Helv.* 3, 1-3(1928).—To 4 drops of tincture of ipecac add 10 drops of concd. HCl and 1 drop of 3% H_2O_2 (v. Mikó); at 60-70° an orange-yellow color is produced, indicating about 0.2 mg. alkaloid. To apply the test to powd. ipecac (*A*), Dover's powder (*B*), infusion of ipecac (*C*) and sirup of ipecac (*D*), put into a test tube, resp., 0.03 g., 0.3 g., 3 cc and 3 cc., add 1 drop 0.2 *N* NH_3 , 5 cc. Et_2O , shake for 2 min., remove 2.5 cc. of the clear Et_2O soln. into another test tube, evap., add 10 drops of concd. HCl, 1 drop 3% H_2O_2 and warm gently, as before. In *A* and *B*, a min. of 0.3 mg. of alkaloids, in *C* and *D*, a min. of 0.36 mg. is indicated. S. WALDBOTT

The parent plant of Natal aloe. R. MARLOTH. *Pharm. Acta Helv.* 3, 10-11(1928).—The parent plant of Natal aloe, no longer in commerce, was found to be *Aloe candelabrum* Berger (*Notizblatt, Bot. Garten, Dahlem*, 1906, 246). A photograph of the plant growing at Durban (Natal) is shown. S. WALDBOTT

Determination of tannin substance by means of chromed hide powder; its possible application to medicinal tannins (FRANÇOIS) 29. Alkaloids of ipecacuanha (STAUB) 10. Diacetylthiocarbamide *S*-alkyl ethers (U. S. pat. 1,667,053) 10. Preparation, purification and analysis of pyrogenous oils (HUERRE) 22.

Pharmaceutical compounds, etc. I. G. FARBERIND. A.-G. Brit. 274,058, July 8, 1926. Aminohydroxy compds. or polyamines of the aromatic series or their substitution products are converted into more strongly basic polyamino derivs. by the introduction of further amino groups which are joined to the aromatic amino groups by aliphatic, hydroaromatic, carbocyclic or heterocyclic residues; the latter may contain free or etherified OH groups and the C chain may be interrupted by O or S atoms. Aminohydroxy and polyamino compds. may also be condensed with halogenalkylamines or with the corresponding amino-alkyl esters of inorg. or org. acids, or the basic residues may be introduced by means of phthalimide compds. Compds. may be produced which are useful in combating blood parasites. Numerous examples are given.

Therapeutic amino metal mercapto compounds. W. SCHOELLER, A. FELDT, M. GEHRKE and E. BORGWARDT. U. S. 1,667,052, April 24. Na 4-amino-2-auro-

mercaptobenzene-1-sulfonate is treated in aq. soln. with phosgene, until no further diazo reaction occurs, to form the urea of the 4-amino-2-auriomercaptobenzene-1-sulfonic acid (the Na salt of which may be formed and pptd. with alc.). By this and similar processes there are obtained products which may be used as therapeutic agents in combating spirochetes. Au and Ag compds. of these products may be employed.

Phthalamic acid esters and anesthetics produced from them. A. CHESNAIS. Brit. 273,765, July 3, 1926. Phthalamic acid esters are prepd. by adding aq. NH_3 to phthalic anhydride, treating with alkali or alk. earth hydroxide to form a phthalamate and esterifying with an alc. in the presence of H_2SO_4 . Me, Et, Pr, iso-Pr, Am, iso-Am and benzyl esters are mentioned. Anesthetics are produced by reaction of these esters with derivs. of *p*-aminobenzoic acid such as *p*-aminobenzoyldiethylaminoethanol.

Attenuating bacteria or their toxins. E. LILLY & Co. Brit. 273,349, Jan. 4, 1926. Cultures such as those of streptococci or staphylococci, living or dead, or a toxin such as that of diphtheria or scarlet fever is attenuated or detoxified by treatment *in vitro* with a surface-tension depressant such as a 20% soln. of Na ricinoleate. The products may be used as therapeutic agents or for the production of anti-toxic serums.

Disinfectants. BRITISH DYE STUFFS CORPORATION, LTD., T. H. FAIRBROTHER and A. RENSHAW. Brit. 274,187, April 14, 1926. A block composed of auramine (or any other salt of aminotetramethyldiaminodiphenylmethane) and plaster of Paris, diatomite or a volatile solid such as C_{10}H_8 (with or without addn. of NaCl) is placed in water used for flushing urinals, etc.

18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

Some unexplored sources of sulfuric acid. E. T. ELLIS. *Dyer, Calico Printer* 59, No. 698, 73(1928).—Sources of H_2SO_4 suggested are calcination of FeSO_4 , oxidation of SO_2 by means of HIO_3 and reaction of K_2SO_4 with B_2O_3 . CHAS. E. MULLIN

Formation of sulfur dioxide by burning sulfur. ANON. *Svensk. Pappers-Tid.* 31, 173-7(1928).—The quality of the gas depends on the construction and operation of the S furnaces and coolers. The use of an automatic rotary burner is described in detail.

W. SEGERBLOM

A new process for the manufacture of zinc oxide. JEAN BERTHONNEAU. *Rev. gén. caoutchouc* 1928, No. 38, 7-8.—The new Cornillat process (cf. French Patent 632,235) burns metallic Zn but does away with retorts and allows intermittent production without deterioration of the furnaces. Its advantages are the simple and economical equipment, the use of liquid fuel, a higher yield, a product as fine as C black and the negligible cost of upkeep. The equipment consists of a metal rotary furnace, an oxidation flue of refractory brick and an ordinary condensation chamber equipped with fine gauze and externally air-cooled. A mazout flame is directed into the furnace and when a sufficient temp. has been reached Zn is added and the jet of burning mazout is projected on to the Zn bath. By rotating the Zn bath, the Zn is in permanent contact with the incandescent walls of the furnace. The Zn vapor is carried very rapidly through the oxidation flue, direct contact of flame and Zn vapor and the rapid movement of the vapors making the product extraordinarily fine. The furnace is charged each 2 hrs. and meantime requires no supervision. Each furnace produces about 2 tons of ZnO per day. The ZnO has a light grayish cast due to C from the mazout. C. C. D.

Chromic oxide and its recovery from waste products. A. HUTIN. *Cuir tech.* 17, 139-40(1928).—Methods of prepn. and the value of Cr pigments are briefly outlined. It is suggested that spent chrome liquors be utilized in the production of Cr_2O_3 .

J. G. NIEDERCORN

Composition of bleaching powder. C. T. KINGZETT. *J. Chem. Soc.* 1928, 528.—The formula $\text{Ca}(\text{ClO})_2 \cdot 4\text{H}_2\text{O}$ represents only the compn. of the substance as sepd. in a more or less wet condition, by rapidly drying between sheets of filter paper. H. S.

The use of plaster of Paris and allied substances for dental models. C. S. GIBSON AND W. H. SODEAU. *Brit. Dental J.* (reprint) 6 pp. Dec., 1927. H. J. DEUEL, JR.

Ignition point of activated charcoals (SWIENTOSLAWSKI, ROGA) 22.

Phosphoric acid. INGENUIN HECHENBLEIKNER. U. S. 1,667,549, April 24. Phosphate rock is ground in H_3PO_4 with addns. of dil. H_2PO_4 sufficient to provide a substantially continuous overflow of acid and fluid product of the grinding, and the overflow is treated with H_2SO_4 . An app. is described.

Stabilizing hydrocyanic acid. H. LEHRCKE. Can. 276,027, Dec. 6, 1927. Liquid HCN is stabilized by adding to it small quantities of salts or other acid products, such as org. halogen compds., which are capable of hydrolysis or ionization under certain conditions.

Hydrogen sulfide. H. H. SMITH. U. S. 1,667,272, April 24. Steam and a restricted quantity of air are passed through a mixt. comprising sulfides of Fe or Cu or other S-bearing material and C, to obtain a gas consisting largely of H_2S . An app is described.

Ammonia synthesis. W. GAUS and W. WILD. U. S. 1,666,694, April 17. In prep. gases for the catalytic synthesis of NH_3 , a producer is operated by use of incandescent fuel and steam and with 2 kinds of oxygenated air, one contg. less and the other more O than atm. air, and both derived from rectification of liquid air, while controlling their proportions so as to give a gas mixt. contg. one vol. of N for each 3 vols. of H and CO together; the producer can thus be continuously operated without intercalating heating periods; the gas mixt. from the producer is treated, e. g., passed with steam over Fe oxide or $Ca(OH)_2$, to substitute H for the CO and to remove CO_2 .

Ammonia synthesis. A. T. LARSON. U. S. 1,667,322, April 24. A catalyst is prep. by forming particles from an intimate mixt. of Fe oxide, K_2O and MgO and treating the particles with a H-contg. gas at 300–700°. U. S. 1,667,323 specifies a similar process in which a mixt. of Fe oxide and oxides of Mg and Na may be used.

Ammonia synthesis. Soc. d'ÉTUDES MINIÈRES ET INDUSTRIELLES. Brit. 274,023, July 6, 1926. The temp. for the process described in Brit. 253,540 (C. A. 21, 2536) is reduced to 250–450° when the Al_2O_3 , MgO or CaO of the catalytic mixt. is replaced by a halide, oxyhalide, oxide, ferrocyanide, or ferricyanide of an alkali or alk. earth metal. Li_3NH_2 or a Li imide also may be used.

Ammonia synthesis. F. UHDE. Brit. 273,735, July 2, 1926. Catalysts are used comprising Fe, Al, C and N and an alkali metal or alkali metal compd., preferably a compd. of K such as the cyanide or ferrocyanide. A soln. of $Al_2(SO_4)_3$ or $AlCl_3$ may be mixed with a soln. of $K_4FeC_6N_6$ and the mixt. evapd. to dryness *in vacuo* and then heated with H, with or without N, preferably under pressure at 300–450°. The NH_3 synthesis may be effected at about 400° under 100 atm. pressure.

Catalytic oxidation of ammonia. I. W. CIDERBERG. U. S. 1,666,958, April 24. In forming N oxides, a mixt. of NH_3 and O is passed over a catalyst heated to a reaction temp. and one face of the reaction zone is cooled so that a high-temp. gradient is formed between the catalyst and the cooled face. Cf. C. A. 21, 303.

Catalytic oxidation of ammonia. N. CARO and A. FRANK. Brit. 273,718, June 29, 1926. In producing highly concd. HNO_3 by catalytic oxidation of NH_3 with air or O, the heat of reaction is absorbed by arranging in advance of the catalyst a layer of water or other liquid through which the reaction mixt. is bubbled. Various details and modifications are described.

Oxidizing ammonia. N. CARO and A. R. FRANK. Brit. 274,099, July 8, 1926. Elementary H is added to the mixt. of NH_3 and air or O and oxidation may be effected under pressure as described in Brit. 273,718 (cf. preceding abstract).

Alkaline earth metal sulfides. T. LICHTENBERGER and K. FLOR. U. S. 1,667,423, April 24. An alk. earth sulfate is dissolved in molten alk. earth metal salts such as CaF_2 and alkali fluorides which are fusible without water and which do not decomp. alk. earth metal sulfates when molten; coke is added to effect reduction to sulfide and the materials are sepd. by sedimentation of the sulfide produced.

Alumina. H. SPECKETER. Can. 276,643, Dec. 20, 1927. Bauxite is dissolved in an acid, and the soln. is filtered off from the insol. silicic and titanic acids and evapd. The remaining salts are heated to such a temp. that they are decompd. into oxides and acids. The oxides, freed from silicic acid, are heated with C in a suitable furnace up to their decompn. into Al_2O_3 and metallic Fe.

Ammonium chloride. J. W. MOORE, W. G. POLACK and CASTNER-KELLNER ALKALI CO., LTD. Brit. 274,263, June 25, 1926. Synthetic NH_3 is treated with a mixt. of HCl and H obtained by the direct combination of H and Cl, the H being in excess. Cf. C. A. 22, 1831.

Separating borax from mixed salts. G. B. BURNHAM. U. S. 1,666,733, April 17. Mixed salts which contain borax together with salts of greater soly. are caused to move countercurrent to a lixiviating liquid such as "brackish water."

• **Calcium arsenate.** W. C. PIVER. U. S. 1,667,490, April 24. CaO is first hydrated to produce a dry hydrated powder without excess water, the hydrated product is then agitated and arsenic acid of a suitable sp. gr. is added in only such quantity and at such a rate that the heat of the resulting reaction drives off excess water present, including

the water of hydration, to produce Ca arsenate in dry powder form. U. S. 1,667,491 specifies the use of an excess of CaO in both stages of the process.

Calcium sulfate masses. R. SCHÖNHÖFER. Can. 276,227, Dec. 13, 1927. Self-setting CaSO_4 masses are produced by wet-grinding unburnt CaSO_4 material, drying, and grinding it to powder.

Light-weight gypsum products. C. K. ROOS and M. G. ALLISON. U. S. 1,666,180, April 17. For the purpose of increasing the bulk and decreasing the weight of products such as calcined gypsum, the gaging water for each 100 parts of material carries 2.3 parts of Na silicate soln.

Chromates and aluminates. I. G. FARBENIND. A.-G. Brit. 273,666, July 1, 1926. Chrome ore is heated with bauxite or other aluminiferous material in the presence of alkali carbonates or mixts. forming such carbonates at decompn. temp. On lixiviating the product a soln. of chromates and aluminates is obtained. Caustic alkali may be used instead of carbonate and lime may be added.

Copper sulfate and nickel. E. BREUNING. Brit. 274,064, July 10, 1926. Metal sheets formed of alternate layers of Cu and Ni are treated with an aq. soln. of a ferric salt such as $\text{Fe}_2(\text{SO}_4)_3$ to dissolve the Cu as sulfate and leave the Ni unattacked. The treatment may be at a temp. of 80° and in the presence of air, O, persulfates and O carriers such as ceric sulfate.

Ferrous sulfate. II. C. STEWART. U. S. 1,667,693, April 24. A stream of FeSO_4 soln. of $35\text{--}40^\circ \text{Bé.}$ is treated with a transverse stream of air to effect atomization and crystn. of the FeSO_4 . An app. is described.

Ferric sulfate. B. HART, HARRIS, HART & Co., LTD., and REFINERS, LTD. Brit. 273,883, June 12, 1926. Ferruginous wastes such as oxidized Fe borings resulting from the manuf. of aniline are treated with H_2SO_4 first in sufficient quantity to render the Fe sol. and then with addnl. H_2SO_4 and an oxidizing agent such as HNO_3 or a nitrate or MnO_2 .

Lead carbonate and acetate. R. DALOZE. Brit. 273,660, July 3, 1926. Crude Pb sulfate and an excess of Ca acetate or other alk. earth acetate are mixed and the insol. matter is sepd. and the clear soln. thus obtained is treated with a base such as $\text{Ca}(\text{OH})_2$ to form tribasic Pb acetate in soln. By use of CO_2 , this is decompd. to produce Pb carbonate. The Ca acetate is regenerated.

Sodium hypochlorite. M. P. APPLEBY and C. CARTER. Brit. 274,197, April 16, 1926. A dry stable prepn. of NaOCl is obtained by admixt. of a strong soln. or the melted crystals of the NaOCl with anhyd. or partially or completely dehydrated salts of definitely alk. character, which are either capable of forming stable hydrates or of producing by reaction with NaOCl Na salts which will form stable hydrates, *e. g.*, Na metaborate or K_3PO_4 . Brit. 274,198 specifies the use of Na_3PO_4 or compds. which will form it such as Na_2HPO_4 and NaOH.

Separating sodium stannate from sodium arsenate and antimonate. H. HARRIS. Brit. 273,440, May 7, 1926. Mixts. of Na stannate and Na arsenate, with or without Na antimonate, are treated without heating, with NaOH soln. of such strength as to dissolve only the Na stannate, the soln. is sepd. and the residue is treated for the recovery of pure Na arsenate.

Washing and bleaching powders containing persalts. G. LERSCHIK. Brit. 273,711, July 5, 1926. Quant. liberation of O from persalts is obtained by the use of catalysts such as Mn sulfate or lactate or Mn K sulfate or of tyrosinase (which may be obtained from potato skins).

Treating materials containing lead and zinc. W. H. CORBOULD. Brit. 273,420, April 13, 1926. Material contg. oxides of Pb and Zn is treated with HOAc to dissolve the Pb and Zn, the Pb is pptd. as sulfate and the Zn acetate and HOAc soln. is treated for sepn. of the Zn and recovery of the acid for further use. Numerous details and modifications are given.

Precipitation of metal hydroxides. O. LEDERER, W. STANSZAK and H. KASSLER. Can. 276,338, Dec. 20, 1927. Metal hydroxides, free from Fe, are pptd. from metal salt solns. contg. Fe, by allowing basic substances to react with such metal salt solns. in the presence of H_2S , a slightly acid reaction being maintained during the pptn.

Activating carbon. VEREIN FÜR CHEMISCHE INDUSTRIE AKT.-GES. Brit. 273,683, July 3, 1926. The process described in Brit. 259,616 (C. A. 21, 3430) is modified by starting with C in the form of dust which is then made into press-cakes with a binder such as wood tar and the press-cakes are then coked and the material is activated.

Activated carbon. NAAMLOOZE VENNOOTSCHAP ALGEMEENE NORIT MAATSCHAPPIJ. Brit. 273,761, July 3, 1926. In activating carbonaceous material with gases such as superheated steam, CO_2 , air, Cl, SO_2 or combustion or generator gases, vertical retorts

are used of elongated cross-section with the major dimension at least double the minor dimension. Coarse raw material may be mixed with fine material being activated.

Separating hafnium and zirconium. A. E. VAN ARKEL and J. H. DE BOER. U. S. 1,666,800, April 17. A mixt. of Hf and Zr compds. such as the orthophosphates is treated with Hf and the resulting complex compds. are subjected to fractional crystn. Cf. C. A. 22, 1219.

Separating hafnium and zirconium. J. H. DE BOER. U. S. 1,666,811, April 17. A soln. is formed from the action of cond. H_2SO_4 on a mixt. of phosphates of Hf and Zr; at least one other salt of Hf and Zr is added to the soln. and the latter is subjected to pptn., *e. g.*, by adding water. Cf. C. A. 22, 1219.

Separation of hafnium and zirconium. J. H. DE BOER. Can. 275,696, Nov. 22, 1927. A mixt. of Hf and Zr phosphates is introduced into a medium contg. HF and is subjected to fractional decompn. by the addn. of boric acid or other boron compd. The mixt. of Hf and Zr phosphates thereby pptd. is richer in Hf than the original mixt.

Separating hafnium and zirconium. D. COSTER and G. VON HEYBESY. U. S. 1,666,440, April 17. Oxychlorides or other halogen compds. of Hf and Zr are subjected to fractional crystn., *e. g.*, from a soln. in HCl . Cf. C. A. 22, 1220.

Separation of a mixture of hafnium and zirconium. NAAMLÖÖZE VENNOOTSCHAP PHILIPS GLOEILAMPENFABRIEKEN. Dutch 17,742, Feb. 15, 1928. The mixt. in the form of the phosphate soln. contg. free HF is fractionally pptd. by addn. of H_2SO_4 , H_3BO_3 or other B compds., Al, Sn, Mo, W, Cr, Cb, V, Ta or Be salts or SiO_2 sol. Part of the soln. pptd. by alkali to give ZrO_2 may also be used for pptn. of the rest.

Sulfur from alkaline earth sulfates. SALZWERK HEILBRONN AKT.-GES., T. LICHTENBERGER and K. FLOR. Brit. 273,841, April 16, 1926. In a process of obtaining S from alk. earth sulfates as described in Brit. 251,942 (C. A. 21, 1526), the NaCl used as a flux is replaced by other alkali or alk. earth salts which fuse without liberating water and which when fused have no decomp. action on alk. earth sulfates. Alkali metal sulfates or fluorides may be used.

Detergents and bleaching agents. T. BENCKISER, A. REIMANN and A. REIMANN (trading as J. A. BENCKISER) and F. DRAISBACH. Brit. 273,414, April 7, 1926. Soap powders contg. perborate or similar persalts, with or without soda, are also mixed with NH_4 phosphate or a neutral or acid pyrophosphate or an alkali to increase their stability and retard the liberation of O in the washing and bleaching bath.

Stencil sheets. S. HORII. Brit. 274,241, May 25, 1926. See U. S. 1,664,033 (C. A. 22, 1660).

Transfer sheets. W. F. GRUPE. U. S. 1,667,689, April 24. Sheets for heat impression transfers are formed of glassine paper coated with a mixt. of powd. Al or other metal powder and an aldehyde and phenol condensation product.

Colloidal emulsion. R. WHITTELSEY. Can. 276,438, Dec. 20, 1927. An emulsion specified consists of a non-aq. soln. of an org. colloid and a liquid substantially free from dissolved materials.

Water-repellant substance. G. J. MANSON. Can. 276,392, Dec. 20, 1927. An aq. emulsion contains wax coated with a ppt. formed from 2 H_2O -sol. electrolytes.

Treatment of condensation products of urea or its derivatives. K. RIPPER. Can. 276,324, Dec. 13, 1927. A molding compn. consists of condensation products resulting from the reaction of a urea and CH_2O brought to a fine state of division and incorporated with substances capable of exercising a swelling action.

Gramophone records. F. G. MITCHELL. Brit. 273,716, June 30, 1926. A disk is cut from a sheet of celluloid or the like and is treated with a solvent such as MeOH, acetone, AmOAc or EtOH, an alc. camphor soln. or mixts. of these. After 15–30 sec. a coating of finely powd. thermoplastic material which may be formed of a mixt. of pipe clay, shellac, rotten stone, barytes, C black and resin is applied and the disk is dried either at about 50° for $\frac{1}{2}$ –1 hr. or at about 22° for 2–4 days. The disks are impressed with the record by use of heated matrices.

Solution for use in hydraulic brake system of automobiles. W. G. CALKINS. U. S. 1,66,6871, April 17. Castor oil 50 and BuOH 50 parts are used together.

Dressing composition for brake bands. E. J. SCHELLING. U. S. 1,667,222, April 24. Castor oil 95 and lard oil 5%.

Coating core strands with pulp fibers. J. S. LITTLE. U. S. 1,666,214, April 17. A core such as an elec. conductor is subjected to a liquid contg. pulp, *e. g.*, wood, jute, cotton or asbestos pulp, in the presence of soap so that a coating of felted fibers is produced which is of uniform character.

Translucent projection screen. H. PADAIN. Brit. 273,849, April 22, 1926. A "base" which may be paper, parchment or a fine cotton or linen fabric is treated with

solns. of Na silicate of successively increasing concns. Yellow or other dyes may be added to the soln. as may also sugar, molasses, cellulose, glycerol, casein or castor oil or these substances, or some of them, may be separately applied to the screen. Crude rubber may be added to roughen the surface.

Fire-extinguishing composition. POLBO FEUERLÖSCH APPARATE GES. Brit. 273,713, June 30, 1926. MeBr 60, CCl₄ 35 and ethylene bromide (or a similar substance which is stated to prevent formation of phosgene) 5%.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

Recent progress in the glass industry. W. E. S. TURNER. *Glass* 4, 186(1927) - Production statistics are given. W. RISING

Glass-works practice. T. C. MOORSHEAD. *Glass* 4, 280(1927). - A description of the modern method of manufg. glass. W. RISING

The glass industry of Czechoslovakia. THEODORE WOLFRAM. *Ceram. Ind.* 9, 542(1927). - A description is given of the historical development of the industry giving present status, number of plants, their products, number of employees per plant and their estimated output. W. RISING

The use of cullet in glass manufacture. J. CURRIE. *Glass* 4, 243(1927). - Some modern machines, especially the Westlake, have a tendency to produce too much cullet. The careless and indiscriminate use of cullet in the batch will only result in the formation of greater amounts of cullet from bad ware. For best results the proper ratio of cullet to batch should always be maintained and the cullet should be broken to a suitable state of fineness and thoroughly mixed with the batch. W. RISING

The flow of glass in tanks. D. J. McSWINEY. *Glass Ind.* 8, 255-8(1927); cf. C. A. 21, 3720. H. P. HOOD

Some notes on the annealing of glass. H. V. E. RENN. *Glass* 4, 428, 470(1927). W. RISING

The analysis of a simple soda-lime-magnesia-silica glass, and some pitfalls to be avoided. VIOLET DIMBLEBY. *Glass* 4, 374(1927). W. RISING

The devitrification of glasses. IV-B. K. TABATA. *Researches Electrotech. Lab., Tokyo* No. 211, 6 pp (1927). (In English) - The same method of surface devitrification by heat as described in the previous papers (C. A. 21, 1170, 2054) has been applied to the series of glasses having comps. of 1.0 R₂O, 0.5 MgO, γ SiO₂, 1.0 R₂O, 0.75 MgO, γ SiO₂, 1.0 R₂O, 1.0 MgO, γ SiO₂, 1.0 R₂O, 1.5 MgO, γ SiO₂ and 1.0 R₂O, 2.0 MgO, γ SiO₂. The results show that MgO in these glasses is present as MgO·2SiO₂, and that MgO·2SiO₂ does not dissolve SiO₂. W. OGAWA

The weathering of glasses. II. K. TABATA, K. YEGAMI AND S. MORIYASU. *Researches Electrotech. Lab., Tokyo* No. 189, 15 pp (1927). (In English.) - The samples were taken from melts of 1.0 R₂O, 0.5 BaO, γ SiO₂; 1.0 R₂O, 0.75 BaO, γ SiO₂; 1.0 R₂O, 0.5 CaO, γ SiO₂; 1.0 R₂O, 0.8 CaO, γ SiO₂ and 1.0 R₂O, 0.5 ZnO, γ SiO₂ (cf. C. A. 21, 1170). The results showed that all the glasses under expt. suffered weathering pretty much in the atm. The crystals produced on the glass surface by weathering were alkali metasilicate (with some water of crystn.). The results show that the alkali present in ordinary glass constitutes alkali metasilicate. W. OGAWA

The relative importance of errors in sampling and measurement in ceramic research. A. E. R. WESTERMAN. *J. Am. Ceram. Soc.* 11, 264-70(1928). C. H. KERR

The effect of temperature on the optical properties of kaolinite. T. N. McVAY. *J. Am. Ceram. Soc.* 11, 224-6(1928). - Euhedral crystals of kaolinite were heated to various temps., draw trials made at frequent intervals and the effect of temp. was studied microscopically. The results indicate 3 classes of kaolinite: (1) the natural kaolinite, (2) the uniaxial form produced at 625°, the metanacrite of Rinne and (3) the change of the metanacrite into what is probably mullite and glass at 1450°. C. H. KERR

A lecture on china clay. G. S. CLARKE. *Pottery Gazette* 31, 435(1928).

The influence of different feldspars on the "freezing" behavior of cones. E. ORTON, JR. AND J. F. KREHBIEL. *J. Am. Ceram. Soc.* 11, 215-23(1928). - While German and American cones (cone 10) check well in normal firing, they diverge when subjected to a freezing (or arrested heating) treatment. The freezing effect was most

serious in the Hybla feldspar and best in the Swedish feldspar. The kaolin used with the feldspar has some influence in the amt. of freezing effect produced. C. H. K.

The water-absorbing capacity of ceramic products referred to volumetric values exclusively. JOSEF MATRJKÁ. *Sprechsaal* 61, 39-40(1928).—The formula $\frac{\% \text{ absorp-}}{\text{wet wt - dry wt.}}$

$\text{tion} = \frac{\text{wet wt} - \text{dry wt.}}{\text{dry wt.}} \times 100$ does not give a sufficiently clear conception of the relative porosity of pottery because its value is not only dependent on the size of the open pores but also on the wt per unit of the vol material. It is therefore better to refer the pore vol. to the total specimen vol. The volumetric H_2O -absorbing capacity = $\frac{\text{wet wt} - \text{dry wt.}}{\text{vol. of specimen}} \times 100$.

R. A. HEINDL

Use of manganese in the manufacture of face brick. G. E. SEIL and H. A. HEILIGMAN. *J. Am. Ceram. Soc.* 11, 241 8(1928).—A discussion of the effect on color of variations in size of the Mn particles, compn. of the Mn and of the character of gaseous conditions of firing.

Some experiments in terra cotta slips. E. C. HILL. *J. Am. Ceram. Soc.* 11, 260-3(1928).—Variations in compn were studied. *Vitrification*.—Decreasing clay is the most effective means of increasing vitrification. Other means are to increase feldspar, decrease Cornwall stone or increase ball clay at the expense of china clay. *Crazing* is best overcome by increasing clay. Crazing may be reduced by substituting Cornwall stone for feldspar or china clay for ball clay. *Cracking* is reduced by increasing Cornwall stone or by substituting china clay for ball clay. *Color*.—Whiteness is increased by increasing clay or substituting Cornwall stone for feldspar or china clay for ball clay.

C. H. KERR

A new method of testing paving bricks. J. A. VAN DER KLOES. *Brit. Clayworker* 36, 364-6(1928).—The Brinell test for steel is recommended with certain changes. The test consists in laying the bricks in a suitable box of sand and filling the interstices with sand. The middle brick of several in the box is subjected at its middle to the pressure of a steel ball 19 mm in diam until failure occurs.

R. A. HEINDL

Porcelain as structural material. H. HANDREK. *Z. Ver. deut. Ing.* 71, 1553-60 (1927).—The phys. and chem. properties of porcelain are compared with those of the several metallic and non metallic structural materials commonly employed in industry. The effect of temp. upon the d., elec. resistance and mech. strength of porcelain is discussed.

H. F. K.

The causes of the yellow discoloration obtained in firing porcelain. M. MIELDS. *Sprechsaal* 61, 22-3(1928). A short review and discussion of the principal reasons for and against the two present theories that the yellow color obtained in firing porcelains is due to the (1) atm. or (2) smoke.

R. A. HEINDL

The decorating of porcelain. MAX SCHNEIDER. *Sprechsaal* 61, 40-2(1928).—A discussion of procedures involved in printing of designs on porcelains by decalcomania and metal plates.

R. A. HEINDL

Steatite. W. DEMUTH. *Z. Ver. deut. Ing.* 71, 1566-8(1927).—Steatite is well adapted to particular ceramic uses such as elec. insulators especially for high voltage. Steatite can be worked well and develop great body strength and d. when fired.

H. F. K.

Mullite refractories extend field of high-temperature processes. W. A. KOEHLER. *Chem. Met. Eng.* 35, 86-8(1928).—The related minerals andalusite, sillimanite and cyanite are discussed in connection with the formation of mullite. A recent development in refractories for condition of high temp. and excessive corrosion is the cast mullite. Bauxite and fireclay are fused in an elec. arc furnace and cast, the molds being glass sand baked with a binder. Annealing for about 8 days is necessary for these mullite refractories. Excellent phys. and chem. properties are developed.

H. F. K.

Refractories for the glass industry. W. J. REES. *Glass* 4, 52, 97, 184, 232, 372, 468(1927).—The characteristic properties of clays and the relative merits of aluminous and siliceous clays are discussed. An Al_2O_3 - SiO_2 eutectic curve is given together with a table showing the analysis and refractiveness of various clays from ten different countries. Porosity and shrinkage of various clays are discussed. Curves are given showing the porosities obtained by firing at diff. temps. Clays for pot and tank block manuf. should show steady reduction in porosity and vol. and should be fairly dense at 1400° . The shrinkage should not exceed 5% between 1000° and 1450° . Up to a porosity of 50% an increase in porosity is accompanied by a decrease in coeff. of expansion. With porosities over 50% the change in thermal expansion with change in porosity is very small. Angular grog particles give greater crushing strength than do rounded particles.

and also increase the resistance to deformation under load when heated. Proper grading of size is a means of control of shrinkage. The analyses of several clays are given together with their refractoriness and deformation temps. The method of testing fire clays under load at high temps. and the characteristics which make a clay suitable for pots are described. Resistance to erosion and corrosion is discussed. W. RISING

Ceramic glazes and enamels. I, II. B. M. PEARSON. *Ceram. Age* 10, 92, 214 (1927).—A review. W. RISING

Glazes containing lead or lead-free glazes. JACOB KLUG. *Sprechsaal* 61, 79-82 (1928).—The possibility and suitability for the substitution of lead-free glazes for those containing Pb in the manuf. of stoneware are considered. R. A. HEINDL

Enamels containing antimony. K. BECK AND W. A. SCHMIDT. *Z. Untersuch. Lebensm.* 55, 1-24 (1928).—Expts. were carried out on the use of opacifiers contg. Sb compds., especially Na metantimonate. Such enamels may be so prepd. that the quantity of Sb which goes into soln. during the prepn. of liquid foods is very small. A method is given for the accurate detn. of small quantities of Sb^{III} and Sb^V when both are present. WILLIAM J. HUSA

The labor and air-power cost of sand blasting [in enameling]. E. A. STEHMAN. *J. Am. Ceram. Soc.* 11, 227-34 (1928). C. H. KERR

HANSEN, JAMES EDWARD: **The Technique of Vitreous Enameling Cast Iron by Wet Process—Sheet Iron.** Cleveland, O.: The Ferro Enameling Co. 203 pp.

Apparatus for feeding "gobs" of molten glass. UNITED GLASS BOTTLE MANUFACTURERS, LTD. and J. TIPPING. *Brit.* 274,370, Feb. 19, 1927.

Apparatus for drawing sheet glass. H. N. DIEDERICHS. U. S. 1,667,145, April 24

Polished sheet glass. J. L. DRAKE. U. S. 1,667,146, April 24. Both sides of a glass sheet are ground, the ground sheet is passed through a heating chamber and on one side is fire-polished; the sheet is then turned and the other side is fire-polished, and it is then cooled. An app. is described.

Glass annealing leer of the tunnel type. E. O. HILLER. *Brit.* 273,724, July 1, 1926.

Apparatus for fire-polishing tumblers or other glassware. R. BROWN. *Brit.* 274,377, Feb. 28, 1927.

Lens-polishing composition. H. W. HILL. U. S. 1,666,701, April 17. A backing such as textile fabric is treated with a compn. contg. beeswax, methyl salicylate, a phenolic substance and an abrasive.

Decolorizing china clay. P. E. WICKHAM. *Brit.* 273,373, March 23, 1926. Any Fe present is removed, and org. coloring matter is first reduced and then removed by treating an aq. paste of the clay with a hydrosulfite and then with an acid and filtering.

Pottery. J. W. MELLOR. U. S. 1,666,828, April 17. See *Brit.* 253,184 (*C. A.* 21, 2543).

Molded ceramic products. L. KERN. U. S. 1,666,936, April 24. In forming bricks, tiles or similar articles, a substantial proportion of hydrated silicic acid is added to a sand and Ca(OH)₂ mixt., the mixt. is molded under pressure, and the product is indurated under superatm. pressure with an elastic fluid such as steam capable of entering into a reaction with the material and effecting hardening.

Fused silica laboratory ware. QUARTZ ET SILICE. *Brit.* 273,636, July 15, 1926. In making ware such as crucibles or dishes, a silica blank is molded in approx. the desired shape but of somewhat larger than final dimensions and is then reheated and allowed to shrink onto a metal form which may be made of Ni or a Ni alloy. Cf. *C. A.* 22, 148, 849.

Sintering refractory metals. N. R. DAVIS and METROPOLITAN-VICKERS ELECTRICAL CO., LTD. *Brit.* 274,283, July 26, 1926. Refractory metals which are chem. active when hot are slowly heated in the form of a body of the compressed powd. metal while maintained in a high vacuum to remove gases at a temp. below that at which the occluded gases would combine with the metal, and finally heated to effect sintering quickly after an intermediate cooling *in vacuo*. With Zr, occluded gases may be removed at about 350° and the metal may be preliminary sintered at 800-1000° before the cooling stage and the final sintering effected near the m. p. by elec. induction or resistance heating.

Abrasive articles. M. L. HARTMANN. *Brit.* 273,679, July 3, 1926. Abrasive grains are bonded with other granular material, the grains of which break down more readily than the abrasive material, e. g., calcined clay, diatomaceous earth, MgO or

porous alumina. The bond may be ceramic material, synthetic resin, cement, rubber, shellac, glue or like substances. Cf. *C. A.* 21, 808.

Cementing porcelain or porcelain and iron. *STUDEN GES. FÜR WIRTSCHAFT U. INDUSTRIE.* Brit. 274,408, July 17, 1926. The process of Brit. 260,592-3 (*C. A.* 21, 3439) is modified by use of Se or Se compds. such as Se oxide instead of S in the cementing compn.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Historical development of cement testing. BURCHARTZ. *Zement* 16, 947-50, 970-4(1927). H. F. K.

Cement classification in Sweden. W. DE SHARENBRAD. *Zement* 16, 746-7(1927). H. F. K.

Technical progress of cement manufacture in England during the last fifty years. A. C. DAVIS. *Zement* 16, 749-53(1927).—Improvements include quality of labor, and equipment, closer control of raw materials and plant processes with increased fineness and strength of product and the development of quick hardening and special cements. H. F. K.

Cements and lutes. S. S. SADTLER. *Trans. Am. Inst. Chem. Eng.* 19, 1-8(1927).—"Cements are substances used to join surfaces, and to fill spaces between surfaces that are being united in a more or less permanent way, and lutes are similar substances or compns. used in a distinctly temporary way." Surface prepn. is important and expansion on setting is a virtue in cements. Cements are classified by compn. and by use made of them. Numerous inorg. and org. cements are listed. Means of testing of chemically resistant cements are outlined. W. H. BOYNTON

Analysis of cements. G. GALLO. *Giorn. chim. ind. applicata* 9, 313-7(1927). *Brit. Chem. Abstracts* 1927B, 780.—From analyses of cements of known compn. before and after setting, it is concluded that the method of Kriege (*C. A.* 18, 2231) is inaccurate. An alternative method, considered more satisfactory, is described. C. C. DAVIS

Early strength cements and cold water. H. VIERHILLER. *Zement* 16, 998-9 (1927).—The temp. change during the setting of 1.3 cement-sand mortar was observed. Blocks 30 cm. each way were poured, the initial temp. of the wet mix being 10.5°, the air temp. being -6-8°. The lowest point reached by the setting mass was 6°, after 3 hrs. After 7 hrs. the peak temp. of 27° was reached. Not until after 17½ hrs. had the mass cooled to 0°. After 10-day cold-air curing a compression strength of 350 kg./sq. cm. was attained. In large masses the low-temp. effect is less. Aluminous cements suffer least of the early strength cements because of their high energy liberated as heat during the hardening process. H. F. K.

Technical research of the American portland cement industry. F. R. McMILLAN. *Zement* 16, 757-60(1927).—A discussion of the lab. of the Portland Cement Association and its accomplishments. H. F. K.

Present condition of portland cement research and the possibilities of producing superior cements. P. H. BATES. *Zement* 16, 753-7(1927).—The discussion includes the possible changes in character of portland cement with altered proportions of the major constituents, additions of other materials, and improvements in the manuf. processes. H. F. K.

Influence of different methods for the analysis of portland cement. O. KALLAUNER AND J. SIMANE. *Zement* 16, 974-6(1927).—A comparison of several American and German methods of cement analysis showed greatest variations in the procedures and results of the SiO₂ and R₂O₃ detns. H. F. K.

The weight per liter of portland cement. K. GOSLICH. *Zement* 16, 895-7(1927).—The app. is described which consists of an upper box contg. 5 kg. cement provided with a trap bottom permitting the cement to fall upon a 2 l. cylinder below. No further tamping or jolting is given. The top is struck off at once and the full container weighed. The app. is enclosed. H. F. K.

The reactions during the first part of burning a calcareous-argillaceous mixture for portland cement. E. MONATH. *Rev. matériaux construction trav. publics* No. 222, 81-6 (1928).—Mixts. heated in a small furnace at various temps. up to 1000° were analyzed. Free CaO was found first at 750° and reached a max. at about 920°, at which point the insol. residue began to fall off. F. O. A.

A review of the literature on the constitution of portland cement clinker. H. RICHARZ. *Tonind. Ztg.* 52, 410-2, 566-9(1928). F. O. A.

Types of crystals in technical portland cement clinker. A. GUTTMANN AND F. GILLE. *Zement* 16, 921-4, 951-3(1927); cf. *C. A.* 22, 1663.—The cryst. minerals and the glass commonly found in clinker are described. Some photomicrographs are shown. H. F. K.

Clinker research. HANS KUHLE. *Zement* 16, 869-71(1927).—The statements by Dyckerhoff (*C. A.* 22, 1837) that the compd. $8\text{CaO} \cdot 2\text{SiO}_2 \cdot \text{Al}_2\text{O}_3$ does not exist and that $3\text{CaO} \cdot \text{Al}_2\text{O}_3$ is not formed in cement clinker are refuted. H. F. K.

Some observations regarding the nature and occurrence of adhering masses in the sintering zone of rotary kilns. KARL BIEHL. *Zement* 16, 817-20(1927).—The chem. examn. of the material from 3 plants' furnaces shows quite dissimilar compn. even within portions of the same mass. The causes of the formation were different in each case: (1) an increase in the total fluxes, (2) increase in the alk. SO_4 content and (3) the nature of the raw materials themselves. H. F. K.

Our actual knowledge of the constitution of aluminous cements. CHARLES BLANCHET. *Rev. matériaux construction trav. publics* No. 219, 397-402(1927), No. 220, 8-14, No. 221, 44-8(1928).—A review of the literature covering the silicates and aluminates of Ca. Some of the effects on aluminous cement of ferric oxide, method of burning and of cooling are considered. F. O. A.

Colloidal chemical reactions of aluminous cement mortars. LÉOPOLD JESSER. *Zement* 16, 741-6(1927).—The hydration properties and physical characters of cement mortars subjected to definite temps. and humidities are studied. The adsorption isotherms of several mortars are established. It was found that the H_2O held in the pores of sand-cement mortar goes into the cement-gel soon after hardening begins. H. F. K.

Influence of hardening temperature on the mortar strength of an aluminous cement. A. F. R. LUND. *Zement* 16, 747-9(1927).—Tensile and compression tests were made on 1.3 mortar cylinders kept at temps. of 9-92° during the first 24 hrs. At 25-27° compression strength was more slowly attained than at higher or lower temps. while the slowest gain in tensile strength was found at 27-37°. No ill effect on 7- and 28-day strength was found by a starting temp. of 7-9°. Cylinders cured at 16° for a day gave the highest compression strength at 28 days' water curing. In 19 hrs' curing at 52° very high strength was found, though no further gain was made in 28 days. Early high-temp. curing reduced the later strengths. H. F. K.

Cements used in heavy chemical manufacture. H. B. BISHOP. *Trans. Am. Inst. Chem. Eng.* 19, 9-12(1927).—A tabular résumé. The types are those for bonding bricks; those applicable for chem. stoneware and fused silica; and those adapted to metal joints. W. H. BOYNTON

Cements for gaseous and liquid hydrocarbons. F. W. SPERR, JR. *Trans. Am. Inst. Chem. Eng.* 19, 13-7(1927).—Cements ordinarily used in the gas and petroleum industries in app. handling gaseous and liquid hydrocarbons are (1) red- or white-lead and linseed oil; (2) shellac; (3) portland cement; (4) litharge and glycerol; (5) rust-joint cements; and (6) miscellaneous plastic materials, e. g., soap and clay. The applicability of each is outlined. W. H. BOYNTON

Silicates of soda—their application in cements. JAMES G. VAIL. *Trans. Am. Inst. Chem. Eng.* 19, 27-34(1927); *Ceram. Age* 10, 91.—Cements made from sol. silicates can be designed for the uses of the chem. engineer by taking into account the properties and relations of the materials entering the mixts. and building up the required combination. According to setting properties cements are classified as those becoming hard by simple drying and those depending upon some reaction in which silicate soln. takes part. The behavior on drying, materials used with silicate solns. and refractory cements and the effect of acidic material addns are discussed. W. H. BOYNTON

The determination of manganese in lime, cement and their raw materials. F. PUJOL. *Rev. matériaux construction trav. publics* No. 220, 7-8(1928).—Treat 1 g. material with 20 cc. HCl and evap. to dryness. Take up with 10 cc. HNO_3 , sp. gr. 1.20, and a little H_2SO_4 and evap. till SO_3 fumes are produced to remove Cl . Cool, add 30 cc. H_2O and 5 cc. of 1.1 HNO_3 and transfer to a conical flask. Add 10 cc. 0.01 N AgNO_3 and 20 cc. satd. $(\text{NH}_4)_2\text{S}_2\text{O}_8$ and raise to boiling in 10 min. Cool and just decolorize with FeSO_4 soln. Add 10 cc. more $(\text{NH}_4)_2\text{S}_2\text{O}_8$ and heat to boiling, cool and finally titrate with standard As_2O_3 . This method does not work for more than 1% MnO . F. O. A.

Tests on the influence of calcium chloride on the compression strength and the volume changes of cement mortar and concrete. O. GRAF. *Zement* 16, 776-7(1927).—The addn. of CaCl_2 to the mixing H_2O lessened the effect of low-temp. curing on test pieces. The vol. changes were increased by CaCl_2 addns. H. F. K.

Some later investigations of the institute for concrete in Karlsruhe. B. E. PROBST AND A. HUMMEL. *Zement* 16, 778-81(1927).—The application of the water/cement ratio depends upon the grading of the sand in sand-cement mortars as well as upon the kind of cement. Aluminous neat cements and mortars are least affected by increasing water content. H. F. K.

Our knowledge of gas concrete. JULIUS MEYER. *Zement* 16, 1002-4, 1026-30 (1927).—The discussion includes a review of the patent literature and the present practices in the prepn. of porous concrete by gas evolution processes. Of the gas formers considered, Al, Ca, Mg, Zn, Ca-Zn and Ca-Mg, the last most effectively produced H_2 bubbles in the wet batch, 0.15% addn. increasing the vol. nearly 50%. Larger quantities increased the final vol. of mortars but not in like proportion. Concrete of sp. gr. as low as 1.20 can be produced. The compression strength of concrete decreases with decreased sp. gr. H. F. K.

Proper proportioning of mortar and concrete. R. DUTRON. *Rev. matériaux construction trav. publics* No. 216, 304-6; No. 217, 329-33; No. 218, 374-7; No. 219, 406-14(1927); No. 220, 14-21; No. 221, 48-52; No. 222, 91-7(1928).—A study of the strength as a function of the water-cement ratio. F. O. A.

Comparison of the strength of test specimens with the compression strength of the concrete in the structure. H. BURCHARTZ. *Zement* 16, 764-71(1927).—Tests were made on several series of mixes differing in type of cement, kind of coarse aggregate and quantity of H_2O , both with the usual tamped molded test pieces and with specimens sawed from the finished concrete. With wet mixes the molded test pieces gave higher strengths than the sawed samples while with drier consistencies no difference was found. H. F. K.

Effect of water on the strength of powdered materials upon heating. BERNWARD GARRIE. *Zement* 16, 1023-4(1927); cf. *C. A.* 22, 520.—Finely powd. Al_2O_3 , SiO_2 and $CaCO_3$ were mixed with 6-30% H_2O or C_6H_6 and pressed into pellets. The strength of these pellets after ignition to 900° increased definitely with the H_2O content but decreased or increased slowly with increasing C_6H_6 . The strength developed by H_2O -moistened batches is due to (1) its action on the surfaces of the particles, (2) the distribution of the particles and (3) the recrystallization. H. F. K.

Preparation of dry raw mixes. MARC ELBER. *Rev. matériaux construction trav. publics* No. 220, 1-7(1928). F. O. A.

Building research and the building research station. ANON. *Munic. Eng. Sanit. Record* 80, 332-3(1927).—A brief description of the plan and equipment and mention of some of the investigations on terra cotta, cements, concrete, steel, heat, ventilation, etc., is given. The station is located at Garston near Watford (England) and was set up by the Department of Scientific and Industrial Research. Information collected is freely available. C. H. BADGER

An experience in cold-surface treatment of roads. WM. RIDLEY. *Munic. Eng. Sanit. Record* 80, 429-30(1927).—"Colas" a cold bitumen was used. Cost figures are given. C. H. BADGER

Air-seasoning and conditioning of timber. F. M. OLIPHANT. *Dept. Sci. Ind. Research, Forest Products Research*, 1927, (Special Reprint) No. 1, 26 pp.—The drying and seasoning of wood are complicated by the heterogeneous cellular structure. Wet green wood may contain double the wt. of water compared with that of the dry wood, as free water in the cell cavities and water absorbed by the cell walls, the latter moisture causing considerable lateral shrinkage on evapn. This shrinkage is by no means uniform, because of presence of bands known as wood rays, which restrict contraction of the adjacent cell walls. Hence "checking" and warping (cupping and twisting) result from internal straining. End-checking of sawn logs can be diminished by coating the ends with paint or a resin prepn.; sometimes paraffin wax is used on the ends of high-class furniture timber. Case-hardening is caused by quick surface-drying and may give rise to cupping, and a further defect known as collapse is probably due to the rapid removal of water in the cells without a corresponding penetration of air, the cell walls thereby being drawn together. When air-seasoning, advantage must be taken of drying air currents, while avoiding undue shrinkage and a heavy decay by fungi. Illustrations of various methods of piling are given. In addn. to reducing wt., increasing stability and reducing the liability to decay, the seasoning of wood increases all the strength values except toughness. The prevailing poor reputation of kiln-dried wood is due to excessive drying below the fiber satn. point, together with the use of too high temps. at the commencement of the "run." B. C. A.

Photographic transfer process for imitating grains of different kinds of wood (Brit. pat. 274,030) 5. Mixing ingredients of cement (Brit. pat. 273,768) 13.

Coloring cement, concrete and plaster. BRITISH DYESTUFFS CORPORATION, LTD., J. BADDLEY, A. SHEPHERDSON and A. DAVIDSON. Brit. 273,477, June 19, 1926. Vat dyes are added in highly dispersed form before, during or after the gaging process.

Staining and hardening concrete. R. B. LAMMENS. U. S. 1,666,423, April 17. In coloring concrete and the like, solns. such as those of tannic acid and $K_2Cr_2O_7$ are successively introduced so that they react to produce the desired color; each soln. also contains a substance, e. g., 2% of sucrose, capable of producing a relatively high osmotic pressure.

Waterproofing walls, building materials, etc. A. J. BUITENHUIS. Brit. 274,017, July 10, 1926. Surfaces are first treated with a soln. of colophony or other resin in a solvent such as "methylated spirit" and then with a soln. of paraffin or similar hydrocarbon material in another solvent, e. g., C_6H_6 . Several formulas for similar solns. are given.

Preservative impregnation of building materials. D. FINLEY. U. S. 1,667,201, April 24. A sheathing material comprises a fibrous base such as roofing felt satd. with asphalt, stearin pitch and creosote.

Plaster-block composition. F. M. VENZIE. U. S. 1,667,019, April 24. Plaster of Paris 100 is mixed with sawdust 50-100 parts and with about 100 parts of an aq. soln. contg. liquid glue 5, dextrin 5 and Na silicate 10%.

Moldable oxychloride compositions. R. H. ABBEY. Brit. 273,989, Feb. 14, 1927. Raw or calcined magnesite is heated with a fluxing material such as Na silicate or borax and the clinkered product thus formed is mixed with a soln. of $MgCl_2$. $AlCl_3$ and $BaCl_2$ may be added as may also waterproofing substances such as resin soap, Al, Zn, Mg or other insol. stearates or greasy or fatty substances and fibrous or other fillers. Wall tiles, table tops, floorings, wash basins or other articles may be formed from the mixts.

Bituminous pavements. M. LEVY and PRODORITE SOC. ANON. Brit. 273,759, July 2, 1926. A liquid coat of tar or bitumen is applied to a concrete or macadam road and stone powder is applied, with or without an addnl. treatment with sand.

Road surfacing compositions. J. F. BENNETT and J. HADFIELD. Brit. 274,248, June 4, 1926. A mixt. of equal quantities of an oil such as castor oil and bitumen 32 parts is heated with 13-64 parts of S until evolution of gas takes place. Tars, resins, filling and coloring substances may also be used and the product may be applied hot or dissolved in creosote and sprayed on the road.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

Newer points of view on carrying out fuel investigations. P. SCHLÄPFER. *Monats-Bull. Schweiz. Ver. Gas-Wassersach.* 8, 60-6(1928).—General discussion of the usual methods of coal and coke analysis, etc., with recommendations for their standardization and special reference to and research on the detn. of coke reactivity.

F. S. GRANGER

Fuels and motors for power vehicles. A. HELLER. *Z. Ver. deut. Ing.* 72, 335-40 (1928).—A general paper dealing with the present state of substitute fuels, cracking, remedies for knocking, choice of both motor design and no. of cylinders for internal-combustion motors, improved cooling system and the elec. propulsion of power vehicles.

R. E. SCHAAD

Fineness and structure of coal dust under the influence of types of mills and coals. P. ROSIN and E. RAMMLER. *Zement* 16, 820-3, 840-4, 871-5, 897-901(1927).—Sieve analyses and microscopic exams. were made of the coal dust of a series of coals ground in various types of mills. The fineness and the shape of the particles of coal dust were independent of the type of mill or method of grinding. Photomicrographs are included.

H. F. K.

The preparation and examination of coal sections. JAMES LOMAX. *J. Roy. Microscop. Soc.* 47, 239-49(1927).—The applications of microscopic studies of coal to the recognition of ingredients, history and relationships of deposits. Methods are given for sampling seams, mounting and sectioning of slices for examn. by transmitted light.

C. W. MASON

An examination of the influence of various factors on the products of the carbonization of coal. H. H. THOMAS. *J. Soc. Chem. Ind.* **47**, 77-83T(1928).—Lab. tests were made in a test plant carbonizing 0.001 ton. Distns. at 950°, 1000° and 1050° showed that reduction of temp. decreased the gas yield but increased its calorific value; the net result was a loss in heating value. At high temp., the tar formed is less and has higher free C. The rate of carbonization is greater at higher temp. Reducing the size of the coal in the retort charge increases the gas vol. but reduces its calorific value, and at the same time the rate of carbonization is reduced. The addn. of coke to the coal before carbonization gives a net calorific yield about the same as with coal alone, but the rate of carbonization is increased. Admixt. with non-coking coal instead of coke gives the same calorific yield, but slightly increases the carbonization time. The coke from the last expt was the most reactive, when tested by reduction of CO₂ to CO.

T. S. CARSWELL

Compression of city gas for automotive use. JAMES CHAPPUIS. *J. usines gaz* **52**, 145-53(1928); cf. *C. A.* **22**, 860.—City gas, contg. less than 6% O₂, can be compressed to 200 kg. per sq. cm. and stored in cylinders without danger. The compressor should be of at least 3 stages, lubricated with distd. water, and of low enough linear piston velocity to permit the temp. to be kept below 80° by water cooling.

F. S. G.

Removal of dusts and mists from gases by electrical precipitation. C. HAHN. *Gas u. Wasserfach* **71**, 269-76(1928).—Elec. pptn. is contrasted with other methods of removing dusts and mists from gases, and modern plants are described and illustrated. Among the special uses of elec. pptn. are the removal of coal dust from air used to dry coal or lignite, sepn. of ashes from flue gases in powdered-fuel-burning installations, removal of dust from hot producer gases and tar from cool gases, dusts from all types of milling operations may be collected, dust from sulfur-burner gases and acid fogs may be collected, blast furnace gases may be freed from dust (it is said that several such installations are being made and that all requirements for the use of blast furnace gas have been satisfied). Moist air used in textile mills may be freed from fibers and dust and recirculated. In one briquetting plant 300 tons of coal per week were recovered and in a cement plant 70 tons of cement in a week.

R. W. RYAN

Some aspects of corrosion in gas supply practice. F. C. SMITH. *Gas J.* **182**, 118-23(1928).—The increased corrosion of distributing pipes since the war is attributed to the practice of stripping the gas initiated at that time. Previously, a protective tarry coating was deposited by the gas. CO₂ + O₂, or city gas, passed through clean pipes at a temp. above the dew point for a considerable time produced no corrosion. But when moisture was allowed to condense, rust began to appear, even in the absence of CO₂. But CO₂ greatly increased the rate of corrosion which was then accompanied by liberation of H. Fe, under water under CO₂ alone, liberated gas bubbles but the water remained clear. This was attributed to the formation of Fe(HCO₃)₂ in soln., the existence of which in gas mains is shown by the pptn. of Fe(OH)₃ from rapidly filtered siphon liquor on standing in the air. Corrosion tests were made by suspending specimens of pipe in purified water of definite cond., through which pure CO₂ was passing and measuring the steadily increasing cond. due to soln. of the Fe as bicarbonate. Blank tests, CO₂ without and N₂ with the specimen, both showed const. cond. Leakage of O₂ into the cell causes reduction of the rate of cond. increase due to the pptn. of the electrolyte as Fe(OH)₃. The app., method and precautions are described in detail. The rate of corrosion, as Fe dissolved per unit time and surface, is calcd. from the cond. The loss in wt. was of course too small to detect by weighing. It increased with the S content of the Fe.

F. S. GRANGER

Soot—How to control and dispose of it in gas-producer practice. R. A. BLUNT. *Ceram. Ind.* **10**, 153(1928).—Causes of soot formation and former methods of disposal are discussed. The author describes an incinerator which has been successfully used and in which the soot is quickly and completely burned periodically by being drawn through a preheated chamber of checkerwork accompanied by a regulated amount of air from a blower.

W. RISING

Evaluation of gasifying equipment. OSW. PEISCHER. *Gas u. Wasserfach* **71**, 247-52(1928).—The evaluation of water-gas, producer-gas and coke-oven installations is critically discussed. The usual method of evaluating the over-all efficiency of coke-oven plants is unsatisfactory. In comparing various coke-oven installations, type of coal and moisture content, gas used for heating the coke ovens, heating surface per kg. of coal per hour, as well as air excess in the flue gases and temperature of the flue gases must be considered.

R. W. RYAN

The use of active charcoal in the gas industry. A. ENGELHARDT. *Gas u. Wasserfach* **71**, 290-7(1928).—Active carbon for use in the gas industry must not be too

friable, since it is desirable to use it in granular form and to avoid dust. Comparisons of different charcoals should be made with equal grain size, equal water content, and with the same temp., humidity and solvent content of the air or gas. The "shaken down" wt. of active charcoal varies from 200 to 500 g. per l., depending on the method of prepn. Ease of regeneration must be considered in evaluating a charcoal. Adsorbed materials such as benzene are ordinarily removed from the active charcoal by passing steam through the reaction chamber, and this is facilitated by the use of a heating coil in the chamber, so that water vapor will not be condensed. Active carbon may be used for removing benzene from gas on analytical and plant scales. Means of saving steam in benzene recovery are suggested. The chief cause of loss of activity in a benzene-recovery unit is adsorption of higher hydrocarbons. Such a plant is more economical than one using wash oil. Active charcoal may also be used advantageously in the recovery of natural gas gasoline, especially where only 100 g./m³ or less is present, as compression or wash oil processes are uneconomical for such concns. H₂S in coal gas may be removed by passing over the active carbon which oxidizes the H₂S to S completely even at high rates. 400 kg. active carbon will remove 400 to 600 kg. S. The active carbon may be regenerated by repeatedly digesting with (NH₄)₂S. The polysulfide thus formed decomposes to give S, NH₃ and H₂S when heated under pressure; the melted sulfur is recovered and the (NH₄)₂S formed by the condensation of the NH₃ and H₂S under pressure is reused. In the NH₃ works at Oppau and Merseburg 175,000,000 cu. ft. of gas per day give 15 tons of S. Illustrations are given.

R. W. RYAN

Chemical constituents of lignites. J. MARCUSSEN. *Z. anorg. Chem.* **40**, 1101 (1927); cf. *C. A.* **21**, 641.—Lignites contain, on an av., about 69% C, 5.5% H, 25% O and 0.8% N (reckoned on the ash-free, dry substance). The constituents, other than water and mineral matter, are waxes, resins, free humic acids, humic acid anhydrides, humic ketones, water-sol. carbonyl acids, acetic acid, lignin and cellulose. Waxes and resins are extd. with CCl₄, and sepd. with a mixt. of alc. and ether at a reduced temp., the waxes being insol. Free humic acids are removed with NH₃, and humic acid anhydrides are hydrated with hot 1% NaOH. Lignin and ketones are sepd. by mixing with molten resorcinol, the ketones remaining unchanged. Cellulose is detd. by chlorination. Lignites derived from tree trunks are principally composed of humic acid anhydrides, lignin, cellulose and water-sol. carbonyl acids. In earthy lignites, lignin and cellulose have been almost completely converted into humic acids and anhydrides. The content of humic ketones increases with the age of the lignite. Alkali-sol. lignites contain a high proportion of free humic acids, and their cellulose is in the form of oxycellulose, so that they are almost completely sol. in cold 1% Na₂CO₃. Water-sol. carbonyl acids present in lignites have reducing properties and comprise a mixt. of glucuronic acid and an acid derived from it by oxidation.

B. C. A.

Decomposition of lignite wax. A. MAILHE. *J. usines gaz* **52**, 132-5 (1928).—Heating with ZnCl₂ to 440° yields about 50% liquid hydrocarbons, mostly satd. paraffins, covering the whole petroleum range. The sp. gr. is high because of the presence of a small quantity of ketones. The changing compn. of the gas evolved in the course of heating resembles that from lignite semi-coke, H₂ greatly predominating, CO next and CO₂ falling off rapidly from an initial value of 18%. Olefins predominate in the gaseous hydrocarbons until the final stage when CH₄ rises suddenly from 1% to 18.6%.

F. S. GRANGER

Brown coals of the Cheliaba region. G. L. STADNIKOV AND N. F. PROSKURNINA. *Trans. Karpov Inst. Chem.* **1926**, No. 5, 95-9.—The coals of the Cheliaba region have the external appearance of typical coals, as they are black, brilliant and fairly hard; their C content is also similar to that of typical coals. Nevertheless their contents in matter extractible by aq. alkalies, their ability to react with 10% HNO₃, their calorific capacity and the circumstance that they give resinous water (acid to litmus) on being distd. in Fischer's still classify them as brown coals. Elementary compn. is: C 71.51-76.05, H 4.40-4.97, N 1.32-2.00, S 0.84-3.53 and O 16.49-20.61%. They give moisture 16.9-19.0, ash 7.3-23.4, volatile matter 44.1-52.3, coke 47.7-55.9, S 0.75-2.52 and resins 0.8-3.2%. Calorific capacity is 4018-5334. The dry distn. of semi-coke shows that the latter contains a considerable quantity of volatile matter, hence these coals on gasification will give a generator gas rich in hydrocarbons and H and poor in CO₂; such a gas will find wide application in metallurgical processes. Because of the high content in N, a large quantity of NH₃ will be recovered on gasification. These coals are not suitable for briquetting.

BERNARD NELSON

Extraction and carbonization of Westerwald bituminous clay. G. AGDE AND F. SCHIMMEL. *Braunkohle* **27**, 191-3 (1928).—The material was a brown coal called clay

because of its high ash content. As taken from the mine it was approx. $\frac{1}{3}$ water, $\frac{1}{3}$ ash and $\frac{1}{3}$ combustible. The usual extn. methods yielded 4.5% resin and 8.2% wax, on the dry coal. The carbonization test, heating to 550° in 46 min., yielded 3140 cc. of gas per 100 g. moist coal, or 8% by wt., 38.5% H₂O, 8% tar and 45.5% residue. The residue contained 70.3% ash, 22.7% C, 1.6% H and 5.4% miscellaneous volatile constituents. The tar yielded 1.6% asphaltene (insol. in gasoline), 1.6% phenols, 41% paraffin + montan wax (insol. in acetone), 10% light oil distillate, becoming dark and turbid in contact with air and 14% brown viscous high-boiling distillate, stable in air.

F. S. GRANGER

The volatile constituents of brown coal semi-coke. A contribution to the closer characterization of brown coal semi-coke and its behavior in the fire. M. DOLCH AND O. KOCH. *Braunkohle* 27, 141-53, 169-73, 185-91 (1928).—A 1-cm. quartz test tube was filled to a depth of 3 cm. with weighed specimens of various semi-cokes, connected through a 2-way cock to 2 gas burets, so that the gas evolved could be measured and removed for analysis without interruption of flow, and heated horizontally in an elec. furnace to a final temp. of 1150° which was maintained until evolution of gas ceased. The heating was so regulated that the time-temp curve was the same in all cases. The gas evolved was cut in 3 temp. intervals for measurement and analysis. The results are plotted against temp. for comparison. Three groups of specimens were investigated (1) com. semi-cokes from earthy brown coals, (2) from lignitic brown coal and (3) lab. specimens produced in a Fischer Al retort from the same coal under various conditions. Previous methods of detg. the gas yield of semi-cokes, with its important bearing on their firing behavior, have been very inadequate because the max. temps. attained were far below those required for complete gasification, and the fractions of the total gas yields, evolved in corresponding temp. intervals, differ greatly for different specimens. This is shown in the present work by the variety of curve forms obtained. In some cases there was no sign of a falling-off of gas evolution even at 1150°, while in others the horizontal was approached below that temp. The 3 lignitic specimens, however, though of widely different origin, gave nearly parallel straight lines lying close together. The total gas compns. differed so little that the coke specimens fell in the same order whether arranged according to gas yields or gas thermal yields calcd. from the individual gas constituent yields. The changes in gas compn., during degasification, were also similar. CO₂ predominated in the early stages but fell off rapidly while the other 2 main constituents, H₂ and CO, increased accordingly. Of the 3 lab. specimens, the 1st was prep'd by carbonizing the moist coal directly, with superheated steam, the others after drying at 110°, the 2nd in a current of H₂ and the 3rd in O₂. The 1st and 2nd developed heat on exposure to air, presumably from oxidation, and gave the same gas yield. The 3rd gave a higher yield. The 2nd yielded less H₂ than the others, whereas the CO and CO₂ increased in the order 1, 2, 3. The results are discussed at length with reference to conditions before and during carbonization and degasification.

F. S. GRANGER

A comparison of oven and gas coke for central heating plant boilers. W. LEDER. *Gas u. Wasserfach* 70, 1045-7 (1927).—The prejudice against gas coke is not well founded. At prevailing German prices (30-33% below oven coke) it is a more economical source of fuel than oven coke.

R. W. RYAN

A new device for determining the ignition point of coke and technical charcoals. W. SWIENTOSLAWSKI AND B. ROGA. *Przemysł Chem* 12, 18-31 (1928).—The ignition point of cokes, wood charcoals and the like is defined as that temp. at which on contact of O₂ with the given coal spontaneous combustion of the coal takes place, and at the same time there is a marked rise in the temp. of the device. This device consists of an Al block in which tubes are bored for conducting the gas from the outside to the combustion chamber in the center of the block, thereby bringing the gas to the temp. of the app. The combustion chamber holds on a grate 2 cc. of the powd. sample which surrounds the bulb of a Hg thermometer or the junction of a thermocouple. The block is heated externally by a gas flame, and the corresponding time-temp. curve is plotted. The temp. of intersection of the 2 smooth curves marks the ignition point sought. The complete app. consists of a H₂SO₄ gas wash bottle, a flowmeter and a CaCl₂ column through which O₂ must pass before entering the Al block. The coal sample is held in a removable part so that cleaning and assembly are easy. Results can be reproduced to $\pm 1^\circ$ on activated charcoals and $\pm 3^\circ$ on cokes. Effects of grain size of the sample, and of rate of flow of O₂ were found measurable but small. A brief review of earlier work is given.

A. C. ZACHLIN

Cracking, especially of lignite tars, by the Blümner process (KARSTEN) 22. Purifica-

tion of waste water from lignite-distillation plants (WITT, SCHUSTER) 14. Homologs of $C_{10}H_8$ [as motor fuel] (Brit. pat. 273,665) 10. Hydrogenating coal (Brit. pat. 273,337) 22. Ozonides [as motor fuels] (Brit. pat. 273,832) 10. Condensation product of olefins with hydrocarbons of the naphthalene series [as motor fuels] (U. S. pat. 1,667,214) 10.

LITINSKY, L.: Kokerei und Gaswerkofen. Halle (Saale): W. Knapp. Reviewed in *Am. Gas J.* 128, 66(1928).

Fuel briquet. J. S. ROBESON. U. S. 1,667,358, April 24. Tubular briquets are formed of fine coal, oil and lignone; the outer portions are harder than the inner portions and contain less volatile matter.

Fuel briquets. E. W. BOWEN. U. S. 1,667,304, April 24. Fine dust is sepd. from the granular portion of fuels such as coal or coke and after the granular portion has been mixed with sulfite liquor or other binder a definite proportion of the fine dust is added to the mixt. An app. is described.

Fuel briquets. T. NAGEL. U. S. 1,666,663, April 17. An acid phosphatic compd. such as crude dil. H_3PO_4 and flour mill sweepings or other starchy material are used together as a binder for finely divided coal or other fuels.

Fuel briquets. S. SHIMAMOTO. Brit. 273,556, Oct. 30, 1926. Sawdust or other pulverized vegetable fuel is steeped in slaked lime while still hot and may be formed into briquets with various addns. such as coal, wood, chips, starch paste or heavy oils.

Briquetting fuels. H. E. WETTERBER and W. L. JACOBUS. Brit. 274,046, July 10, 1926. Anthracite, bituminous coal, lignite or other carbonaceous fuels in sub divided form are briquetted with binders which comprise coking material such as a petroleum residuum or coal-tar residuum and kerosene, light coal tar, gas-producer distillate or other filming carrier to assist in evenly distributing the binder. The materials may be mixed in hot water, briquetted after draining off the water and then heated for several hrs. at about 200–315°. Cf. *C. A.* 21, 2977.

Distillation of carbonaceous materials. SALERMO, LTD. and E. M. SALERNI. Brit. 273,528, Sept. 15, 1926. Material such as coal, lignite or shale is ground to pass a sieve of about 0.375 in. mesh, dried by being fed from hoppers in a thin layer onto flat plates exposed to heating gases and then carbonized during lateral passage through a series of open-topped troughs; the coke formed is cooled by being conveyed along water-cooled plates. An app. is described.

Fuel for internal-combustion engines. J. B. NEUENDORFF. U. S. 1,666,976, April 24. Liquid petroleum distillates such as kerosene, gasoline and naphtha mixts. are subjected to the action of clear line water, to remove impurities.

Generating power from low-grade fuels. M. J. TRUMBLE. U. S. 1,667,403, April 24. Steam is blown through fuel such as oil shale in a closed chamber to vaporize hydrocarbons, the steam and hydrocarbons are used in a prime mover such as turbine and hydrocarbon values are recovered by condensation from the exhaust.

Downwardly flared retort for carbonizing solid fuels. T. M. DAVIDSON. Brit. 273,389, March 30, 1926.

Low-temperature carbonization of coal. K. M. SIMPSON. Brit. 273,935, Sept. 22, 1926. Uncharged receptacles are preheated to carbonize the charge which is then placed in them and conveyed through the distg. zone. An app. is described.

Treating fine coal. E. W. WILKINSON. U. S. 1,667,277, April 24. Fine coal is agitated in an aq. pulp with the addn. of less than 1% of K xanthate or K Et mercaptide or other org. S compd. which improve agglomeration, to obtain an oil-coated floating coal and the coal is sepd. from excess water and may be briquetted.

Hydrogenizing coal, etc. I. G. FARBENIND. A.-G. Brit. 274,404, March 13, 1926. In the destructive hydrogenation of coal or like solid carbonaceous fuel by a 2-step process as described in Brit. 249,156 (*C. A.* 21, 1002), the tarry vapors from the first stage are submitted to the second stage without condensation, and preferably after sepg. them from solid substances.

Destructive hydrogenation of coal, oils, etc. I. G. FARBENIND. A.-G. Brit. 273,712, June 29, 1926. Low-boiling oils are obtained from coals, tars, oils, bitumens and the like by first heating them under pressure in the presence of H or gases contg. H and of catalysts which assist cracking and then further hydrogenating the products by the aid of catalysts. Brown coal-tar oil may be heated in an Al-lined vessel with H under 200 atm. pressure at 450° in the presence of active C and the vapors thus produced may then be passed over a Co catalyst to produce a product contg. 90% of "benzine." Cf. *C. A.* 21, 3733; 22, 1843.

Gasifying powdered fuel. G. SZIKLA and A. ROZINEK. Brit. 274,110, July 9, 1926. In gasifying or distg. powd. coal in a limited air supply, incandescent fuel dust is added to fresh fuel dust during circulation in a closed circuit in the gasifying chamber as described in Brit. 255,857 (C. A. 21, 2977) and an app. is employed in which the bottom of the gasifying chamber inclines so closely to the horizontal that coal dust collects on it in the shape of a crater surrounding the air flame. Various other details of the app. are described.

Gas from coal. F. J. WEST, E. WEST and WEST'S GAS IMPROVEMENT CO., LTD. Brit. 273,474, June 18, 1926. A charge of coal in vertical retorts is steamed to obtain a large vol. of gas of low calorific value and this gas is enriched by admixt. with oil gas from a retort heated by the hot waste gases from the heating flues of the coal gas retorts.

Gas producer. C. W. LUMMIS. U. S. 1,666,604, April 17.

Carbureted water gas. F. B. HAYES. U. S. 1,667,518, April 24. In making water gas by the alternate up and down steam run method, the up-run water gas is passed through a carburetor and simultaneously enriched with oil supplied to the carburetor; the down-run blue water gas is by-passed with respect to the carburetor and oil gas is made in the carburetor during the steam down-run period; the different gases are commingled in a holder.

Silica brick bench setting for gas retorts. H. J. TOOGOOD and R. DEMPSTER & SONS, LTD. Brit. 274,154, March 15, 1926.

Distilling coal tar. C. WESSEL. Brit. 273,675, June 29, 1926. The $C_{10}H_8$ from coal tar together with light oil and water is driven off by steam led directly into the distg. vessel. An app. is described in which a distg. column and dephlegmator are placed above the still. The $C_{10}H_8$ seps. out in receivers and liquids are decanted.

Coke-oven construction. E. COPPER ET CIE. Brit. 273,630, Sept. 4, 1926.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

F. M. ROGERS

The light-oil residues of oil-gas tar from Solar oil (gas-oil) and from raw naphtha. EWALD PYHALÄ. *Erdöl u. Teer* 4, 146-9 (1928).—The distillate and distn. residue from the Solar-oil residue resembled those from raw turpentine oil in phys. and tech. properties. The yield and properties were improved by treatment with flordin. These products were absent in the Baku oil residue which yielded, instead, considerable quantities of marketable naphthalene, the yield of which was trebled by distg. under partial decompn. conditions.

Transformer oils and their brown deposit. G. L. STADNIKOV and Z. I. VOZZINSKAIA. *Trans. Karpov Inst. Chem.* 1926, No. 5, 109-26.—The brown deposit obtained on filtering used transformer oils has been subjected to a systematic analysis. On being heated in a current of H at 100° it lost 0.70% of its wt. The ash was 13.16% and contained Fe, Cu, Pb and Sn. The dry ash-free portion contained N (Kjeldhal) 0.83, S (bomb test) 78.03, H 9.29, O (by difference) 11.48%. The deposit on destructive distn. gave 5% water, 49% oil, a small amt. of tar and gas contg. CO_2 . The water had an acid reaction and discolored a permanganate soln. The oil, on being extd. with water and with 3% aq. NaOH, gave org. acids. Thus during the destructive distn. of the deposit are formed CO_2 , volatile and water-sol. org. acids and non-volatile water-insol. org. acids. On fusing the brown deposit with NaOH, then dissolving in water and HCl and treating with $BaCl_2$, a ppt. was obtained indicating the presence of sulfo acids in the original deposit. This result shows that the brown deposit is formed in transformer oil by condensation of its resinous substance with org. compds. produced by oxidation of the oil. In these condensations, sulfo acids and their Na salts which are contained in transformer oils that have been refined with H_2SO_4 , and insufficiently washed play a very important part, even if they are present only as traces, since they act as very effective catalyzers; they effect condensations in oils free from resins as well as in oils contg. a slight amt. of resin. They exist in the oils in form of an emulsion formed by their aq. soln. and the oil, and this emulsion is not always broken up when the oil appears clear and transparent to the naked eye, for it is possible to detect a turbidity of the oil by means of the microscope. To obtain confirmation of these views on the harmful action of traces of sulfo acids or of their salts on resin-free and slightly resinous oils, the authors subjected various grades of commercial transformer oils to different refining treatments. Two samples were refined by 3

treatments with 5% of their wt. of 90% H_2SO_4 followed by centrifuging, repeated washing with water, then agitating with a 40% soln. of alkali, washing again very thoroughly until agitating the oil with water formed no emulsion, and water easily sepd. from the oil on mere standing. Two other samples were refined by 3 treatments with 10% of their wt. of 90% H_2SO_4 followed by the same careful purification. Finally 2 samples were refined by 2 treatments with fuming H_2SO_4 (4.3% SO_3) and purification as above. No treatment of these samples with silica gel or flordin has been made, for fear of polymerization of unsatd. constituents. After being thus refined the samples were oxidized by air for 45 hrs. at 120° in presence of reduced copper gauze. The air, before it entered the oil, was passed through wash flasks contg. alkali and H_2SO_4 , and after it came out of the oil was passed into titrated NaOH . After this oxidation, the acid values, resinification numbers, and particularly the capacity of forming a solid deposit, were carefully detd. on the oils obtained; for the latter test, the oils, after cooling, were kept for several months in closed cylinders. Volatile acids were formed in noticeable amounts. The oils refined with 90% H_2SO_4 had slightly increased acid and resinification numbers, but the oils which were treated with fuming H_2SO_4 had suffered changes increasing their capacity for oxidation. No solid deposit developed in any of the samples. The same oils were oxidized after an addition of 0.1% of naphtha sulfo acids, and under these conditions soon darkened and easily gave considerable amts. of brown deposit. In repeating the oxidation treatments in presence of 0.2% of K salts of sulfo acids it was found that the salts cause an even more abundant formation of solid deposits than the free acids.

BERNARD NELSON

Remarks on the preparation, purification and analysis of pyrogenous oils. R. HUERRER. *J. pharm. chim.* 7, 58-69(1928); cf. *C. A.* 20, 2561; Massy, *C. A.* 20, 3775.—For complete extn. of phenols, the pyroligneous fraction contg. much phenol must not be discarded. To free pyrogenated oil (A) from acid, wash the oil, instead of with H_2O , with a 10% soln. of $(\text{NH}_4)_2\text{CO}_3$, which leaves the phenols unaffected. In detg. phenols in A, treat it with $(\text{NH}_4)_2\text{CO}_3$ before setting free the phenols with 5% NaOH . Since warm alkalies have a marked effect on the optical rotation of *l*-cadinene, only cold alkalies should be used. When distn. temps. of A are to be detd., the oil must be a carefully prepd. homogeneous mixt.

S. WALDBOTT

Judging the knock-stability of hydrocarbons. N. A. BUTKOW. *Erdöl u. Teer* 4, 162-3(1928).—Investigation of the sensitiveness to oxidation, by heating with O_2 under 3 atm. at 230° , of heptane, typically knocking, and toluene, non-knocking, showed that this is a measure of their tendency to knock. β -Naphthylamine and aniline, known as antiknock agents, check the oxidation of heptane. Addn. of toluene to aviation gasoline reduces the latter's sensitiveness to oxidation.

F. S. GRANGER

Action of lead tetraethyl in delaying detonation in the internal-combustion engine. E. MARDLES. *Nature* 121, 424-7(1928).—Antiknock fuel arriving in Gt. Brit. from the U. S. contains 6 cc. of ethyl fluid (PbEt_4 , 54.5%; $(\text{CH}_3\text{Br})_2$, 36.5%; monochloronaphthalene, 9%) per gal. gasoline. A water-cooled engine with comparatively low performance detonated badly at 5:1 compression ratio when run on gasoline alone, but on gasoline contg. 5 cc. Et fluid/gal., compression could be raised to 6:1 before detonation began. With the higher compression, power development increased 10.5% while fuel consumption decreased 6%. Prolonged engine tests with fuels contg. not more than 6 cc. Et fluid/gal. confirmed the claim that ethyl gasoline will not injure spark plugs, valves or stems. Typical analyses are given of a gray deposit found in the engine stripped after a 33-hr. continuous run. A brief review is given of various explanations of detonation.

R. E. SCHAAD

Solubility of paraffin wax in pure hydrocarbons. PAUL WEBER and H. L. DUNLAP. *Ind. Eng. Chem.* 20, 383(1928).—The soly. of purified paraffin wax in pentane, hexane, heptane, octane and isodecane decreases with increasing mol. wt. of the solvent and increases rapidly with rise in temp. This increase in soly. with rise in temp. is greater the higher the mol. wt. of the solvent. The soly. per mol. of solvent is nearly const.

E. E. CRANDAL

Improved manufacture of crack-benzine especially from brown-coal tar and shale oils. ALFRED KARSTEN-SALMONY. *Chem.-Ztg.* 52, 209-10, 232-3(1928); cf. following abstract, also *C. A.* 22, 1465.—The Blümner cracking process produces about 70% refined benzine from paraffin base oil, 50-60% from asphaltic oil, and 35-50% from brown-coal tar. The benzine contains approx. 15-20% aromatics. Light gasoline is recovered by activated charcoal from the approx. 10% uncondensable gas evolved in cracking.

R. E. SCHAAD

Cracking, especially of lignite tars and shale oils, by the Blümner process. ALFRED KARSTEN. *Oesterr. Chem.-Ztg.* 31, 38-9(1928); cf. Brit. Pat. 182,868 (*C. A.* 16,

4332); also preceding abstract.—A description is given of the Blümner process, Ger. pat. 338,846 (1922). Crude oil, shale oil, low-quality lignite tars or tars of any kind are pumped and injected through a pipe lowered into molten Pb contained in an autoclave heated externally. The charged oil bubbles to the surface of the melt without touching the walls of the heated zone. The process is carried on under pressure of 35–40 atm. at about 450°, the cracking temp. of the oil. Automatic circulation of the melt causes const. heat transfer from the source to the oil, thus preventing overheating and coking. Advantages of the process are: larger yield of benzine of better quality, uninterrupted operation, greater safety and ability to handle crude and distillates simultaneously. The process is operated commercially in a plant near Berlin.

R. E. SCHAAD

Method for extracting high-quality cylinder oils from residue left from lubricating oil.

R. E. VORONOV. *Neftyanoye Khozyaystvo* 14, 213–6(1928).—Lubricating-oil residues were mixed with 15% of heavy gasoline or kerosene and the mixt. was treated with 92.5% H_2SO_4 and fuming H_2SO_4 (22% SO_3). The product obtained is then stripped from gasoline or kerosene and treated with fuller's earth. The residue was mixed with 15% kerosene and 0.5% naphthenic acids. This mixt. had a flash point (Brenken) 100–110°, Engler viscosity at 100°, 3–3.5. Forty kg. of the mixt. was heated with steam to 90° and the sepd. H_2O drawn off; 1% H_2SO_4 (92.5%) was added, the mixt. was agitated with air for 30 min. and allowed to settle 2 hrs. The acid sludge was drawn off. If water was still left, the drying operation was repeated. Three % of fuming acid was added, the mixt. agitated 1 hr., allowed to settle 3 hrs. and the acid sludge drawn off again. A second portion (4%) of fuming acid was added, the mixt. agitated 1.5 hrs., allowed to settle 3 hrs. and the acid sludge drawn off again. The residue was given another treatment with 2% (92.5%) H_2SO_4 , agitated for 1.5 hrs. and 0.05% of 20° B ϕ . NaOH added. After 4 hrs. settling the sludge was drawn off, 15% of hot water added to keep the temp. at 90° and after 3 hrs the acid H_2O was drawn off. The flash point (Brenken) increased 2–5°; Engler viscosity at 20° decreased 3–4°; the color was dark green. Superheated steam (250–280°) was used to evap. the kerosene and SO_2 and SO_3 . After this treatment the yield of oil was 65–66% of the residue used. The oil obtained had a flash point (Brenken) 290°, Engler viscosity at 100°, 6.10, coke (Konradson) 3.2%, color faint dark green. Treatment with 3% of fuller's earth 5% gave a total yield of 60%.

	Treated residue	American cylinder oil	Russ. Viskosin 7
Flash (Brenken)	305–310°	280–290°	300° and more
Viscosity E_{100}	6.65	5.55	7–8
Carbon (Konradson)	2.2–2.4%	4.5–5.5	2.8–3.0
Color	Dark green	green	black

The cost of making this oil is equal to that of Viskosin 7. This process is covered by the Russian Patent No. 16, 151, issued March 26, 1927. A. A. BOGHTLINGK

Lubrication. W. R. ORMANDY. *Proc. Inst. Mech. Eng. (London)* 1927, 291–327; *Engineer* 143, 361–2, 393–4(1927).—The forces active at the surfaces of solids are discussed. When oil is allowed to penetrate between two metallic surfaces, the equilibrium position is quickly taken, but if an excess of oil is placed between the plates a long time is necessary for the excess to be squeezed out and the metal to settle into equilibrium position, this behavior suggests that the viscosity of the oil is enormously increased in these circumstances. This period can be shortened by heating or mechanical agitation. The presence of 0.7% or over of a polar compound in a lubricant insures a coeff. of friction of the order of that for the polar compd. alone. Lubricating films of limiting thickness are probably very rare in practical experience. Measurements of elec. resistance and capacity between two ground and polished stainless-steel disks immersed in oil showed that the metal pieces formed contact at one or more points long before the film between was reduced to thickness. Even with optically true surfaces such as Hardy used in his studies, the height of the unevennesses would be some 40 times the length of a stearic acid mol. Expts. indicate that when spheres or disks fall freely through a mass of liquid, as in one type of viscometer, the viscous resistance is proportional to the velocity as long as the viscous forces are large compared with the forces causing motion. When the moving body approaches the walls or bottom of the container, the influence of the walls is exerted; in the viscometer, a large correction has to be applied. As a disk rotating in oil in a horizontal plane at the end of a wire attached perpendicularly to its center approaches the bottom of the container, the logarithmic decrement of rotation increases very rapidly. The flatter the viscosity-

temp. curve of an oil, the better its lubricating properties; these are generally, but not always, the oils of lowest sp. gr. Oxidizing conditions to which lubricating oils are subjected produce asphaltic substances in the oil or acids which easily emulsify with water; in either case the oil ducts are liable to become clogged. S content is thought by Moore to be concomitant with the tendency to asphalt formation. Fe, Cu, Pb and Zn, all catalyze the oxidation processes, though in different degrees.

E. E. CRANDAL

Viscosity of lubricants under pressure. M. D. HERSEY and HENRY SHORE. *Mech. Eng.* 50, 221-32(1928).—Under pressures of 20,000 lb per sq. in. viscosities of animal and vegetable oils are less affected by pressure than the viscosities of mineral oils. Above this pressure, lard oil in particular gives evidence of suddenly solidifying. This fact reopens the possibility suggested by Kingsbury in 1903 that oiliness is a sort of intensified viscosity. Lard oil, Veedol medium (paraffin), Texaco medium (naphthene-base), Mobiloil A (mixed-base or blended) and castor oil were studied. Pressures up to 57,000 lbs. per sq. in. were applied by means of a specially designed pump and an intensifier. Viscosity was measured in a ball- and -slanted-tube viscometer. The actual pressure applied to the oil in the tube as the ball passed down the 15° slope was measured through the elec. resistance of a manganin wire which had a resistance of over 100 ohms. The resistance of a manganin wire increases 1.6% per 100,000 lbs per sq. in. This coiled-wire pressure-gage was inserted in one of the 3 openings of a tee in a rectangular block of steel. The left-hand arm of the tee connected with the high-pressure side of the intensifier, the right with the viscometer. A glycerol-and-water mixture was used to communicate pressure on the low side of the intensifier and kerosene was the medium between the high side and the pressure gage. The viscometer was heated by a coil of nichrome wire around it and two pyrometers indicated temps. For "roll-times" over 6 sec, the abs. viscosity, $\mu = T/T'$ (T is the observed roll-time, and T' the roll-time for a liquid with a viscosity of 1 poise, T' being a function of the density of the oil). For shorter roll-times it is necessary to plot a curve from the data for oils of known viscosities and densities; this may be used for obtaining abs. viscosities giving short roll-times. Of the five oils whose viscosities were taken at high pressures, only the lard oil and paraffin-base oil appear to solidify at such pressures; castor oil showed a slight tendency to do so. By plotting log-viscosity against $\log(t^\circ + 18)$, (t is temp.), const.-pressure curves or isopiesticities were obtained; from these curves it was seen that the temp. coeffs. of all the oils tested except lard oil were considerably higher at high pressures.

E. J. CRANDAL

Practical observations on stability in bitumens. R. W. PARKHURST. *Commonwealth Eng.* 15, 261-5(1928).—Stability is of 2 forms: phys. and chem. The former is usually indicated by 3 standard tests: softening point, penetration and ductility. Binding power depends upon cohesiveness and adhesiveness. While highly cohesive bitumens are most resistant to temp. change, the very adhesive ones are the least resistant; from a practical standpoint the most desirable combination is a proper "balance" in these properties. Mineral matter may reduce the susceptibility of bitumen to thermal changes without altering its chem. structure. Observations were made on the colloidal capacity of bitumens, and the existence of colloidal conditions in residual bitumens. Trinidad has a greater colloidal capacity than residual. Relative to chem. stability, carbenes (compds. insol. in CCl_4) are not related to phys. stability, the ratio between the asphaltene and petrole content as disclosed by the naphtha soly. test is of particular interest when the character of the petrole is known. No mineral values are yet available to indicate the binding power. From service results it seems that cementitiousness in a bitumen depends largely upon the ratio of asphaltenes and petrole and upon the character of the latter. A bibliography is appended.

W. H. BOYNTON

The ignition point of wood charcoals. W. SWIENTOSLAWSKI and M. CHORAZY. *Przemysł Chem.* 12, 31-7(1928).—The ignition point of a wood charcoal may be regarded as one of its characteristic consts and can be detd. with the specially designed app. (cf. C. A. 22, 2047). The conditions of the expt. must be held strictly standard, however, to obtain comparable results. The ignition point depends on the wood and on the temp. of charring. Charcoals obtained at a lower temp. on a subsequent heating to a higher temp. show an ignition point of the same temp. that they would have had if they were originally prepd. at that higher temp. Having the necessary graphs it is possible to tell at what temp. a given charcoal was prepd.

A. C. ZACHLIN

Ignition point of activated charcoals. W. SWIENTOSLAWSKI and B. ROGA. *Przemysł Chem.* 12, 38-9(1928); cf preceding abstr.—No relationship is evident between

the ignition temp. and the adsorbing power of charcoals. A relationship does exist between the ignition point and the temp. of activation. In some cases where charcoal obtained from similar raw materials but prepd. at different temps. was used a straight line relationship was found between the ignition point and the activating temp.

A. C. ZACHLIN

A device for determining the ignition point of technical charcoals (SWIENTOSLAWSKI, ROGA) 21. Flood waters of Bradford pool and relation to oil production (TORREY) 8. Destructive hydrogenation of coal, oils, etc. (Brit. pat. 273,712) 21. Distillation of carbonaceous materials (Brit. 273,528) 21.

KLEVER, HELMUT W., and MAUCH, KARL: Über den estländischen Olschiefer, "Kukkersit." Halle (Saale): W. Knapp. 60 pp.

Cracking hydrocarbon oils. PETROLEUM CHEMICAL CORPORATION and E. P. STEVENSON. Brit. 273,781, March 24, 1926. In cracking gas-oil or other petroleum products to obtain gas for carburetting water gas and other products, intermediate products such as a motor spirit fraction and olefins are sep'd. from the cracked products, e. g., by use of H_2SO_4 . An app. is described and various details of procedure are given.

Fractionating hydrocarbon oils. C. M. ALEXANDER. U. S. 1,667,340, April 24. Oil vapors are brought into contact with reflux condensate having a lower final b. p. than the highest b. p. constituent of the vapors being contacted and the vapors are subsequently brought into contact with a condensate of higher b. p. An app. is described.

Distilling petroleum hydrocarbons. W. M. CROSS. U. S. 1,666,119, April 17. Oil such as crude petroleum is heated in a preliminary heating stage to a temp. sufficient to vaporize the lighter hydrocarbons, the heated oil is passed to a vaporizing stage and the liquid and volatilized material are there sep'd. The liquid products are returned for further heating to vaporize addnl. fractions of high b. p. and the reheated material is passed to a sep. vaporizing stage. The relative heating to which the charging stock and recycled stock are subjected is controlled by limiting the extent of their circulation through the heating zone. An app. is described.

Distilling petroleum oils. A. E. PEW, JR. and H. THOMAS. U. S. 1,666,300, April 17. Oil is heated to a distg. temp. and a stream of the hot oil is caused to flow within a still at successively higher elevations and the stream of oil at each elevation is divided into confined multiple streams which are spaced apart. Oil to be vaporized is introduced into the upper part of the still and passes in heat-exchanging relation to but not in contact with the hot streams of oil and passes successively in thin films in heat-exchange relation with the stream of oil at successively lower elevations and at successively higher temps. so as to effect fractionation. An app. is described. U. S. 1,666,301 specifies a generally similar system in which separate streams of oil may be consolidated before passing from one stage to another of the treatment. An app. is described. U. S. 1,666,302 also relates to similar process and app.

Distilling mineral oil. A. E. HARNSBERGER. U. S. 1,666,597, April 17. In vacuum distn. of mineral oils a quantity of oil is drawn, without reduction in its total weight, through a heated pipe still of progressively increasing cross-sectional pipe area from the inlet to the outlet end; this increasing area permits such reduction in back pressure due to pipe friction of the oil and vapors drawn through the still as to allow a vacuum carried on the outlet end of the still to penetrate back to the inlet end. An app. is described.

Purifying mineral oils. J. P. FRASER. Brit. 273,351, Jan. 25, 1926. In order to sep. aromatic and unsat'd. hydrocarbons, mineral oils are shaken with phenol contg. a small quantity of H_2O . Numerous details are given.

Converting hydrocarbon oils with aluminum chloride. ALLGEMEINE GES. FÜR CHEMISCHE INDUSTRIE. Brit. 273,999, Sept. 17, 1926. In the process described in Brit. 272,433 (C. A. 22, 1847), the residue after the first distn. with $AlCl_3$ is ext'd. with concd. H_2SO_4 instead of with SO_2 .

Oxidizing mineral hydrocarbons. J. H. JAMES. U. S. 1,667,419, April 24. Hydrocarbon material of mixed character such as petroleum or shale oil is heated at least sufficiently to vaporize part of the material, heavier portions are sep'd. from a lighter portion in the vapor phase, and a lighter portion is mixed while still in vapor or gaseous phase with an O-contg. gas and the vapor-O mixt. is passed in contact with a catalyst such as blue oxides of Mo and partial oxidation is effected.

Refining heavy mineral oils with sulfur dioxide. L. EDELEANU, K. PFEIFFER, K. GREGG and P. JODECK. U. S. 1,666,560, April 17. In a continuous refining operation, an intimate mixt. of the oil and SO_2 is prepd. in a vessel by use of a churning device, and the mixt. is continuously supplied to a settling receptacle with a successively decreasing speed at a zone about in the midst of the mixt. already in the settling receptacle.

Hydrogenating coal, oils, etc. I. G. FARBENIND. A.-G. Brit. 273,337, June 26, 1926. Liquid hydrocarbons of low b. p. are obtained from coals, mineral oils, bitumens and like materials by first producing fractions of narrow b.-p. range and then subjecting the fractions to hydrogenation at high temps. and pressures in the presence of a catalyst. Middle fractions b. 250-350° are especially suitable and may be hydrogenated by use of H_2 in the presence of porous C, active SiO_2 and hydrosilicates. Cf. C. A. 21, 3122.

Destructive hydrogenation. I. G. FARBENIND. A.-G. Brit. 274,401, Mar. 8, 1926. The process described in Brit. 247,583, (C. A. 21, 643) and in Brit. 249,501 (C. A. 21, 1005) for destructive hydrogenation of carbonaceous materials under a pressure of at least 50 atm. in the presence of Mo or its compds. is applied to the treatment of conversion products of mineral oils and bitumens such as to cracked products, acid sludge or hydrogenation products of bitumens. Cf. C. A. 22, 1848.

Separation of petrolatum from oil. C. R. WAGNER. Can. 276,498, Dec. 20, 1927, U. S. 1,669,151, May 8. Steam-refined stock is dild. with a solvent (e. g., MeEtCO) in which petrolatum is less sol. than in naphtha and the dild. stock is chilled to sep. the petrolatum.

Automatic relief valve for pressure oil stills. A. J. SLOAN. U. S. 1,667,055, April 24.

Apparatus for extracting oil from shale deposits by heating in situ. R. CRAWSHAW. U. S. 1,666,488, April 17.

System for obtaining of oil from natural strata by treatment with compressed air, etc. L. RANNEY. U. S. 1,667,269, April 24.

Apparatus for removing coke deposits from petroleum stills. L. V. ROBBINS. U. S. 1,666,865, April 17.

Apparatus for mixing sludge (derived from petroleum) with fuel oil, etc. R. BRATTIE. U. S. 1,667,235, April 24.

Treating lead sludge. J. B. HILL. U. S. 1,667,550, April 24. Pb sludge such as is obtained in refining petroleum with plumbites is treated with an alkali metal hydroxide and an O-contg. gas, to regenerate alkali metal plumbite.

"Antiknock" liquid fuels. W. GAUS. U. S. 1,666,693, April 17. Fuels such as gasoline are treated with a metal carbonyl such as Fe carbonyl and with MeCl , NH_4Cl or other suitable halogen compd. sol. in the fuel.

Gas-absorption apparatus for recovering gasoline from natural gas or for other purposes. W. G. LAIRD. U. S. 1,666,744, April 17.

Lubricating mixture. R. P. JUDN. U. S. reissue 16,943, April 24. See original pat. 1,449,608, C. A. 17, 1852.

Bituminous emulsion. H. PLAUSON. Can. 276,480, Dec. 20, 1927. Bituminous emulsions are prepd. by emulsifying a glyceride with K_2CO_3 and agitating the bituminous material with the emulsion so obtained.

Packing asphalt for shipment. F. BREEZE, JR. U. S. 1,666,730, April 17. Melted asphalt is poured into a mold which may be formed of metal plates and the walls of which are coated with a clay slurry or other lubricating substance; the asphalt is allowed to solidify and the molded block thus formed is then placed in a fiber container in which it fits snugly and in which retained lubricant prevents adhesion.

23 CELLULOSE AND PAPER

CARLETON E. CURRAN

Recent work on the oxidation of cellulose. J. L. PARSONS. *Ind. Eng. Chem.* 20, 483-5 (1928).—A review (with bibliography) covering 2 yrs. from which it is concluded, in agreement with Cross and Doré, that there is no justification for the term "oxycellulose" as applied to a chem. individual. The expression "oxidized cellulose" is preferable to designate the mixt. resulting from the oxidation of cellulose. E. J. C.

Sulfite cellulose from spruce wood. R. BERGGVIST. *Svensk. Pappers-Tid.* 31, 138-40, 171-3 (1928).—The importance of the different variables, particularly the temp. curve, affecting the sulfite process, is emphasized. Cooking at 130° is insufficient as a

basis for fully evaluating results and detns. should be made on standard com. sized chips to compare results with greater certainty. Various theories proposed to explain the mechanism of the reactions in sulfite digesting are discussed. A suspension of 6% unbleached pulp in $\text{Ca}(\text{OH})_2$ soln. contg about 0.03% $\text{Ca}(\text{OH})_2$ after standing 10 hrs. at 35° sepd. nearly half the resin. Lime soap from spruce resin is far from insol. Samples of pulp withdrawn at digesting periods of 13, 14, 15, 16 and 17.5 hrs. gave 0.70, 0.68, 0.58, 0.35 and 0.86% resin, resp., indicating that, as the neutral point is passed and the p_H value drops, the lime soap is decompd and the resin fixes itself to the fibers again. The action of NaOH and $\text{Ca}(\text{OH})_2$ on the resin is compared. Investigations on the diffusion of acid in the chips are discussed. B. suggests considering sulfite digesting in 3 steps: (1) in acid digesting liquor, causing satn of the wood by the digesting acid; (2) in alk. digesting liquor, causing certain hydrolytic decompns.; and (3) in the presence of available lime with lowering of p_H . The chem. compn. of spruce wood is discussed with reference to improved methods of prep. pulp. The necessity of not exceeding a max. SO_2 content of 0.06% is emphasized, also sufficiently long absorbing period during digesting and the use of S free from Se.

W. SEGERBLUM

Polysaccharides. XXXVII. The behavior of different celluloses toward snail cellulase. P. KARRER AND P. SCHUBERT. *Helv. Chim. Acta* 11, 229-30(1928); cf. *C. A.* 21, 3466.—There is no apparent relation between the amt. of enzyme action on the different celluloses and other properties such as viscosity, Cu no., etc. Cellulase from snails ferments β -cellulose more quickly than α -cellulose. Filter paper was 93% decompd. after 4 successive treatments with an especially active, concd. snail enzyme soln. XXXVIII. Contribution to the knowledge of the behavior of viscose silk toward snail cellulase. O. FAUST, P. KARRER AND P. SCHUBERT. *Ibid* 231-3. The resistance of viscose to enzyme action is considerably increased by stretching during coagulation. Origin and processing appear to have some influence on the enzyme resistance

RUBY K. WORNER

Viscose. IV. The viscose film (cellophane). M. NUMA. *Cellulose Ind. Tokyo* 3, 235-49(1927); cf. *C. A.* 22, 1038.—In the prepn of films from ripened viscose the permanence of the qualities of the film is perfectly satisfactory if a cellulose of high quality is used, but with low-quality wood pulp a marked degradation of the film may take place after a year. Under the conditions adopted the toughest films were obtained when the sulfurized viscose product was dissolved in caustic soda of 7% concn. The quantity of ash, ranging between 0.2 and 1.0%, had no influence on the mech. properties of the film. Within a certain limit of moisture content the tensile strength and elongation increase regularly with the thickness of the film, but with higher moisture the increase in elongation is no longer proportional to the increase in thickness. Increase in moisture decreases the tensile strength and increases elongation, but there is no definite relation. Above 12% of moisture these effects are strongly marked. Generally, if the film is comparatively thin, the influence due to a variation of 1-2% in moisture is negligible. The moisture content of a film of medium softness is 9-12% and independent of the thickness; a soft film has higher tensile strength and lower elongation than a harsh one, apart from the moisture content. The mech. properties of the film depend chiefly on the phys. properties rather than on the chem. properties of the pulp, although the colloidal condition plays a part. The higher the intensity of color of the pulp in cuprammonium soln., the better are the mech. properties. It is advantageous to dry the film before desulfurizing and bleaching; the presence of free fibers in the film is stated to be advantageous from the point of view of strength and elongation, though affecting its transparency and luster.

B. C. A.

Forerunners of rayon. H. A. GOODMAN. *Am. Dyestuff Rept.* 17, 203-6(1928).—An interesting sketch is given, which presents the ideas of Hooke (*Micrographia*, year 1665, *Reaumur Histoire des insectes*, years 1740 to 1754) and those of the workers of the 19th century.

L. W. RIGGS

Possible cellulose bases for rayon manufacture run gamut of vegetable kingdom. JOHN E. JACKSON. *Textile World* 73, 1291-2(1928).—Brief discussion of possible sources of cellulose.

CHAS. E. MULLIN

Artificial silk. J. W. PENNINGTON. *Textile Am.* 48, No. 3, 17-9; No. 4, 17-8, 21; No. 5, 13-5, 52; No. 6, 16-20(1927); 49, No. 1, 16-20; No. 2, 14-6(1928).—The prepn. of the soln. for spinning, the spinning process and the app. used in spinning the four varieties of rayon are described.

CHAS. E. MULLIN

Industrial hygiene and its relation to the manufacture of artificial silk in Italy. UMBERTO POMILIO. *Giorn. chim. ind. applicata* 10, 7-11(1928).—A description, with special reference to the Soie de Chatillon viscose plant, of problems of industrial hy-

giene, such as the removal of H_2S . In any viscose plant H_2S and CS_2 are the chief sources of danger, and if these are properly controlled unhealthful conditions are minimized. The suggestions of Loriga (cf. *Boll. Lavoro*, May, 1925) are considered to be of special value. A survey of different plants indicates that most of the latter eliminate the H_2S danger by diln. of the air, and the methods are so well developed that physiol. disturbances from H_2S are almost unknown. Analyses of spent liquors of the viscose process of the Soie de Chatillon are given to show the character of the waste substances and that such waters are harmless to fauna and flora and can be used for irrigation.

C. C. DAVIS

Efficient arrangement characterizes this modern newsprint mill. A. E. BUCHANAN, JR. *Chem. Mct. Eng.* 35, 205-9 (1928).—The plant of the Anglo Canadian Pulp and Paper Co. at Quebec is described.

E. H.

The acetolysis of mannocellulose (BERTRAND, LABARRÉ) 10. Preparation of larger amounts of vanillin from sulfite waste liquors (KÜRSCHNER) 10. Formation of SO_2 by burning S (ANON) 18. The determination of polysaccharides (APPLEMAN, *et al.*) 7.

REINHOLD, GERHARD: Die Papierholzversorgung. Berlin: Carl Hofmann. G. m. b. H. 147 pp. M. 6. Reviewed in *Pulp and Paper Magazine* 26, 427 (1928).

Cellulose esters. G. SCHNIDER and C. DREYFUS. Brit. 273,743, July 2, 1926. The viscosity characteristics of cellulose esters such as cellulose acetate are lowered by treatment with H_2O_2 in the presence of Fe or an Fe salt, preferably a ferrous salt such as ferrous acetate. The treatment may also be applied to cellulose butyrate or nitrate.

Sheets of cellulose ester compositions. H. J. HANDS. U. S. 1,666,377, April 17. Sheets of material such as photographic films are formed with gradual variations in density, flexibility, etc., from one face to the other of the sheet, which may be produced by superposing different fluent compns. in forming the sheets.

Saccharifying cellulose, etc. H. SCHOLLER. Brit. 273,317, June 23, 1926. Cellulose-dextrins and the like are saccharified by passing dil. acid through the material while heated under pressure; the glucose soln. formed is continuously withdrawn and cooled.

Use of liquid jets for detaching hollow articles of cellulose or cellulose derivatives from molds. WOLFF & Co., E. CZAPEK and R. WEINGAND. Brit. 273,564, Nov. 27, 1926.

Recovering camphor from celluloid or like materials. A. FRIEDEN. U. S. 1,666,645, April 17. Celluloid or similar material from which camphor is to be recovered is placed in an alk. soln. such as NaOH, the strength of which is such that most of the nitrocellulose is not decompd. and the batch is subjected to steam distn. to distil off the camphor.

Hollow filaments from viscose. COURTAULDS, LTD., H. J. HEGAN and E. HAZELRY. Brit. 273,506, July 19, 1926. A viscose contg. Na_2CO_3 (suitably 1-3%) is used with a coagulating bath contg. H_2SO_4 9-11, Na_2SO_4 10-14, $MgSO_4$ 8-14 and $ZnSO_4$ 8% or less (a total of 15-28% sulfates being used in the bath). Glucose or other org. material may also be added to the coagulating bath.

Artificial silk. BORVISK SYNDICATE, LTD. Brit. 273,647, July 2, 1926. Artificial silk having a mat appearance is obtained from viscose by adding, before spinning, olive oil, castor oil, mineral oil, tetrahydronaphthalene or other suitable oils, fats, soaps or hydrogenated hydrocarbons.

Artificial silk. COURTAULDS, LTD., W. H. GLOVER and G. S. HEAVEN. Brit. 273,386, March 29, 1926. Artificial silk of diminished luster is made by spinning a viscose soln. with which has been incorporated a small proportion (suitably about 0.5%) of liquid petroleum or petroleum jelly. The petroleum jelly is retained in the filaments.

Artificial silk. F. J. GAHLERT. U. S. 1,666,090, April 17. Freshly spun threads of artificial silk are treated with water or other suitable softening agent and the softened thread is stretched and retwisted.

Artificial silk, films or other products from cellulosic solutions. WOLFF & Co., E. CZAPEK and R. WEINGAND. Brit. 274,054, July 8, 1926. Products from viscose or other cellulosic derivs. are given a silky luster by mixing with the solns. from which the products are formed powd. asbestos or similar materials.

Apparatus for continuous wet-spinning and collection of artificial silk. W. P. DREAPER. Brit. 273,354, Jan. 11, 1926.

Utilizing material rich in lignin. R. GRIESSBACH and J. EISEL. U. S. 1,666,696, April 17. Lignin from wood meal or similar material is extd. with an org. halogen-contg. solvent such as ethylenechlorohydrin to ext. vanillin and other substances which may be recovered.

Wood pulp. J. D. RUE, F. G. RAWLING and S. D. WELLS. Can. 276,156, Dec. 13, 1927. Wood is treated so as to dissolve the intercellular material without materially decomp. the lignocellulose content, by digestion with an aq. soln. contg. Na_2SO_3 and an alkali capable of producing CO_2 during the period of digestion. The wood is boiled under pressure, CO_2 and steam being released during the boiling period.

Paper-making apparatus. C. J. GUENTHER. U. S. 1,667,516, April 24. Devices are provided for recording the tautness of the sheet and for automatically controlling the heat for drying in accord with the tautness.

Paper-making apparatus. F. MOUFANG. Brit. 273,602, March 26, 1926.

Paper-making apparatus. C. SEYBOLD and J. BOLTERS DORF. U. S. 1,666,472, April 17.

Drying section of paper-making apparatus. E. v. ASTEN. Brit. 273,610, Nov. 11, 1926. Hot air is supplied by rotating slotted tubes.

Paper pulp. S. D. WELLS. Brit. 273,663, June 29, 1926. Materials such as wood, cereal straws and grasses are boiled under pressure with a soln. of Na_2CO_3 to which S is added. Temps. above 120° are suitable.

Beating engine for paper pulp. R. M. WENDEL. U. S. 1,666,587, April 17.

Waterproofed paper. J. RUED. U. S. 1,667,691, April 24. In forming material suitable for waterproof bags the surface layer of paper is infused with bituminous material having a m. p. above 120° by passing it through a bath of the molten material repeatedly and while the latter cools until viscous; the sheet is removed before it is completely satd. with the bituminous material.

Fibrous paint-like material for use as a "substitute for wall paper," etc. G. E. HEYL. Brit. 273,848, April 21, 1926. See U. S. 1,656,198 (cf. C. A. 22, 1051).

Metal foil for wallpaper decoration. ALUMINUM-WALZWERKE SINGEN DR. LAUBER, NEHER Co., GRS. Brit. 273,669, July 5, 1926. Wallpaper such as described in Brit. 247,234 is made with a soft annealed foil, the back of which is preferably roughened as by etching with water-sol. agents such as waterglass or acid or alk. solns. The foil may be attached by an adhesive having an etching action such as a soln. of shellac in NH_4OH .

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

The explosive industry of Italy. FRANCO GROTANELLI. *Atti II congresso naz. chim. pura applicata* 1926, 168-81.—A description of developments since the World War. C. C. DAVIS

Special motors reduce hazards in explosive atmospheres. R. H. ROGERS. *Chem. Met. Eng.* 35, 232-3(1928).—Various types of enclosed elec. motors are described. E. H.

Liquid-air blasting explosives. C. BUNGE. *Z. ges. Schiess-Sprengstoffw.* 22, 21-7 (1927).—Controversial as to the relative tendencies of ordinary and liquid-air explosives to generate toxic fumes, etc. C. G. STORM

A new method of determining water in dynamite glycerol. RIESENER AND KESSEN. *Chem.-Ztg.* 52, 243-4(1928); cf. *Chem.-Ztg.* 23, 975).—A thorough check showed that the H_2O content of a dynamite glycerol after distn. over AgNO_3 was about 0.6% higher than without AgNO_3 . Brown vapors were observed again, especially after distn. was stopped. The AgNO_3 was converted into AgCl . At 140° AgNO_3 is attacked by glycerol, giving a Ag mirror. $\text{CH}_2\text{ClCCl}_3$ heated with AgNO_3 gives small quantities of AgCl , the least with freshly distd. $\text{CH}_2\text{ClCCl}_3$, but the latter always forms HCl on long storage, especially if moist. The proposed method gives false values for H_2O in the glycerol because the H_2O found was not in the glycerol originally. Distn. without AgNO_3 gives concordant results for H_2O . E. M. SYMMES

Explosibility of moving picture films. A. H. GILL and A. H. HAMILTON. *Army and Navy Register* 83, 314(1928).—By firing tests with a 38-caliber pistol it was found that moving picture films, cut or filed to powder, used as the powder charge gave results similar to smokeless powder except that it produced less muzzle velocity and penetration. In one round, at a distance of 10 in. from the target, the bullet penetrated about 2 in. of white pine. CHARLES E. MUNROE

Inflammability. PAUL BEYERSDORFER AND LOTHAR BRAUN. *Z. tech. Physik* **9**, 17-9 (1928); cf. *C. A.* **22**, 1475.—A numerical value for the inflammability of a substance can be given by the quotient (heat of combustion)/(heat of ignition); heat of ignition is ignition temp. divided by sp. heat. For a few substances the value of this quotient is: H_2 (from C_2) 25, H_2 (from C_2) 35, CS_2 63, sugar dust 5, P (yellow) 834, P (red) 128, S dust 39, Al powder in diff. degrees of fineness 1.2, 60 and 140.

B. J. C. VAN DER HORVEN

Limits of inflammability of gases and vapors. H. F. COWARD AND G. W. JONES. *Bur. of Mines, Bull.* **279**, 99 pp (1928).—This presents the results of cooperative work of the Mines Research Board of Great Britain and U. S. Bureau of Mines in detg. the limits in mixts with air, or O and occasionally other atms. of some 34 diff. aliphatic and aromatic hydrocarbons, alcs., acids, esters, ketones, NH_3 , H_2S , CS_2 and other compds., together with many data on mixts of combined inflammable gases and vapors in air and other atms., which includes many com. products such as gasoline and oil, coal, blast-furnace and natural gases. The subject, including Le Chatelier's formula, is discussed at length, and there is appended a considerable bibliography. C. E. M.

The explosion temperature and sensitiveness to impact of liquid and solid explosives. G. TAMMANN AND C. KROGER. *Z. anorg. allgem. Chem.* **169**, 1-32 (1928).—The explosion temp. of an explosive decreases with increasing size of sample and increases with rate of heating. With volatile explosives which melt before exploding the explosive limits are at appreciably higher quantities than with non-volatile explosives, 20 to 100 mg vs 0.4 to 10 mg. With volatile explosives having gaseous products of explosion the substance evaps or decomposes below the explosive limits. Non-volatile explosives decomp. and oxidize below the explosive limits. The dependence of explosion temp. upon rate of heating is linear in most cases, the exception being K picrate. With non-volatile explosives these straight lines do not run parallel with various quantities of sample, and the explosion temp. falls with increasing quantities of sample at the same rate of heating. With volatile explosives the corresponding lines converge at higher rates of heating and intersect at a temp. at which the explosion temp. is independent of temp. Trinitrocresol begins to decomp. at 180° , trinitrotoluene at 150° , detd. by rise in the heating curve. The true explosion temp. of trinitrocresol is 30° to 50° higher than ordinarily observed. The true explosion temp. observed in closed vessels is always higher than in open vessels. On long heating at const temp. the explosion temp. of trinitrotoluene is raised, by formation of decompn. products. Uniform distribution of impact throughout a liquid explosive can cause explosion. Distribution of pressure in an explosive by propagation of impact through a solid substance is quite different from hydrostatic (Hg) propagation where no local high pressures can develop. Suspended in Hg a solid explosive withstands a far greater impact.

E. M. SYMMES

Investigations on the explosion and fire risk of potassium and ammonium persulfates and the best method of packing and loading. G. AGDE AND E. ALBERTI. *Chem.-Ztg.* **52**, 229-32 (1928).—German railways regard $(NH_4)_2S_2O_8$ as safe and impose no restrictions, but some ship lines refuse to load it. $(NH_4)_2S_2O_8$ alone and mixed with ship sweepings gave no deflagration and only charring at 160° . Impact tests with a 10 kg. weight dropped 1 m. were negative. No tests with blasting caps were made as these would not correspond to actual conditions. When heated 20° per min. the decompn point of $(NH_4)_2S_2O_8$ is 180° , of $K_2S_2O_8$ 195° . By admixing 10% org. material the former was reduced to about 160° and the latter to about 185° . Mixed with 10% H_2O and tested at 60° the decompn. was appreciable and increased by the presence of org. material. At a high temp. persulfates melt, evolving SO_3 which chars the org. material, excluding air and hindering combustion. Wood pulp covered with persulfate and ignited only charred and the salt incrustation prevented glowing. Persulfates are neither explosive nor flammable.

E. M. SYMMES

The gaseous explosive reaction—the effect of inert gases. F. W. STEVENS. *Nat. advisory Com. for Aeronautics, Rept.* No. **280**, 12 pp. (1927).—Attention is called to previous investigations carried out under const.-vol. conditions where the effect of inert gases on the thermodynamic equil. was detd. The advantage of const.-pressure over const.-vol. methods as applied to this problem is pointed out and the possibility of realizing a const.-pressure bomb for this purpose mentioned. The application of const.-pressure methods to the study of gaseous explosive reactions, made possible by the use of a const.-pressure bomb, led to the discovery of an important kinetic relation connecting the rate of propagation of the zone of explosive reaction within the active gases, with the initial course of those gases: $s = k_1[A]^{n_1}[B]^{n_2}[C]^{n_3}xxxx$. By a method analogous to that followed in detg. the effect of inert gases on the equilibrium

const., K , this paper records an attempt to det. their kinetic effect upon the expression given above with the result that for N_2 , He and CO_2 it may be stated as follows: $s = k_1[A]^n[B]^m[C]^p \dots + \beta[G_1]$, where $[G_1]$ represents the initial course of the inert gas. From results obtained it seems probable that the value of β depends upon the combined effect of the thermal properties of the inert gas on the heat distribution of the reaction, the property of heat cond. being predominant. An example of the suitability of the const.- pressure bomb for the study of the kinetics of the gaseous explosive reaction is offered in the results of the present paper (cf. *C. A.* 20, 2749). CHARLES E. MUNROE

Processes, products and personnel links explosives manufacture to other chemical engineering industries. E. M. SYMMES. *Chem. Met. Eng.* 35, 234-5(1928).—The inter-relation of the explosives manuf. with other industries is shown by citation of concrete examples. Incidentally attention is called to the recent development of "high count" cartridges of detonating explosives by the use of bulky materials in the dope, the no. of cartridges per 100 lbs. of explosive rising from 270, the former general average, to 500. These high count detonating explosives give a "pushing" effect on explosion similar to black blasting powder CHARLES E. MUNROE

Analysis of nitroglycerin waste acid (WERR) 7. Season-cracking of small-arms cartridge cases during manufacture (GRIMSTON) 9.

Hydraulic press for extruding cordite, etc. J. H. BARKER. *Brit* 273,850, April 24 1926.

Gelatin dynamite. R. B. SMITH and E. M. SYMMES U. S. 1,667,083, April 24 low strength gelatin dynamite contains nitroglycerin 17-18, dinitrotoluene 2-4, "nitrocotton" 0.1-0.2, $NaNO_3$ 60-65, S 9-12, starch 2-5% and a small proportion of chalk.

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

A history of dyestuffs. A. P. SACHS. *Textile Colorist* 50, 87-9(1928) —General. CHAS. E. MULLIN

Standardization of the fastness of dyestuffs. S. G. BARKER. *J. Textile Inst* (special issue) 18, 313-48T(1927) —A survey of the requirements in the establishment of standards of fastness to light. The violet C arc is suggested as the most suitable source of light in fading tests. Fading comprises simple loss of color, color change to a different hue, and loss of brightness, but not of color, *i. e.*, the material looks dull. Its extent for exposures under natural conditions depends on the constitution of the sunlight and atm. conditions, humidity being of special importance, for testing, 75% R. H. is suggested as a standard. Fading is related to the wave length of the incident light, and for expts with a fadeometer the relation, $T = aL^n$, where T is the time of exposure in hours, L the percentage loss of the predominant color, a is a numerical const. depending on the dyestuff, and n is a no. of value about 2, holds approx. except for short exposures. For different depths of shade of the same color the actual loss of color for exposure under the same conditions is approx. const. As increase in the ultra-violet radiation produces increase of fading, an artificial fading lamp should transmit only such radiation in the ultra-violet region as would be detd. by the limits of the solar spectrum, if results are to be compared with those due to sunlight. Several instruments, such as the tintometer, and the Eastman and Guild colorimeters, useful for purposes of color matching, are described in detail. B. C. A.

Standardization of laboratory tests on dyed fabrics for fastness. L. C. HIMEBAUGH. *Proc. Am. Assn. Textile Chem. Colorists* 1928, 125-6; *Am. Dyestuff Rept.* 17, 217-8.—The ability of dyed fabrics to withstand light and power-laundry operations was detd. for a wide range of colors which had proved satisfactory to the trade. The fadeometer and washing tests are described. L. W. RIGGS

New plant of the Thies Dyeing & Processing Company at Belmont, North Carolina. A. H. GRIMSHAW. *Textile World* 73, 2617-21(1928).—A description of the Thies system of dyeing is included. Illustrated. RUBY K. WORTER

Red and yellow dyes from the species of *Centrobolium*. C. D. MELL. *Textile Colorist* 50, 100-1(1928). CHAS. E. MULLIN

Hematoxylin from *Saraca indica*. C. D. MELL. *Textile Colorist* 50, 101-2(1928); cf. *C. A.* 22, 1045. CHAS. E. MULLIN

Neolan dyes for printing wool and silk. ISMAR GINSBERG. *Textile Colorist* 50, 89-91(1928).—Formulas and dyestuffs are suggested. CHAS. E. MULLIN

A wide range of fast shades may be produced on cotton piece goods with naphthol colors. WINN W. CHASE. *Textile World* 73, 457-8, 1301-3(1928).—A discussion of the application of the naphthols, fast color salts and fast color bases, formulas, fastness of the resulting colors, etc. CHAS. E. MULLIN

Determining suitability of dyes. ARTHUR S. ROBERTS. *Textile World* 73, 1313 (1928).—An app. for detg. the capillarity of dyestuff solns. is described. C. E. M.

Azoic and other insoluble colors. A. E. EVEREST AND J. H. WALLWORK. *J. Soc. Dyers Colorists* 44, 101-6(1928).—A history of the production of azoic is given. New processes discovered by the authors are shown. These relate to the application of azoic colors to silk and wool. By the use of selected azoic colors in combination with vat dye discharges it is often possible to produce colors of fastness comparable to those of vat dyes, and which are satisfactory to the "Guarantee" trade. L. W. RIGGS

Direct cotton dyes for viscose. COURTAULDS, LTD. *Textile World* 73, 2627, 2635(1928).—Description of a recently developed temp range test which enables a more selective gradation to be made between the individual dyestuffs than is possible with the capillary test. RUBY K. WORNER

Dyeing, sizing, delustering and scrooping rayon yarn in the skein. R. M. GUTKUNST. *Textile World* 72, 3117-8, 3131(1927).—The requirements for rayon dyestuffs also apply to the selection of vat dyes. Compd. shades should be avoided wherever possible. A good rayon size may be prepd by boiling glue in H₂O and dilg. to 0.25° Tw. at 38°. Add 5% of soap to lubricate and soften the thread. The addn. of a trace of caustic increases the absorption of the size by the rayon, giving a heavier sizing. Rayons may be scrooped by washing in a heavy soap soln. at 49°, hydroextracting and immersing in a bath contg. 160 gal. H₂O, 24 lbs tartaric acid, 8 oz. gelatin and 1 pt. HCHO for 100 lbs. of yarn. It is then hydroextracted again and dried in the usual manner. CHAS. E. MULLIN

Dyeing viscose with direct cotton dyestuffs. ANON. *Rayon* 5, No. 5, 20-3, 34 (1927).—A list of dyes with the capillarity numbers for viscose. CHAS. E. MULLIN

Dyeing viscose with direct cotton dyestuffs. C. E. MULLIN. *Textile Colorist* 49, 591-4(1927); *Can. Colorist Textile Processor* 8, 10-11(1928).—Contrary to the commonly accepted saying that "viscose dyes like cotton," there are many differences in dyeing cotton and viscose, particularly in the selection of easily leveling direct cotton dyestuffs and their correct application for level shades. On cotton the direct dyestuff solns. having the greatest capillary attraction for the fiber give the most level shades, while on viscose the exact reverse is the case. Rapid-dyeing dyestuffs give the most level shades on rayon. In selecting direct cotton dyestuffs for rayon, those having a high capillary number (low capillarity), dyeing most rapidly, bleeding most upon undyed rayon, and requiring the least salt in the dye bath, give the best results. Viscose should be dyed in a bath contg. only soap and dyestuff (no Glauber's or common salt) at a high temp for a short time, say 30 min. It should be entered at the same temp. as the dyeing, 90°. Various tests for detg. the suitability of direct dyestuffs for use upon viscose are described. CHAS. E. MULLIN

Faults in woolen piece dyeing. S. KIRKLAND. *Dyer, Calico Printer* 59, 6-7 (1928).—Causes, prevention and cures. CHAS. E. MULLIN

Comparative tests with the precipitants Katanol and Tamol for basic dyes to obtain lakes. GUSTAVE ARNOLD. *Chem.-Ztg.* 52, 211(1928).—The prepn. of lakes with Tamol which are light-, lime- and water-fast. A. S. CARTER

Black on cotton. H. D. ARNOLD. *Prcc. Am. Assocn. Textile Chem. Colorists* 1928, 129-32; *Am. Dyestuff Rept.* 17, 247-50.—An address. L. W. RIGGS

Rapid and continuous printing. RAFFAELE SANSONE. *Dyer, Calico Printer* 59, 29(1928).—Mechanical. CHAS. E. MULLIN

Printing with naphthol AS dyes. H. GÜRTLER. *Rayon* 6, No. 3, 10-11, 33-4 (1928).—Formulas and methods are given. CHAS. E. MULLIN

Bleaching of "back-greys" (in printing) stained with indanthrene dyes. M. M. CHILKIN. *Textilber* 8, 280-1(1927).—Back-greys, after use for printing indanthrene dyes, become stained in colors very resistant to bleaching when afterwards subjected to a kier boil. Thus, Helindone Orange R yields a pinkish orange stain, Thioindigo Red B a violet. The staining is due to dissoln. of the loose dye on the back-grey in the alk. kier liquor, which has a reducing action, so that dyeing of the back-grey in a pale shade then occurs. Staining is prevented, so that the back-greys may be satisfactorily bleached by adding Leucotrope W to the kier liquor and first maintaining this for 15 min. at 50-100° and ordinary pressure. Alternatively stained back-greys

may be decolorized by boiling for 15 min. at 100° in a liquor contg. 5 g. of caustic soda and 0.03 g. of Leucotrope W per l. B. C. A.

Some "foolproof" dyehouse methods. W. R. SMITH. *Proc. Am. Assoc. Textile Chem. Colorists* 1928, 126-8; *Am. Dyestuff Rept.* 17, 218-20.—Knowing the amt. necessary to dye 100 lbs. of hose, the dyer weighs out that quantity, which is dissolved and made up to 100 oz. One oz. of this stock liquid dyes 1 lb. of material. As the trade demands lots of less than 100 lbs. it is only necessary to weigh out the no. of liquid oz. corresponding to the no. of lbs. to be dyed. This procedure insures uniform shades, and avoids the errors incident to weighing powders for each batch. L. W. RIGGS

Painting of dye houses and bleaching rooms. MAXIMILIAN TOCH. *Textile Colorist* 50, 45-6(1928).—Paints made from China-wood oil varnish and bituminous compounds are superior to linseed-oil paints for materials exposed to Cl. CHAS. E. MULLIN

Textile Research Association plant at the Bureau of Standards, Washington. CHARLES W. SCHOFFSTALL. *Textile World* 73, 1567-70(1928). C. E. M.

Practical textile microscopy. E. R. SCHWARZ. *Proc. Am. Assoc. Textile Chem. Colorists* 1928, 143-8; *Am. Dyestuff Rept.* 17, 261-6.—The app. and technic are described. L. W. RIGGS

Some problems of textile testing. F. T. PEIRCE. *J. Textile Inst.* (special issue) 18, 475-89T(1927).—The influences of variable factors in the testing of textile materials are discussed from a math. point of view. B. C. A.

Ultra-violet radiation as an aid to textile analyses. H. R. HIRST. *J. Textile Inst.* (special issue) 18, 369-75T(1927).—By the examn. of substances submitted to the radiation from a Hg vapor lamp 2 types may be qualitatively distinguished: those showing pure brilliant colors and those having only ordinarily colored appearances. Patterns of dyed fabric which have faded through exposure to light show considerable change in appearance under the influence of this radiation, and the method of examn. furnishes a means of controlling the dyeing process in the production of shades fast to light. Many benzene substitution products, and azo dyes having benzene nuclei, show no fluorescence; similar naphthalene compds. and dyes are strongly fluorescent. α -Naphthol in aq. alk. soln. gives a brilliant blue, β -naphthol a violet fluorescence, while salts of fluorescent compds. are more fluorescent than the acids or bases themselves. Solns. of fluorescent compds. (e. g., α - or β -naphthol, or quinone sulfate) may be used as indicators for the titration of colored or turbid solns., since definite changes in the color of the fluorescence are given at the neutral point. Textile fibers, and the same fibers in different stages of bleaching, give characteristic colors and can be thus identified; the method also furnishes information about oils and oil, mildew and other stains on wool fabrics. Unsatsd. fatty acids give blue or violet, the satd. compds. white, and oxidized fatty acids yellow-brown or no fluorescence. Satd. hydrocarbon oils are non-fluorescent and unsatd. strongly so, although oxidation appears to destroy the source of fluorescence in oils. B. C. A.

Transmission of ultra-violet radiation by various fabrics. H. R. HIRST, P. E. KING AND P. N. LAMBERT. *J. Soc. Dyers Colorists* 44, 109-13(1928).—The construction and use of app. for measuring the transmission of ultra-violet radiation by fabrics are described. An examn. of over 100 fabrics showed that every one cuts off a large proportion of the ultra-violet radiation. The amt. transmitted depends mainly on the weave and texture of the fabric and not on the material of the fiber, as has been claimed elsewhere. For equal thicknesses of material, wool has on the whole a higher transmissive power than the other fabrics examd. Any kind of dyeing decreases the ultra-violet transmission. These results are in agreement with those of the U. S. Bureau of Standards, published while this work was in progress. L. W. RIGGS

Strength test for knitted fabrics. W. H. WHITCOMB. *Textile World* 73, 1701-2(1928).—The rubber diaphragm of the usual fabric bursting machine is a const. and variable source of error in all detns. In order to avoid this error, an app. has been developed and is described, wherein a hemispherically topped steel plunger furnishes the bursting pressure. Three tables of results are given. CHAS. E. MULLIN

Cleaning and brightening prints. HENRY P. BAND. *Dyer, Calico Printer* 59, 8-9(1928). CHAS. E. MULLIN

Facts and fallacies in fulling. A. W. DAVIDSON. *Dyer, Calico Printer* 59, 38-9(1928). CHAS. E. MULLIN

A practical program for humidity (in textile manufacture). GEORGE B. HAVEN. *Textile World* 73, 1700-1(1928).—It is proposed, among other things, to retain 70° F. and 65% relative humidity as standard condition, and to specify a standard regain for cotton of 6.5% for fabrics and heavy yarns, 7.5% for fabrics and 8.5% for fleece cottons. CHAS. E. MULLIN

Constant humidity in textile testing. R. W. FEARNSIDES. *Textile Recorder* **45**, No. 539, 52-4, 68(1928).—The effects of humidity on regain upon the results of tests are discussed. CHAS. E. MULLIN

Humidity alters worsted yarn. GEORGE BARKER. *Textile World* **72**, 3131(1927); *Dyer, Calico Printer* **59**, 17(1928). CHAS. E. MULLIN

Extensibility of flax yarns. J. A. MATTHEW. *J. Textile Inst.* (special issue) **18**, 506-14T(1927).—A brief survey of published work with deductions therefrom. It is shown that stretch-load diagrams from flax yarns may be interpreted to reveal effects due to differences in the nature of the fiber in the yarns, and a measure is deduced which reveals the effects of past tensions and is an indication of irregularities in mfg conditions. B. C. A.

Use of fine filament yarns. G. J. GROH. *Textile World* **73**, 2606-7(1928).—An address, dealing with problems and methods of treating and dyeing fine filament rayon yarns and knit fabrics made from them. The development of an all-around ideal oil to be used on rayon yarns is not yet accomplished. RUBY K. WORNER

The contact potential of textile fibers in water. P. KARRER and P. SCHUBERT. *Helv. Chim. Acta* **11**, 221-9(1928).—The potentials at the surface of contact of a no. of textile fibers in water have been detd. The exptl. method and data are given. Silk appears to be the most nearly electrically compensated fiber. Wool assumes in water a strongly negative character. Cu, Chardonnnet and viscose rayons are only weakly negative, while cellulose acetate is strongly so. The decrease in negative character going from native to mercerized cotton to regenerated cellulose is striking. All yarns treated with pyridine assume a positive charge. There appears no relation between the contact potential and dyeing properties, enzyme resistance or the acid or salt content of the coagulation bath of the viscose rayon. RUBY K. WORNER

Moisture relations of colloidal fibers. J. J. HEDGES. *J. Textile Inst.* (Special issue) **18**, 350-9T(1927).—The percentage regain of wool obtained by use of a com. oven is always lower than that given by a lab. method. A Bradford Conditioning House oven gives results as near the true moisture content as can be obtained without circulating dry air through the oven, the attraction for the last traces of moisture being very great. Curves for the variation of moisture content of chemically pure wool with atm. R.H. are of the usual sigmoid character given by other hygroscopic colloids. The heat of wetting of dry wool is considerable, being 24.1 g.-cal./g. Wool and its absorbed water may be considered as a two-phase system in which a little water is adsorbed by the colloid particles, while the bulk is held in a system of pores. The difference between the apparent (in water) and true sp. vols. of wool is much greater than that between the corresponding values for cotton, which, in conjunction with the relative values of the satn. moisture contents, points to a much greater contraction in total vol. for wool. Wool, artificial silk and silk (except heavily weighted silk) are perfect elec. insulators when dry and all, except chemically pure wool, increase in cond. with increasing humidity. The fastness to light of dyed fabrics also appears to depend on the amt. of moisture present. B. C. A.

Cultivation and preparation of jute fiber for the market. T. WOODHOUSE and A. BRAND. *Textile Recorder* **45**, No. 539, 67-8(1928).—Reeling is described and discussed. CHAS. E. MULLIN

Nature of the action of sunlight on cotton. C. BARR and (MISS) I. H. HADFIELD. *J. Textile Inst.* (special issue) **18**, 490-3T(1927).—Continuous decrease of strength and of the viscosity in cuprammonium soln., with increase in reducing power (as shown by the Cu and Ag nos.), are obtained with increasing time of exposure of cotton, while the methylene blue absorption shows first a fall and then a slow rise, the modification of cotton thus produced corresponding to that formed by mild oxidation with Cl water. Expts. with linen show the reaction to be essentially one of oxidation, loss of strength occurring most rapidly in O, less so in air, and to an almost negligible extent in a vacuum, H, or CO₂. No significant change takes place when strips of cotton cloth are exposed for 6 months in sealed glass tubes contg. H, either dry or about 2/3 satd. with water vapor. Similar exposure in tubes contg. O results in considerable loss of strength with increase of Cu no. and the production of CO₂, and CO and perhaps H, the reaction being more rapid in the presence of moisture and a rough parallelism being shown between Cu no. and the corresponding quantities of CO₂ produced. Similar cloth previously steeped in 0.001N H₂SO₄ is more highly reducing and shows a greater production of CO₂ after exposure under the same conditions. Pptn. of Fe(OH)₃ on the cotton before exposure (0.1% Fe₂O₃ on the wt. of cloth) results in increased attack but diminished formation of CO₂. It is suggested that at least 2 reactions may occur during the exposure of cotton to sunlight, both being accompanied by the development of

reducing power and loss of strength, but one producing much less CO_2 than the other, Fe being a photocatalyst to the latter reaction. B. C. A.

Sizing of cotton. PAUL KRAIS AND HERBERT GENSEL. *Dresdner Forschungsinstitut für Textilindustrie, Forschungsheft 7; Leipzig. Monatschr. Textil Industrie* **43**, 3-7, 50-3(1928).—Exptl. studies with a miniature slasher showed that wheat starch and potato starch worked up with *activin* give good results. E. R. CLARK

After-treatment of hypochlorite-bleached cotton with commercial hyposulfites. H. KORTÉ. *Leipzig. Monatschr. Textil Industrie* **43**, 30-2, 73-5(1928).—In Cl bleaching, after treatment with $\text{Na}_2\text{S}_2\text{O}_4$ (Blankit I) gives material of better appearance than similar use of NaHSO_3 . Blankit is really a bleaching agent; for anti-chloring NaHSO_3 is as good and cheaper. Blankit is specially useful in cold bleaching. E. R. CLARK

Strength of oiled cotton cloth. A. H. GILL AND W. D. MCJENNETT. *Textile World* **73**, 2621-3(1928).—In general, oiled cotton cloth shows a gain in tensile strength during the first 2 weeks after oiling and a loss during the subsequent 3 weeks. The gain is ascribed to the oil acting as a glue, the loss to oxidation. The comparative effect on the tensile strength of cotton cloth, of raw and boiled linseed oils with or without driers is shown. RUBY K. WORNER

Some chemical aspects of wool research. A. T. KING. *J. Textile Inst.* (special issue) **18**, 361-8T(1927).—Clean wool removes hydrolysis-alkali from neutral soap solns., the liberated fatty acids being partly deposited on the fiber as acid soap and partly left in suspension in the liquid. In proportion to the amt. of NaOH absorbed, the wool becomes yellowed by heating or steaming, acquires an increased affinity for dyestuffs, is more susceptible to bacterial attack, and less resistant to bleaching and chlorination. Wool keratin allows of no criterion of purity. Its S content varies not only with variety, but also with fibers of different fineness from the same fleece. Approx. 66% of the total S is removed in cystine, one of the most readily isolated of the hydrolysis products of wool, but although several products of amino-acid nature of known constitution have been obtained by the acid hydrolysis of keratin, no light has been shed on the nature of the keratin complex. In view of the changes in properties (e. g., dyeing affinity) produced by exposure or chem. processing, it is suggested that some form of incipient hydrolysis occurs which, if it does not detach the simpler proteins, liberates their active groups by lactone or other ring formations. The anhydride of glycine (diketopiperazine) is suggested as representing the ring formation predominantly present in keratin, and its behavior on hydrolysis as being similar to that of keratin; a large no. of substituted diketopiperazine ring formations are, however, possible. The cystine nucleus may act as an O carrier in a similar manner to glutathione from which it is derived by hydrolysis, thus explaining the oxidation occurring on the exposure of neutral wool to light, and the behavior of certain azo dyes on wool. B. C. A.

Yield and scour tests (on raw wool). ANON. *Textile Recorder* **45** No. 539, 76 (1928).—A sample washing machine for raw wool is shown. CHAS. F. MULLIN

Pointers on wool oiling and scouring. JAMES JOHNSON. *Textile Colorist* **50**, 102-3 (1928).—General. CHAS. F. MULLIN

Wool scouring. A discussion of soap in its relation to the scouring of wool. How to determine the efficiency of a soap for wool scouring. PROCTER & GAMBLE. *Textile Res. Div., Procter & Gamble Wool Scouring Bull.* No. 1, 1-19.—The most desirable characteristics in a soap for wool processing are high degree of soly., high degree of rinsibility, ability to form a stable fatty acid emulsion in the presence of acids, low degree of hydrolysis, low degree of preferential absorption, and stability toward oxidation and rancidity. Since the properties of a soap are dependent finally on the percentage of solid and liquid fatty acids, comparison of a soap made from 100% liquid fatty acid with one made from 100% solid fatty acid furnishes data for detg. the efficiency of any soap made from a mixt. Na oleate and Na stearate were studied. The former was superior in all respects except the tendency to become rancid. If this tendency is no greater than that of Na oleate, the soap will be sufficiently stable for practical purposes. Conclusion. In general, the higher the percentage of liquid fatty acid in the stock from which the soap is made, the more nearly ideal that soap will be for the scouring of wool. RUBY K. WORNER

Recent wool finishing manufacture. The chlorination process. RAFFAËLE SANSONE. *Textile Recorder* **45**, No. 539, 57-64(1928).—The process and app. used are described. CHAS. F. MULLIN

Intracellular structure of the wool fiber. J. B. SPEAKMAN. *J. Textile Inst.* (special issue) **18**, 431-53T(1927); cf. C. A. **21**, 2068.—The elastic properties of the wool fiber

as a whole are those of the single cell, which is assumed to consist of an elastic cell wall, enclosing a fibrillar structure the interstices of which are filled with a viscous medium. This structure tends to lie preferentially along the axis of the fiber and is heterogeneous in compn. Under small stress, extension of the cell is at first delayed by internal friction, Hooke's law being obeyed up to 2% extension for different wools in water and for the same wool at different humidities; for the same wool in water at higher temps. (up to 100°), deviation begins between 1.4 and 2% extension. Above this crit. value rapid extension occurs chiefly by rotation of the fibrillae, the rate being detd. by the viscosity of the medium within the cell and the elastic constns. of the cell framework; it is greatest at high humidities. When all the fibrillae are drawn into line, extension is retarded and afterwards takes place by direct extension of the fibrillae. The parts of the cell structure which are not plastic in water at ordinary temps. become so at higher temps., while at 100° extended fibers take a set which is permanent as regards subsequent immersion in cold water and is due to plastic flow within the fibrillae. Different wools show fibrilla plasticity to different degrees, and for ease in manuf. wools should be highly plastic. B. C. A.

The nitrogen content of natural and processed wools. JOHN BARRITT. *J. Soc. Chem. Ind.* 47, 69-72T (1928).—Analytical methods and results are given. With the exception of the colored samples, natural wools varying widely in quality of fiber and locality where grown show little variation in N content. The av. value is 16.72%. The N content of the colored samples decreases with increasing color contrast, suggesting the presence of a pigment of lower N content than normal wool. The general effect of alkali is to increase the N content, that of acid to decrease it. The portion of wool substance removed by chlorination and also by chlorination followed by treatment with dil. NH_3 soln. appears to have a similar N content to that of the remainder. RUBY K. WORNER

Testing black silk for loading substances. JAMES R. SPENCER. *Textile Colorist* 50, 109 (1928).—Various tests are outlined. CHAS. E. MULLIN

Determination of materials used in weighting raw silk. JAMES WALLACE. *Textile Colorist* 50, 111 (1928).—Fat, soap, glycerol and sugar are sometimes used to increase the wt. of raw silk. Various methods of detecting these are suggested. C. E. M.

Determination of the physical properties of artificial silk and their relationship to textile manufacture. A. L. WYKES. *J. Textile Inst.* (special issue) 18, 494-505T (1927).—An artificial silk thread acts as though it consisted of 2 components, one brittle and one ductile, difficulties in weaving and knitting being ascribed to this dual nature. Its percentage extension under load increases very slowly with increasing tension until a yield point is reached, when it increases rapidly. Tension-% extension curves show that artificial silk can be converted into such a form that the thread is very brittle, very strong, and almost completely elastic, and it is suggested that the material under ordinary conditions contains a varying proportion of this brittle form of cellulose. For a thread tested first in a dry and then in a wet state the following relation holds. E/T for dry viscose, $E/1.9T$ for wet viscose (where E is the % extension and T the tension), and from it the phys. properties of any viscose silk, e. g., yield point, elasticity, etc. may be calcd. B. C. A.

Methods of applying rayon size have undergone gradual change. ANON. *Rayon* 6, No. 3, 12-3, 22 (1928).—Sizing formulas and methods of application are discussed. Tragacanth and gum arabic are recommended for rayon. CHAS. E. MULLIN

Waterproofing umbrella cloth, awnings and rain coats. GEORGE RICH. *Dyer, Calico Printer* 59, No. 697, 60-1 (1928).—General. CHAS. E. MULLIN

Why, when and how of temperature control. T. J. KENNY. *Proc. Am. Assocn. Textile Chem. Colorists* 1928, 123-5; *Am. Dyestuff Rept.* 17, 215-7.—The 2 types of thermoregulators discussed are represented by the externally controlled which is more sensitive than necessary in dye work, and the self-contained type which holds the temp. within 2 to 2.5° F. Large saving of heat and more uniform results follow the proper use of temp.-control app. L. W. RIGGS

Oil sizes and finishes. J. J. SOKOLINSKI. *Proc. Am. Assocn. Textile Chem. Colorists* 1928, 136-9; *Am. Dyestuff Rept.* 17, 254-7.—An address. L. W. RIGGS

Possible cellulose bases for rayon manufacture (JACKSON) 23. Condensation product of olefins with hydrocarbon of the naphthalene series [as intermediate] (U. S. pat. 1,667,214) 10. Alkali fusion [production of indanthrene blue R] (U. S. pat. 1,667,480) 10. Isoelectric point of silk fibroin (DENHAM, BRASH) 2.

Dyes. H. A. E. DRESHER, J. E. G. HARRIS, B. WYLLAM, J. THOMAS and SCOTTISH DYES, LTD. Brit. 274,156, March 15, 1926. Vat dyes and quinones generally are converted into water-sol. derivs. of their reduction products by treatment in the presence of a tertiary base with a quaternary NH_4 halide, a metal and a compd. of a tertiary base with SO_3 such as the product from pyridine and methylchlorosulfonate. Several examples are given.

Dyes. SOC. POUR L'IND. CHIM. A. BALE. Brit. 274,130, July 10, 1926. Azo dyes of the general formula $\text{R}'-\text{N}:\text{N}-\text{R}''-\text{NH}-\text{X}-\text{NH}-\text{R}'$ (in which R' is an α -naphthyl residue coupled in the *peri*-position to the azo group, R'' the residue of a primary amine of the C_6H_5 or C_{10}H_7 series which can be coupled in the 4-position to the amino group, R''' any aromatic complex contg. at least one azo group, and X a connecting link such as $-\text{CO}-$ or $-\text{CS}-$) are obtained by the action of phosgene or a substitute or thiophosgene or CS_2 on 2 mol. proportions of aromatic amino compds. of which at least one must consist of an aminoazo dye obtained by coupling a diazotized 1,8-aminonaphthol or an *O*-acydyl deriv. with a primary amine of the C_6H_5 or C_{10}H_7 series, while the other may consist of an aminomono- or polyazo dye or of a component of such a dye which can be transformed into the dye after being united with the first-mentioned aminoazo dye. The products dye vegetable fibers in various shades of orange, red and blue which are fast to light and can readily be discharged. The fastness of some of the dyeings can be increased by after-treatment with metal salts, or the dyes may be converted into metal compds. Several examples are given.

Dyes and lakes. I. G. FARRENIND. A.-G. Brit. 274,128, July 9, 1926. Azo dyes are made in substance, on a substratum, or on the fiber, by coupling a 1,3-dimethyl-4-amino-6-halogen (or 2,6-dihalogen)-benzene with a 2,3-hydroxynaphthoic arylide. Various shades of yellow and red are obtained and several examples are given. 1,3-Dimethyl-4-amino-6-halogen (or 2,6-dihalogen)-benzenes are obtained by halogenating asym-*m*-xylidine in H_2SO_4 or by similar processes. Cf. C. A. 21, 2804.

Azo dyes. H. FRITZSCHE, E. KRUMMENACHER, H. GÜBLER and O. KAISER. U. S. 1,667,312, April 24. Azo dyes which contain the cyanuric nucleus are formed by condensing a cyanuric halide with components which have reactive H atoms attached to O, S or N and at least one of which components contains an azo group. A large no. of detailed examples are given for producing dyes of a wide variety of colors.

Azo dyes. M. ISLER and L. VON MEHREL. U. S. 1,667,318, April 24. A large variety of azo dyes are produced by combination of 3-amino-1,8-naphthalenedicarboxylic acid with the diazo derivs. of 1-aminobenzene-4-sulfonic acid, 5-nitro-2-amino-1-phenol-4-sulfonic acid and other components. The dyes are yellow to brown and black powders, which dye wool in an acid bath yellow to brown, violet and grayish blue tints. They have characteristics of mordant dyes. Numerous examples are given.

Azo dyes. A. L. LASKA and A. ZITSCHER. U. S. 1,667,667, April 24. Diazotized aromatic aminopseudoazimine compds. with arylides of 2,3-hydroxynaphthoic acid are specified. The aminopseudoazimines may be obtained by reducing nitro-substituted pseudoazimines or according to the process of Schmidt and Hagenböcker, which involves treating *o*-aminoazo dyestuffs with $\text{CuO}-\text{NH}_4$ salts (cf. C. A. 16, 1092). Among the compds. of this kind, not described hitherto, the following may be mentioned: 2-(2'-aminophenyl)pseudoazimino- α - β -naphthalene, crystg. from 80% alc. as feebly colored granules, m. 120° (not corr.); 2-(3'-aminophenyl)pseudoazimino- α - β -naphthalene, crystg. from a mixt. of xylene and ligroin as almost colorless granules, m. 160° (not corr.); 2-(4'-aminophenyl)pseudoazimino- α - β -naphthalene, crystg. from xylene as almost colorless granules, m. 203–205° (not corr.); 2-(3'-amino-4'-methylphenyl)pseudoazimino- α - β -naphthalene, obtained from a mixt. of xylene and ligroin as colorless scales, m. 172–173° (not corr.); 2-(3'-amino-4'-methoxyphenyl)pseudoazimino- α - β -naphthalene, crystg. from xylene as feebly yellowish soft needles, m. 185° (not corr.); 2-(2'-amino-4'-methylphenyl)pseudoazimino- α - β -naphthalene, crystg. from a mixt. of alc. and pyridine as lemon-yellow soft needles, m. 137–136° (not corr.); 2-(2'-amino-4'-chlorophenyl)pseudoazimino- α - β -naphthalene, crystg. from xylene as feebly yellowish glassy scales, m. 192° (not corr.). As azo components for the process all the arylides of 2,3-hydroxynaphthoic acid may be used, e. g., the anilide, toluidides, anisidides and phenetidides, α - and β -naphthalide, arylides, chloro-substituted in the arylido residue, the bis-2,3-hydroxynaphthoylarylenediamines. The dyes obtained (numerous examples of which are given) are suitable for the production of lakes and when produced on vegetable fiber give fast scarlet red to dark violet shades. Cf. C. A. 22, 1049.

Triazo dyes. B. MAYER and J. GRUNGER. U. S. 1,667,327, April 24. Substantive azo dyes are obtained by coupling equimol. proportions of resorcinol, diazotized

dehydrothio-*p*-toluidinesulfonic acid and a diazotized amino-azo dye of the general formula $R'-N:N-R''-NH_2$, in which R' and R'' are aromatic nuclei free from OH groups and at least one of which contains a sulfonic group. The dyes produce yellow-brown to red-brown and violet-brown tints on cotton and may be readily discharged. Several examples are given.

Vat dye. J. G. DINWIDDIE. U. S. reissue 16,939, April 24. See original pat. 1,558,252; C. A. 20, 114.

Dyes from benzanthrone derivatives. I. G. FARBENIND. A.-G. Brit. 273,656, July 1, 1926. The 2-benzanthronyl-1-aminoanthraquinones obtainable by condensing 2-halogenbenzanthrone with 1-aminoanthraquinones are treated with acid condensing agents such as H_2SO_4 , H_3BO_3 or a mixt. of $AlCl_3$ and $NaCl$; the resultant dyes produce on vegetable fibers from the vat orange-red, brown and violet-brown shades.

Metal compounds of dyes. F. STRAUB and H. SCHNIDER. U. S. 1,667,333, April 24. Metal compds. such as those of Cu, Cr, Ni or Co are obtained from azo dyes produced from 2-amino-1-hydroxynaphthalene-4,8-disulfonic acid and other components such as β -naphthol, 1-hydroxynaphthalene-3,8-disulfonic acid, 1-phenyl-3-methyl-5-pyrazolone or α -naphthol. Several examples are given of dyes producing different colors.

Anthraquinone derivatives. I. G. FARBENIND. A.-G. Brit. 274,211, April 19, 1926. *p*-Diaminoanthrarufin-2,6-disulfonic acid or one of its *N*-methyl derivs is condensed, in the form of its boric acid ester in H_2SO_4 soln, with PhOH or other suitable aromatic hydroxy compd. or an ether of such a compd. in equimol. quantity or in excess. Addn. products are first obtained which upon further treatment with acid or alk. reagents are converted into other compds. in which the phenol residue has probably replaced a sulfo group with elimination of SO_2 . These compds. dye wool or mordanted wool fast blue shades. By removing the second sulfo group other products may be obtained which may serve as mordant dyes or as intermediates. Several examples are given.

Leuco flavanthrone, etc. B. WYLLAM, J. F. G. HARRIS, J. THOMAS and SCOTTISH DYERS, LTD. Brit. 274,303, March 1, 1926. Leuco flavanthrone is treated with chlorosulfonic acid in the presence of a tertiary base such as pyridine at a temp. of not less than 45°. Reddish compds. are obtained which after soln. in weak alkalis such as Na_2CO_3 soln. can be used for dyeing or printing cotton and the shade of flavanthrone developed by hydrolysis and oxidation.

Carbonizing fabrics. C. DREYFUS, R. G. DORT and H. PLATT. Brit. 274,074, July 8, 1926. Carbonization treatment is applied to mixed fabrics or articles comprising fibers or threads of cellulose acetates, propionates or other org. esters or ethers of cellulose mixed with vegetable fibers. $AlCl_3$ may be used as carbonizing agent and the luster of the cellulose esters or ether may be preserved by adding a protecting salt such as Na_2SO_4 , or the luster may be restored by a soaping treatment. The dye resist properties of cellulose acetate and the like to wool dyes are unaltered by the carbonization treatment. The process may be used in the production of embroidery from cellulose acetate or similar fibers on a cotton or jute canvas which is removed by carbonizing with HCl, rinsing and soaping.

Jigger dyeing-apparatus. D. McCAIG and R. LIVINGSTONE. Brit. 273,418, April 13, 1926.

Dyeing cellulose acetate. DURAND ET HUGUENIN SOC. ANON. Brit. 274,094, July 10, 1926. An ester salt of a leuco-vat-dye is applied, steamed and developed at a high temp. by an oxidizing agent such as H_2SO_4 (which may be used at a temp. of 80°) and a nitrite or dichromate. Solid shades are thus obtainable on a mixed fabric of cotton and cellulose acetate.

Dyeing cellulose acetate. BRITISH CELANESE, LTD. and G. H. ELLIS. Brit. 273,819, April 10, 1926. Insol. or difficultly sol. coloring substances or org. compds. for dyeing or printing cellulose acetate and the like are solubilized by pretreatment with sulfo-aromatic ricinoleic acids such as sulfo-benzene-(or phenol or naphthalene) ricinoleic acid or their salts. Several examples are given. Brit. 273,820 specifies the use of sol. resin soaps or Na or other sol. salts or soaps of resin acids as solubilizing agents (preferably as free as possible from free alkalis).

Dyeing, printing or stenciling of cellulose acetate. H. DREYFUS. Can. 276,512, Dec. 20, 1927. Stilbene disazobisphenol, stilbene disazobis-*m*-toluidine, stilbene disazobis- α -naphthylamine, aminostilbene-azo-*m*-phenylenediamine or aminostilbene-azo-*m*-toldidine is employed in the dyeing, printing or stenciling of threads, yarns, fabrics, etc., made with or contg. cellulose acetate.

Dyeing, printing or stenciling of cellulose acetate. G. H. ELLIS and W. O. BOB-

THORPE. Can. 276,515, Dec. 20, 1927. Materials contg. cellulose acetate are treated with relatively H_2O -sol. org. compds. capable of coloring cellulose acetate, such org. compds. being employed in the form of solubilized modifications obtained by pretreating them with a solubilizing agent consisting of a Na salt of sulforincinoic acid and with at least 1 hydrocarbon.

Dyeing cellulose esters. R. MERTZGER. U. S. 1,666,715, April 17. Molasses is used with aminoazobenzene, dinitrodiphenylamine or other org. substances capable of producing dyeings in full and deep shades on cellulose esters such as cellulose acetate but not sufficiently sol. in water to permit use of its simple aq. soln. The molasses may in part be replaced by concd. sulfite cellulose waste liquor.

Dyeing cellulose esters and ethers. C. DREYFUS. Brit. 273,692, June 30, 1926. When Fe-mordanting material made from cellulose acetate or other cellulose esters or ethers, concd. solns. (suitably those of 40-55% strength) are used of Fe salts such as $Fe(NO_3)_3$, $Fe_2(SO_4)_3$ or $FeCl_3$. The treatment may be effected at a temp. of 40-60° and excess Fe salt may be removed and the material treated with a cold aq. NH_3 bath after washing. The product is readily dyed with vegetable dyes such as logwood (which gives deep black on cellulose acetate). Brit. 273,693 specifies the use of mordanting salts such as acetates of Cr, Al or Fe in connection with swelling agents such as formic acid, HOAc, furfural, PhOH and pyridine. The treatments may be applied to mixed goods formed only in part of cellulose esters or ethers.

Dyeing of material containing cellulose derivatives. H. DREYFUS, Can. 276,553, Dec. 27, 1927. Materials, comprising an org. substitution deriv. of cellulose, are dyed with a coloring compd. comprising at least 1 urethan residue. Cf. C. A. 22, 1859.

Dyeing of materials containing cellulose derivatives. H. DREYFUS. Can. 276,554, Dec. 27, 1927. Materials, contg. an org. substitution deriv. of cellulose, are dyed with an azo coloring compd. which comprises at least 1 amino group substituted by a glyceryl residue.

Dyeing of materials containing cellulose derivatives. H. DREYFUS. Can. 276,555, Dec. 27, 1927. Materials, contg. an org. substitution deriv. of cellulose, are dyed with a coloring compd. which comprises at least 1 ω -amino group.

Dyeing of materials containing cellulose derivatives. H. DREYFUS. Can. 276,556, Dec. 27, 1927. Materials, contg. an org. substitution deriv. of cellulose, are dyed with a coloring compd. in which an aryl dye nucleus is linked through N_2 to at least 1 glyceryl residue.

Dyeing artificial silk. J. BADDILEY, P. CHORLEY and C. BUTLER. U. S. 1,667,524, April 24. Regenerated cellulose "silks" are dyed with the secondary diazo dyes which can be made by combining amino-*o*-hydroxycarboxy acids of the $C_{10}H_8$ series such as aminosalicic acids with α -naphthylamine or other usual middle components, further diazotizing and combining with a sulfonated 1,8-disubstituted $C_{10}H_8$ deriv. Cf. C. A. 22, 875.

Dyeing cotton. SANDOZ CHEMICAL CO., LTD. and A. E. WOODHEAD. Brit. 274,276, July 19, 1926. Cotton which has been treated by processes as described in Brit. 224,502 and Brit. 241,854 (C. A. 20, 3577) and in German pat. 346,883 is colored according to the process described in Brit. 246,609 (C. A. 21, 501) in which there is used substantially insol. dyes which have been solubilized by treatment with higher fatty acids or their sulfo or other derivs. or salts of such acids or derivs. The process of German pat. 346,883 comprises the treatment of alkali-treated cotton with aromatic acid chlorides in the presence of inert solvents.

Dyeing textile materials. J. S. WILSON, J. THOMAS and SCOTTISH DYES, LTD. Brit. 274,178, April 12, 1926. A mixt. of 2 or more vat dyes is used, of which at least one is dischargeable with a reducing agent in conjunction with a leucotrope while at least one is not dischargeable; the material is then printed with an appropriate discharge paste to obtain a 2-color effect. Several examples are given.

Dyeing and other treatments of rolls of fabric by immersion. W. FEHRMANN. Brit. 273,828, April 12, 1926. Mech. features.

Printing fabrics. C. DREYFUS. Can. 276,367, Dec. 20, 1927. To portions of a mixed fabric contg. fibers of a cellulose deriv. there is applied a mixt. of 12 parts of infusorial earth, 5 parts dextrin, 30 parts lactic acid and 3 parts H_2O . This mixt. is allowed to remain in contact with the fabric at a temp. below 125° until at least a part of the fibers of the cellulose deriv. are removable by washing with water.

Preparing fibers for spinning. NAAMLOOZE VENNOOTSCHAP OCTROOI MAATSCHAPPIJ VEDE. Brit. 274,331, Nov. 8, 1926. Straw, grasses, especially agaves, cantula, sicilana, coconut husks, leaves, barks, etc., are treated with an alk. soln. such as NaOH, if necessary with the addn. of a catalyst such as a soln. of a salt of a heavy metal such as $CuSO_4$.

or Ni sulfate and NH_4Cl , and the material is then treated (while still impregnated with the alkali soln.) with stearic acid or other suitable fat, fatty acid, oil or emulsion.

Mercerizing and similar treatments of fabrics. M. MELLIAND. Brit. 273,327, June 25, 1926. In the treatment of cotton materials, the ordinary mercerizing processes may be used and may precede or follow treatment as described in Brit. 254,605 (C. A. 21, 2565). The liquors are used alternately hot and cold in any desired sequence. If the soln. employed for the hot treatment is of higher concn., such as 60% NaOH , the feel of the material becomes somewhat fuller.

Composition for edging fabrics. * T. MILLER. U. S. 1,666,143, April 17. Shellac 15, rosin 5, stearic acid 5.5 and a metallic powder such as Al or bronze 5.5 parts.

Treating vegetable yarns and fabrics. A. BODMER. U. S. 1,666,082, April 17. The material is given a permanent finish by treating it with an inorg. acid such as concd. H_2SO_4 , capable of dissolving cellulose, in the presence of pyridine or other heterocyclic base contg. a pyridine nucleus and which serves to stabilize the reaction by retarding its rate without inhibiting the ultimate effect desired. U. S. 1,666,083 relates to similar processes of producing wool-like effects on cellulosic yarns and fabrics.

Obtaining metallic effects on fabrics. R. CLAVEL. Can. 276,359, Dec. 20, 1927. Metallic effects are obtained on fabrics contg. org. derivs. of cellulose by applying to the surface of the fabric a paste contg. a gum, a solvent for the org. derivs. in the fabric and a powder suitable for obtaining the desired effects.

Mothproofing various materials. I. G. FARBERIND. A.-G. Brit. 274,425, July 13, 1926. Wool, skins, hair or other materials are treated with 1-hydroxy-4-chloro-2-benzoic acid, 1-hydroxy-4,6-dichloro-2-benzoic acid or similar compds. or sulfurized derivs. of such compds.

Washing wool. E. C. DUHAMEL and COMPAGNIE GÉNÉRALE DES INDUSTRIES TEXTILES. Brit. 273,755, May 4, 1925. The process of Brit. 256,635 (C. A. 21, 2990) is used, so far as applicable, to wool in sheep-skins or on live sheep.

Washing wool. E. C. DUHAMEL and COMPAGNIE GÉNÉRALE DES INDUSTRIES TEXTILES. Brit. 274,100, May 4, 1925. The process of Brit. 240,477 (C. A. 20, 2253) is modified to apply to limed, acidified or similarly treated wool flocks; they are subjected to a preliminary desuinting washing, *e. g.*, with soap or Na_2CO_3 , before entering the suint bath. Various details are described.

Mercerizing cotton associated with cellulose acetate. CALICO PRINTERS' ASSOCIATION, LTD., L. A. LANTZ and C. M. KRYWORTH. Brit. 273,830, April 12, 1926. Cotton fabrics contg. cellulose acetate artificial silk are mercerized with caustic lye in the manner usual for cotton fabrics, after the acetylcellulose has been pretreated with liquids which are insol. in caustic alkali of mercerizing strength such as C_6H_6 and its homologs, PhCl , *o*-dichlorobenzene, PhNO_2 , monomethylaniline, hydrogenated phenols, hydrogenated naphthalenes, petroleum distillates, solvent naphtha and essential oils. The protective liquid may be floated on the surface of the mercerizing soln. or may be otherwise applied.

Hot-pressing patterns on fabrics of cellulose derivatives after treating them with volatile swelling or softening liquids. BRITISH CELENASE, LTD., W. A. DICKIE and H. HALKVARD. Brit. 273,406, April 1, 1926.

Treatment of threads, fabrics, etc., of cellulose acetate. J. F. BRIGGS, C. W. PALMER and J. T. KIDD. Can. 276,514, Dec. 20, 1927. AcOH , PhOH , PhCH_2OH , triacetin, cyclohexanone, NH_4SCN or other thiocyanates are employed as solvents or swelling agents for cellulose acetate in a process for imparting luster to delustered cellulose acetate filaments.

Weighting silk with tin phosphotungstate. J. C. MACKAY and J. S. KAUFMAN. U. S. 1,666,501, April 17. Silk weighted with Sn phosphotungstate has the same properties as regards dyeing and printing as exist in unweighted silk.

Loading material containing cellulose derivatives. G. H. ELLIS. Can. 276,516, Dec. 20, 1927. Materials, comprising an org. substitution deriv. of cellulose, are treated with a soln. of a loading metal, *e. g.*, Sn , at least partly in the form of thiocyanate.

Treating "viscose silk." SILVER SPRINGS BLEACHING & DYEING CO., LTD., F. E. MASON and A. J. HALL. Brit. 274,266, July 2, 1926. Yarns and fabrics contg. non-desulfurized viscose artificial silk and other fibers such as cotton, wool, natural silk or cellulose acetate artificial silk are treated with caustic alkali of mercerizing strength and are then desulfurized; deleterious action of the alkali on the viscose artificial silk is thus avoided. The fabric may subsequently be washed and bleached.

Treating artificial silk for making shaving brushes. J. ST. MARTIN. Brit. 274,340, Nov. 30, 1926. Bristles of artificial fiber are successively treated with 3 baths: a concd. aq. H_2SO_4 soln., an aq. NH_3 soln. and a 20% aq. Na_2SO_4 soln.

26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

Causes of livering in paints, enamels and printing inks. P. E. MARLING. *Am. Paint & Varnish Mfrs.' Assn.*, *Circ.* No. 319, 535-40 (1927).—Mixts. of ZnO and variously treated linseed oils (e. g., blown, heat-treated, free fatty acids added) were observed for livering. It is shown that the acid value of an oil is not a deciding factor in this connection, its previous history being more significant. The formation of metallic soaps that later redissolve is discussed. B. C. A.

Zinc oxide in exterior mixed paints. E. H. BUNCE. *Am. Paint & Varnish Mfrs.' Assn.*, *Circ.* No. 319, 541-50 (1927).—The advantages of using ZnO in paints for exterior use are: increased gloss of finished surface, protection of binding material from actinic rays, hardening of the film and neutralization of acidic decompn. products. Each of these points is amplified. B. C. A.

Kauri reduction test as applied to flat wall paints. R. H. EVERETT. *Am. Paint & Varnish Mfrs.' Assn.*, *Circ.* No. 319, 570-7 (1927).—The Kauri reduction test does not give concordant results in the hands of various operators when applied to flat wall paints, nor are the results substantiated by exposure tests on the paints. Reliable conclusions as to the life of this type of paint on exposure may be drawn from the compn. by vol. of the paint. B. C. A.

Lead pigments present highly developed technology. J. B. NEALEY. *Chem. Met. Eng.* 35, 219-20 (1928).—The Chicago plant and process for the manuf. of white lead of the National Lead Co. are described. The Dutch process is used. E. H.

Austrian standards for pigments. *Farben-Ztg.* 32, 1498 (1927). J. SCHALCH
Standards for pigments, given by the German Pigment Manufacturer's Association. *Farben-Ztg.* 32, 1495-6 (1927). J. SCHALCH

Pigments for iron and steel primers. E. W. FASIG AND J. M. PURDY. *Am. Paint & Varnish Mfrs.' Assn.*, *Circ.* No. 319, 611-22 (Nov., 1927).—A general dissertation on rusting and rust prevention is followed by details of tests on a no. of pigments when placed in wet contact with steel. The results of the tests, which were still proceeding, indicated that among the foremost rust inhibitors, litharge compares favorably with Zn chromate, and it is suggested that red lead pigments with as much as 10% of free litharge are preferable to pure red lead in this connection. B. C. A.

The curing phenomenon in polymerized and oxidized linseed oils. P. SLANSKY AND L. KÖHLER. *Chem. Umschau Fette, Oele, Wachse, Harze* 35, 41-4 (1928).—Linseed oil was blown at 50° for 10 days, 8 hrs. daily, and samples were drawn at intervals. These samples were examd., then set aside in stoppered bottles in H₂O at 21-24° in the dark and analyzed after 1 and 3 months. Another linseed oil was polymerized (heated without blowing) at 290-295°. Ultramicroscopic examn. showed that the no. of visible particles increased from 1 to 40 during blowing, and to 80 during polymerization. In the curing stage the no. of particles increased in each sample by about 30 for the oxidized oil and by 8 for the polymerized oil. This increase may be due to the sepn. of impurities that had become insol. by the treatment. During storage the oxidized as well as polymerized oil increased in viscosity—a colloidal change that had been started during blowing and during heating. No chem. change occurred during curing. P. ESCHER

A study of the composition of galipot from *Pinus silvestris*. B. A. ARBUZOV. *J. Russ.-Phys. Chem. Soc.* 59, 247-64 (1927).—Galipot was obtained from 3 specimens of *Pinus silvestris* in the absence of air. The α_D of the liquid portion varied from 9.14° to 15°, α_D/α_O from 2.16 to 2.59 and d_{40}^{20} 0.950-0.959. Turpentine formed 35.5% of the galipot, the α -pinene content of the former reaching 87%. A sample of the turpentine of $\alpha_D = +37.95^\circ$ was allowed to stand for 12 hrs. over fused K and then fractionated 4 times under reduced pressure until the change in α_D was only a few tenths of a degree. A sample of α -pinene thus obtained $b_{71.1}^{20}$ 155.7°, its α_D was 40.79°, d_{40}^{20} 0.8625, d_{40}^{20} 0.8580 and (α_D/α_O) = 1.97. The rotatory dispersion can serve as a criterion of purity of Russian turpentines because of their relatively simple compn. BASIL C. SOYENKOFF

Limited splitting during the natural drying of oils and the so-called non-drying linseed oils. A. EIBNER AND R. HELD. *Chem. Umschau Fette, Oele, Wachse, Harze* 35, 65-77 (1928).—In order to det. the effect of H₂O vapor upon the drying process of oils, 25 g. linseed oil was heated in a fused tube with 1 g. H₂O to 110°, 150°, 200° and 250° for 24-70 hrs., in an atm. of CO₂.

Temp.	110° -	150° -	200° -	250°	Original
Hgs.	70	55	36	24	3.7
Acid no.	7.07	64.3	72.5	73.5	179.9
I no.	176.5	163.3	160.3	147.5	766.5
Mol. wt.	701	405	455	524	

On opening, the product turned rapidly brown in all cases. The fat that was left undissociated contained 6.3% α -linolenic acid. The free fatty acids (54.8%) were sepd. and identified. 13.4% α -linolenic, 0.9% β -linolenic, 11.2% α -linolic, 25.0% β -linolic, 2.5% oleic and 2.8% solid acids, total 54.8%. The hydroxyl value of mono- and diglycerides was detd. to be 34.1 from the difference between the sapon no. of the undissociated fat in the product and its hydroxyl value after acetylation. Drying tests of the undissocd. fat showed tackiness after 5 days and dryness after 15 days. The mono- and diglycerides show drying quality but less than the triglycerides. Sadt. as well as unsatd. acids are split off in part; of the linolenic acid $\frac{2}{3}$ had been split off. The drying of fatty oils occurs in steps *via* di- and monoglycerides, disclosing limited sapon. The natural drying of fatty oils occurs slowly because the amt of free acids increases slowly, in addition oxidative splitting occurs. The presence of large amts of free fatty acids makes drying oils unfit for use. Basic lead colors aid in drying by neutralizing the acids. Allowing linseed to turn moldy to varying degrees and then pressing yielded oils with 15.6-162.1 acid no. The compn. of these free acids was 17.8% α -linolenic, 16.4 α -linolic, 1.8 β -linolenic, 40.9 β -linolic, 3.97 oleic, 5.85 solid and 13.9 hydroxy acid. Splitting linseed oil by fermentation yields the same products as accelerated sapon, in a closed tube, with the exception of oxyenic acids in the fermentation products. Oil quality can be improved by adding basic lead colors or wood oil or polymerized oil.

P. ESCHER

Cellulose lacquers. STANLEY SMITH. *J. Soc. Dyers Colorists* **44**, 106-9(1928).--S. gives a sketch of the manuf. of cellulose lacquers, particularly those that are applied by spraying methods.

L. W. RIGGS

Urushi lacquers as an insulating varnish. T. HANYU. *Researches Electrotech. Lab., Tokyo* No. **215**, 49 pp.(1927) -- Elec. and other properties of raw and treated urushi lacquers necessary for insulating varnish were examd. Lacquer films dried at 100° possess exceedingly good insulating properties when dry, but in humid air their elec. resistance is remarkably decreased by their high water-absorbing capacity. Various substances have been employed up to this time as siccativ, but most of them, especially inorg. metallic salts, lower the elec. resistance of the film and their use must be avoided in insulating varnish. Perilla oil, coumarone resin and furfural resin are good mixing ingredients for the lacquer. If these lacquers can be made more flexible and non-absorbent for water they will be excellent insulating varnishes.

W. O.

Consistency, storage and clouding of lacquers, varnishes and so forth. E. O. RASSER. *Kunststoffe* **18**, 5-6(1928).--The correct consistency of lacquers and varnishes and methods of testing it are briefly discussed. In general, lacquers should not be stored in rooms in which the temp. may go below 5-6°, and they should never be used until they have reached ordinary room temp. (14-16°). The clouding of lacquers and varnishes is attributed to the formation of Pb salts of hydroxy and sadt. acids.

A. L. HENNE

Causes of instability of varnishes on standing. J. F. MAGUIRE. Am. Paint & Varnish Mfrs.' Asscn., *Circ.* No. **319**, 564-9(1927).--A brief summary of the effects of the constituents of varnishes, mixing, aging, chilling and centrifuging on the stability of colloidal varnish systems.

B. C. A.

The baking insulating varnishes. S. MIZUSHIMA. *Researches Electrotech. Lab., Tokyo* No. **221**, 39 pp.(1928).--About 30 kinds of baking insulating varnishes were prepd. with gilsonite, petroleum and coal-tar pitches, rosin pitch, mineral rubber, Manila copal, rosin, rosin ester, linseed, perilla and Chinese wood oils. Gilsonite is the most suitable bitumen for the prepn. of black baking insulating varnish, no other pitch being able to compare with it. Oil resistivity and time of drying of the black varnish can be materially improved by the addn. of a small amt. of resin. Gilsonite 20%, copal 5%, boiled linseed oil 75% or gilsonite 25%, copal 5%, boiled linseed oil 70% is the most favorable compn. Boiled oils for the manuf. of the insulating varnishes must have rather thick consistency, and the use of those having d. above 0.967 or refractive index higher than 1.49 is recommended. During the process of oil-boiling, the degree of the thickness of the oil can be conveniently measured by the estn. of the refractive index. As the thinner for the insulating varnishes, low-boiling petroleum naphtha is more suitable in every connection than the spirit of turpentine, although

for wood-oil varnish spirit of turpentine is the best thinner. Boiled perilla oil compares favorably with boiled linseed oil. Moreover, during the boiling process, acidity formation in the former is lower than in the latter. Because of the rapid drying of boiled perilla oil, it is specially recommended for the prepn. of black baking varnish. For insulating purpose, rosin ester wood oil varnish has no advantage over the ordinary rosin wood oil varnish.

W. OGAWA

Evaluation of the kauri-butyl alcohol solvency test (for varnish thinners). S. R. KIEHL. *Am. Paint & Varnish Mfrs.' Assocn., Circ. No. 319*, 585-96 (1927).—A "solvency" test for varnish thinners dependent on their degree of miscibility with a standard soln. of kauri in butyl alc. is described in full detail. The applications of this test to the specification of individual thinners and to the examn. of binary mixts. are illustrated. It is shown that mixts. of equal "solvency" may exercise similar functions when used as thinners.

B. C. A.

Damar Penak. R. W. BLAIR AND F. E. BYRON. *Malayan Forest Rec.* 3, 1-12 (1926).—The chem. and phys. properties of 5 grades of Damar Penak (pale yellow, amber, dust coarse and dust fine) and 3 grades of "dead" (opaque) Damar, all obtained from *Balanocarpus Heimis*, are tabulated and compared with the results of earlier observers. The acid value of pale Damar Penak increases with age, light or absence thereof having no effect on this change. Details of varnish trials and of methods of purification of the resin are given.

B. C. A.

Synthetic resins from polybasic acids and polyhydric alcohols. T. HEDLEY BARRY. *Ind. Chemist* 4, 53-6 (1928).—A résumé of Pre-War and Post-War developments in the polymerization of polybasic acids and polyhydric alcs. Resinification products resulting from the condensation of polybasic acids with glycerol may be classed in stages as: "A" form which is fusible, sol. in acetone and not resistant to water. It is converted by heat into—"B" form which is fusible, insol. in acetone, and not resistant to water. This is converted by heat to—"C" form which is infusible, insol. and resistant to water. The glyptal resins yield a more flexible yet tougher condensation product than do the bakelite resins and have greater adherence to very smooth surfaces such as glass, mica, etc. The vol. and surface resistivity of glyptal bonded micanites is 2-3 times as strong as that of shellac-bonded articles. A short bibliography and a list of related patents are appended.

W. H. BOYNTON

Painting of dye houses and bleaching rooms (TOCH) 25. Fruits of Siberian cedar and the cedar oil (RUCHKIN) 27. Chromic oxide and its recovery from waste products (MUTIN) 18. Ozonides [as turpentine substitute, etc.] (Brit. pat. 273,832) 10.

Titanium pigment. G. CARTERET. Brit. 274,072, July 12, 1926. A white pigment is made by pptg. Ti oxide on a powd. base such as SiO_2 or Al silicate (or a mixt. of these). Kaolin or "fossil silica" is preferred. The product is washed, dried and calcined at a temp. of cherry redness.

Steam turpentine still. J. O. REED. U. S. 1,667,168, April 24

Lacquers and varnishes. L. LEVY. Brit. 273,756, July 3, 1926. The sulfuretted condensation products of phenols and aldehydes of the fatty series such as CH_2O are dissolved in liquids such as alc., "carbureto," furfural, PhNO_2 , pyridine, mesityl oxide, melted or dissolved $\text{C}_{10}\text{H}_{18}$, acetins or cyclohexanol. Materials coated with the resulting lacquers are preferably dried first by exposure to the air or by moderate heating and then at 110-160°. The lacquers made with furfural are black. The sulfuretted starting materials may be prepd. as described in Brit. 184,164.

Coating paper, wood, glass, marble or other materials successively with gelatin and varnish. M. A. V. C. GEORGES VILLE. Brit. 273,708, July 2, 1926.

Enamel for coating cans. R. H. LUECK. U. S. 1,667,212, April 24. An enamel suitable for use on cans which are to contain food products consists of a substantially neutral oleoresin varnish substantially free from Pb and which has incorporated in it ZnO or other insol. compd. of a metal which forms sulfides which are not dark colored and which is held in place in the compn. during processing of foods in the cans.

Printing ink. K. STEPHAN. Can. 276,638, Dec. 27, 1927. One-half part by wt. of a fat-sol. blue dye is mixed with 74.5 parts varnish and 25 parts of MnO_2 .

Synthetic resin. C. F. BURKE AND H. H. HOPKINS. U. S. 1,667,189, April 24. Pentaerythrite is heated with a polybasic acid or its anhydride such as phthalic anhydride and with a "drying oil acid" such as the acid derived from linseed or China wood oil. The reaction may be effected at a temp. of about 180-265° and the product is suitable for use as coatings.

Synthetic resins. I. G. FARBENIND. A.-G. Brit. 274,155, March 15, 1926. Condensation products are obtained by the action of CH_2O on aniline, *o*-toluidine or other aromatic amines in the presence of a quantity of amino salt not substantially exceeding 10% of the quantity of amine used. The condensation may be effected in aq. solns. of alcs. in which the amines are sol. The products are resistant to alkali and may be used as resists in batik dyeing and printing. They can be removed from the fabric by org. solvents or by weak acids or by treatment with hot water.

Synthetic resins. J. V. MEIGS. Brit. 274,146, Feb. 9, 1926. PhOH, corn sugar and a quantity of H_2SO_4 equal to 0.833 the quantity of the PhOH may be boiled while refluxing the PhOH but allowing water vapor to escape. The temp. rises from 120° to 180° and when the reaction is complete the resinous product is treated with stearic acid, serving as a mold lubricant, and is then distd. *in vacuo* to sep. excess PhOH. The material is prepd. for molding by grinding it with $(\text{CH}_2)_6\text{N}_4$ and wood fiber and may be pressed in a steel mold for 5 min. at a temp. of 170° . Other similar processes are described in which aniline, furfural and other reagents and starting materials may be used.

Synthetic resin. C. R. DOWNS and L. WEISBERG. U. S. 1,667,197, April 24. A dibasic aliphatic carboxylic acid such as fumaric acid is heated (suitably at a temp. of about 170 – 200°) with a polyhydric alc. such as glycerol to form a synthetic resin resistant to water and suitable for making molded articles. U. S. 1,667,198 specifies the use of tribasic aliphatic carboxylic acids such as malo-malic acid. U. S. 1,667,199 specifies the use of malic acid. U. S. 1,667,200 specifies the use of succinic acid which may be heated with a polyhydric alc. such as glycerol for about 20 hrs. at 170 – 200° , then below 135° for about 10 hrs., and then between 170° and 250° until a water-resistant resin is obtained.

Synthetic resin compositions. L. V. ADAMS. Brit. 273,748, July 1, 1926. Condensation products in the heat-hardened or insol-cold condition ("C stage") are heated with a material liquid or liquefiable at the treating temp. until complete soln. is effected. Suitable treating liquids are: glycol diacetate, diethyl phthalate, acetone, acetone oils, benzyl alc., acetate or benzoate, toluidine, cresol, tricresyl phosphate, triacetin, anisole, *o*-cresyl benzoate, Et lactate, indene or indene polymer. The soln. produced may be used as a varnish or for other purposes and may be prepd. from various classes of synthetic resins. Cf. C. A. 22, 1863.

Accelerator for hardening phenol urea synthetic resins. H. V. POTTER and J. W. CRUMP. U. S. 1,667,675, April 24. An intermediate product is formed by the condensation of a phenol, a urea and an aldehyde; this intermediate product is then treated, without heating, with a hardening agent of acid reaction such as oxalic acid or urea nitrate.

Coating compositions. K. LOOS, M. LEHNIG, C. HENNING and R. DASSDORF. Brit. 274,333, Nov. 15, 1926. Artificial resin (or substances which form such a resin) is used with waterglass, with or without silicic compds., and clay or metallic oxides to form coatings resistant to various chem. influences. Solvents such as alc. or acetone may be added. Brit. 274,355 specifies hardening the coatings by heating in the absence of air, *e. g.*, in a bath of oil of h. b. p.

Linoleum cement. A. B. CRAVEN, C. S. BEDFORD and YORKSHIRE DYEWARE & CHEMICAL CO., LTD. Brit. 274,300, Aug. 30, 1926. A cement suitable for use in the manuf. of linoleum is made by incorporating colophony or other resinous substance in vulcanized rubber at such a temp. and for such a time that a homogeneous material is produced. Various oils or hydrocarbon solvents may be added.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

Systematic classification of fats. I. A proposal for a scientific classification of fats. W. HALDEN. *Chem. Umschau, Fette, Oele, Wachse, Harze* 35, 55–6(1928).—The following classification of fats is proposed: (I) fats of marine and poikilothermic animals; (II) fats of homoiothermic animals. Subdivision: milk fats. Appendix: fats of lower animals. The individual animal fats are to be classified zoologically. P. 3.

Neutral saponification or fat splitting? K. CAZAFURA. *Seifensieder-Ztg.* 55, 115–6, 126–7(1928).—Working data of factory runs are given, showing a larger yield of glycerol by splitting, a larger loss by purifying lyes, recovery of NaCl by concg. lyes, and better color of soap by sapon. Preference of either method depends upon 3 factors: quality of raw materials, glycerol market and desires of consumer. P. ESCHER

Comparative experiments on the different methods for the separation of solid and liquid fatty acids. KONRAD AMBERGER AND E. WHEELER-HILL. *Z. Untersuch. Lebensm.* 54, 431-4(1927).—By the methods of Twitchell and of Holde and co-workers, solid fatty acids may be sepd. from the liquid acids almost quantitatively, the results by these methods being superior to those obtained by the Pb salt-ether method.

WILLIAM J. HUSA

The hexabromide of eleostearic acid. K. H. BAUER AND E. ROHRBACK. *Chem. Umschau Fette, Oele, Wachse, Harze* 35, 53-4(1928).—Eighteen g. α -eleostearic acid in 180 g. petroleum ether in a freezing mixt. was exposed in a quartz flask to ultra-violet light and Br added dropwise with agitation to the amt. of 6 atoms Br; a white solid sepd. after several hrs. with evolution of much HBr. Recrystd., it sinters at 134° and m. 139-141°; it is sol. in C_6H_6 , Me_2CO , $CHCl_3$ and ether; less so in alc., ligroin and $AcOEt$. Analysis confirms the formula $C_{18}H_{30}O_2Br_6$. By debrominating with Zn in alc. the β -eleostearic acid, m. 69-71°, was obtained. An oily by-product of the hexabromide has a Br content between that of penta- and hexabromide, and when debrominated with Zn in alc. it yields an oil with a Br content between di- and tribromoeleostearic acid.

P. ESCHER

The standard Polenski apparatus. G. D. ELDON AND J. R. STUBBS. *Analyst* 53, 212(1928).—In the Official Methods of the A.O.A.C. the distance between the adapter and the bulb of the still head is given as 70 mm. whereas 78 mm. was recommended in the original publication.

W. T. H.

Oxidation products of fatty oils. A. W. *Seifensieder-Ztg.* 55, 100-1(1928).—Analyses of oils from bleaching earths for semi-drying oils led to the following conclusions: Autoxidation of the oil in fuller's earth leads to extended polymerization of the fatty acids at their double C bonds (low I no.) but little formation of hydroxy acids occurs. On further oxidation, some lower acids and hydrocarbon-like substances are split off.

P. ESCHER

Oxidation of vaseline oil. G. S. PETROV, A. I. DANILOVICH, AND A. YU. RABINOVICH. *Trans. Karpov. Inst. Chem.* 1926, No. 5, 81-9.—Vaseline oil purified with fuming H_2SO_4 when heated and refined with alkalis does not become oxidized when treated with a current of air for 49 hrs. at 100° in the presence or absence of catalyzers such as metallic Zn or Fe, although its color darkens in presence of Fe. With Pb as catalyzer, which is sol. in the oil, some oxidation takes place with formation of oxyacids insol. in benzene and having a tendency to ppt. Com. vaseline heated at 250-70° begins to show signs of oxidation after 10 hrs., whereas vaseline oil thoroughly purified by fuming H_2SO_4 does not oxidize under those circumstances. Distd. oils, though not purified by H_2SO_4 , do not oxidize on being heated at 250-70° in a flask with an inverted condenser. Oxidation of oils below 100° gives the best results, in the presence of catalyzers sol. in the oils, e. g., the Co salt of naphthenic acid. With these low-temp. oxidations and in presence of water one obtains more acids sol. in benzene and less benzene-insol. matter than in the oxidations in the presence of Pb at 100°; e. g., on oxidizing vaseline in the presence of Pb at 100° 27.07% of the acids formed were sol. in benzene and 68.61% were insol., whereas on operating at 90-94° in the presence of water and of Co naphthenate as catalyzer, 82.24% of the acids formed were sol. and only 17.76% were insol. in benzene.

BERNARD NELSON

Rancidification and oxidation of olive oil. L. L. LLOYD. *J. Textile Inst. (Special issue)* 18, 517-9T(1927).—The rancidity of olive oil is due chiefly to the marc or foots, which either acts as a fermentative agent or aids bacterial action. Moisture plays only a small part in the production of fatty acids. By passing, resp., dry and moist air through samples of (a) oil contg. foots, (b) the same oil free from foots, and (c) a mixt. of equal parts of both, for periods up to 3 years, it was shown that the fatty acids are almost completely oxidized, whereas the neutral oil is oxidized only to a small extent. The larger the content of fatty acids, the more is the neutral oil oxidized; it appears that the former have a catalytic oxidizing effect on the latter. It is advantageous to filter fresh oil to free it from foots before storing.

B. C. A.

The composition of oat oil. KONRAD AMBERGER AND E. WHEELER-HILL. *Z. Untersuch. Lebensm.* 54, 417-31(1927).—The following fatty acids were found in oat oil: palmitic 10.4, α -linoleic 17.2, β -linoleic 13.9 and oleic 58.5%. Erucic acid was absent. Linolenic acid could not be detected either by bromination or by the oxidation method of Hazura.

WILLIAM J. HUSA

Determination of the iodine number of oils in aqueous emulsions. B. M. MARGOSCHES AND K. FUCHS. *Z. anal. Chem.* 72, 185-7(1927).—Fialkov (C. A. 21, 1718) claimed to have improved the method of Margosches and Hinner by adding gum arabic and obtaining an emulsion. Tests with the method of F. show that low results are

invariably obtained unless the time of contact is much more than the 5 min. specified and the time required varies with different oils. W. T. H.

•The determination of organically combined sulfuric acid in sulfonated oils. K. H. BAUER. *Chem. Umschau Fette, Ole, Wachse, Harze* 35, 25-6(1928).—B. uses the U. S. A. standard method and tabulates results which vary from 2.06% in Turkey red oil to 9.0% in olive oil. P. ESCHER

Fruits of Siberian cedar and the cedar oil. V. RUCHKIN. *Oil and Fat Ind.* (Russia) 1926, No. 4-5, 13-6.—The seeds of the Siberian cedar (*Pinus cembra* L.) contain about 60% of a light yellow drying oil (d 0.93, n 1.485, sapon. value about 192, I value (Hul) 130-160, Reichert-Meissl value 0.44-3.77) which is edible and can also be used for the prepn. of a slow-drying varnish. B. C. A.

Correction in the method for the determination of lecithin in oil. W. FRESSENIUS. *Z. anal. Chem.* 73, 295(1928).—A change in one of the formulas given in the paper by Fresenius and Grunhut (C. A. 5, 1846) is suggested. W. T. H.

The utilization of whales. JAKOB LUND. *Chem.-Ztg.* 52, 241-2(1928).—The whale catch has increased during the last 20 yrs. to about 200,000 tons annually, and improved processes, e. g., hydrogenation of oils, have increased the value of the product. Methods for obtaining, refining and utilizing the blubber, tongue and intestines, bone, flesh, etc., are outlined; these portions amount to approx. 20, 8, 17 and 55%, resp. Blubber contains 50-88% oil, 14-26% H₂O and 15-26% connective tissue, while the tongue and intestines contain 30% fat, 50% H₂O and 20% connective tissue, and the bones 23% fat, and the flesh runs only traces of fat, about 75% H₂O and 25% meat substance. W. C. EBAUGH

Change of iodine number of fatty acids in aged cakes of settled soaps. W. KRISTEN. *Chem. Umschau Fette, Ole, Wachse, Harze* 35, 105-6(1928).—Analyses of outside and inside layers of cakes of settled soaps, contg. rosin, of varying ages showed that the inside had from 2 to 18% greater I no in from 2 to 130 weeks. When the cakes were cut into 4 or 6 concentric layers, the following I nos. were found in a sample contg. no rosin, in the outside and inside layers, resp.: 38.0, 49.7; 37.2, 52.6; 37.5, 58.5; 41.7, 58.9; 42.2, —; 45.5, —. P. ESCHER

Limeproof hexalin soaps. W. SCHRAUTH. *Seifensieder-Ztg.* 55, 108-9(1928).—Contrary to Welwart's views (C. A. 1866), the addn. to soaps of 20-30% hexalin or methylhexalin prevents formation of Ca ppts in hard waters, and produces a turbidity when added in lesser quantities. P. ESCHER

Bleaching soaps with chlorine. CHAS. F. SCHUMAKER. *Soap* 3, 25-6(1928).—The soap in chip form for milling is used dry with not over 2% of hypochlorite and 1% of 40% formaldehyde. The chips are passed through 2 mills in tandem; and the bleaching operation takes place during the milling. Another method is to add the hypochlorite to the soap in the crutcher and after it is in chip form the formaldehyde is added at the mill. Neither of the bleaching agents used alone gave satisfactory results. The formaldehyde apparently liberates nascent O from the hypochlorite soln. and also prevents rancidity and after-darkening; but its exact action is not known. E. SCHERUBEL

Soap analysis in cost figures. E. SCHOTTE. *Soap* 3, 33-4(1928).—Reports of analyses from different labs. differ in the interpretations of the terms used. An analysis should not only give the figures found but also the percentages figured on a dry basis which will make it easy to compare 2 reports on the same kind of soap. E. S.

Utilization of the soy bean for human nutrition (VENTURI) 12. Action of cold on the fats of milk (QUAGLIARIELLO) 12.

Preparation of kneadable fats from crumbling fat. K. EISLER. *Dutch* 17, 124, Feb. 15, 1928. To the crumbling fat (e. g., coconut fat) are added small quantities (1/2%) of rubber in the form of a concd. soln. (10%) of crepe rubber in fat.

Purifying wool fat* E. MERTENS. *Brit.* 273,642, July 1, 1926. A purified "lanolin" is prepd. by treating the viscous mass obtained from wool washing water in a digester under a "few atm." pressure. NaOH may be added to eliminate fatty acids.

Sulfonating polymerized fats, oils and acids. H. T. BOHME AKT.-GES. and H. BERTSCH. *Brit.* 274,104, July 8, 1926. Polymerization products of fats, oils or fatty acids are sulfonated in the presence of anhyd. org. acids, their anhydrides or chlorides; e. g., "floricin" (obtained from castor oil by dry heating) is mixed with Ac₂O and the mixt. is treated with H₂SO₄. Glacial HOAc or AcCl also may be used. Cf. C. A. 21, 4084.

Sulfonic derivatives of unsaturated aliphatic acids. A. THAUSS, G. MAUTHÉ and A. GÜNTHER. U. S. 1,667,225, April 24. In producing sulfonic acids of unsatd. aliphatic acids unalkylated on a C atom, an aralkyl halide such as benzyl chloride is reacted on with an unsatd. aliphatic acid such as oleic acid and the resulting product is treated with H_2SO_4 or other sulfonating agent. U. S. 1,667,226 specifies producing sulfonic acids of aralkylated unsatd. aliphatic acids by reacting with benzyl chloride or other aralkyl halide upon a glyceride of an unsatd. aliphatic acid such as that of rape-seed oil and then sulfonating the product.

28—SUGAR, STARCH AND GUMS

P. W. ZIERBAN

Production of sugar in India by modern refineries and factories during 1925-26. WYNNE SAYER. *Agr. J. India* 22, 384 5(1927).—Statistical. K. D. JACOB

The undetermined chemical losses in refinery work. M. J. NACHMANOWICH. *Centr. Zuckerind.* 35, 1371-72(1927); *Zapiski* 1926 27, 339-54, 396-411.—From 18 observations on massecuites for loaves and cubes N. concludes that crystn. of the slightly acid massecuite, leaving the vacuum pans at 101-102.5°, is accompanied by an increase of invert sugar of 0.07% on the weight of the dry substance and an increase in color of 20% in Stammer units. In fillmasses of lower quality contg. 0.48-0.80% invert sugar on the dry substance the invert sugar increases amounted to 0.1% on the weight of the dry substance. In refining by the Adant process which is characterized by fillmass dropping temp. of 103-105°, decompn. of sugar takes place after dropping and invert sugar increases 0.03-0.06% on the dry substance. Color increases 20-45%. In refining by the Dix and Kriner process cooling of fillmass takes place so rapidly in small molds that no decompn. occurs. No decompn. occurs during covering of fillmass while in the centrifuges but during the subsequent stages in the curing room requiring 2-3 days at 45°, addnl. 0.047% of invert sugar are formed. From 29 observations on boiling of after-products, N. concludes that a comparison of reducing sugars in sirups and the fillmasses thereof is not permissible because of the destruction of reducing sugars during boiling. Decompn. losses may be approximated from a comparison of org. non-sugar of sirups and resulting fillmass. F. R. BACHLER

Juice purification with special consideration of important physical processes. KARL KOLLMANN. *Centr. Zuckerind.* 35, 1257(1927)—K. speculates upon the effect which acid or alk. diffusion water will have upon the protein and pectin movement from beet to diffusion juice and the probable behavior of these colloidal substances during defecation and carbonation, and concludes that acid diffusion water will probably give diffusion juices of superior quality. F. R. BACHLER

Determination of melassigenic nitrogen in beet root. M. S. FILOSOFV. *Ukrainskii Khim. Zhurnal* 2, Tech. Pt. 127-35(1926).—The total sol. N in beet root was first detd. and then that present as amides and ammoniacal salts, the difference giving the amt. of melassigenic N, i. e., that present as betaine and primary amines. The values so obtained agreed within 0.04% with those found by direct titration with formalin. With treacle it is necessary to acidify the soln. before titration until an acid reaction toward litmus is given. B. C. A.

Ultramicroscopic examination of starch sols. M. SAMEC. *Archiv. Hem. Farm.* 1, 243-4(1927).—Sols. of starch examd. under an ultramicroscope exhibit thread-like aggregates of erythro-starch and granular aggregates of amylo-starch. Heating diminishes the Brownian movement of the particles of starch sols, thus accelerating aggregation. Peptization is accompanied by diminution in the size of the ultramicros, the no. of which in unpeptized starch sols is therefore less than might be expected from osmotic pressure measurements. B. C. A.

The determination of polysaccharides (APPLEMAN, *et al*) 7.

Extracting sugar or other substances from vegetable materials. K. KOMERS and K. CUKER. *Brit.* 274,131, July 10, 1926. The material is subjected to a gentle pressing or suction which does not injure the cell membrane and is then subjected to an oxidizing current of gas which dries the cells and concentrates their internal juices, thus raising the osmotic pressure and accelerating the diffusion process. Slices of beet, sugar cane, wood or bark may be thus treated, and a battery of diffusers with interposed centrifuges may be used for extrn.

Tricalcium sucrate. C. STEFFEN, JR. U. S. 1,667,446, April 24. A filter cake of impure tri-Ca sucrate contg. sol. non-sugars is washed under pressure with a tri-Ca suspension substantially free of sol. non-sugars.

Starch. D. R. NANJL. Brit. 273,481, June 23, 1926. Purified and dried starch is mixed with an alk. agent such as a carbonate, bicarbonate or hydroxide or borate, in a quantity not more than 0.3% that of the starch, to obtain a product which gives limpid, neutral solns. in water, the viscosity of which varies inversely as the quantity of alk. substance added. It may be used for sizing and finishing textile materials and paper. The preliminary purification of the starch may be effected with HCl, KMnO_4 or dichromate and SO_2 or a bisulfite.

29—LEATHER AND GLUE

• ALLEN ROGERS

New tanning materials and sundries. LEOPOLD POLLAK. *Gerber* 54, 11-2(1928); cf. C. A. 21, 1027.—Analysis and description of various proprietary products are given.

H. B. MERRILL

Report of the Committee on qualitative tannin analysis. E. STIASNY. *Ledertech Rundschau* 20, 14-7(1928).—A review of recent literature.

I. D. CLARKE

Tannin analysis by the shake method with the aid of the centrifuge. V. KUBELKA. *Collegium* 1928, 21-2.—The solns. are centrifugalized at about 4000 revolutions instead of being filtered. Special 200-cc. vessels are used in which the hide powder is chromed and washed and the liquor detannized.

I. D. CLARKE

Determination of tannin substance by means of chromed hide powder; its possible application to medicinal tannins. MAURICE FRANÇOIS. *J. pharm. chim.* 7, 114-23 (1928).—The chroming of hide powder, and the method of removing and detg. tannin by means of it are described in detail. Since tests with gelatin and FeCl_3 showed complete absence of gall tannin in the filtrate, the method was applied to 20 com. samples of tannin of which 7 were prepd. by extn. with Et_2O , 13 with EtOH . In 5 of the Et_2O samples, the tannin content referred to anhyd. com. tannin was 97.31-99.82%; in 2 samples, 87.20-91.60%. Three of the EtOH samples contained 70.01-76.50%, 10 showed 90.86-99.23%. Thus the method permits detection of excessive non-tannin matter, i. e., control of quality in manuf.

S. WALDBOTT

The influence of hydrogen-ion concentration on tanning. P. PAVLOVICH. *Collegium* 1928, 2-12.—The quantity of tannin absorbed by gelatin or hide powder (found by measuring the decrease in concn. of the tannin soln.) did not reach a max. at p_H 7-8 as found by Thomas (C. A. 20, 2426). Penetration of skin by tannin was most rapid at the p_H of min. astringency of the tannin, usually p_H 6 to 8. Rapid tanning should be possible by starting at this p_H and finishing at the natural p_H of the tannin ext.

I. D. CLARKE

Tanning, dyeing, and finishing formaldehyde-tanned leathers and skins. J. W. LAMB. *Halle aux cuirs* 1926, 6-16; cf. C. A. 21, 4089.—A description.

H. B. M.

Dyeing of chrome-tanned side leather for shoe stock. F. H. SCHORTEMAYER. *Dyestuffs* 29, 9-11(1928).—Dyestuffs and formulas are suggested.

Influence of salt and temperature during preparation of the extract on the results of enzyme analysis. JOSEF SCHNEIDER, JR. AND ANTONIN VLCEK. *Collegium* 1928, 22-6; cf. C. A. 21, 4090.—Oropon was extd. with solns. of $(\text{NH}_4)_2\text{SO}_4$, NH_4Cl , NaCl or mixts. of these. Before heating with casein the salt content of each ext. was made the same. The quantity of casein digested increased as the quantity of salt during extn. was increased. Com. bates differed but usually showed max. activity at a temp. between 40 and 30°.

I. D. CLARKE

Tannery and leather factory sewage and its purification. A. SCHULZE-FORSTER. *Gerber* 54, 39-40(1928).—A brief discussion.

H. B. MERRILL

Chromic oxide and its recovery from waste products (HUTIN) 18.

Leather substitutes. J. D. MCBURNEY and E. H. NOLLAU. Brit. 273,324, June 24, 1926. A backing of textile fabric is coated with a cellulose ester compn. and with a surface film of a compn. such as one contg. casein with an alkali and a polyhydric alc. such as glycerol which facilitates adhesion of glue, paste or inks. The material is suitable for book covers. Cf. C. A. 22, 1056.

Glue. P. KREISMANN. U. S. 1,667,073, April 24. Potato starch, clay, water and an alkali such as NaOH are heated together to obtain a semi-fluid product by conversion.

30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

American rubber factories. F. KIRCHHOF. *Kautschuk* 1928, 35-9.—An abridged version of a recent address by van Rossem (*The American Rubber Industry and Its Scientific Research Work*).

Twenty years' work on the synthesis of rubber. FRITZ HOFMANN. *Gummi-Ztg.* 42, 1190-2(1928).—A review.

Patent review. C. BÖHM. *Kautschuk* 1928, 43-4.—Recent American and foreign patents on latex, raw rubber, mixing, vulcanization and the manuf. of rubber are itemized.

The coagulation of latex. PAUL BARY. *Rev. gén. caoutchouc* 1928, No. 39, 3-5.—A crit. review of recent experimentation and hypotheses, with 17 references

Some data on rubber from *Ficus*, *Castilloa* and *Manihot*. O. DE VRIES AND W. SPOON. *Arch. Rubbercultuur* 12, 7-19(1928). (In English 20-4.)—The report is a summary of tests of the 3 rubbers in comparison with *Hevea* rubber, made from 1916 to 1925, and includes detns. of the ash, N content, acetone ext., viscosity and vulcanizing properties with S alone, with S-hexamethylenetetramine-ZnO and with S-PbO. Rubber from *Ficus elastica* had a higher acetone ext. and much slower rate of vulcanization than *Hevea* rubber. The plasticity was usually greater also, and the tensile strengths were low. Rubber from *Castilloa elastica* cured more slowly than *Hevea* rubber, had a higher acetone ext. (which was not diminished by previous water extrn.) and resembled *Ficus* rubber more than *Hevea*. On the other hand *Manihot glaziovii* (Ceara) rubber more nearly resembled *Hevea* in compn. and in its rate of vulcanization. It coagulated spontaneously when dild. with water. It has a very high viscosity, high acetone ext. and low tensile strength when cured. A representative sample of latex contained 21-22% rubber.

Coagulation, structure and plasticity of crude rubber. O. DE VRIES. *Trans. Inst. Rubber Industry* 3, 284-303(1927).—Expts. in which plasticity and vulcanization tests of rubber contg. varying proportions of serum substances were made show that the serum substances have little or no influence on the plasticity of the resulting rubber but they do tend to decrease the slope of the stress-strain curves of the cured rubber. Therefore the dry serum residues deposited irregularly throughout the rubber do not act as a lubricant but rather increase the internal friction. When rubber prepd. by evapn. of latex films was extd. with water and stored, the plasticity decreased so that the rubber was considerably softer after 1 yr., whereas rubber prepd. similarly but not extd. became harder. Kerbosch rubber and latex-sprayed rubber harden for the same reason. In general, reduction of serum substances (by using dil. latex, by washing or by soaking crepe or sheet in water) gives products which become softer. Therefore to obtain a rubber of invariable plasticity, which is of great importance commercially, the proportion of serum substances must be controlled closely. The content of serum substances best suited for const. plasticity may, however, not conform to that which imparts the best aging properties to the vulcanized rubber, and a systematic study should be made of the influence of the individual serum substances. Besides the serum substances, proteins are pptd. during coagulation and these may form a network in the coagulum. Removal of these from rubber (by centrifuge methods) or increasing their proportion had little influence on the plasticity. Different methods (mech. pressure, EtOH, thymol or coalse) of coalescing the flocculates of heated latex (1:9) had very little influence on the plasticity of the rubber. The expts. indicate that it is difficult to produce by manipulation of the non-rubber components a soft rubber which has no

tendency to become tacky or hard. A discussion of closely related earlier work by de V. and others is included, and a general open discussion follows the paper.

C. C. DAVIS

Phenomena of swelling. The swelling of rubber. P. STAMBERGER. *Rec. trav. chim.* **47**, 316-28 (1928). cf. *C. A.* **21**, 3767; Klein and S., *C. A.* **19**, 1064.—Expts. deal with the extent of swelling of unmilled rubber (I), dead-milled rubber (II) and dead-milled rubber contg. various proportions of C black (III) in solvents and in their vapor. When swollen to the same degree in vapors, the consistency of I, II and III differed greatly. I maintained its structural shape and was very elastic and almost without tackiness, whereas II became a viscous liquid. With III the greater the proportion of C black the greater its structural strength. With 5 vol.-% C black, swelling was still unlimited and the mass lost its form, but with higher proportions of C black the structural form remained as with I. In excess liquid solvent, I and III contg. 20 vol.-% C black maintained their structural form, even though the swelling was unlimited. With III contg. less C black and with II, swelling was unlimited and the structure disappeared. In liquids the magnitude of the swelling differed greatly with I, II and III, whereas in vapor the magnitude of the swelling of I, II and III was the same for a given vapor pressure. This does not mean, however, that mastication fails to cause deep-seated changes, as maintained by Pohle (cf. *C. A.* **15**, 1089). The relative magnitudes of swelling in liquid and in vapor were very different with I compared with II, the swelling of I being around 16 times as great in liquid C_6H_6 as in C_6H_6 vapor, whereas the swelling of II in liquid C_6H_6 was less than twice that in C_6H_6 vapor. The phenomena observed cannot be explained by any concept of swelling suggested up to the present time, and both material and structural factors are probably involved, the former being independent of the swelling medium, the latter being evident only in a liquid (cf. Terzaghi, *Colloid Symposium Monograph IV*, 58).

C. C. DAVIS

Latex contaminated with copper compounds as a source of danger of fire. J. G. FOL AND W. DE WISSER. *Bull. Rubber Growers' Assoc.* **10**, 124-7 (1928).—Double texture cotton fabric rubberized with latex became on standing rolled up so hot that the fabric scorched and the rubber became resinous. Investigation showed that the fabric contained no Cu, but that the latex had been stored in a brass tank and that the NH_3 in the latex dissolved enough Cu to cause the subsequent rapid oxidation. Systematic expts. therefore were carried out with the Mackay app. (cf. Lewkowitsch, *Chem. Technology and Analysis of Oils, Fats and Waxes*, **III**, 99 (1915), *C. A.* **9**, 1852) in which cloth impregnated with (1) pure ammoniated latex, (2) $CuO-NH_3$ soln. and (3) latex in which Cu had been immersed for 24 hrs. (290 mg. Cu per l. or 40 mg. per sq. m. of fabric) was used. With (1) and (2) there was no rise of temp. above the 92° used as a medium, but with (3) the temp. rose in 45 min. to 249°, which caused complete oxidation and distn. of the rubber and charring of the cotton, and the temp. then returned toward its original value. The expts. show the danger of spontaneous combustion, particularly when rubberized cloth with Cu present is rolled while still warm. Cu or brass equipment must be avoided.

C. C. DAVIS

Aldol- α -naphthylamine [as a rubber accelerator]. H. KLOPSTOCK. *Kautschuk* **1928**, 40.—Comments on expts. by Esch (cf. *C. A.* **22**, 511) with aldol- α -naphthylamine. The latter has a slight accelerating action. Reply. WERNER ESCH. *Ibid.* 40-1.

C. C. DAVIS

Adsorption and diffusion of gases through rubber and balloon fabrics. A. DUBOSC. *Rev. gén. caoutchouc* Feb., 1928, No. 39, 7-8.—A review and discussion of the general phenomena.

C. C. DAVIS

Jelutong. C. D. V. GEORGI. *Malayan Agr. J.* **15**, 400-7 (1927).—Jelutong may deteriorate by drying to a brittle mass or by becoming sticky and resinous through mold (cf. *C. A.* **22**, 183). In an exptl. study of the causes of such deterioration, jelutong latex was coagulated with $AcOH$, HCO_2H , H_2SO_4 , K alum and Na_2SiF_6 , let stand 3 days, squeezed and dried slowly with periodic examn. After 7 months only the sample coagulated with Na_2SiF_6 was in good condition, and the moisture in this had decreased from 60 to 15%. Aside from Na_2SiF_6 , which prevented mold development, the order of merit of the coagulants was $AcOH$, HCO_2H , H_2SO_4 , and K alum. With K alum the product had become a brown-black sticky mass. In further expts. the same coagulants were used, but the coagula were creped. Deterioration was less rapid, but again the only product which did not deteriorate was that with Na_2SiF_6 . Coagulated with $EtOH$, jelutong dried more rapidly than with the other agents, and after 7 months it contained only 1% water. The results indicate that mold development is the chief cause of deterioration, and since the sugars and gums are attacked, removal of these by boiling jelutong in water greatly retards deterioration. Jelutong, refined by boiling

and dried, showed no deterioration from drying or fungoid growth after 14 months, though the moisture was then only 2%. This is confirmed by new reports from America on the good quality of jelutong prep. by boiling the acidified latex and then boiling the coagulum with water. Though Na_2SiF_6 is shown to be an excellent coagulant, its toxic properties preclude its use. The addn. of soap emulsion when refining the coagulum is unnecessary and does not influence the aging. Jelutong prep. by boiling acidified latex is less porous and dries more slowly than that prep. by allowing the acidified latex to stand.

C. C. DAVIS

The colloidal and elastic properties of polyvinyl acetate. G. S. WHITBY, J. C. McNALLY and W. GALLAY. *Trans. Roy. Soc. Can.* **22**, 27-32 (1928).—Polyvinyl acetate (cf. German Patents 271,381, 403,784, 281,687, 281,688; Staudinger, Frey and Starck, *C. A.* **22**, 215) swells and dissolves generally in polar org. liquids, and dissolves in the lower fatty acids, ketones, alcs. and esters, but less readily in the higher members of such homologous series. It also dissolves in liquids of high dielec. const., *e. g.*, AcCN and MeNO_2 . It is insol in paraffin hydrocarbons, but resembles hydrocarbon colloids in its soly. in CHCl_3 and aromatic hydrocarbons. When heated or swollen in solvents it becomes elastic, and this property is shown when the polymerization is low and corresponds only to a hexamer. Unlike rubber, it fails to give an x-ray fiber diagram when stretched. Unlike sols of most lyophilic colloids, the relative viscosity of its sols changes only slightly with change of temp. Polyvinyl acetate is chem. heterogeneous, and a representative sample prep. with benzoyl peroxide contained mols. with mol. wts. from 566 to 6192. There is an approx. linear relation between the state of polymerization and the viscosity of C_6H_6 sols. A study of the swelling or solvent power of various hydrocarbons, esters, ketones, alcs., ethers, acids, aldehydes, halogenated hydrocarbons and certain other representative compds. showed that the best solvents are HCO_2Me , HCO_2Et , AcCN, Me_2CO , CHCl_3 , AcH, $\text{CH}_3(\text{OMe})_2$, and MeNO_2 , the power of the solvents decreasing in the order cited.

C. C. D.

Some derivatives of β , γ -dimethylbutadiene. A. D. MACALLUM and G. S. WHITBY. *Trans. Roy. Soc. Can.* **22**, 33-8 (1928).—Modifying a method already described (German Patent 233,894), 42% of pinacone hydrate (I) was obtained from Me_2CO . Fused over NaOH, I was converted to pinacone. A comparison of different methods for converting pinacone to β , γ -dimethylbutadiene (II) showed the best results by distn. over 10% of K alum (cf. German Patent 250,086). This gave 60% II, 22% higher fraction (chiefly pinacone) and 5% I. Sulfanilic acid also gave a good yield. S_2Cl_2 in CS_2 added dropwise to II in CS_2 , let stand several days in darkness and evapd. *in vacuo* at 50°, yielded an oil which on attempted distn. gave a solid polymer or decompn. product, probably $\text{C}_{12}\text{H}_{20}\text{Cl}_2\text{S}_2$, n_D^{26} 1.5400, d_4^{26} 1.1172. With S, II in C_6H_6 at 100° gave no thiophene deriv., nor did it react in MeOH at room temp with SbCl_3 . Brominated at 0° in CCl_4 , Et_2O or EtCl , washed with MeOH, and recrystd. repeatedly, II yielded the solid dibromide, $\text{BrCH}_2\text{CMe}:\text{CMeCH}_2\text{Br}$ (III) (cf. *J. prakt. Chem.* **62**, 166 (1900)), $b_{18.6}$ 105-10°, d_4^{50} 1.6912, n_D^{50} 1.5470. The liquid dibromide (IV), $b_{18.6}$ 105-10°, n_D^{50} 1.5390, d_4^{50} 1.6502. Ozonization of III in very cold EtCl gave 84.15% bromoacetone. III heated at 100° with EtONa (calcd. quantity), dild., salted out with KOH, dried and distd., yielded 1,4-dimethoxy-2,3-dimethyl-2-butene, oil, peppermint odor, $b_{33.6}$ 81-4°. Prep. similarly, 1,4-diethoxy-2,3-dimethyl-2-butene, oil, faint rose odor, b_{26} 90-5°. III in Et_2O added slowly to excess MeMgI soln., ice and then HNEt_3 added, dild. with mineral acid, dried and the Et_2O ext. distd., gave a terpene oil, $\text{C}_{12}\text{H}_{20}$, b_{20} 50°, not the normal terpene of Lebedev and Merezchkovskii (*C. A.* **8**, 320), and a residue with high b. p. III in C_6H_6 heated 4 hrs at 100° with HNMe_2 (2 mols.), extd. with dil. HCl, the acid ext. extd. with Et_2O , made alk., again extd. with Et_2O , the aq. soln. made acid to Congo red and H_2PtCl_6 added, yielded 1,1,3,4-tetramethyl- Δ^3 -pyrrolinium bromide platinichloride $\text{C}_{16}\text{H}_{32}\text{N}_2\text{Cl}_6\text{Pt}$, yellow, m. 199°. A higher yield was obtained by pptn. as the auribromide, red. Washed with water, extd. with dil. HCl and made acid to Congo red, and pptd. with a Au salt, the combined Et_2O exts. pptd. 23.4% of 1,4-bisdimethylamino-2,3-dimethyl- Δ^2 -butene dihydrobromide aurichloride, $(\text{BrHMe}_2\text{NCH}_2\text{CMe})_2\text{Au}_2\text{Cl}_6$, yellow, m. 188-9°. The tendency toward ring formation is therefore less in III than in the solid dibromide of Braun (*C. A.* **17**, 1083-4). Following the same procedure was prep. after purification from EtOH , 1,4-diphenylmethylamino-2,3-dimethyl- Δ^2 -butene, $(\text{PhMeNCH}_2\text{CMe})_2$, m. 76-7°. The aq. soln. gave no ppt. with Au or Pt chlorides or picric acid. From III and $\text{C}_6\text{H}_5\text{N}$ (20 parts) was obtained, after purification from Et_2O , 2,3-dimethyl- Δ^2 -butene-1,4-dipyridonium dibromide, $(\text{PhBrNCH}_2\text{CMe})_2$, m. 124°. Platinichloride, $\text{C}_{16}\text{H}_{30}\text{N}_2\text{Cl}_6\text{Pt}$, m. 228° (decompn.). IV, HNEt_3 (2 mols.) and Et_2O (50 parts) let stand 1.5 days,

evapd. and the products isolated in the way described for the auribromides yielded 26.75% *quaternalry salt*, $C_{10}H_{20}NBr_4Au$, dark red, m. $106-7^\circ$, and 21.22% of *dilertiary salt*, $C_{14}H_{22}N_3Br_3Au_3$ (V), orange, purified by pptn. with Et_2O from MeOH, m. $177-8^\circ$. By the same method III gave 11.55% of *quaternalry salt* (28.78% Au), m. 52.8° and 27.2% of *dilertiary salt*, m. $177-9^\circ$ (unchanged by mixing with V). The greater tendency of IV to form a ring compd. showed that it is the *cis*-form and III the *trans*-form. Other reasons are given to show that IV is the *cis*-form. Since, however, the quaternalry compds. from III and IV were not identical, IV as prepd. may have been a mixt. or the product from III may have been bimol., thus. $BrEt_2NCH_2CMe:CMech_2N(Et_2Br)CH_2CMe:CMech_2$, instead of $MeC.CMech_2N(Et_2Br)CH_2$. III refluxed with Zn dust and 90% EtOH, extd. with Et_2O and the ext.

brominated yielded III. III in dry Et_2O with Mg ($1/2$ atom) gave no trace of rubber or $C_{12}H_{10}Br_2$, but only IV. III heated 12 hrs. at 100° with II gave II, III and IV.

C. C. DAVIS

A new tetramethylbutadiene. A. D. MACALLUM AND G. S. WHITBY. *Trans. Roy. Soc. Can.* 22, 39-44(1928).—The expts. are part of a study of the influence of methylation on the ability of butadiene to polymerize, earlier work having indicated that methylation of the end positions has, compared with methylation of the middle positions, an unfavorable effect, and that the greater the no. of Me groups the less the tendency to polymerize. Reduction of $MeEtCO$ to 3,4-dimethylhexan-3,4-diol (I) was tried under various conditions. Na and moist Et_2O gave a 9.5% yield. In C_6H_6 , Fe or Zn gave no yield, Al and Mg gave a 40% yield (Mg acting much more rapidly), amalgams were not better than the corresponding metal with $HgCl_2$, small proportions of I or CuCl did not increase the yield, too great diln. with C_6H_6 diminished the yield and excess ketone ruined the yield. The best crude yield (41%) was obtained by refluxing Mg shavings (1 equiv.) with $HgCl_2$ (0.0747 mol.), $MeEtCO$ (2.22 mols.) and C_6H_6 (2.13 mols.), adding when stiff more C_6H_6 (1.06 mol.), decomp. with ice, adding NaOH (2 mols.), drying over NaOH, distg. *in vacuo* and purifying by fractionation. I (10-30 g.) and 20% H_2SO_4 (1 drop) distd. at $140-50^\circ$, the oil sepd., dried over $CaCl_2$, fractionated *in vacuo*, gave 84% of crude product which on further fractionation under 100 mm. pressure gave 3,4-dimethylhexa-3,4-diene (II), b. $132-4^\circ$, b_{100} $71-3^\circ$, n_D^{25} 1.4630, $d_4^{19.2}$ 0.7832, $[\alpha]$ 38.78. In soln. with Br at 0° it absorbs 2 atoms of Br, and on standing at 20° it absorbs 4 atoms with evolution of HBr, yielding a dibromide, could not be crystd. and decompd. on standing at 20° . Excess 3% aq. $KMnO_4$ added to II, filtered, neutralized with HNO_3 , excess $AgNO_3$ added and evapd. *in vacuo* yielded $AcOAg$. Crude II may contain a structural isomer, for fractions above and below its b. p. had the same compn. but different *n* values and oxidation yielded a *Ag salt* contg. less Ag. II did not undergo thermopolymerization when heated at 100° under 28 mm. pressure. Neither was it polymerized by long standing with Na. Dissolved in concd. H_2SO_4 and pptd. with water, II formed a viscous liquid compd., b. $170-200^\circ$, n_D^{25} 1.4915, contg. 85.4% C and 12.69% H and probably an impure dimer. Unlike isoprene and dimethylbutadiene, it does not react with aq. SO_2 . Exposed to air II undergoes autooxidation, forming a gummy polymer. Short exposure to a deficiency of air formed a colorless gum, which purified with MeOH contained 67.1% C and 10.01% H, gave a strong peroxide reaction with hot titan. acid, but a negative test with KI. II probably differs from a compd. of the same compn. prepd. by Herschmann (*Monatshfte* 14, 233(1893)). Attempts to brominate *n*-BuBr by prolonged exposure to light with Br and water gave negative results. With the Linne-mann method (*Ann.* 161, 199(1872)) 15.5% of a dibromo compd., b. $170-80^\circ$, was obtained, probably a 1,3-1,2-deriv. Reboul's method (*Bull. soc. chim.* 7, 124(1892)) and Fe as catalyst gave 32.6% of the 2,3-dibromide (*Ann.* 144, 234). Therefore Fe causes isomerization during bromination. In prep. $MeCH:CMech_3$, it was found best to use excess KOH (cf. *Ann.* 253, 231(1889)), 263 g. of dibromide, 82 g. of KOH and 400 cc. of MeOH, giving 124.7 g. of $MeCH:CMech_3$, b. $89-93^\circ$. Treated in dry Et_2O with Mg and with I as catalyst, decompd. with ice and dil. AcOH and distd. it gave, not the diene desired, but the compd. $C_{10}H_{18}O$, oil, onion odor, boiling approx. 160° , n_D^{25} 1.4735. The compn. of II, as indicated by the formation of AcOH on oxidation, is $MeCH:CMech_2CMe:CHMe$.

C. C. DAVIS

Comparative study of the addition of zinc oxide, lithopone, zinc sulfide and titanic acid to thin-walled rubber products vulcanized with sulfur chloride. RUDOLF DITTMAR AND GUSTAV BALLOG. *Gummi-Ztg.* 42, 1303-4(1928).—Expts. indicate that 8% is

about as much "colloidal" pigment as can be added to rubber cured with S_2Cl_2 vapor or S_2Cl_2 in CS_2 without causing imperfect goods. Using this max. of 8%, the relative merits of ZnO , ZnS , lithopone and TiO_2 were detd. ZnO imparted the most nearly white color; in all cases the quality was good when new and there was no essential difference in the aging.

C. C. DAVIS

Direct determination of rubber in soft vulcanized rubber. A. R. KEMP, W. S. BISHOP AND T. J. LACKNER. *Ind. Eng. Chem.* 20, 427-9 (1928).—When somewhat modified, the Wijs method, which has already been shown to be suitable for raw rubber (cf. *C. A.* 21, 1901), is applicable to the detn. of the rubber content of vulcanized rubber. Ext. the sample with Me_2CO , then with $CHCl_3$, ext. with alc. KOH if factice is present, disperse the dry residue (0.07-0.10 g.) in $(CHCl_3)_2$ (50 cc.) by refluxing, dil. with pure CS_2 (25 cc.), add 0.02*N* Wijs soln. (25 cc.), keep cold for 2 hrs., add 15% aq. KI (25 cc.) and water (50 cc.), titrate with 0.1 *N* $Na_2S_2O_8$, adding 5% starch soln. (5 cc.). From the difference between the blank and sample titration is calcd. the I no. as before (*C. A.* 21, 1901). To det. combined S, disperse the extd. residue (0.5 g.) in $(CHCl_3)_2$ (50 cc.), make up at 25° to 250 cc. with CCl_4 , centrifuge or let settle, evap. 100 cc. to dryness and det. S by the method of Waters and Tuttle (Byr. Standards, *Sci. Paper* 174 (1911); cf. *C. A.* 6, 1540). From the sum of the hydrocarbons in the unsatd. and combined states is calcd. the total rubber content. The various factors influencing the precision are discussed and representative analyses are given. Factice is about the only org. or inorg. ingredient which ordinarily affects the results. $(CHCl_3)_2$ was chosen as the best of numerous solvents of vulcanized rubber.

C. C. DAVIS

The effect of mineral rubber on the tensile strength of vulcanized rubber. WERNER ESCH. *Kautschuk* 1928, 31-5.—Papers by Stoll (*C. A.* 22, 888) and by Ditmar (*C. A.* 22, 1061) on the properties and effects of "mineral rubber" are reviewed critically. Phys. tests of several vulcanized mixts. are tabulated to show that the effect of "mineral rubber" depends upon the temp. and time of vulcanization, on the particular accelerator and its proportion and on the proportion of S. The addn. of small proportions, e. g., 5%, tends to stiffen a vulcanized mixt. and also to accelerate its rate of vulcanization.

C. C. DAVIS

Measurement of resistance of vulcanized rubber to penetration of benzene and other combustible substances. F. C. SCHMELKES. *Ind. Eng. Chem.* 20, 430-1 (1928).—The method is particularly suitable for hose. A definite length and diam., i. e., a const. surface of the latter, is surrounded by the solvent (C_6H_6 , gasoline, etc.) and air is blown through the hose at a definite and const. rate. The issuing air is then analyzed continuously for its solvent content by a calorimetric device operating a current recorder. Besides the dimension of the hose, such factors as temp. must be controlled.

C. C. DAVIS

The resistance to stretching of vulcanized rubber. II. R. ARIANO. *Nuovo cimento* [N. S.] 4, 263-81 (1927).—A. has extended his investigations (*C. A.* 20, 3362) to a consideration of the effect of various inorg. ingredients, to a study of the variation in vol. with respect to the Joule effect and to an examn. of the degree of vulcanization upon the parameters characteristic of stretching. He had demonstrated the independence of the type of mixt. and of the degree of vulcanization (Poisson's coeff.) and explains various characteristic parameters and their phys. significance. L. T. F.

A new process for the manufacture of ZnO (BERTHONNEAU) 18.

Rubber Chemistry and Rubber Technology. (*New Journal*.) C. C. DAVIS, editor. Published quarterly under the auspices of the Rubber Division of the American Chemical Society, Easton, Pa. Vol. 1, No. 1, appeared in Apr., 1928.

KIRCHHOF, FERDINAND: Fortschritte in der Kautschuk-Technologie. Dresden and Leipzig: T. Steinkopff. 201 pp.

Rubber composition. H. P. BUTLER. *Can.* 276,353, Dec. 20, 1927. A surfacing compn. is made by dissolving 3-5 ozs. crude rubber in 2 pints C_6H_6 , adding 4-5 pints CCl_4 and cooking the mixt. for 2-3 hrs., after which pyroxalin is added.

Rubber articles from latex. RUBBER LATEX RESEARCH CORPORATION. Brit. 273,991, Feb. 14, 1927. A jet of latex is coagulated in contact with acid, e. g., 20-30% $HOAc$, the superficially coated material is allowed to stand until the coagulation proceeds throughout, and the product is pressed, washed and dried. An app. is described.

Apparatus for mixing, masticating, working or kneading rubber, etc. R. C. LEWIS and FARREL FOUNDRY & MACHINE CO. Brit. 273,455, June 2, 1926.

Electrodeposition of rubber. P. SCHIDROWITZ. Brit. 273,662, July 5, 1926. Articles are produced and fabrics are impregnated by electrodeposition of vulcanized rubber by methods as described in Brit. 193,451 (C. A. 17, 3430) and Brit. 208,235 (C. A. 18, 1589). A mold may be connected as anode in a 30% vulcanized latex and a current d. of 0.8-1.0 amp. per sq. dcm. maintained. A porous layer may be placed before the anode and fillers and dyes may be added to the latex.

Vulcanizing rubber footwear. L. CANDEE & Co. Brit. 274,357, Jan. 15, 1927. Articles such as footwear covered with a soft tacky vulcanizable varnish are given a hard finish by treatment with a halogen or a halogen S compd. such as Cl, Br, S chlorides, sulfonyl chloride, thionyl chloride or Se oxychloride. The varnish used preferably contains an oxidizable or drying oil. An app. is described.

Regenerating vulcanized rubber. C. O. CARLSSON. Brit. 274,387, March 15, 1927. Vulcanized rubber is dissolved in tar oil, impurities are removed by centrifuging or otherwise and the rubber is pptd. from the soln. by adding alc. or other suitable reagent.

Sheet material containing rubber. E. C. VILLIERS. Brit. 273,961, Dec. 8, 1926. A filler such as powd. asbestos, bitumen, C. black, chalk, kieselguhr, lime, portland cement, "sulfur talc," dried or baked clay or sand, is mixed with coal-tar naphtha or other rubber solvent to form a pasty mixt. and there is added to this rubber latex or a similar latex. The order of mixing also may be reversed. After preliminary stirring and coagulation, the material is rolled into sheets, which may be reinforced with fabric or wire netting, and if S is present vulcanization by heating may be effected.

Molding ebonite. A. FRASER and R. and F. RISSIK, FRASER & Co., LTD. Brit. 273,355, Feb. 2, 1926. Undercured ebonite dust is placed in molds and subjected to a pressure exceeding 500 lbs. per sq. in. and heated to 220-250° for a short time, and allowed to cool before removing from the mold. Ni or other metals may be embedded in the material.

"Catgut substitutes." DUNLOP RUBBER CO., LTD., R. TRUBSDALE, R. C. SMITH and E. SIMPSON. Brit. 273,896, July 7, 1926. Threads of silk, ramie, cotton or wool are impregnated with solns. such as those of cellulose, rubber, gutta percha or balata and twisted. An app. is described. Cf. C. A. 22, 165.

CHEMICAL ABSTRACTS

Vol. 22.

JUNE 20, 1928

No. 12

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Iodine colorimeter with artificial light. L. S. VAN DER VLUGT. *Chem. Weekblad* 25, 196-7(1928).—The Fellenberg tubes (I in CHCl_3 color) are observed by magnifying glass, illuminated from behind by a 10-candle lamp with Co glass light filter. In a horizontally sliding tube rack test solns and standard colors alternate.

B. J. C. VAN DER HOEVEN

A modification of the Brown apparatus for the colorimetric determination of p_H . W. H. WRIGHT. *J. Lab. Clin. Med.* 13, 182-4(1927).—An inexpensive app., with an improved indicator scale, is described for the colorimetric detn. of p_H by the drop method.

E. WICKWIRE

Recent modifications of electrical temperature-measuring apparatus. W. JAEKEL. *Messtechnik* 2, 57-9, 95-8, 127-8(1926); *J. Inst. Metals* 38, 541.

E. J. C.

An improved titration apparatus for preservation of carbon dioxide-free alkali.

H. W. VAN URK. *Pharm. Weekblad* 65, 390(1928).—By the use of a stopcock at A and air pressure at D, the liquid is forced through the buret to the desired level and a normal meniscus obtained. C and D are soda-lime tubes.

A. W. DOX

A simple and accurate constant-volume pycnometer for specific gravity determinations. H. V. ELLSWORTH. *Mineralog. Mag.* 21, 431-5(1928).—The pycnometer is constructed of silica glass of 10 cc. capacity and 10 g. wt. The stopper has a capillary side tube of uniform bore which is graduated at intervals of $\frac{1}{2}$ cm. A ring on the neck permits of convenient handling by means of tongs. A special thermometer 5 mm. diam., 260 mm. long and graduated from 12° to 30° enables the temp. to be read to at least $\frac{1}{20}^\circ$. Rapid results are obtained which are extremely accurate.

W. F. H.

Developing the internal-type vacuum filter. J. T. SHIMMIN. *Mining and Metallurgy* 9, 227-8(1928).

E. H.

Some recent improvements in spray driers. C. D. POWER. *Chem. Eng. Mining Rev.* 20, 201-5(1928).—Detailed descriptions are given of the Kestner, Krause and Gray-Jensen driers.

T. S. CARSWELL

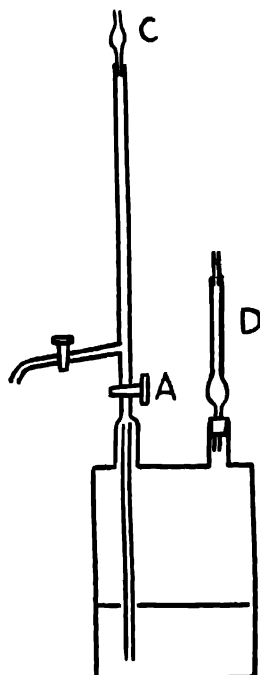

Sensitive springs from quartz fibers. H. D. H. DRANE. *Phil. Mag.* [7], 5, 559-60(1928).—Directions are given for producing helical springs of quartz fiber of diam. 0.005 cm. and less.

GEORGE GLOCKLER

Calculations concerning containers, especially those made of cast iron, designed for high pressures. F. VON ZEPEL. *Svensk Pappers-Tid.* 31, 140-2(1928).—Data are given for globe-shaped containers similar to those given in detail in C. A. 20, 3813, for plane container walls.

W. SEGERBLOM

Thermoelectric platinum-platinum rhodium couples. A. SOURDILLON AND ROLET. *Rev. métal.* 25, 90-7(1928).—Deterioration of the Pt wires is due to S-contg. gases only, and is permanent and cannot be destroyed by any known heat treatment. Metal protecting tubes are insufficient, but SiO_2 tubes afford perfect protection. An unprotected couple rapidly corrodes. If the whole of the corroded zone is at an absolutely uniform temp., it causes no error in the reading; otherwise (as is generally the case) the reading is inaccurate. Direct standardization of the couple by means of fixed points (as generally

recommended) must be accompanied by testing for parasite couples, and if such are present the standardization is meaningless unless the whole zone where they are present is at a uniform temp.; but if there are no parasite couples the instrument can be used without special precautions, otherwise the comparison should be made with a standard non-corroded couple under the same temp. conditions. A. PAPINEAU-COUTURE

The three-electrode vacuum tube and its application to some chemical engineering problems. H. C. WEBER. *Trans. Am. Inst. Chem. Eng.* 19, 107-16(1927).—The general principles of the three-electrode vacuum tube are discussed. Descriptions are given of its use in gas analysis, for measurement of gas velocity and pressure, as a sensitive micrometer, and for the detn. of dielec. const. and resistance. T. S. CARSWELL

Tungsten-zirconium furnaces. W. M. COHN. *Z. tech. Physik* 9, 110-5(1928).—A review on lab. furnaces for temps. up to 3000° (31 references). The technic of winding coils for W-Zr ovens with internal or external heating is described; a mixt. of 50-50 high and low burned ZrO₂ is used as cement. Pure H₂ (25%) and N₂ (75%) are used as protective gas, being passed around the heating coils. Temps. up to 2000° can be reached with these furnaces. B. J. C. VAN DER HORVEN

HAUSBRAND, E.: **Evaporating, Condensing and Cooling Apparatus.** London: Ernest Benn, Ltd. Price, approx. 21s., net.

Manifold for gas-analysis apparatus. C. B. FRANCIS. U. S. 1,668,362, May 1.
Resistance thermometers for stacks, rooms, silos, etc. C. E. FOSTER. Brit. 275,036, Sept. 9, 1926.

Spectroscope for gas analysis. SOC. ANON. DES CHARBONS ACTIFS E. URBAIN. Brit. 274,826, July 24, 1926.

Titration apparatus (suitable for determining salinity of brackish water). J. F. MARSHALL. Brit. 274,623, June 17, 1926.

Ultra-violet lamp apparatus. D. C. LINK. U. S. 1,668,566, May 8.

Viscometer. W. A. NIVLING. Brit. 274,479, July 13, 1926.

Filter for effecting thickening of various materials. J. B. VARNAY. Brit. 275,573, Aug. 3, 1926.

Filter and sterilizer for air or other gases. M. G. VON LINDEN, R. MELDAU and DEUTSCHE LUFTFILTER-BAUGES. Brit. 274,942, April 23, 1926. Cu or material contg. Cu is used for the filter and is coated with a viscous soln. of a Cu salt such as colloidal Cu oleate mixed with paraffin or "white oil."

Intermittently operating filter for liquids. E. J. SWEETLAND. Brit. 275,333, May 5, 1926.

Strainer head for filtering apparatus. W. J. HUGHES. U. S. 1,668,205, May 1.

Filter plate formed of expanded silica particles adhering together without a binder. H. L. WATSON. U. S. 1,669,362, May 8.

Apparatus for continuous filtration of chemical precipitates or other materials. G. GRÖNDAL. U. S. 1,668,557, May 8.

Baffle apparatus for separating dust from gases. E. BUDIL (NÉE MEIXNER). Brit. 275,257, July 31, 1926.

Apparatus for determining the degree of fineness of pulverulent or fine granular substances by suspending them in liquids. H. HARKORT. U. S. 1,667,783, May 1.

Apparatus for charging gas producers, shaft furnaces, etc. J. LAMBOT. U. S. 1,668,968, May 8.

Apparatus for producing gaseous ozonides. E. J. BAGNALL. U. S. 1,668,884, May 8.

Apparatus for screening wood pulp or other materials. R. E. WAGNER. U. S. 1,669,029, May 8.

Apparatus for gradual production of gases such as chlorine by reaction of chemicals mixed with inert materials. W. E. KEMMERICH. U. S. 1,668,371, May 1.

Temperature indicator for encased electrical apparatus. E. D. TREANOR. Brit. 274,852, July 23, 1926.

Tubular heat-exchange apparatus. D. K. DEAN. U. S. 1,669,291, May 8.

Annular rotary hearth furnace or oven for drying or dry distillation of granular and pulverulent materials. TROCKNUNGS-, VERSCHWELUNGS- UND VERGASUNGS, GEs., L. HONIGMANN and F. BARTLING. Brit. 275,041, Oct. 2, 1926.

Heat-exchange apparatus adapted for use with gases, vapors and liquids. E. MENZEL. U. S. 1,669,062, May 8.

Electric discharge device. F. MEYER, H. J. SPANNER and E. HERFURT. Brit.

275,552, Aug. 6, 1926. The pressure of gas or vapor in an incandescent-cathode rectifier is maintained by means of a highly porous material such as activated C or silica gel, satd. with gas and which may be placed in the main or in an auxiliary container. Inert gases such as Kr or Ar may be used in the filling.

Electron-emitting cathode. E. E. SCHUMACHER. U. S. 1,668,734, May 8. A filament of metal such as W or Mo is supported in an evacuated vessel contg. powd. Ce or other thermionically active material, a heating current is passed through the vessel and the latter is agitated to bring the thermionically active material into contact with the filament. Cf. C. A. 21, 3494.

Apparatus (with catalytic disks) for hydrogenating liquids and semi-liquids. G. R. SCHUBLER. Brit. 274,952, April 28, 1926.

Apparatus (with rotating disks) for effecting contact between gases and liquids. P. F. HOLMES, D. M. HENSHAW and W. C. HOLMES & Co., LTD. Brit. 275,092, Feb. 7, 1927.

Multiple-chamber continuous kiln. M. BISCH. Brit. 275,616, Aug. 6, 1926.

Apparatus for emulsifying fats, dried milk or other materials with water. A. C. BAMFORD. Brit. 275,375, June 12, 1926.

Apparatus for preparing filaments of platinum or other metal coated with calcium oxide or like substances. E. R. STOEKLE. U. S. 1,668,742, May 8. A metallic boat holds the coating material which is heated out of contact with the filament.

Tanks or vats formed of cement mixed with latex and lined with rubber. N. SWINDIN. Brit. 275,316, May 3, 1926.

Apparatus for depositing metals on textile materials, paper or the like by electric discharges in a vacuum chamber. W. A. F. PFANHAUSER. Brit. 275,523, April 14, 1927.

Apparatus for producing actinic rays of extremely short wave length for sterilizing water or foods or for other purposes. V. H. M. A. DANGERFIELD. Brit. 275,596, Aug. 4, 1926.

Thermionic valves. S. LOEWY. Brit. 274,509, July 19, 1926. Incandescent cathodes of rectifiers and other electron tubes comprise a coating of metal oxides or other substances of high electron emission properties which may be applied to a wire of Fe or Cr-Ni covered with Pt or Pt-Ir.

Thermionic valve. NAAMLIOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 275,449, Oct. 27, 1926. A helical cathode such as described in Brit. 274,981 (cf. following abstract) is formed of Ni and a layer of Cu oxide may be placed between the Ni and the alk. earth oxide.

Thermionic valves. NAAMLIOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 274,981, May 6, 1926. Cathodes are formed with a core or metal such as W or Mo, helically wound with a wire of Pt, Pt-Rh or other Pt alloy, and coated with alk. earth oxide or other material of high electron emissivity. Cu may be applied to the cathode and oxidized and Ba applied to the Cu oxide, followed by heating to form BaO and volatilize the Cu. Cf. preceding abstract.

Thermionic valves. RADIOWERK E. SCHRACK. Brit. 275,542, Aug. 6, 1926. A carrier wire which may be formed of W, Mo, or thoriated W may be coated electrolytically with Au, Pt, Ni, Cu, Ag or Fe, or coated with C (which is preferred) to render further coating material more firmly adherent, and is then sprayed with carbonate or other suitable alk. earth compd. which will serve for providing an oxide coating when heated.

Thermostat. A. J. MOTTLAU. U. S. 1,668,973, May 8.

Thermostat. SPENCER THERMOSTAT Co. and L. K. MARSHALL. Brit. 275,527, April 19, 1927.

Thermostatic devices. J. V. GIESLER. U. S. 1,668,896, May 8.

2—GENERAL AND PHYSICAL CHEMISTRY

GEORGE L. CLARK AND J. H. REEDY

Physics in Sicily from the scientific renaissance to the present day. SER. TIMPANARO. *Atti II congresso naz. chim. pura applicata* 1926, 1453-6.—Historical.

C. C. DAVIS

Science in Sicily in antiquity. ALDO MIELI. *Atti II congresso naz. chim. pura applicata* 1926, 1425-7.—Historical.

C. C. DAVIS

Stanislao Cannizzaro, historian of science. ALDO MIELI. *Atti II congresso naz.*

chim. pura applicata 1926, 1422-4.—A review of the contribution of Cannizzaro in promulgating the mol. theory. C. C. DAVIS

"The work of Stanislaw Cannizzaro in physiology and in medicine. S. BAGLIONI. *Atti II congresso naz. chim. pura applicata* 1926, 1413-21.—An historical sketch, with medallion reproduction of Cannizzaro. C. C. DAVIS

An outline of the history of the Edinburgh Chemists', Assistants' and Apprentices' Association. J. W. LAING. *Pharm. J.* 119, 585-8, 614-7(1927).—An address, commemorating the 50th anniversary. S. WALDBOTT

Sir Edward Frankland: a great Lancastrian. H. D. ARMSTRONG. *Chemistry and Industry* 47, 408-10(1928).—Biographical. E. H.

The improved physical laboratory of the University of Groningen. D. COSTER. *Physica* 8, 45-60(1928). B. J. C. VAN DER HOEVEN

Barium or barium? REINHOLD BAHMANN. *Apoth. Ztg.* 43, 450(1928).—A further discussion of the etymology of this name. W. O. L.

Critical study of the origin and the development of the atomic-molecular theory and of its symbolic expression in the form of chemical notation. ADRIANO OSTROGOVICH. *Atti II congresso naz. chim. pura applicata* 1926, 120-67.—A long and very detailed historical and crit. review of the most important contributions, particularly those of Dalton, Berzelius, Avogadro, Ampère, Gerhardt, Gaudin, Laurent, Cannizzaro and Mendeleev. Corrections. *Ibid* 1645. C. C. DAVIS

Variability of old standard kilograms. L. H. SIERTSEMA. *Physica* 8, 37-43 (1928).—A study of wt. changes, appearance, etc., of 27 standard kg. weights over a period of more than 100 yrs. B. J. C. VAN DER HOEVEN

Composition of the air in the streets of Paris. R. CAMBIER AND F. MARCY. *Compt. rend.* 186, 918-21(1928).—The findings agree with those of Florentin (*C. A.* 22, 1069). Six samples of air 0.2 m. above ground contained from 0.08 to 0.50 l. of CO per cu. m. At 1.6 m. above ground the range was 0.01 to 0.05 l. per cu. m. The no. of automobiles per hr. ranged from 800 to 2600 and had no relation to the quantity of CO as detd. in the samples taken, except from samples in confined spaces. The range of CO₂ was 0.34 to 0.60 l. per cu. m. for samples 0.2 m. above ground and 0.30 to 0.51 for samples 1.6 m. above ground. The enormous increase of automobiles has not caused any important change in the compn. of the air. L. W. RIGGS

The atomic weight of copper. RUDOLF RÜER. *Z. anorg. allgem. Chem.* 169, 251-6(1928).—Cu reduced at 750° by H for at. wt. detns. can be weighed in air and still maintain the accuracy of weighing (1-100,000) set by T. W. Richards, if after the reduction the Cu be maintained at 750° in a current of H until it has attained const. wt. Four g. of Cu requires heating for about 50 hrs. after reduction. This gradual change probably corresponds with the fusion of the Cu to a mass of const. surface so that the wt. of the CuO film formed on the surface is const. Cu so formed has a sp. gr. 8.880 (19°/4°). E. R. SCHIERZ

Chemical affinity, cohesion, compressibility, and atomic volume. Studies on the effects of internal pressure. T. W. RICHARDS. *J. chim. phys.* 25, 83-119(1928); cf. *C. A.* 20, 1158; 21, 1728; 22, 518.—A comprehensive review of R's work on this subject since 1902. This summary, the last and in many ways the most complete which he wrote, was prepd. with especial care, and may be considered a statement of his final attitude. W. T. RICHARDS

Latent heat of vaporization as a function of temperature. R. M. WINTER. *J. Phys. Chem.* 32, 576-82(1928).—The expression $\lambda = \lambda_0 (1 - T_r)^{2/3}$ where λ is the total latent heat of vaporization, T_r the reduced temp., and λ_0 an empirical const., is tested and found adequate over a considerable range. No new exptl. data are presented. Relations between this expression and those of similar form involving surface tension and density are pointed out. W. T. RICHARDS

A periodic classification of the hardness and melting points of the elements. S. A. KORFF. *Science* 67, 370-1(1928); cf. *C. A.* 21, 2864.—It is possible to classify the elements according to hardness and m. p. This classification fits with considerable precision into an 18-period table based on spectroscopic similarities. In this table, the elements are arranged according to at. no., with those of similar spectra in columns. The horizontal rows are successively: H and He, Li and Be, B to Mg, Al to Ca, Sc to Sr, Y to Ba, Hf to Ra and Th to U. Thus the latter column comprises He, Be, Mg, Ca, Sr, Ba and Ra. The correlation of the m. p. and hardnesses in this table is considered; predictions are made of the properties of the unknown elements. A. L. HENNE

Influence of relative ionic sizes on the properties of ionic compounds. LINUS PAULING. *J. Am. Chem. Soc.* 50, 1036-45(1928).—The ratio of cation radius to anion radius influences the properties of ionic substances. Irregularities in interionic dis-

tances, m. ps. and b. ps. of the alkali halides can be explained as resulting from this effect.

Molecular weight determinations and solubilities in liquid chlorine. K. H. BUTLER AND D. MCINTOSH. *Trans. Roy. Soc. Can.* [3], 21, Sect. 3, 19–26 (1927); cf. C. A. 22, 599.—The soly. of 60 salts and 10 elements in liquid Cl was detd. by the b. p. method with an accuracy of 0.1%. Tetrahedra of Ag and pieces of garnet were used in the b. p. app. to avoid superheating. The const. for the b. p. of Cl was found to be 1.73. Br gave evidence of dissociation in liquid Cl, but the soln. showed no elec. cond. Polar salts proved insol while many liquids with low f. ps. were extremely sol. in liquid Cl. The reactions of certain of the elements in boiling Cl were examd. and the solubilities of the resulting compds. detd.

Specific molecular geometry. R. FERRIER. *Compt. rend.* 186, 577–8 (1928).—In considering proteins which show a specific absorption for certain other proteins in many cases no difference in chem. properties can be detected. It is suggested that these substances form definite geometrical mol. polygons dependent on the characteristic pro-

tein type of linking. The type of polygons formed may be

$$\begin{array}{ccccccc} & & \text{O} & & \text{O} & & \text{O} & & \text{O} & & \text{O} \\ & & \parallel & & \parallel & & \parallel & & \parallel & & \parallel \\ \text{C} & - & \text{C} & - & \text{N} & - & \text{C} & - & \text{C} & - & \text{N} & - & \text{C} \end{array}$$

Each substance capable of forming this type of linking is unable to ppt. itself. This type of linking would be possible only for compds. showing definite orientation and periodicity of certain groupings.

D. H. POWERS

Conception of polarity derived from physical measurements and its relations to the electronic configuration of aromatic organic compds. J. F. T. BERLINER. *J. Phys. Chem.* 32, 293–306 (1928).—Variations in the entropies of vaporization of the isomeric nitroanilines, mononitrotoluenes and toluidines are used as the basis for discussion of the relation existing between their electronic structure and mol. association. Configurations are illustrated and shown in agreement with properties considered. Study is made of the significance of these relations.

J. L. COSTA

The tenacity of tellurium crystals. E. SCHMID AND G. WASSERMAN. *Z. Physik* 46, 653–67 (1928).—Large crystals of Te were prepd. by fusion in vacuum and subsequent slow cooling. Angles of cleavage planes were verified. For orientations 90° to 29° between cleavage plane and tension, the crit normal tension is 431 g./sq. mm. Below 29° the value falls very rapidly, a secondary fracture type apparently taking place. Plastic deformation occurs along the cleavage plane and in the direction of the diagonal axis.

J. L. COSTA

The vaporization of orthorhombic sulfur. G. AMINOFF. *Z. Krist.* 65, 632–5 (1927).—The vaporization of a sphere cut from a crystal of S develops plane faces which correspond to the most important crystal faces.

L. S. RAMSDALL

The principles of temperature measurement. KARL SCHIEBL. *Messtechnik* 1, 3–6, 32–5 (1925).

E. J. C.

A method of great precision and simplicity for determining the index of refraction of liquids. A. SELLERIO. *Atti II congresso naz. chim. pura applicata* 1926, 1232–43.—See C. A. 21, 3015.

C. C. DAVIS

The crystal structure of stannic sulfide. IVAR OPTEDAL. *Norsk Geol. Tids.* 9, 225–33 (1927).—Debye-Scherrer photographs were taken from 2 different preps. of SnS₂. From these the crystal structure was found completely analogous to that of CdI₂, ZrS₂, etc. Positions: Sn (000) or (00¹/₂), 2S (1/3, 2/3 u, 2/3, 1/3 ū), u lying between the limits 0.23 and 0.27, most probably being exactly 0.25. Dimensions of the unit cell: a = 3.62 Å. U., c = 5.85 Å. U., c/a = 1.615. Least distance between atoms: Sn–Sn 3.62 Å. U., S–S 3.60 Å. U. (u = 0.25), Sn–S 2.55 Å. U. (u = 0.25), Sn–S 2.62 Å. U. (u = 0.27), Sn–S 2.49 Å. U. (u = 0.23). A remarkable anomaly of the intensities of certain reflections was explained from the prevalence of a certain form among the powder particles, tables parallel to (001).

C. A. ROBAX

The lattice dimensions of zinc oxide. TOM BARTH. *Norsk Geol. Tids.* 9, 317–9 (1927).—Powder photographs of c. p. ZnO according to the method used by Wyckoff with an addn. of NaCl for comparison showed the following exact dimensions of the unit cell: a₀ = 3.242 Å. U., c₀ = 5.176 Å. U., accordingly c/a = 1.596 ± 0.004.

C. A. R.

X-ray investigation of the alkaline earth fluorides. F. THILO. *Z. Krist.* 65, 720–2 (1927).—SrF₂ and BaF₂ have the fluorite type of structure, with the side of the unit cube 5.81 and 6.20 Å. U., resp.

L. S. RAMSDALL

The crystal structure of the modification C of the sesquioxides of the rare earth metals and of indium and thallium. WILLIAM ZACHARIASEN. *Norsk Geol. Tids.* 9,

310-6(1927).—A preliminary report on x-ray investigations of the oxides M_2O_3 of the elements Sc, Y, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, In and Tl. The elementary cube contains 16 mols. M_2O_3 , which is in good agreement with the observed ds. As only even values of $h^2 + k^2 + l^2$ are observed, the underlying lattice is body-centered. Consequently only the following space groups are possible: T^3 , T^4 , T_h^6 and T_h^7 . None of these has 32 equiv. positions, so the metal atoms cannot all be equiv. In order to get further data on the symmetry of the crystals Laue photographs were prepd. (of Tl_2O_3). The patterns obtained showed hemihedral symmetry thus excluding the space groups of the classes Oh, O and Td. A comparison of the powder photographs of the lightest and the heaviest molecule in the series Sc_2O_3 – Tl_2O_3 shows that all the interference lines except 16, 32, 48, 64, etc., must be due to the metal atoms alone. The lattice const., a_0 in A. U., were: Sc 9.79, Y 10.60, In 10.12, Sm 10.85, Eu 10.84, Gd 10.79, Tb 10.70, Dy 10.63, Ho 10.58, Er 10.54, Tm 10.52, Yb 10.39, Lu 10.37, Tl 10.57. Of all the possible arrangements of the 32 metal atoms it was proved that only the arrangement $12c + 12c + 8b$ is compatible with the observed intensities. As the predominating lines in the powder photographs are reflections from the faces 222, 400, 440, 622, 444, 800, etc., the unit cell may be divided into 8 small cubes, each of them being nearly a face-centered cubic lattice. The parameters consequently must obtain values which nearly place them in special positions. The 3 parameters $8b$ (t), $12c$ (u) and $12c$ (v) therefore differ only very little from the figures $t = 1/4$, $u = 0$, $v = 1/2$. It looks very probable that it is exactly 0.25. The values of u and v are detd.: $u = 0.021$ and $v = 0.542$. Presuming that an O atom has the same distance from the 4 surrounding metal atoms the following values of at. distances were calcd.: Sc–O = 2.18 A. U., Y–O = 2.36 A. U., Sm–O = 2.42 A. U. By regarding one-eighth cube of the whole unit cell the analogy to the CaF_2 arrangement is evident. The metal atoms form a distorted face-centered lattice while O atoms occupy approx. 6 of the 8 positions of the F atoms. Each metal atom consequently is surrounded by 6 O atoms at the same distance and each O atom by 4 metal atoms forming a nearly regular tetrahedron.

C. A. ROBAK

The crystal structure of the antimony oxides. U. DEHLINGER. *Z. Krist.* 66, 108–19(1927).— Sb_2O_3 is cubic and gives the same diffraction pattern as Sb_2O_4 , but with the side of the unit cube 10.22 A. U. which is about 10% smaller than that of Sb_2O_3 . Powder photograph patterns identical with that of Sb_2O_4 were obtained from what D. assumed to be Sb_2O_3 and Sb_2O_4 .

L. S. RAMSDELL

The crystal structure of cobalthexammine iodide. HANS HENTSCHEL. *Z. Krist.* 66, 466–7(1928); cf. C. A. 22, 1711.—The structure of $Co(NH_3)_6I_3$ as detn. by H. is identical with that by Wyckoff and McCutcheon. Cf. C. A. 21, 1384.

L. S. R.

Crystal structure of potassium hydroxystannate. R. W. G. WYCKOFF. *Am. J. Sci.* 15, 297–302(1928).—Laue and spectral photographs of $K_2Sn(OH)_6$ have been taken. The atomic arrangement is a distortion of the R_2PtCl_6 structure. The crystal is rhombohedral. The K and Sn positions can be expressed in terms of a uni-mol. unit: $a_0 = 5.66$ A. U.; $\alpha = 70^\circ 1'$, with Sn at 000, K at uuu , $\bar{u}\bar{u}\bar{u}$ where $0.25 < u < 0.27$. The cell is developed from the space group 3 Di-5.

R. L. HERSHEY

The fine structure of β -corundum. C. GOTTFRIED. *Z. Krist.* 66, 393–8(1928).—The unit cell of β -corundum contains 12 mols. and has the dimensions $a = 5.63$ and $c = 22.63$ A. U. The axial ratio is $a:c = 1:4.02$. The O atoms are not close packed. An analysis of β -corundum is given.

L. S. RAMSDELL

The space lattice of calcium carbide. CARL HERMANN. *Z. Krist.* 66, 314–6(1928).—A criticism of the x-ray detn. of Glocker and Dehlinger (cf. C. A. 21, 1210).

L. S. R.

The crystal structure of beryllium sulfate. R. FRICKE and L. HAVESTADT. *Z. anorg. allgem. Chem.* 170, 35–41(1928).— $BeSO_4 \cdot 4H_2O$ is tetragonal body-centered. The cell dimensions are: $a = b = 8.03$ A. U.; $c = 10.75$ A. U. There are 4 mols. per unit cell and the space group is D_{4h}^{18} .

R. L. HERSHEY

The crystal structure of lithium chloride monohydrate. S. B. HENDRICKS. *Z. Krist.* 66, 297–302(1928).—Powder, Laue, and spectrum photographs indicate a simple tetragonal unit for $LiCl \cdot H_2O$. The unit cell contains 1 mol. and has the dimensions $a = 3.88$ and $c = 3.81$ A. U. The Cl atoms are at 000, the O atoms at $\frac{1}{2}\frac{1}{2}\frac{1}{2}$ ($u = 0.42$ – 0.46) and Li at 00v or $\frac{1}{2}\frac{1}{2}\frac{1}{2}$. An alternative soln. is a unit cell with 2 mols. and $a = 3.88$ and $c = 3.81\sqrt{2}$ A. U. The detn. by Ott (cf. C. A. 20, 3106) giving a simple cubic lattice, based on powder data alone, is wrong.

L. S. RAMSDELL

The crystal structure of the tetragonal compounds silver chlorate and silver bromate. LEIV HARANG. *Z. Krist.* 66, 399–407(1928).—There are 8 mols. in the unit cells of $AgClO_3$ and $AgBrO_3$ and the dimensions are $a = 8.49$ and 8.59 , and $c = 7.91$ and 8.01 A. U., resp.

L. S. RAMSDELL

Crystal structures of the normal paraffins, octane, hexane and pentane. J. C. McLENNAN AND W. G. PLUMMER. *Trans. Roy. Soc. Can.* [3], 21, Sect. 3, 99-113 (1927).—X-ray photographs of the powdered crystals of the lower members of the paraffin series were made, by means of a modified Debye app., with liquid air or liquid H as refrigerant. Each of the hydrocarbons was found to crystallize in 2 forms, orthorhombic and monoclinic. In the rhombic modification the mols. apparently arrange themselves so as to produce a straight line of carbon atoms, while the monoclinic modification with approx. the same length of mol. has tilted over so as to make an angle of 60° with the basal plane. The authors consider the mol. symmetry for the orthorhombic forms is of a low order. J. W. SHIPLEY

A note on the crystalline structure of certain aromatic compounds. W. H. BRAGG. *Z. Krist.* 66, 22-32 (1927).—Naphthalene and anthracene give certain reflections due to carbon rings which show a periodicity that is a submultiple of the unit cell spacing. The unit cells of naphthalene tetrachloride and tetrabromide are as follows: $a = 7.88$, $b = 10.30$, $c = 14.20$ A. U., $\beta = 112^\circ 40'$, and $a = 10.75$, $b = 8.97$, $c = 13.25$ A. U., and $\beta = 112^\circ 57'$. The additional Cl and Br atoms change the length of the b axis, but have little effect on c or a . L. S. RAMSDELL

Investigation of two remarkable organic substances. SIEGFRIED RÖSCH. *Z. Krist.* 65, 680-711 (1927).—A detailed crystallographic and optical investigation of *p*-toluylacetophenone enol and dibenzoylmethane enol. L. S. RAMSDELL

The molecular symmetry of pentaerythritol. S. B. HENDRICKS. *Z. Krist.* 66, 131-5 (1927); cf. *C. A.* 20, 2435.—A redctn. gives 4C-2 (S_4^2) or 4C-5 (C_5^4) as the correct space group of $C(CH_2OH)_4$. It is possible to have a splenoidal arrangement of (CH_2OH) groups around the central C atom. L. S. RAMSDELL

The crystal structure of pentaerythritol. A. NEHMITS. *Z. Krist.* 66, 408-16 (1928).—The space group of pentaerythritol cannot be C_4 , but is S_6^2 . L. S. R.

The crystal structure of the tetracetate and tetranitrate of pentaerythritol. A. GERSTACKER, H. MÖLLER AND A. REIS. *Z. Krist.* 66, 355-92 (1928).—The tetracetate of pentaerythritol is tetragonal, C_{4h}^2 . The unit cell contains 2 mols., and $a = 12.18$ and $c = 5.58$ A. U. The tetranitrate is also tetragonal, with symmetry V_4^4 . The unit cell contains 2 mols. and $a = 9.38$ and $c = 6.69$ A. U. The two O atoms in the NO_2 group are not strictly equiv. L. S. RAMSDELL

X-ray investigation of several triclinic-pinacoidal crystals. A. GERSTACKER, H. MÖLLER AND A. REIS. *Z. Krist.* 66, 421-33 (1928).—The unit cell of racemic acid monohydrate contains 2 formula weights, and has $a = 8.3$, $b = 10.03$, and $c = 4.90$ A. U. Anhydrous racemic acid: 2 formula wts., $a = 7.18$, $b = 9.71$, $c = 4.98$. Malonic acid: 2 formula wts., $a = 8.36$, $b = 5.33$, $c = 5.14$. $K_2S_2O_8$: 1 formula wt., $a = 5.11$, $b = 6.51$, $c = 5.48$. L. S. RAMSDELL

Crystallographic and optical investigation of dicyanamide. E. BAIER. *Z. Krist.* 65, 719 (1927).— $(CN_2H_2)_2$ is monoclinic, with $a:b:c$ 1.0021:1.04854, $\beta = 90^\circ 31'$. $n_D^{20} = 1.5492$ and $2V = 38^\circ 31'$. The optical character is positive. L. S. R.

The tetroxalates of the alkali metals K, Rb, Cs and of NH_4 and Tl. MARY W. PORTER. *Z. Krist.* 66, 217-35 (1928).—Optical and crystallographic data are given for this isomorphous series of triclinic crystals. L. S. RAMSDELL

New kinds of mixed crystals. V. D. BALAREFF AND R. KAISCHEW. *Z. anorg. allgem. Chem.* 167, 237-40 (1927); cf. *C. A.* 21, 3502.—Expts. in pptg. $BaSO_4$ from a soln. containing $KMnO_4$ indicate that the coloration is due to adsorbed $KMnO_4$ and not to the formation of mixed crystals. The co-pptn. of CuS and ZnS is found to depend upon the conditions, indicating that the ZnS is adsorbed on the CuS. Thus in hot neutral soln. no ZnS is pptd. in the CuS, but an increase in acidity causes first a sharp increase in the amt. of enclosed ZnS, and then a gradual decrease. VI. D. BALAREFF, R. KAISCHEW AND G. KRATSCHEW. *Ibid* 168, 154-62.— $BaSO_4$ pptd. from solns. containing other salts, e. g., $KMnO_4$, brings down some of the other salt. The analysis of a series of such ppts. shows that the amount of foreign salt in the ppt. first increases with increasing concn. in the soln., then reaches a max. and finally declines. In general the greater the H_2O content of the ppt., which corresponds to a greater surface of ppt., the greater the amt. of foreign salt. Microscopic analysis reveals the ppt. from solns. of low foreign salt concn. to be composed of small regular crystals; from the concd. solns. they are deformed. It is concluded that $BaSO_4$ can enclose not only permanganates but salts of the types Na_2SO_4 , $BaCl_2$, $FeCl_3$, $AlCl_3$, $CaSO_4$; these enclosures are mechanical, and stand in a relation to the presence of interior surfaces in the $BaSO_4$ ppt. $BaSO_4$ was pptd. in 3 ways: (1) slowly in a hot slightly acid soln., (2) slowly in a hot strongly acid soln., (3) rapidly in a cold soln. All ppts. were similarly washed, dried, etc., and direct

detns. of soly. made. (1) and (3) gave solubilities of 2.3 mg./l.; (2) gave 3.3 mg./l. There appear to be two different forms. (1) and (3) are the stable form; (2) is metastable and of itself or in the presence of I or BaCl_2 reverts to the stable form. R. L. H.

* The isomorphism of trivalent molybdenum and trivalent iron. G. CAROBBI. *Gazz. chim. ital.* 58, 35-45 (1928).— $(\text{NH}_4)_2\text{MoCl}_6 \cdot \text{H}_2\text{O}$ prepd. by the method of Chilesotti (*Ibid.* 33, 349 (1903)); *Z. Elektrochem.* 12, 146 (1906)) is an intense red with distinct pleochroism, brown-red longitudinally and wine-red normally. Its d_{111} is 2.175. It is rhombic, with $a \ b \ c = 0.6862 \ 1.07166$, and is isomorphic with $(\text{NH}_4)_2\text{FeCl}_6 \cdot \text{H}_2\text{O}$. Mixed crystals of $(\text{NH}_4)_2\text{MoCl}_6 \cdot \text{H}_2\text{O}$ and $(\text{NH}_4)_2\text{FeCl}_6 \cdot \text{H}_2\text{O}$ contains a max. of 10% of the former. Similarly $\text{K}_2\text{MoCl}_6 \cdot \text{H}_2\text{O}$, d. 2.39, is rhombic and is isomorphic with $\text{K}_2\text{FeCl}_6 \cdot \text{H}_2\text{O}$, d. 2.184, and mixed crystals were obtained, with d. 2.22, which contained a max. of 17% $\text{K}_2\text{MoCl}_6 \cdot \text{H}_2\text{O}$. When a soln. of the 2 salts was let stand several days and then concd., $\text{K}_2\text{FeCl}_4 \cdot 2\text{H}_2\text{O}$ sep'd., showing the strong reducing action of MoCl_5 . MoCl_5 soln. (40 cc. from 40 g. MoO_3 in 150 cc. concd. HCl), concd. to 0.5 its vol., treated with NH_4Cl (6 g. in 10 cc. water), formed anomalous mixed crystals contg. either 2.59% $\text{MoCl}_5 \cdot 4\text{H}_2\text{O}$ and 97.31% NH_4Cl or else 2.93% $\text{MoCl}_5 \cdot 6\text{H}_2\text{O}$ and 97.31% NH_4Cl , d. 1.551, monorefringent, with no optical anomaly, stable for many months. $(\text{NH}_4)_3\text{MoCl}_9$ prepd. by the method of Foerster and Fricke (*C. A.* 18, 1094) was microcryst., d. 2.069, and probably octohedric, monometric and monorefringent. NH_4Cl (22.5 g.) added to MoCl_5 soln. (20 cc. of same concn. as above), concd., satd. with HCl gas and let stand, formed the previously unknown compd. $(\text{NH}_4)_4\text{MoCl}_7 \cdot \text{H}_2\text{O}$, d. 1.905, monoclinic but difficult to analyze crystallographically. C. C. DAVIS

Demonstrations of the progress of crystallization by means of the Schlieren method. I and II. W. KRAEMER. *Z. wiss. Mikroskop.* 44, 476-7 (1927).—Crystals of org and inorg. substances are followed microscopically, between crossed nicols. Typical phenomena of liquid crystals are described briefly. C. W. MASON

Crystallization of silver beads and detection of the platinum metals by the microscope. C. O. BANNISTER. *J. Roy. Microscop. Soc.* [3], 47, 143-4 (1927).—Illustrations are given of distinctive effects of the various metals of the Pt group on the surface crystal. of Ag cupellation beads. C. W. MASON

The determination of the melting point of paraffin, and the preparation of paraffin mixtures of definite melting points. J. KISSER. *Z. wiss. Mikroskop.* 44, 443-51 (1927).—F. ps. are detd. by noting crystn. in a drop floating on water which is slowly cooled. M. ps. are detd. in a capillary, the range from incipient fusion to complete transparency being noted. Formulas are given for making up mixts. from paraffins of known m. ps. C. W. MASON

Equation of state for binary mixtures of methane and nitrogen. F. G. KEYES AND H. G. BURKS. *J. Am. Chem. Soc.* 50, 1100-6 (1928).—Exptl. data for three mixts. of N_2 and CH_4 were obtained for the temp. range 0° to 200° and at pressures up to 200 or 300 atms. The equation of state for each mixt. has been found to be the same in form as that applying to the pure gases (*C. A.* 21, 1732, 2825). The consts. of the equations of state representing the mixts. were found to be linear functions of the consts. of N_2 and CH_4 and compos. of the mixts. JAMES M. BEIL

The pseudo-integration constant in the Kirchhoff formula. NICOLAS KOLOSOVSKII. *J. chim. phys.* 24, 723-6 (1928).—Mathematical discussion of the apparent anomaly between λ_0 of the Kirchhoff formula in $\lim (\lambda)_{t \rightarrow 0} = \lambda_0 = \text{const.}$, and value $\lim (\lambda)_{t \rightarrow 0} = 0$ derived from Clapeyron-Clausius equation for perfect gases. J. L. COSTA

Chemical constant of hydrogen vapor and the failure of Nernst's heat theorem. R. H. FOWLER. *Proc. Roy. Soc. (London)* A118, 52-60 (1928).—An investigation is made of the chem. const. of H_2 on the assumption, indicated by Demison's explanation of the sp. heat, that H_2 at low and ordinary temp. is a mixt. in metastable equil. of 2 distinct sets of mols., anti-symmetrical and symmetrical, in the ratio 3:1, the rate of change of the one to the other being very slow. On the assumption that in the vapor-solid equil. the 2 components are always present in both phases in the const. 3:1 ratio, the vapor-pressure curve can be satisfactorily accounted for in the ordinary way. The statistical weight, however, of the H_2 mol. in the condensed phase cannot be unity, but must be 9 and 1 for the lowest states of the anti symmetrical and symmetrical mols., resp., and the const. in the vapor pressure equation is not the chem. const. of gaseous H_2 , but is smaller than that by $3/2 \log 3$, a result which throws doubt on the validity of the Heat Theorem for H_2 . The failure is due to the fact that theory and observation consider a metastable equil. instead of the true equil. state of the H_2 . If the H_2 were in a state of true equil., the theory requires a weight of 1 for the lowest state of the mol. both in the crystal and in the vapor, and no failure of the heat theorem is involved;

but all the ordinary equil. properties of H_2 , as its vapor pressure, sp. heat, reaction rates do not refer to these true equil. states at all. W. WEST

The Budde effect with a mixture of bromine vapor and air. ERNEST BROWN AND D. L. CHAPMAN. *J. Chem. Soc.* 1928, 560 3.—According to Ludlam (*C. A.* 19, 3222), and Lewis and Rideal (*C. A.* 20, 2123) a dry mixt. of Br_2 and air does not expand when exposed to light. By a different method, B. and C.'s results indicate that the Budde effect with air and Br_2 is not diminished by drying. The app. and method used are described, the light source being a 1000-w gas-filled W-filament lamp, the rays being filtered through $Fe(NH_4)_2(SO_4)_2$ or $Na_2Cr_2O_7$ solns. J. BALOZIAN

Method for demonstrating the diffusion of oxygen through rubber and various other substances. S. E. HILL. *Science* 67, 374-6 (1928).—A simple visual demonstration of the diffusion of O may be made by using luminous bacteria as an indicator. A test tube is completely filled with a dilute suspension of bacteria and stoppered. If the stopper is made of glass, the luminescence disappears completely. If a rubber membrane is used as stopper, the bacteria in contact with the membrane or within a short distance of it remain active. A comparison of the luminous columns will give a rough estimation of the amts of O diffusing through various substances. A. L. H.

The diffusion of gaseous mixtures through membranes. D. ALEXEJEV AND V. MATALSKI. *J. chim. phys.* 24, 737-41 (1927).—Exptl study of the diffusion velocities of CO_2 , O_2 , C_2H_2 and N_2 through a rubber membrane gives relative velocities ($N_2 = 1$) of $O_2 = 2.29$, $C_2H_2 = 0.85$, $CO_2 = 13.7$. Results obtained with mixts of these gases show that the diffusion velocity of a mixt is equal to the sum of the diffusion velocities of its components, even for wide differences in value of the latter and wide ranges in the compn. of mixt. J. L. COSTA

Researches on molybdenum sulfides. I. The vapor pressures of the sulfur of molybdenum trisulfide. N. PARRAVANO AND G. MALQUORI. *Atti accad. Lincei* [6], 7, 19-22 (1928).—The method allowed the detn. of the temp. at which the vapor pressure of S evolved from MoS_3 is in equil. with the vapor pressure of S maintained at a fixed temp. The end of a sealed tube contg. MoS_3 was inserted (with a thermoelec. temp. recorder) in an elec. furnace and the other end in the vapor of a const.-boiling liquid. The temp. of each end could be measured at all times. When the liquid was boiled and the furnace was heated, a dew of S suddenly formed in the coldest point of the tube and at this moment the vapor pressure of MoS_3 at the temp. of the thermocouple was the same as liquid S possessed at the temp. of the boiling liquid. The method was standardized by detg. the vapor pressure of S in CuS at the b. ps. of naphthalene, quinoline and benzoic acid (217° , 237° and 249° , resp.). At these temps. the vapor pressures of S were 4, 7.5 and 11.8 mm., resp., and CuS had to be heated to 423.5° , 431° and 349.5° , resp., to maintain equil. These results are in good agreement with those of Allen and Lombard (*C. A.* 11, 1348). With MoS_3 and naphthalene, α -naphthylamine and anthracene (217° , 301° and 351° , resp.), the S deriv. appeared when the MoS_3 was at 355° , 390° and 418° , resp. The vapor pressures of the S of MoS_3 at 355° , 390° and 418° are 4.0, 28.8 and 178.6 mm (Hg), resp. A lowering of the temp. of the furnace of $7-8^\circ$ caused complete disappearance of the S deriv., showing that the evolution of S from MoS_3 is reversible. II. Equilibrium of reduction of molybdenum bisulfide by means of hydrogen. *Ibid* 109-12.—The equil. of $MoS_2 + 2H_2 \rightleftharpoons 2H_2S + Mo$ was studied by a dynamic method similar to that of Jellinek (*C. A.* 19, 1513), H being passed at a const. velocity over MoS_2 and H_2S over Mo at 805° , 910° , 1005° and 1100° . With the aid of the disocn. consts. of H_2S and the V_{H_2S}/V_{H_2} ratios obtained, the vapor pressures of S from MoS_2 could be detd. from the relation: $\log P_{H_2S} = 2 \log (P_{H_2S}/P_{H_2}) + \log K$. With the Nernst formula and the log P_{H_2} values, the Q values were then calcd. These averaged 79,425 cal. over the range $805-1100^\circ$. With the isochor equation the heat tones of the reaction could be calcd. These were -20,000, -28,000 and -24,000 cal. at $805-910^\circ$, $910-1005^\circ$ and $1005-1100^\circ$, resp. To prove that the system is univariant, isothermic reduction at 1100° was studied by passing a known vol. of H at a const. velocity over MoS_2 and periodically detg. the V_{H_2S}/V_{H_2} ratio. The constancy of the latter showed that 2 solids are always present. C. C. DAVIS

The vapor pressure of acetone at low temperatures. E. H. ARCHIBALD AND WILLIAM URE. *Trans. Roy Soc. Can.* [3], 21, Sect. 3, 133-44 (1927); cf. *C. A.* 18, 1770.—Vapor-pressure measurements for acetone over the temp. interval $+20^\circ$ to -105° , were taken in order to det. the assocn. of the liquid at different temps. Calcn. of the degree of assocn. was made from the variation in the latent heat of vaporization over this temp. interval. The measurements were made with a differential tensimeter, with purified C_3H_8 as the standard of reference. Temps., measured with a Pt resistance

thermometer, were const. to 0.2° . The purified acetone had $d_4^{20} = 0.79170$ and $n_D^{20} = 1.3597$. The latent heat of vaporization increased with the temp. up to a max. at 4.6° and then decreased as the temp. rose higher. This abnormal variation was attributed to assocn. of the acetone. Between the f. p. and 4.6° the liquid associates with rise in temp. and then proceeds to break down. Equations for the variation of vapor pressure and for the variation of the latent heat of vaporization with temp. were obtained which fit the exptl. results very satisfactorily.

J. W. SHIPLEY

The surface tension and the structure of the surface of aqueous ammonia solutions. O. K. RICE. *J. Phys. Chem.* **32**, 583-92(1928); cf. *C. A.* **21**, 1212.—Data are presented for the surface tension of aq. NH_3 solns. from 0 to 14 molal, detd. by a modification of the capillary-rise method, using glass tubes. From adsorption calcs. it appears that there are not enough NH_3 mols. at the surface to fill it even at the highest concn. used. The work done on a mole of NH_3 when brought from the body of the soln. to a small distance from the surface is calcd. as a function of the concn., from which, by extrapolation to infinite diln., it is inferred that the average distance of the adsorbed mol. from the surface is about 10^{-8} cm.

W. T. RICHARDS

The adsorption of iodine by charcoal in organic solvents. TRIVIDIC. *Compt. rend.* **186**, 865-7(1928).—T. finds, contrary to results reported by previous investigators, that adsorption of I by charcoal is a reaction that approaches completion rapidly and that the adsorption values obtained follow closely the Freundlich adsorption isotherm.

L. B. MILLER

Adsorption of vapor by charcoal and silica gel. J. TRAUBE AND ST. BIRUTOWITSCH. *Kolloid-Z.* **44**, 233-9(1928).—Air satd. with various vapors has been brought in contact with activated charcoal and SiO_2 gel. H_2O , CS_2 , MeAc, Me_2CO , MeOH, C_6H_{14} , EtOAc, EtOH, C_6H_6 , MeCOEt, PrOH, iso-AmOH have been tested. After completion of the equil., the product of the no. of adsorbed mols by the surface of one mol. (calcd. from the molar refraction) seems to be a const. at least in first approximation; this would verify Langmuir's theory. The adsorption velocity for steam-air mixts. has been measured.

A. L. HENNE

The adsorption of electrolytes by crystalline surfaces. A. PINKUS AND M. DE BROUCKERE. *Bull. sci. acad. roy. Belg.* **13**, 415-40(1927).—Pure cryst. BaSO_4 (I) is added to solns. of HCl, LiCl, KCl, CuCl_2 and NiCl_2 previously satd. with I and allowed to come to equil. by agitation for 5-10 hrs. The electrolyte absorbed is detd. in four ways: (a) by fusing I with Na_2CO_3 and analyzing for Cl nephelometrically and for the cations gravimetrically. (b) by washing I repeatedly with pure H_2O and detg. the desorbed electrolyte as above. (c) by detg. the change in cond. of the soln. after the addn. of I. (d) by the change as detd. electrotitrimetrically. The results obtained show that a reproducible equil. is reached in each case and that there is equiv. adsorption of the cations and anions. The agreement of results obtained by the different methods proves that the adsorption of the solvent is too small to modify the equil. concns. Their adsorption isotherm $x = p/(Ax^v + Bp)$ is verified for all concns. studied; $x = \text{g. equiv. adsorbed}$, $p = \text{osmotic pressure of the anions}$, $A = Na/S$ where $N = \text{no. of particles absorbed by cc. of surface per sec.}$ and $S = \text{the absorbent surface in cc. per g. of adsorbent, and } a \text{ is a const., and } B = 4N\theta/mnS \text{ where } \theta \text{ is the surface in cc. occupied by an adsorbed particle and } mn \text{ the concn. of cations and anions, and } v \text{ is a const.}$ As detd. by the isotherms the order of decreasing dimensions of the cations are $\text{K}^+ > \text{Li}^+ > \text{H}^+$; $\text{Cu}^{++} > \text{Ni}^{++}$. By measuring 1000 crystals of BaSO_4 an approx. value for the mean surface of the crystal was obtained as $S = 2.8 \times 10^{-7}$ cc. Calcg. into the isotherm close approximation to the at. diams. were obtained.

D. H. POWERS

Adsorption of vapors on charcoal and the thermal expansion of the liquified surface film. F. GOLDMANN AND M. POLYANI. *Z. physik. Chem.* **132**, 321-70(1928).—Adsorption isotherms of EtCl, $(\text{CH}_3)_2\text{O}$, $n\text{-C}_6\text{H}_{12}$ and CS_2 on charcoal at -15.3 , 0 and 20° , and of $n\text{-C}_6\text{H}_{12}$ at -63.7 and $+5.2^\circ$, were measured. Equil. pressures from 0.01 mm. to 90% of the satn. pressure were used. A refinement of the usual adsorption method permitted weighing as liquid, successive portions of desorbed vapor. Equil. was attained before each portion was removed and condensed. Capillary condensation of the adsorbed vapors was not indicated by the results. The amt. of each liquid necessary to wet a given adsorbent was proportional to the ds. of the liquids. The vol. of the liquid surface film was independent of temp. The thermal expansion of the film was about 20% less than that of the liquid. The potential theory of adsorption (cf. *C. A.* **10**, 1131) was approx. confirmed by the exptl. results. A hypothetical picture of the mechanism of adsorption of vapors is deduced from the exptl. data by the help of the potential adsorption theory.

R. L. DODGE

Adsorption of dyes in aqueous solutions by means of charcoal, silica gels or earths.

ST. BIRUTOWITSCH. *Kolloid-Z.* **44**, 239-42(1928).—The adsorption of dyes in aq. soln. by means of charcoal, SiO_2 gel or earth is a function of the dye basicity and of its degree of dispersion. The adsorption on charcoal resembles that of the majority of adsorbent materials. The differences exhibited by SiO_2 and earth are possibly connected with their polarities.

A. L. HENNE

The absorption of sulfur dioxide by titania gel. SIMON KLOSKY AND A. J. BURGRAFF. *J. Am. Chem. Soc.* **50**, 1045-9(1928).—The object of this investigation was to det. whether a porous substance similar to SiO_2 gel, but with more specific attraction for SO_2 , would absorb it according to Patrick's condensation formula. The app. was similar to Patrick and Ophdyke's (cf. *C. A.* **19**, 2290). Titania gel was exposed to a current of air- SO_2 mixt. until no further increase in wt. was observed. The absorption was measured at -22.5 , 0 , 25 and 50° . The data substantiated Patrick's formula at low relative pressures, but over the whole range Polanyi's absorption equation was more suitable. The absorption was not strictly reversible.

R. L. DODGE

Sectioning methods applied to the study of the microstructure of charcoal, bone and wood fibers. W. CLERC. *Z. wiss. Mikroskop.* **44**, 417-34(1927).—Detailed directions are given for the rapid prep. of sections of hard and brittle materials, using cooked balsam as an imbedding medium, and pumice powder in paraffin oil as an abrasive.

C. W. MASON

Properties of powders. IX. The scattering of light by graded particles in suspension. T. M. LOWRY AND M. C. MARSH. *Trans. Faraday Soc.* **24**, 195-201(1928).—Powd. barytes, consisting of transparent cleavage fragments of a good grade, was graded into 13 fractions by means of a water elutriator. The av. size of the particles in the several fractions was detd. by means of a microscope with calibrated eye-piece. Light scattering by the particles suspended in medicinal paraffin was detd. by means of a Hilger sector-photometer. The optical d. is proportional to the surface-concn. of the powder, but increases slowly as the diam. is reduced to 50μ and much more rapidly when the diam. is reduced below 30μ . The probable existence of a max. degree of opacity on further subdivision is indicated. The results are applicable in regard to the covering power of pigments.

L. B. MILLER

Activating and retarding agents of the setting of plaster of Paris. P. P. BUDNIKOV. *Kolloid-Z.* **44**, 242-9(1928); cf. *C. A.* **21**, 3326.—Plaster mixed with water evolves heat, due to its hydration. The gypsum particles swell and a colloidal gel forms on their surface. The hydration is retarded and the temp. sinks. Further hydration and the transformation of the gel into cryst. needles occurs only after an induction period, when heat is again evolved. Solns. of various compds. modify sharply the character of the temp./time curve. The accelerating agents are many inorg. salts which increase the gypsum soly. (chlorides and nitrates); compds. isomorphous with gypsum; water glass, which causes an instantaneous setting when used in proper amt. The retarding agents are: $\text{Ca}(\text{OH})_2$, casein, tannin, which act as protective colloids; alcohol, sugar and soluble citrates, which diminish gypsum solubility; $\text{Ca}(\text{OAc})_2$. Phosphates and sulfates are capable of acting both ways, depending on the concn. used.

A. L. HENNE

Some new properties of silicic acid gels. PAUL BARY. *Compt. rend.* **186**, 863-4(1928).—Silicic acid gels prepd. by mixing water glass and HCl and dried in the air at room temp. pulverize violently upon being dropped into water. Best results are obtained with water to which a trace of acid has been added. Et_2O , either liquid or vapor, produces the same effect. C_6H_6 and C_7H_8 have very little effect.

L. B. M.

Gelation of silicic acid. The formation of gas bubbles and drops in silicic acid during gelation. H. A. FELS AND J. B. FIRTH. *Trans. Faraday Soc.* **23**, 623-30(1927).—Methods are given by which the formation of bubbles or liquid drops during the process of gelation may be partially or completely controlled. The shape and size of the bubbles have been detd. by photographic methods. They are found to vary as gelation occurs. Deductions concerning the internal condition of the gel are drawn from the character of the bubbles. Gelation is closely associated with hydration of the silicic acid. Water present in the gel is of two kinds: "free water" contained in the cells of the gel structure and "fixed water" which is combined with the silicic acid as water of hydration.

L. B. MILLER

The structure and formation of colloidal particles. HERBERT FREUNDLICH. *Trans. Faraday Soc.* **23**, 614-22(1927).—F. explains the deductions which may be drawn with regard to state of aggregation, cryst. form and shape of colloidal particles from studies with x-rays, the Siedentopf ultra-microscope, the cardioid ultra-microscope, and other optical instruments. The effect upon aggregation, cryst. form, shape and size of colloidal particles of the mode of formation is discussed.

L. B. MILLER

Some properties of jellies. EMIL HATSCHKE. *Pharm. J.* **119**, 676-7; F. B.

ELWELL. *Ibid* 709; *Chemist and Druggist* 107, 762-3(1927).—An address, with demonstrations. Addnl. notes by E. S. WALDBOTT

Viscosity of colloids in the presence of electrolytes. N. R. DHAR, D. N. CHAKRAVARTI AND M. N. CHAKRAVARTI. *Kolloid-Z.* 44, 225-33(1928).—The viscosity of the following salts has been detd. in the presence and the absence of electrolytes: ThO_2 , CeO_2 (prepared at high and at low temp.), W_2O_3 , benzopurpurin and SiO_2 (prepd. at high and at low temp.). In each case, the addn. of an electrolyte lowers the viscosity. In the case of ThO_2 , the viscosity is more reduced by $\text{Th}(\text{NO}_3)_4$ than by KI ; this is due to the larger charge increase caused by $\text{Th}(\text{NO}_3)_4$. In the case of SiO_2 , the viscosity decreases immediately a little upon addn. of an electrolyte, then it increases rapidly, reaches a max., then starts to fall again. A tentative explanation of this phenomenon is proposed. The viscosity of a 1% gelatin soln. is increased by the presence of KCl or BaCl_2 ; NaOH or HCl raise the viscosity to a max., behind which the viscosity decreases. It has been mathematically shown that by increase of a colloidal particle charge, the surface and consequently the hydration and viscosity are reduced, expts. confirm the calcd. results.

A. L. HENNE

The kinetics of coagulation. B. N. DESAI. *Trans. Faraday Soc.* 24, 181-95 (1928).—The velocity of coagulation of colloidal ThO_2 has been measured by a very accurate optical method, *i. e.*, the scattering of light. The constancy of the ratio T_∞/T demanded by Smoluchowski's theory is maintained only up to a certain coagulator concn. The view that the nature of coagulation is autocatalytic is supported by the exptl. results. The velocity const. K has been calcd. according to the equation $dx/dt = K(1-bx)(1-x)$, the value of b being equal to dx/dt at the point of inflection of the $x-t$ curve. A fairly const. value is obtained. Reasons for the non-observance of the slow coagulation region by many workers are advanced. The value of P in the equations of Paine and Freundlich varies with the diln. and depends upon the concn. of the electrolyte taken as a standard. The difference in the value of K for corresponding concns. of KCl and LiCl is due to the difference of the ion carrying the same charge as the colloid. Freundlich's theory for rapid and slow coagulation is extended. The ultimate size of coagulated particles varies with the concn. of the coagulator. The peculiar behavior of bivalent ions is due to their greater adsorbability and consequent initial rapid rate of coagulation.

L. B. MILLER

Note on the explanation of a so-called interaction phenomenon. N. K. ADAM. *Proc. Roy. Soc. (London)* A118, 262-3(1928); cf. *C. A.* 21, 1041. —A slow upward stream of water, impinging on a disk of filter paper soaked in a dye soln., washes out the color in a no. of radial streamers; a slow current of colored liquid, impinging on a plate on the surface, does not produce streamers. This is given as evidence in support of the author's explanation that the streamers appearing when a disk of filter paper soaked in colored-albumin soln., and fixed to the under side of a cover glass, is floated on salt soln., are due to the outward motion of currents of less dense salt soln. from beneath the cover glass which have lost salt to the filter paper by diffusion.

W. WEST

Alumina gels. D. G. R. BONNELL. *Z. anorg. allgem. Chem.* 169, 345-55(1928).—Three alumina gels, A, B and C, were prepared by the method of Willstätter and Kraut (*C. A.* 20, 533) and their properties confirmed. Suspensions of C gel boiled under a reflux with varying quantities of HCl gave clear solns. after excess suspension settled. Au particles from a gold sol were adsorbed by the suspension of C with no change in color. Gel B boiled with varying concn. of HCl gave polydisperse suspensions which showed a strong Tyndall effect. The no. of particles obtained in the sol was independent of the concn. of the acid, but the size decreased with increasing acidity. Gel A is completely insol. in 1% HCl and difficultly sol. in stronger acid. It is very easily peptized by HCl and does not lose this property on aging or drying. The residues of the hydrosols obtained on drying dissolve colloiddally in water.

ARTHUR FLEISCHER

Fundamental principles of the Weimarn theory on the colloidal state. S. F. SLOKASOFF. *Anales asoc. quim. Argentina* 15, 237-86(1927).—A summary and review.

E. M. SYMMES

A simple method to measure coagulation. Preliminary communication. BR. JIRGENSONS. *Kolloid-Z.* 44, 202-5(1928).—The coagulation of dispersoids can be quantitatively observed on the scale of a spectroscope. When the degree of dispersion increases, the diffuse absorption limit shifts from the violet toward the red, then back to the violet when flocculation and sedimentation occur.

A. L. HENNE

Colloidal nature of lignic acid—so-called Cassel brown; a comparison. E. WEDKIND AND G. GARRE. *Kolloid-Z.* 44, 205-12(1928).—Lignic acid is easily peptized by OH ions, even in minute concn. The hydrosol is easily purified by dialysis. The sol. is negatively charged; an acid reagent or any positively charged hydrosol causes im-

mediate coagulation. With the exception of SO_2 , the gel does not adsorb acids; in this it is different from the lignin prepared by Willstätter. A wet gel fixes irreversibly 1 or basic dyes (up to 63% of the dry substratum). The sol and the gel resemble closely those of Cassel brown, which is also easily peptized in the same conditions. Cassel brown exhibits the colloidal characteristics of a typical humic acid. It differs from lignic acid only by being subject to autoxidation.

A. L. HENNE

Sensitization of Prussian blue and sulfur sol (in accordance with Sven Odén) by means of gelatin and tannic acid. S. GHOSH AND N. R. DHAR. *Kolloid-Z.* **44**, 218-25 (1928).—In the coagulation of Prussian blue with KCl or BaCl_2 , a small amt. of gelatin acts only as a weak sensitizer; a large amt. stabilizes the sol. The sensitization is much more apparent in the flocculation with HCl . Small amts. of tannic acid sensitize Prussian blue in the coagulation with KCl , but have a reverse action on the coagulation with HCl . The stability of S sols (prepd. in accordance with Sven Odén) toward KCl or BaCl_2 is decreased by a gelatin addn.; large amts. of gelatin cause coagulation. Tannic acid stabilizes S sols. Traces of acids are stabilizers, traces of alkalis are sensitizers. The coagulation powers of Na or K salts of weak org. acids decrease when their dissociation consts. increase. The following explanation is available: pentathionic acid, which is the stabilizing agent of S sols, is stable in the presence of acids, but is decomposed by alkalis. The discrepancies from the Schulze-Hardy law may be explained by an hydrolysis of the salts investigated. Traces of OIL ions have a sensitizing influence on SiO_2 , WO_3 and MoO_3 ; this action should be referred to the splitting of a easily adsorbed stabilizing ion. The sensitizing properties of gelatin, albumin and tannic acid should be explained as follows: the H ions of the sensitizer cause a retrogradation of the sol hydrolysis; the H ions of the sol reverse the charge of the sensitizer; the sol charges are neutralized by the opposite charges of the sensitizer.

A. L. HENNE

Ultrafiltration. W. J. ELFORD. *J. Roy. Microscop. Soc.* [3], **48**, 36-45 (1928); 3 text figs.—A historical survey, with methods for the prepn. of a graded series of collodion membranes. Selection of nitrocellulose (11% N), purification of solvents, and choice of paper for supports (Schleicher and Schull 575, or Whatman 50) are discussed. Vacuum impregnation is used for treatment of paper disks with glacial AcOH . Method I: After draining for 1 min. the disks are kept *in vacuo* for 1 hr. They are then immersed in the collodion, contained in a petri disk in a vacuum desiccator, and the air withdrawn from the paper. Amounts of collodion, and times of evacuation and draining should be kept uniform. Method II: (Bechhold's method) Collodion is admitted to the previously evacuated vessel in which the paper disks are suspended. After 15 min. air is admitted, and soaking continued for 1 hr. or more. Uniform draining is insured by "wringing" between two glass rods. From either method of impregnation, the disks are immersed in dist. H_2O for gelation and washing. Collodion membranes are made from 1.5-2.0% nitrocellulose in 75:25 ether-alcohol (by weight). A definite quantity is floated on mercury in a shallow dish, evapd. for a definite time at known temp., flooded with water, and washed. By varying the amount of evapn. very uniform and evenly graded membranes are obtained, superior to impregnated papers, and of good strength.

C. W. MASON

The viscosity of supersaturated solutions. I. I. K. TAIMNI. *J. Phys. Chem.* **32**, 604-15 (1928).—The viscosities of the supersatd. solns. of six substances: NaNO_3 , NaClO_4 , CuSO_4 , $\text{Na}_2\text{S}_2\text{O}_8$, tartaric acid and cane sugar—have been measured by a specially arranged app. The viscosity-temp. plots obtained are in all cases smooth curves, showing irregularities neither at the satn. temps., nor at the so-called "temps. of spontaneous crystallization." Tendency to crystallize spontaneously was observed only with CuSO_4 solns. T. gives no theoretical treatment, and makes it exceedingly difficult for others, since the data are presented as small-scale curves and not as tables.

W. T. RICHARDS

The creeping of solutions. J. G. F. DRUCE. *Pharm. J.* **119**, 333 (1927); cf. Washburn, *C. A.* **21**, 3792.—The tendency to creep is seen with solns. of the following salts in descending order: NH_4Cl , ZnSO_4 , $\text{K}_2\text{Cr}_2\text{O}_7$, CuSO_4 , alum, Na_2SO_4 , FeSO_4 , BaCl_2 , KNO_3 , MnSO_4 , NaCl .

S. WALDBOTT

The solution velocity of aluminum. W. KUCZYNSKI. *Czechoslovak Chem.* **7**, 397-401 (1927).—The rate of soln. of Al in 1.5 N HCl was studied. It is reduced by 0.025 N KNO_3 and KClO_4 . On an Al surface electrolytically oxidized in 4% $\text{K}_2\text{Cr}_2\text{O}_7$ at room temp. with 220 v. HCl produced only pitting. An Al sheet with a just perceptible oxide layer showed after a 4-hr. period of induction a const. rate of soln. suggesting that the action of HCl was limited to certain surface areas from which it proceeded into the depth of the sheet.

MARY JACOBSEN

Velocity of solution of solid substances. W. JACEK AND Z. LEHR-SPAWINSKA.

Roczniki Chem. 7, 309-33(1927).—The equation $dx/dt = Pk(S-x)$ (I) involves the surface of the solid substance P . Spheres cut from NaCl crystals behave like amorphous substances when uniformly agitated in water. Even after a prolonged action of the solvent the deformation is within the limits of the exptl. error. This permits the calcul. of the velocity independently of P : $-dr/dt = K_1(c+r)$, where r is the radius of the sphere after the time t , $k_1 = 4/3\pi k$, the velocity const. and $c = a_1^3 - a^3$, a_1 being the radius of a sphere sufficient to sat. the quantity of solvent applied and a the radius of the sphere at the time 0. The equation may be applied to irregularly shaped bodies provided they resemble a sphere or a regular body. In this instance k_1 is actually higher and the following equation permits a more correct calcul.: $dr/dt = (P/4r_1\pi)k_1(c+r)$, P being the surface, r the radius of a sphere of the same vol. $P/4r^2\pi$ is const. within the limits of variation of r and always >1 . Since dissoln. is a reversible process the equation $-dr/dt = \xi/a_1^3(cr^3)$, identical with I is obtained where ξ is the thickness of the surface layer dissolving in the unit of time. Consequently $(\xi \text{ surface unit})/(4/3\pi a_1^3) = k$ where k is the const. of I. ξ is a const. characteristic of soln. velocity and independent of the size of the sphere and the quantity of the solvent, but dependent on the temp. and the velocity of agitation.*

MARY JACOBSEN

The viscosities of solutions and mixtures. W. HERZ AND GEORG SCHELIGA. *Z. anorg. allgem. Chem.* 169, 161-72(1928).—In general, the viscosities η of solns. up to 7% of I, $C_{10}H_8$, and phenanthrene separately in PhH, PhMe, CCl_4 , CS_2 , and Me_2CO at 20°, 40°, and 60° vary in the order $I < (II) < (III)$ except that in Me_2CO the order is $(II) < (III) < I$. The amt. of increase is peculiar to the solvent and the solute. For mixts. of equal amts. of (II) and (III) (2 and 4%) in the same solvents at 20°, 40° and 60° the detd. results agree within the limit of exptl. error with those calcd. from the law of mixts. The d . is also additive. η for mixts. by wt. of PhH- CS_2 (1.1)(2.1)(1.2); PhH-PhMe (1-1); PhHMe- CS_2 (1-1)(1-2)(2-1) at 20° and 40° is not additive. The viscosity of 2.5% fumaric acid in 80% alc. exceeds that of its isomer, maleic acid, and that of succinic acid of the same concn. The latter two have about the same η (5% maleic $\eta_{sp} = 0.02159$). Aq. solns. of d -tartaric and racemic acids show the following peculiarities at concns. 14.28 and 21.73% η for the d -form exceeds that for racemic acid at all temps.; for concn. 7.69% η for racemic acid becomes equal to that of the d -form at 40° (0.00789) and exceeds it at 60°. The variations in η for l - and dl -malic acids in aq. soln. are negligible. (27.18% l -malic acid $\eta_{sp} = 0.02021$). The formula $(1/x) = ky^n$ (x = mols. water, y = viscosity, k and n consts.) expresses the facts for NaCl solns., but not for $MgCl_2$ solns. Densities and viscosities for all concns. measured are given.

E. R. SCHIERZ

Prediction of boiling points of concentrated caustic-salt solutions. F. W. ADAMS AND C. W. RICHARDS. *Ind. Eng. Chem.* 20, 470-1(1928).—The effect of pressure on the b. ps. of NaOH solns. satd. with NaCl has been detd. at various concns. Dühring's rule gives valid predictions of the b. p. of such concd. solns. with a max. deviation from observed data of 2.1° at 50 mm. pressure.

J. H. PERRY

Solubility relations of isomeric organic compounds. VII. The mutual solubility of the dinitrobenzenes with the nitroanilines, and of the three chlorobenzoic acids. JOHN JOHNSTON AND E. P. JONES. *J. Phys. Chem.* 32, 593-603(1928).—"Investigation of each of the 30 soly. curves in the 15 possible binary mixts. of the dinitrobenzenes and nitroanilines shows that the curve is in all cases not far from the ideal calcd. from the heat of melting; these divergencies, though small and in either direction, are real, but bear no obvious relation to any other measured properties of the pair of compounds. There is no appreciable formation of mix-crystals even between those three pairs in which the relative position of the substituents is the same. On the other hand, the three like pairs of the chloronitrobenzenes and bromonitrobenzenes form a complete series of solid solns., p -toluic and p -chlorobenzoic acid, however, show only partial mutual crystal miscibility."

W. T. RICHARDS

The question of the solubility of the "natural semi-hydrate" or natural anhydrite. P. P. BUDNIKOV. *Z. anorg. allgem. Chem.* 170, 111-2(1928).—A naturally occurring $CaSO_4$, designated by Zvorukin (*C. A.* 21, 3297) as the semihydrate, does not behave as artificial semihydrate, e. g. react with water with the evolution of heat to form gypsum. B. holds therefore that the substance is a mixture of anhydrite and dihydrate. A. YA. ZVORUKIN. *Ibid.*—The possibility of the deposition of $CaSO_4 \cdot 1/2 H_2O$ from sea water as well as its formation in steam boilers is maintained.

H. F. JOHNSTONE

The effect of salts on the solubility of water in phenol. R. CERNATESCU. *Z. physik. Chem.* 133, 31-8(1928); cf. *C. A.* 21, 1912.—The cations and anions of the salts investigated can be arranged in the order of decreasing effect on the soly. of H_2O in

PhOH, as follows: Li, Na, NH₄, Rb, Cs and Cl, Br, I, F, SCN. The formula $t = ac^b$, where t is the elevation of the crit. temp., a is a const. depending on the added salt and b is a const. depending only on the H₂O-PhOH mixt., was used to interpret the results.

E. R. SMITH

Density and electrostriction of dilute manganese salt solutions. N. CAMPBELL. *J. Chem. Soc.* 1928, 653-8.—The ds._{15°} are detd. for 0.5, 0.3, 0.2, 0.1, 0.05, 0.02 and 0.01 *N* NH₄Cl, MnCl₂, MnSO₄ and Mn(NO₃)₂ solns. by Kohlrausch and Hallwachs' method (*Wied. Ann.* 53, 14(1894)). The solid anhyd. MnCl₂ and MnSO₄ ds. are obtained from the literature, while that of Mn(NO₃)₂ is calcd., approx., from the ds. of the 6-hydrate and ice. By substituting the ds. of the above salt solns. in Bender's equation (*Wied. Ann.* 20, 560(1883)) the modulus for Mn is obtained, practically const. at 355 in dilns. to 0.1 *N*. From these data, the electrostrictions (*I*) are calcd. As these and results of others make no allowance for the contraction of the solute on dissolving, new values of *I* are calcd., on the assumption that the mol. vol. of the salt is given by: $M(n^2-1)/d(n^2+2)$, n being the refractive index of light of infinite wave length. Hydrogen C and F line values of n for Mn salt solns. are detd. at 20°, the mol. refractivities of the solid salts being obtained from these by the rule of mixts. The refractivity moduli are calcd. from an equation similar to that of B., with KCl solns. as reference. Max. in the curves indicate the existence of two opposing forces, one being greatest on each side of the max. Using the true mol. vol. gives a negative value of *I* for MnCl₂ and Mn(NO₃)₂ solns., indicating an expansion of the solvent.

J. BALOZIAN

Temperature coefficients of electrical conductivity for concentrated solutions of calcium chloride with precision measurements of conductivity for the high concentrations. MARGUERITE CROWE. *Trans. Roy Soc. Can.* [3], 21, Sect. 3, 145-56(1927).—Figures and tables are given for (1) the relation between d . and the temp. of solns. of CaCl₂ between 25 and 50%, (2) the variation of sp. cond. of these solns. between 10° and 30°, (3) the relation between concn. and cond. of CaCl₂ solns., and (4) the temp. coeff. of cond. of CaCl₂ solns. over the specified ranges. An accuracy of five parts in 10,000 is claimed for the d . and cond. data.

J. W. SHIPLEY

Chemistry of the platinum-group metals. VIII and IX. Isolation of chloroiridic acid. Electrolytic dissociation of chloroiridic and chloroplatinic acids. Equivalent conductances of the salts of platinum and iridium at 25°. SAICHIRO NAGAMI. *J. Chem. Soc. Japan* 48, 501-20(1927).—The object of investigation was the isolation of chloroiridic acid, supposed to have a compn. analogous to that of chloroplatinic acid, H₂PtCl₆IrO₂ from 50 g. K₂IrCl₆ was dissolved in HCl and the soln. concd. in a current of Cl₂ to prevent reduction. A yield of about 40 g. of reddish black crystals of H₂IrCl₆ was obtained. The crystals are deliquescent, and appear to belong to the triclinic system. An abrupt change in cond. upon neutralization and reaction velocity data indicate a strength almost the same as that of HCl. This strength was definitely shown not to be due to the presence of HCl. By means of a specially designed app. the absence of the Cl⁻ ion was demonstrated. The existence of IrCl₆⁻ ions is indicated by migration-velocity measurements. The hydrolysis of acetates by H₂IrCl₆ and H₂PtCl₆, equivalent conductances at 18° and 25°, λ_{∞} , f. p. depressions and ionic mobilities indicate that for concns. less than 0.05 *N*, dissociation is of the form $H_2MCl_6 \rightleftharpoons 2H^+ + MCl_6^{--}$. Equiv. conductances of H₂IrCl₆, H₂PtCl₆, K₂PtCl₆ and (NH₄)₂PtCl₆ at 18° and 25° were detd.

T. IRIE

Relation between hydrogen ion and metallic ion activities in the hydrolysis of salts of heavy metals. (MLL.) M. QUINTIN. *J. chim. phys.* 24, 712-22(1927); cf. *C. A.* 21, 3149.—The metallic ion activities in Cu, Cd and Zn sulfates and nitrates are detd. by a series of electrode-potential measurements. For concns. 0.005 to 0.5 molal, the activity of the cation is proportional to that of the H-ion and the values are equal if corresponding standard states are chosen.

J. L. COSTA

Hydrolysis of sucrose by hydrochloric acid in the presence of alkali and alkaline earth chlorides. C. F. KAUTZ AND A. L. ROBINSON. *J. Am. Chem. Soc.* 50, 1022-30 (1928).—The rate of inversion of sucrose by 0.100 *N* HCl at 25° in the presence of the chlorides of K, Na, Li, Ca, Sr and Ba of concns. from 0.05 to 3 *M* was detd. No simple relationship was found to exist between the increased rate of inversion in the presence of these salts and the activity coeffs. of the H ion in solns. of the same acid and salt concns. contg. no sucrose, but the rough parallelism observed indicates that the activity of the H ion is probably the most important factor detg. the rate of inversion. For salt concns. above 0.500 *M* the equation of Schmid and Olsen (*C. A.* 21, 519) applied fairly well. This equation is $K = K_0 \times 10^{rc}$, where K is the velocity const., K_0 is the velocity const. in the absence of the salt, C is the concn. of the salt and r is an arbitrary const.

JAMES M. BELL

The action of hydrogen peroxide on ferrous salts. (Studies on oxidation processes.) WILHELM MANCIOT AND GERHARD LEHMANN. *Ann.* **460**, 179-201(1928).—At large dilns. 1 atom of Fe^{++} is equal to 3 equivs. of H_2O_2 . This leads to the conclusion that a primary oxide Fe_2O_3 must form. In concd. solns. as many as 24 equivs. of H_2O_2 are consumed per atom of Fe^{++} . This is explained by the tendency of peroxide to oxidize and then reduce itself, which reaction is catalyzed by Fe^{+++} ions. In acid solns. the equivs. are changed considerably. With dil. acids the reaction is retarded and considerably more than 3 equivs. of H_2O_2 are reduced per atom Fe^{++} . The authors believe that expts. with org. acceptors confirm their conclusion that an oxide of quinquevalent iron exists.

HANS C. DUTTS

The low-pressure decomposition of nitric and nitrous oxides. J. H. HIBBEN. *J. Am. Chem. Soc.* **50**, 940-50(1928).—The decompn. of N_2O , studied with the Pirani gage between 0.075 and 0.026 mm., gives a fair unimol. const., especially at the lower pressures. The most probable explanation is that the reaction is entirely heterogeneous at these pressures. The velocity const. for the decompn. of N_2O_4 does not vary essentially in the range 0.18 to 0.0018 mm., and agrees with Daniels and Johnston's value for high pressure, in contradiction to the observations of Hirst and Rideal.

W. W.

Intermediate products in oxidation with chromic acid. CARL WAGNER. *Z. anorg. allgem. Chem.* **168**, 279-91(1928).—In the oxidation of org. acids such as oxalic, lactic, tartaric and HSCN by CrO_3 , an intermediate product is formed as indicated by liberation of I from KI solns. This intermediate product is found to be stable in AcOH soln. of $[\text{H}^+] = 10^{-4}$, but is very fragile in approx. neutral soln., $[\text{H}^+] = 10^{-7}$. The presence of Cr^{V} is indicated by the fact that $\text{CrOCl}_2 \cdot \text{C}_2\text{H}_5\text{N} \cdot \text{HCl}$ behaves similarly when allowed to act upon lactic acid, a complex of Cr^{V} and lactic acid being formed. In the reaction between CrO_3 and HSCN , free thiocyanogen $(\text{SCN})_2$ is formed as an intermediate product, indicated by formation of an intense red color on addn. of Fe powder in the presence of Et_2O . The presence of Mn^{++} salts suppresses the oxidation velocity of org. acids by CrO_3 , the intermediate Cr^{V} breaking up as follows: $3\text{Cr}^{\text{V}} \rightarrow 2\text{Cr}^{\text{VI}} + \text{Cr}^{\text{III}}$.

H. STOERTZ

The oxidation of sodium sulfite in sodium carbonate solution with air. SUSUMU MIYAMOTO. *Bull. Chem. Soc. Japan* **3**, 76-82(1928), cf. *C. A.* **21**, 2089.—S. studies quant. the oxidation velocity of Na_2SO_3 in Na_2CO_3 solns. of various concns. Under the conditions used, the oxidation velocity is independent of the Na_2SO_3 concn. and is a linear function of the Na_2CO_3 concn. when the latter concn. is larger than 0.02 *N*. Temp. has a negligible effect. The solution velocity of O in Na_2CO_3 solns. of various concns. is calcd. indirectly.

A. L. HENNE

The sulfite addition in unsaturated compounds. II. ERIK HAGGLUND AND ANDERS RINGBOM. *Z. anorg. allgem. Chem.* **169**, 96-8(1928).—Extending their previous investigations (cf. *C. A.* **20**, 1165) to methylpropionic acid (I) (prepd. from acetoacetic ester and PCl_5) and phenylpropionic acid (II) (recrystd. Kahlbaum product) H. and R. found that at 80° the rate of addition of Na_2SO_3 to (I) and (II) ($k = 0.0025$ and 0.00104, resp. 2nd order) is much slower than in the corresponding acids of the ethylene series. This is the reverse of rates for halogen addn. k for (II) decreases with time indicating a decompn. of the acid. From these results the authors conclude that rate of reaction cannot, unreservedly, be taken as a measure of valence force. The excess of Na_2SO_3 is detd. by titration with 0.05 *N* I_2 . There was no evidence of addn. of I_2 to (I) or (II) during titration.

J. R. SCHIERZ

Oxidation of ammonia in presence of contact catalysts. IV. JÓZSEF ZAWADZKI AND HENRYK NARKIEWICZ. *Roczniki Chem.* **7**, 369-79(1927); cf. *C. A.* **21**, 3531.—The results of previous expts. are confirmed. The max. yields are obtained with high temps. and rapid flow. They are further increased and shifted in this direction by the application of several layers and of finer-mesh Pt gauze. Above 1000° the yield may exceed 90%. A comparison between single (I) and triple (II) Pt gauze for equal contact time (triple rate of flow for II) shows that not only the yield in NO but also the percentage of unchanged NH_3 is higher in II. This is of interest for the mechanism of the reaction.

MARY JACOBSEN

Catalytic reduction of nitrobenzene into aniline in the gaseous phase. G. B. SERNERIA AND M. MILONE. *Atti accad. sci. Torino* **63**, parts 1-3(1927-28).— H_2 gas together with $\text{C}_6\text{H}_5\text{NO}_2$ (in drops) was passed over a catalyst of Cu as well as Ag pptd. on pumice. The catalyst was heated to various temps. from 250° to 400°, the H_2 was passed over in theoretical quantities, according to the reaction $\text{C}_6\text{H}_5\text{NO}_2 + 3\text{H}_2 = \text{C}_6\text{H}_5\text{NH}_2 + 2\text{H}_2\text{O}$ as well as 200, 300 up to 900% of the theoretical amt. A table is given showing the yield of $\text{C}_6\text{H}_5\text{NH}_2$ under varying temps., with increasing amts. of

catalyst, both Cu and Ag, as well as with increasing amts. of H_2 . The reaction is exothermic. Cu gives best yields at 350° , as at 400° the reaction $C_6H_5NO_2 + 4H_2 = C_6H_5 + NH_3 + 2H_2O$ becomes appreciable. With Ag the optimum temp. is 400° . The yield increases with increasing amts. of catalyst up to a certain limit and then remains const. Increase in H_2 increases yield when temp. is higher and with greater amts. of catalyst. The catalyst does not lose its activity even after several months' use at 12 hrs. per day. With Cu, the $C_6H_5NH_2$ is always colored by traces of azobenzene; with Ag at 350° the yield is 99.5% pure aniline. Also in *Ann. chim. applicata* 18, 68-77(1928).

A. W. CONTIERI

A catalyst for hydrogenation in the cold. I. A study of the mechanism of this catalysis. M. BOURGUEL. *Bull. soc. chim.* 41, 1443-50(1927).—The rate of catalytic hydrogenation of several acetylenic hydrocarbons was measured at room temp. in order to test a theory of the mechanism. The theory postulates a 3-step mechanism: (1) formation of a labile Pd-H compd., (2) formation of a labile combination of Pd-H-org. compd., (3) decompn. of the second compd. into Pd and mol. H. The catalyst used was a protected colloidal Pd made from Na chloropalladate. The hydrogenation was effected by agitating a 2-phase aq. colloid-org. liquid mixt. in an atm. of H_2 . The rate of reaction was measured by the rate of H consumption. The reaction was selective, yielding reduction to ethylenic hydrocarbons only. The colloidal Pd, in the presence of H , collected in globules at the org. liquid- H_2O interface. The results seemed to be consistent with the proposed 3-step mechanism.

R. L. DODGE

Equilibrium in the reaction of tin with water vapor and carbon dioxide. E. D. EASTMAN AND PRESTON ROBINSON. *J. Am. Chem. Soc.* 50, 1106-14(1928).—The equilibria: $Sn + 2H_2O \rightleftharpoons SnO_2 + H_2$ and $Sn + 2CO_2 \rightleftharpoons SnO_2 + 2CO$ were studied between 650° and 800° by a modification of the dynamic method in which the oxidizing or reducing effect of the gas stream is observed visibly. This method is probably useful in studies of other systems. In confirmation of the method, detns. by the static scheme due to Deville were made in the reaction of tin with water vapor. By combining the equil. consts. of the two reactions, it is possible to estimate the water-gas equil. const., and these results agree with previous indirect detns. (*C. A.* 18, 1418), but differ largely from direct detns., which are now considered to be in error.

JAMES M. BELL

A supplement to the researches on the Landolt reaction. A. THIEL. *Z. Elektrochem. angew. physik. Chem.* 34, 113-4(1928).—Points in the researches of T. (*C. A.* 18, 3517) incomprehensible to Skrabal (*C. A.* 21, 1742) are further discussed.

J. B.

Equilibria at high temperatures in the system iron-oxygen-carbon. R. R. GARRAN. *Trans. Faraday Soc.* 24, 201-7(1928).—G. finds that most of the exptl. results dealing with this system given in the literature were made below 1000° . Extrapolation to temps. above 1000° is very uncertain. Exptl. results are given covering the temp. range 600° to 1300° .

L. B. MILLER

Equilibrium between alcohols and salts. II. ELLIS LLOYD, C. B. BROWN, D. G. R. BONNELL AND WILLIAM JACOB JONES. *J. Chem. Soc.* 1928, 658-66; cf. *C. A.* 20, 1746.—The solubilities are given of LiCl, NaBr, KBr, $CuCl_2$, $BaBr_2$, CaI_2 , $Ba(NO_3)_2$, $CaBr_2$, $MgCl_2$, $Mg(NO_3)_2$, $CdCl_2$, $CdBr_2$, CdI_2 , $NiBr_2$, NaI , $SrBr_2$, $Ca(NO_3)_2$, $HgBr_2$, $CoCl_2$ and $CoBr_2$ are detd. in MeOH, and of $CuCl_2$, $MgCl_2$, $Mg(NO_3)_2$, $CdCl_2$, $HgBr_2$, $CoCl_2$, $Ca(NO_3)_2$, $SrBr_2$, $CdBr_2$, CdI_2 and $CoBr_2$ in EtOH, at various temps. from 0 to 80° , and those of $CuCl_2$ in $PrOH$, iso-AmOH and $PhCH_2OH$ and $CaCl_2$ and $CaBr_2$ in $PrOH$, $BuOH$, AmOH, iso-AmOH and $PhCH_2OH$ at various temps. from 0 to 80° . Dalton's law is assumed to hold for mixts. of air and alc. vapor for pressures of alc. below the satn. point in disscn. pressure calens., shown to be in agreement with theory. The disscn. pressures of the Me alcohols, $CuCl_2 \cdot 2A$, $MgCl_2 \cdot 6A$, $Mg(NO_3)_2 \cdot 6A$, $CdCl_2 \cdot 3A$, $CdBr_2 \cdot 3A$, $NiBr_2 \cdot 6A$, $NaI \cdot 3A$, $Ca(NO_3)_2 \cdot 2A$, $SrBr_2 \cdot 1\frac{1}{2}A$, $HgBr_2 \cdot A$, $HgBr_2 \cdot A$, $CoCl_2 \cdot 3A$ and $CoBr_2 \cdot 6A$ ($A = MeOH$), and the Et alcohols, $CuCl_2 \cdot 2A'$, $MgCl_2 \cdot 6A'$, $Mg(NO_3)_2 \cdot 6A'$, $CdCl_2 \cdot 1\frac{1}{2}A'$, $CoCl_2 \cdot 3A'$, $Ca(NO_3)_2 \cdot 2A'$, $SrBr_2 \cdot 1\frac{1}{2}A'$, $CdBr_2 \cdot 1\frac{1}{2}A'$ and $CoBr_2 \cdot 3A'$ ($A' = EtOH$) are detd. at various temps. from 10- 80° . In general, over a moderate range of temps. logarithms of the dissociation pressures of alcohols are a linear function of the reciprocal of the abs. temps., e. g., for $Mg(NO_3)_2 \cdot 6MeOH$ $\log p = 11.02341 - 3006.63/T$, from expt., gives values of dissociation pressure agreeing closely with exptl. ones, at 30° , 40° and 50° . Further tables of the % salt in the solid phase, dissociation pressures in mm. at 20° and the transition points of Me and Et alcohols are given.

J. BALOZIAN

Equilibria in the reduction of ferric oxide. C. C. FURNAS AND G. G. BROWN. *Ind. Eng. Chem.* 20, 507-10(1928).—New thermal data on Fe_2O_3 have been used with other data in the literature to compute, by means of the 3rd law of thermodynamics, the equil. consts. of 7 reactions involved in the reduction of Fe_2O_3 by CO, C and H_2 , and one

for the decompn. of Fe_2O_3 into Fe_3O_4 and O_2 . Such values of K (equil. const.) are given for 100° , 250° , 500° and 750° based upon actual measurable data, and for 1000° and 1500° upon extrapolation data. It is shown that (a) reduction of Fe_2O_3 by CO and of Fe_3O_4 to Fe_2O_3 by H_2 takes place readily at lower temps.; (b) reduction of Fe_3O_4 by C will not occur to any great extent at low temps., but the possibility of such reduction with higher temps. becomes increasingly greater, a conclusion in harmony with exptl. evidence but contrary to popular belief; (If the gaseous phase is absent no reduction occurs except at high temps.); (c) reduction of Fe_2O_3 by H_2 shows that the power of superheated steam to oxidize metallic Fe decreases with temp., while its ability to oxidize Fe_3O_4 increases with the temp.; (d) data for the decompn. of Fe_2O_3 to Fe_3O_4 and O_2 are not conclusive, but in general the K are lower for 1000° and 1500° than the exptl. work justifies. Inconsistencies are ascribed to the variations in solid phases used. The existence of solid solns. rather than intermediate compds. in the series FeO , Fe_3O_4 , Fe_2O_3 may be assumed. Graphs and tables give much condensed information on the matter treated above.

W. C. EBAUGH

Eutectic freezing point lowering in binary mixtures. IV. Independence of the eutectic equation respecting pressure. E. KORBES. *Z. anorg. allgem. Chem.* **169**, 246-50 (1928), cf. *C. A.* **22**, 902.—The general eutectic equation $[(T_b - T_e)/T_b] : [(T_a - T_e)/T_a] = a : b$ in which T_e = eutectic temp., T_a and T_b are the m. ps. of the 2 constituents (all in degrees abs.), and a and b their concn. in the eutectic in mol. %, is found to be independent of external pressure. This is verified by measurements on the system $\text{Cd}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$ - $\text{Ca}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$ at pressures of 1, 1000, 2000 and 3000 kg./sq. cm. The relation of eutectic temp. to melting temp. of the pure components, $[(T_b - T_e)/(T_a - T_e)]^b = T_b/T_a$, is also independent of external pressure variation. II. STOERTZ

The partition of a base (caustic soda) between two acids (nitric and hydrochloric) in saturated solutions. V. I. NIKOLAEV. *J. Russ. Phys.-Chem. Soc.* **59**, 677-84 (1927).—The system NaCl - NaNO_3 - H_2O was studied, the total content of the salts varied between 40.22% (by wt.) at 15° and 89.6% at 210° . Thermostat was used in soly. measurements below 100° , while at higher temps. the mixt. was introduced in one of the legs of an H-vessel which was subsequently sealed and suspended inside of an electrically heated bomb. Temp. variations did not exceed 0.5° . While still in the bomb, the liquid phase sepd. without difficulty and was quickly decanted into the other leg of the vessel. The total soly. polytherm is a straight line over most of the temp. range, with a positive curvature near the origin and a negative one in the region of higher temps. At 15° Na_2O is about equally divided between the two acids (mol. fraction of NaCl = 0.282, NaNO_3 = 0.279). The mol. fraction of NaNO_3 increases with the increasing temp. and that of NaCl decreases until at 130° the ratio is 0.067:0.0778; from this point on, both the fractions increase, their ratio reaching a min. value of 0.08 at 162° . The presence of free HCl and HNO_3 similarly decreases the soly. of NaCl , while in the presence of 38.45% (by wt.) of free NaOH at 25° there is 6.52% NaNO_3 , 55.03% H_2O and practically no NaCl . Although the "avidities" of both the acids as detd. by the heats of neutralization are the same, the heats of soln. probably influence the equil. in favor of HNO_3 . The part played by water here is important, since at 210° six mols. of H_2O are distributed among 9.6 mols. NaNO_3 and 0.2 mols. of NaCl ; similarly at 25° the mol. fraction of H_2O does not change appreciably with the addition of alkali; i. e., water is drawn away by NaOH from NaNO_3 and NaCl . The existence of undissociated salt mols. is possible in such satd. solns. A tetrahedral model of the system Na_2O - N_2O_5 - H_2Cl_2 - H_2O at 25° shows the displacement of crystn. fields toward HNO_3 . The eutonic point situated at 15° on the line of symmetry NaCl - H_2O shifts to the right at 25° and lies in the triangle N_2O_5 - H_2O - Na_2O . With rising temp. this point recedes from the NaCl - H_2O line, so that the crystn. fields approach HNO_3 . The neutral mols. of NaCl and HNO_3 are represented by a plane through H_2O - NaCl - NaNO_3 on either side of which lie the conjoined pyramids, a tetrahedron on the acid side and a trihedral one on the alk. side.

BASIL C. SOYENKOFF

The different interpretation to give to the critical temperatures of solubility: lower and higher. The ternary systems: water-nicotine-acetone. P. LEONE. *Atti II congresso naz. chim. pura applicata* **1926**, 1200-20.—The system water-nicotine is one of the few known examples of a system in which there are 2 crit. temps. of soln., i. e., where the temp.-concn. curve is a closed curve, 2 strata existing only within a definite interval of temp. above or below which only a single homogeneous phase exists (cf. Hudson, *Z. physik. Chem.* **47**, 113 (1904)). Redetn. of data for the system water-nicotine confirmed except for the smallest variation the data of Hudson. Acetone, which is miscible with each component in all proportions, was then introduced as a 3rd component. The data, tabulated in detail, show that acetone increases the mutual soly. of

water and nicotine, reducing the temp. zone of existence of the 2 phases until with enough acetone the 2 phases disappear. The max. distance between the 2 crit. points occurs with the mixt. contg. 31.73% nicotine and the max. concn. of acetone which still allows the existence of a non-miscibility zone is 35.44%, at which concn. this zone is so greatly reduced that it presents only a slight opalescence between 146° and 155°. With a slightly greater concn. of acetone 2 phases are not formed on heating. The mol. variations of the crit. temp., calculated by the $(T' - T)/C$ formula of Timmermans (*Z. physik. Chem.* **58**, 129) are not const. for all proportions of water and nicotine, but tend to increase slightly with increase in the concn. of acetone. In the crit. zone between 20 and 48% nicotine, the general relation between the ratios of the mol. variations is const. The mol. variations of acetone remain within values of 100–150 for the lower crit. temps., while for the higher crit. temps. they hardly reach 100. For a given sample the mol. variation of the lower crit. temp. is 30–40° greater than the corresponding variation of the higher crit. temp. A distinct and const. difference between the values of the mol. increases of the lower crit. temp. and the corresponding mol. lowering of the higher crit. temp. supports the hypothesis that the 2 crit. points must be interpreted differently.

C. C. DAVIS

The simplest method of representing polynary systems in a plane. VARTAN N. LODOČNIKOV. *Z. anorg. allgem. Chem.* **169**, 177–245 (1928); cf. *C. A.* **20**, 1939.—The author has extended his method to systems of 9 components.

E. R. SCHIERZ

Heat of vaporization and molecules per cubic centimeter. W. HERR. *Z. anorg. allgem. Chem.* **169**, 173–6 (1928).—By means of data from Landolt-Börnstein Tabellen H. has shown that for C_6H_{14} , C_7H_{16} , C_8H_{18} , esters, $SnCl_4$, CCl_4 and PhH the \sqrt{L} (L = heat of vaporization) varies with temp. in the same way as mol./cc. (Z). The value Z/\sqrt{L} , though almost const., first falls, then increases again with increasing temp. For associated liquids $EtOH$, H_2O the same relation holds except that for H_2O the fluctuation of the ratio is in the reverse order, for liquid NH_3 , O_2 and N_2 the ratio is not const., but decreases with temp. This may be due to lack of data over sufficient temp. range. For unassociated compds the ratio \sqrt{Z}/L_s (L_s = heat of vaporization at normal b. p.) is const. near 8.5×10^4 , but for associated compds. like alcs. and fatty acids it varies considerably.

J. R. SCHIERZ

Variation of the specific heat of aniline with temperature, using the continuous-flow electric method. H. R. LANG. *Proc. Roy. Soc. (London)* **A118**, 138–56 (1928).—Measurements on the sp. heat of aniline were made by the continuous-flow elec. method over short ranges between 5° and 75°. Pure dry aniline was used, and the minute water content was detd. The rate of change of sp. heat with temp. increases with temp., and is given between 5° and 60° in terms of the 20-degree cal. per gm. degree, by the formula $S = 0.4951 + 0.0287(t - 20) + 0.027(t - 20)^2 + 0.061(t - 20)^3$.

W. WEST

Isothermal calorimetry at high temperatures. A. MAGNUS AND F. OPPENHEIMER. *Z. anorg. allgem. Chem.* **168**, 305–8 (1928).—The app. described consists of a high-melting glass tube in which the crucible is placed, and sepd. from this tube by only a few mm. is a second tube wound with a heating coil (H). The whole is sealed into a glass chamber which can be highly evacuated and which contains some wood charcoal previously cooled in liquid air. The Fe crucible has double walls, also wound with a heating coil (constantan). The metal or salt is brought just to its m. p. by the coil (H), then when the temp. has become const., a measured current is passed through the crucible coil until the thermoelement in its contents shows a sudden temp. rise. The mol. heat of fusion is given by the equation. $Q = 0.239 M/m e i t$, in which m is the mass of the melt of mol. wt. M , i is the heating current, e the voltage and t the time to temp. rise. Good agreement is obtained and Q in cal./mole is given for Pb as 1224 and for $AgNO_3$ as 2757.

H. STORZT

The free energy of transition in the system calcite-aragonite. J. L. BUCHAN. *Trans. Faraday Soc.* **23**, 668–71 (1927).—The results of previous investigators are tabulated. The free energy of transition is detd. by e. m. f. methods and found to be –414 cal. per g. mol. at 25°. Methods of prepg. pure calcite and aragonite are described.

L. B. MILLER

Thermodynamic studies of chemical change. II. Thermodynamic studies of lead monoxide. 2. FUSAO ISHIKAWA AND IICHI SHIBATA. *J. Chem. Soc. Japan* **48**, 59–66 (1927).—From the e. m. f. of the cell, H_2 (atm.) | 0.26 N $Ba(OH)_2$ | PbO | Pb amalgam (5.7% Pb), the changes in free energy (1), (2), (3), heats of reaction (1), (2), entropy, dissociation pressure and activity product of PbO were detd. For (1), $PbO(s) + H_2(1 \text{ atm.}) \rightarrow Pb(s) + H_2O$, $\Delta F = -11,639$ cal. and $\Delta H = -17,017$ cal. For (2), Pb

(s) + $\frac{1}{2}\text{O}_2$ (1 atm.) \rightarrow PbO (s), $\Delta F_{298}^\circ = -44,921$ cal. and $\Delta H = -51,253$ cal. For (3), $\text{Pb}^{++} + 2\text{OH}^- \rightarrow \text{PbO}$ (s), $\Delta F_{298}^\circ = -20,941$ cal. For PbO at 25° , the entropy is 18.29 units, the dissociation pressure is 1.52×10^{-28} atms. and the activity product is 4.55×10^{-16} . T. SAITO

The free energies of solid compounds, deduced from their crystal structure: with special reference to calcite and aragonite. J. L. BUCHAN. *Trans. Faraday Soc.* 23, 672-6 (1927).—From x-ray measurements the simplest lattice from which the crystal can be built up by a process of repetition is considered, and the ions are taken as point charges. From the force acting between any two ions according to Thompson's formula $F = E_1 E_2 / D a^2 [1 - (K/a)]$, the free energy of formation is calcd. The free energy of formation of calcite is calcd. to be -4060 cal. per g. mol.; of aragonite, -3680 cal. per g. mol.

L. B. MILLER

A new method of measuring overvoltage. L. J. P. BYRNE. *Trans. Faraday Soc.* 23, 661-71 (1927).—A new method of measuring the true overvoltage existing during electrolysis is described and illustrated. Results are given for the electrolysis of CuSO_4 and H_2SO_4 , to show how overvoltage varies with c. d. L. B. MILLER

Electrode potential of nickel. I. Measurements in an atmosphere of hydrogen with reduced nickel powder. KWANGI MURATA. *Bull. Chem. Soc. Japan* 3, 57-69 (1928).—A reproducible electrode, which gives a const. and reversible potential of active Ni has been obtained by using powd. Ni reduced with H directly in the cell, and also using an app. which allows the cell to be filled with the electrolyte entirely in the absence of air. The potentials of the reduced Ni powder in 0.05 and 0.005 molar NiSO_4 soln. have been measured in a H atm. at 18° and 25° . From these observed potentials the normal electrode potentials of Ni have been calcd. on the ground of two different concepts of the strong electrolytes, one of them is that the ion concn. calcd. from the conductance viscosity ratios are involved in the expression of the e. m. f. of a concn. cell; the other one is that the ion activities are involved. The av. values of these normal electrode potentials are 0.2496 v. and 0.2508 v. at 25° and 18° , resp., at one molal ion concn., and 0.2480 v. and 0.2492 v. at the same temps., at one molal ion activity. The change in free energy of Ni electrode reaction per equiv., $i. e., 0.5 \text{Ni}^{++} + \ominus = 0.5 \text{Ni}$, has been calcd.; $\Delta F = 5759$ or 5723 cal. at 25° , and 5787 or 5750 cal. at 18° .

A. I. HENNE

Magnetic transformations of the ferromagnetic metals. Reply to Herr R. Ruer. FRANZ WIEBER. *Z. anorg. allgem. Chem.* 168, 327-8 (1928).—W. takes up and answers specifically certain objections raised by R. (cf. C. A. 22, 208) to W.'s papers on the nature of the magnetic transformation of Fe (cf. C. A. 21, 2245, 2871). W. W. STIFLER

Influence of the electric and magnetic fields on the crystallization of undercooled liquids. W. KONDOGURI. *Z. Physik* 47, 589-601 (1928).—The no. of centers of crystn. of undercooled piperine and salol is considerably increased by elec. and magnetic fields. This was investigated exhaustively for elec. fields with the following results: for equal time intervals the no. of crystn. centers is approx. proportional to the strength of the elec. field; for const. field, the no. increases with time up to a limiting value; an increase in field then produces an increase in the no. of crystn. centers until a new satn. value is reached. Similar results were obtained for magnetic fields. (Cf. C. A. 21, 2207.)

W. W. STIFLER

The interpretation of the paramagnetism of the iron group. OTTO LAPORTE. *Z. Physik* 47, 761-9 (1928).—By use of the relativity doublet formula, L. computes, from purely spectroscopic data, the magneton numbers for the Fe group. In no case do the calcd. values agree with the exptl. results. Various possible explanations are offered. The original should be consulted for the math. details. W. W. STIFLER

Magnetizability of thin manganese films. H. FREEZE. *Physik. Z.* 29, 191-7 (1928).—Mn melted in H_2 was found by Weiss and Kuh to be partly ferromagnetic. F. confirmed this and then attempted to produce films of ferromagnetic Mn (a) by cathode sputtering in H_2 and (b) by electrolysis with simultaneous deposition of H. However, all of the films gave values for the susceptibility of the order of 10^{-5} . There seems to be no satisfactory explanation of the apparent ferromagnetism produced by melting in H_2 . A bibliography is given. W. W. STIFLER

Magnetic rotary dispersion of methanol and propyl alcohol. D. O. JONES AND E. J. EVANS. *Phil. Mag.* [7], 5, 593-608 (1928).—The magnetic rotation of MeOH has been examd. for wave lengths ranging from 0.4379μ to 0.2600μ , and the values of δ (Verdet's constant) can be represented by the equation $\Phi = n\delta\lambda^2 = 1.189 [\lambda^2 / \lambda^2 - (0.1100)^2]^2$, where n is the refractive index of MeOH for wave length λ and 0.1100μ is the wave length of absorption band in the extreme ultra-violet. The weak absorption band in the central region of the ultra-violet at 0.2207μ does not contribute materially

to the magnetic rotation, but the wave length of the strong absorption band (0.1100μ) deduced from the magnetic rotation expts. is very nearly one half that of the weak absorption band. The magnetic rotation of PrOH has been examd. over the range 0.4390μ to 0.2586μ , and the value of δ can be represented by the equation $\Phi = n\delta\lambda^2 = 1.553 [\lambda^2/\lambda^2 - (0.1138)^2]^{1/2}$. The wave length of the absorption band (0.1138μ) is almost exactly one half that of the weak absorption band at 0.2273μ , but the latter does not contribute materially to the magnetic rotation.

GEORGE GLOCKLER

Theory of the magnetic properties of iron and other metals. R. H. DE WAARD. *Phil. Mag.* [7], 4, 641-67 (1927).—A mathematical theory of magnetism based on the result obtained by Barkhausen (*Physik. Z.* 20, 401 (1919)) that during the magnetization of a body the change of magnetic moment is partly discontinuous, and on the extension of Barkhausen's work by van der Pol to show that hysteresis curves in iron wires show discontinuities.

GEORGE GLOCKLER

The refraction and absorption of electrical waves in electrolytes. Part I. KONTANTY ZAKRZEWSKI. *Bull. intern. acad. polonaise* 1927A, 489-503.—The verification of Maxwell's laws deduced for semi-conductors and applied to very dil. solns. is now extended to more concd. solns. The indices of absorption of pure water and of aqueous NaCl were measured. The index of refraction was calcd. by the help of Cauchy's equation and it is concluded that n for concd. solns. of NaCl for a wave length of 23 cm. is much less than that for pure water. To establish whether differences between theoretical and exptl. results are real it would be necessary, however, to use an accuracy greater than that used in the present work.

S. L. B. ETHERTON

New determination of the atomic moments of iron and nickel at low temperatures. PIERRE WEISS and R. FORRER. *Compt. rend.* 186, 821-3 (1928).—The at. moment is computed from the satn. value of the intensity of magnetization at zero abs. This is obtained by double extrapolation to $H = \infty$ and $T = 0$. For any temp. the magnetization, σ , is connected with the satn. value, σ_0 , by the equation $\sigma = \sigma_0[1 - (a/H)]$. The const. a has the same value from room temp. down to that of liquid air. For Fe, $a = 3$; for one specimen of Ni, $a = 10$; and for another, $a = 12$. The internal field of Fe is 16,820 gauss and of Ni it is 18,550 gauss. The satn. value of the magnetization, σ_0 , at any temp., T , is connected with the value, Σ_0 , at $T = 0$ by the relation $\sigma_0 = \Sigma_0(1 - AT^2 - BT^4)$. For Fe, $A = 2.17 \times 10^{-7}$ and the T^4 term is negligible below $T = 288$; for the two specimens of Ni, $A = 5.42 \times 10^{-7}$ and 5.34×10^{-7} resp., and $B = 1.3 \times 10^{-12}$ for both. For both Fe and Ni the value of σ_0 at 100° abs. differs from Σ_0 by not over $1/2\%$. When corrected for the traces of impurities present, the values obtained for the at. intensity of magnetization at satn. are: Fe = $12,393 = 11 \times 1126.6$; Ni (Hereaus) = $3376.4 = 3 \times 1125.5$; Ni (Mond) = $3379.5 = 3 \times 1126.5$. These values for the "exptl. magneton," therefore, agree with the value 1126 deduced in 1924 from measurements on the paramagnetic ions.

W. W. STIFLER

Different magnetic states of the cobaltous ion. ALBERT CHATILLON. *Ann. phys.* 9, 187-260 (1928).—Previous work by Cabrera and by Trumpler indicated the possibility of 2 different magnetic states for the Co^{++} ion in aq. soln., viz., one in which the coeff. of magnetization varies with the concn., and another characterized by a fractional magnetic moment, 24.5 magnetons. C. shows that only this second state is stable. Moreover the Curie point for it is independent of the diln. and of the anion, and is neg. ($\theta = -12^\circ$ abs.). This gives the integral value 25 magnetons for the magnetic moment. CoCl_2 in alc. soln. has the integral moment 23 magnetons. $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$ at temps. below 50°C . has a negative θ and a moment of 23 magnetons; below 110°C . it is sol. in its H_2O of cryst. and the Co^{++} ion has not more than 24 magnetons. Partial dehydration gives 25 magnetons as the moment, with θ pos. The moment of anhyd. CoSO_4 , calcined below 400° is 25 magnetons with $\theta = -20^\circ$ to -30° abs.; if calcined above 600° the moment is 26 magnetons and $\theta = -50^\circ$ abs. As found previously by Mlle. Serres, CoSO_4 (hexagonal) has the fractional moment $25\frac{1}{2}$ magnetons. CoCl_2 in aq. soln. with addn. of HCl has the integral moments 22, 23, 24 and 25 magnetons and the fractional moment 23.5 magnetons. Hence C. concludes that the Co^{++} ion is characterized by the integral magnetic moments 22, 23, 24, 25 and 26 magnetons and that the fractional moments 23.5 and $25\frac{1}{2}$ are to be ascribed to mixts. of ions with integral moments. Crystn. seems to play an important role in detg. the magnetic moments; at times there seems to be a sort of "remembrance" of a previous state. A table summarizing C.'s results and those of previous investigators is given, together with a full bibliography.

W. W. STIFLER

The relation of the diamagnetic susceptibility in the liquid and vapor states. V. I. VAIDYANATHAN. *Indian J. Physics* 2, 135-50 (1928).—The torsion exerted on a test system suspended in the vapor when placed in a non-homogeneous magnetic field

was measured for a no. of org. compds. The app. was calibrated in terms of Takā Sofu's values for the vol. susceptibility of dry air. Measurements were taken at several different pressures and from these the vol. diamagnetic susceptibility, χ_m , was computed. For comparison, the results obtained by V. by measuring the translatory force acting on a thin closed bulb when surrounded by the different vapors, as well as the accepted values for the liquids, are included.

Substance	Vapor $\chi_m \times 10^6$ by Torsion method	Vapor $\chi_m \times 10^6$ by trans force	Liquid. $\chi_m \times 10^6$
CS ₂	62.5	75	45
C ₆ H ₆	74	83	51 and 56
C ₆ H ₁₂	82	82	68
CH ₃ (CH ₂) ₄ CH ₃	96	89	80

404.7	1.5060	1.5100	1.5139		

$$t = +17^\circ \text{C} \pm 0.25^\circ$$

With solns. of NaRbC₄H₄O₄·4H₂O the angle of rotation is a linear function of the concn. Both the crystals and the solns. of the salt are dextrorotatory. LOUISE KELLEY

Molecular scattering of light in solid bodies. I. Scattering of light in crystalline quartz and its dependence on temperature. G. LANDSBERG. *Z. Physik* 43, 773-8 (1927); *Sci. Abstracts* 30A, 798-9. —L. refers to previous work by Strutt and by Raman on the scattering of light by solid bodies, and their suggestions that it was due to mol. scattering. In his own expts a point source of light was used, and a narrow beam from it concd. on the quartz crystal. The scattered light was received on a photographic plate. Particular care was taken to exclude extraneous light. To det. whether the effect was due to mol. scattering and not to admixture of foreign bodies the variation of intensity with temp. was measured. The intensity of the scattered light was found to increase with rise of temp. and to be approx. proportional to the abs. temp. Glass gave an intensity 100 times as great because of its want of homogeneity. In the quartz crystal investigated approx. 25% of the scattered light was due to want of homogeneity, and the remaining 75% due to mol. scattering. Further tests are in progress. H. G.

S. C. LIND

The electron theory and surface energy at the limit of two amorphous media. B. M. EIDELSON. *Physik. Z.* 29, 200-4 (1928).—Mathematical. MARIE FARNSWORTH

The "dative" chemical bond. A. W. C. MENZIES. *Nature* 121, 457 (1928).—The name "dative bond" or "dative linkage" is proposed for the type of co-valence in which both shared electrons are contributed by the same atom. A. I. HENNE

Langevin's theory of atomic magnetism extended to molecules (electronic isomers). S. S. BHATNAGAR and C. L. DHAWAN. *Phil. Mag.* [7], 5, 536-45 (1928).—On Langevin's theory the diamagnetic susceptibility of an atom is proportional to the sum of the av. squares of the projection of the electronic orbit-radius perpendicular to the field. B. and D. use Bragg at. radii (*C. A.* 14, 3584) and calc. from them mean mol. radii (\bar{r}) by assuming closest packing. For isomorphous substances or electronic isomers they obtain the mol. susceptibility $\chi_m = -2.85 \times 10^{10} \Sigma (K\bar{r})^2$. K is a const. for a given group of electronic isomers and for a group of isomorphous substances it is proportional to the at. no. GEORGE GLOCKLER

Recent attempts at transmutation of the elements. F. WOLFERS. *J. chim. phys.* 24, 727-36 (1927).—A review of work of recent years with succeeding critical control expts. Account is included of previously unpublished work by W. with HgCl_2 . The latter is placed between powdered charcoal electrodes and subjected to 3000 to 4000 v. for 100 hrs., current several milliamperes. Spectroscopic examn. revealed no Au, but pptn. with SnCl_2 gave trace of Au, regarded as inconclusive of transmutation by W. Traces of Au pptd. from HgCl_2 with SnCl_2 give a violet coloration of the initial ppt. of Hg_2Cl_2 . One to two parts per million of Au is easily detected. J. L. COSTA

The resolution of an absorption line which has been assumed to be common to praseodymium and neodymium. LORENZO FERNANDES. *Z. anorg. allgem. Chem.* 169, 267-71 (1928).—By observing the absorption spectra of thin sections (1 mm. thick) of $\text{Pr}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$ (I) and $\text{Nd}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$ (II) as well as solid solns. of (I) in La sulfate with a large Hilger const.-deviation, direct reading spectrograph F. has found that the line $\lambda = 469 \text{ \AA. U.}$ which has been accepted as common to Pr and Nd, can be resolved into series of lines which do not coincide for the two elements. At liquid-air temps. the line for Nd is resolved into 16 distinct lines $\lambda = 4776-4560 \times 10^{-8} \text{ cm.}$ and for Pr into 7 $\lambda = 4732-4641 \times 10^{-8} \text{ cm.}$ Spectrum photographs and wave lengths for each line are given. E. R. SCHIERZ

The asymmetric two-center problem according to the wave mechanics and its application to crystal theory (scattering power of atoms). K. F. NIESSEN. *Physik. Thermodynamic fluctuations and radiation from stars. CZESLAW BEALOBZESKE. *Bull. intern. acad. Polonaise* 1927A, 349-62.—The first period in the development of the thermodynamic theory of stars was concluded by the publication of "Gas Kugeln" by Emden in 1907. The second period includes the work of Eddington, Jeans, Eggert, Saha, Milne, Fowler, Rosseland, Zeipel and others. In 1924, Eddington established the assumption that matter within the stars was in the perfect-gas state, an hypothesis hitherto considered only approximate. Contraction alone is insufficient to account for the maintenance of solar radiation over geological (10^8 years) or astronomical (10^{10} years) periods of time. Consequently it is assumed that powerful sources of energy, originally interatomic, exist in the stars. The stars should attain thermal equil. and this is not observed. To account for this B. introduces thermodynamic fluctuations into the theory of gaseous spheres and shows thus how thermal equil. is combated. From statistical mechanics thermodynamic equil. is never perfect; deviations from the state of equil., termed fluctuations, occur without cessation. Moreover, a star is an open,

not a closed system. Complete compensation of deviations from equil., therefore, cannot exist either within or at the surface of a star. In the center of a star, at. nuclei may occur completely stripped of their electronic atm. Neutral atoms, numerous only in the superficial layers occur for the most part in excited states. It is probable that photo-elec. effect and the inverse effect of the combination between electrons and ions is the principal factor in the energy interchange between matter and radiation from the stars. Fluctuations in energy of absorption or emission in a small vol. are very great compared with the energy lost by the same vol. as a result of the exterior radiation and it is possible that all energy radiation is due to fluctuations. Comparison of energy radiated by different stars and referred back to unit mass leads to a remarkable conformity between the formula deduced from the theory of fluctuations and astronomical values.

S. L. B. ETHERTON

Studies with radioactive rays. K. W. F. KOHLRAUSCH. *Physik. Z.* 29, 153-68 (1928).

—The expression $1/N \Sigma \log v$ occurs in the Bohr formulas for the loss in energy and the ionization which results with α - and β -particles. Through a schematic evaluation of these expressions, expt. can be compared with theory. Expts. on energy change, range and ionization of the α - and β -particles in relation to velocity of particles and extent of material traversed, shows that in all cases a quant. agreement is reached, which in many cases is surprisingly good; in other cases, at least not bad. MARIE FARNSWORTH

The radioactivity of an isotope of potassium. MARTIN BILTZ and HANS ZIEGERT. *Physik. Z.* 29, 197-200 (1928).—With a Hoffmann vacuum electrometer, the β activity of the KCl prepn. of v. Hevesy and Logstrup is found to be $4.2 \pm 0.8\%$ greater than that of ordinary KCl. According to the at. wt. detn. of von Honigschmid and Goubau, the first-named prepn. contains a 4.8% higher content of K_{41} . From this agreement it can be concluded that the radioactive constituent of K is the isotope of at. wt. 41. M. F.

The usefulness of the Geiger point counter for β -rays of different velocities and the number of β -rays of radium E and radium D. N. RÜHL. *Z. Physik* 46, 478-505 (1928); 47, 456 (1928).—It was detd. whether with Ra E, which is a pure β -ray emitter, the no. of emitted β -particles was equal to or greater than the no. of decomposing atoms. Since the counting was done by means of a Geiger point counter, it was first detd. what pressure had to prevail in the chamber in order that β -rays with velocities of 34-94% of the velocity of light could be quantitatively counted. A must be used at higher pressures than air. By comparison with the range, pressure and no. of ion pairs formed with Ra D, it was concluded that the quickest β -rays of Ra E (94% c) at atm. pressure gave rise to less than 10 ion pairs per cm. The no. of β -rays sent out per atom decomp. was found to be 1.2. Besides the primary rays emitted by the nucleus there were about 20% as many secondary electrons whose velocity was about 40% of that of light. With Ra D, a comparison of the no. of β -particles with the no. of atoms decomposing showed that only a small part of the primary β -rays was captured under the existing conditions because of absorption in the sample, etc. The velocity of the primary β -rays from Ra D must be smaller or at the highest equal to 20% of the velocity of light. M. F.

The atomic weight of actinium lead, the end product of the actinium decomposition series. FRANZ LOTZE. *Z. anorg. allgem. Chem.* 170, 213-21 (1928).—A review of the different detns. of the at. wts. of radioactive Pb. MARIE FARNSWORTH

Formation of pleochroic halos in biotite. J. H. J. POOLE. *Phil. Mag.* [7], 5, 444 (1928).—Poole now believes that the actual oxidation of Fe^{++} to Fe^{+++} is responsible for halo formation. The oxidation is caused by O_2 which is produced from water decomp. due to α rays. In this connection it is of interest that biotite is distinguished from muscovite (which neither darkens on heating nor contains halos) by its much greater content of ferrous iron. The darkening produced by heating biotite is now thought to be due to oxidation of Fe^{+++} by the heated H_2O , Cf. C. A. 22, 1096.

GEORGE GLOCKLER

Pleochroic halos in biotite from near Murray Bay, P. Q. D. E. KERR-LAWSON. *Univ. Toronto Studies, Geol. Series, Contributions to Canadian Mineralogy* No. 24, 1927, 54-70.—Pleochroic halos in this biotite are distributed along major and minor cleavage planes in such a way as to suggest that the nuclei were formed after the crystn. and rupture of the mica. The halos consist of shells of darkened mica, sepd. by lighter shells, in which there is an active lightening or bleaching action at work, which is capable of influencing a normally dark portion of an interfering halo. The first effect of rays from Ra C is to lighten the biotite. L. W. RIGGS

Thermal instability of earth's crust. H. H. POOLE and J. H. J. POOLE. *Phil. Mag.* [7], 5, 662-7 (1928).—Polemical against H. Jeffreys, C. A. 22, 1093. G. G.

The precise measurement of the ionization effect of single α -particles, and evidence of new activities. HANS ZEIGERT. *Z. Physik* 46, 668-715 (1928).—An original

device for the photographic recording of the ionization effect of single α -particle emissions, connected with a highly sensitive Hoffmann type dipole electrometer (sensitivity 1 mm. = 6740 ions) was used. Emission from U_I , U_{II} , and Ra , gave ionization numbers (0° , 760 mm.) $U_I = 1.16 \times 10^5$, $U_{II} = 1.29 \times 10^5$, $Ra = 1.36 \times 10^5$; whence, the fundamental constant $Z = 3.71 \times 10^{10}$ α -particles per g. Ra per sec. These detns. in the U - Ra group were used as basis for examg. the ionization number of emission from other elements. No activity could be ascribed to Cu or Zn , but examn. of Zn residues and ppts. showed new emission with ionization nos. 0.42×10^5 , 0.69×10^5 and 1.01×10^5 . Ra content of Al , Cu , Zn and a Pb sample 150 years old was detd. as of the order of 10^{-14} g. Ra per g. metal.

Electrodeless discharge—spectra of ionized mercury and of iodine. J. K. ROBERTSON AND J. H. FINDLAY. *Trans. Roy. Soc. Can.* [3], 21, Sect. 3, 89-97(1928); cf. *C. A.* 20, 2118.—In order to det. the origin of certain metallic lines produced in the electrodeless discharge through H_2 when metals were placed in the discharge region, expts. were conducted on Hg and I , in which the main supply was placed outside the discharge region. Spectra were taken chiefly in the ultra-violet region. Most of the lines observed for Hg , with He as the discharge medium, were spark lines including probably ultimate and penultimate lines for ionized Hg . Analysis of the lines observed under varying conditions of discharge favored Carroll's classification of $HgII$ in preference to Sawyer's. The spectra of I in H_2 and in He and alone were also photographed by means of the same app. After the I - He expts. the tube was covered in spots with a brownish flaky coating. The usual violet hue of I_2 was not observed on bringing the tube to room temp. but the color was distinctly brownish, like Br_2 . No evidence of a possible compd. of He and I at low temps was observed. Several plates accompany the paper.

GEORGE GLOCKLER

Oscillatory ionization currents from clouds of CdO particles. H. P. WALMSLEY. *Phil. Mag.* [7], 5, 561-73(1928); cf. *C. A.* 21, 1927.—The ionization currents from CdO clouds dispersed from an arc have been registered photographically, by the steady-deflection method of measuring currents. They fluctuate rapidly. On exptl. grounds, and by comparison of the magnitude of the effect with what would be expected from the theory of chance fluctuations, it is concluded that the observed fluctuations represent time-changes in the density of ionization throughout the cloud. As the currents investigated arise from the disruption of unstable complex particles which have been produced in the cloud during the process of coagulation, it is suggested that each fluctuation is due to a group of unstable complexes which apparently possess the same av. life. The current due to a group is conceived to be zero at first, increase with time to a sharp max. (corresponding to the fluctuation) at the mean time of disruption of the group, and afterwards steadily to diminish. The superposition of currents corresponding to successive groups of unstable particles gives the fluctuating current which is observed.

Auto-electronic currents from cold metals. N. A. DE BRUYNE. *Phil. Mag.* [7], 5,

574-80(1928); cf. *C. A.* 20, 4100; 21, 1927, 3308.—A clean W cathode of small diam. was produced by burning out a W filament. The auto-electronic currents from this cathode in a high vacuum were reproducible. The currents were decreased by H_2 and still more by air; they were increased by coating the cathode with Ba. It is concluded that auto-electronic currents are not due to gas, but that they depend on the nature of the cathode in somewhat the same way as the thermionic emission. G. G.

The electric moment of the water molecule. J. W. WILLIAMS. *Physik. Z.* 29, 204-5(1928).—By using a soln. of H_2O in C_6H_6 , the elec. moment of the H_2O mol. was found to be $(1.70 \pm 0.06) \times 10^{-18}$. MARIE FARNSWORTH

Internal tension in Röntgen photographs. KARL BECKER. *Z. Physik* 47, 454-6 (1928).—An answer to the paper of Goler and Sachs (*C. A.* 22, 209), in which B. calls attention to their misunderstanding of his paper (*C. A.* 21, 2428). B. further disagrees with some of the conclusions of G. and S. MARIE FARNSWORTH

Röntgenographic methods for determining substances adsorbed on carbon. OTTO RUFF, FRITZ EBBERT AND FRITZ LUFT. *Z. anorg. allgem. Chem.* 170, 49-61(1928).—By employing Röntgenographic and chem. methods the question in which form adsorbed substances are deposited on active C is studied. Cryst. deposits in such layer thicknesses that Röntgen interferences occur are detected in only a few cases. With $HgCl_2$, $AgNO_3$ and $AuCl_3$, besides the adsorption of the salts, there is also a deposit of their reduction products, $HgCl$, Ag and Au on the C surface. Röntgenographs detect only the latter. This reduction ability is a property of the C and cannot be lessened by purifying it. It falsifies the results of measurements on adsorbing ability and deceives with the circumstances of a sp. adsorption. With $HgCl$ there is evidence of an orientation of the deposited salt. MARIE FARNSWORTH

The course of a crystal structure determination by x-rays. N. H. KOLKMEIJER. *Chem. Weekblad* 25, 175-83(1928).—A review. B. J. C. VAN DER HOEVEN

Determination of the crystal lattice of microcrystalline substance by means of the radiograms of powders. M. G. ALLARD. *Compt. rend.* 186, 638-40(1928).—A general method for the detn. of the crystal lattice from powder photographs and using the idea of the reciprocal lattice is outlined. R. L. HERSHEY

Absorption of ultra-violet light by glucose, levulose and lactose. L. KWIECINSKI AND L. MARCHLEWSKI. *Bull. intern. acad. Polonaise* 1927A, 379-94.—Two samples of *d*-glucose were examd., the less pure sample gave indications of a band at 2800 Å. U. The purer sample gave no traces of a band. Lactose (lactobiose) gives an absorption band with a max. at about 2750 Å. U., according to Purvis (*C. A.* 18, 498) and to Niederhoff (*C. A.* 21, 1932) but Moroz in 1923 in the lab. of K. and M. and now K. and M. found none. Six samples of *d*-fructose were examd. Some preps. of levulose suffer from being too often crystd. An absorption band was obtained with a max. at 2800 Å. U., confirming the statement of Purvis (*loc. cit.*), but the result is not conclusive since crystn. alone appears insufficient for purification. S. L. B. ITHERTON

Origin of the auroral green line in the oxygen spectrum. J. C. McLENNAN, RICHARD RUDY AND J. H. McLEOD. *Trans. Roy. Soc. Can.* [3], 21, Sect. 3, 22-31 (1928); cf. *C. A.* 21, 3559.—If the auroral green line, $\lambda 5577.341$ Å. U. is due to O_2 , its origin arises from an electronic transition usually classed as "forbidden." This abnormality is explained on the possibility of mol. O_2 breaking up into atoms of O and the resulting atomic fields being decisive factors in detg. the character of the radiation emitted by the excited atoms on reverting to the normal state. Analogous "forbidden" lines in the spectrum of Hg support this view. J. W. SHIPLEY

Under-water spark spectra of certain elements. ELIZABETH J. ALLIN AND H. J. C. IRETON. *Trans. Roy. Soc. Can.* [3], 21, Sect. 3, 127-31(1927); cf. *C. A.* 20, 336; 21, 2609; 22, 1100.—The under-water spark spectra of Be, Au, Mo, Ta and Wo, were produced and photographed, by a small Hilger quartz spectrograph. The values of the absorbed wave lengths were calcd. by means of Hartmann's formula. An additional line, wave length 2175.1 Å. U., to those tabulated in Kayser's Handbuch was found for Be. Eight new absorption lines were observed for Au, and four for Mo. The 8 reversed lines in the spectrum of Ta and 9 lines for Wo correspond to the lines tabulated for the emission spectrum of these metals. Tables of wave lengths accompany the paper. J. W. SHIPLEY

The Zeeman effect of an intercombination line. W. C. VAN GEEL. *Z. Physik* 47, 615-21(1928).—Deviations of the observed from the theoretical positions and intensities were noted in the Zeeman effect of the Hg intercombination line 3663.28 Å. U. ($^3P_2^1D_1$). These are interpreted as an incipient Paschen-Back effect for 3663.28 and its companion line 3662.88 Å. U. ($^3P_2^3D_1$). C. C. KIESS

Intensities in the spark spectrum of oxygen. W. R. VAN WIJK. *Z. Physik* 47,

622-6(1928).—Measured intensities of lines in PP', PD and DD' multiplets of the doublet and quartet systems of O II are in close agreement with the theoretical values.

C. C. KIESS

The doublet components of H α in absorption. L. S. ORNSTEIN, F. ZERNIKE AND J. L. SNOEK, JR. *Z. Physik* **47**, 627-30(1928).—An exptl. procedure was devised for photographing simultaneously, with high resolving power, the components of H α as emitted by the longitudinal and transverse portions of the discharge tube. From the measured intensities of the lines it was found that, for different exciting currents, the lines observed longitudinally were broadened and were not so intense as when observed transversely. This is shown to be the result of absorption. The curves indicate equal absorption for both components, which is regarded as proof that the life of the two final levels of H α is of the same order of magnitude, and that one, 2^3S_1 , cannot be regarded as a metastable state as compared with the other, 2^3P_1 .

C. C. KIESS

A spectroscopic criterion for the benzenoid structure in some types of triphenylmethane derivatives. R. C. GIBBS AND C. V. SHAPIRO. *Proc. Nat. Acad. Sci.* **14**, 251-3(1928).—A study of the absorption spectra of various types of Ph $_3$ CH derivs., including benzenes, phthalenes, sulfonephthalenes, and fluoresceins, has revealed a definite regularity in those compds. known to be benzenoid or lactoid in structure. This consists of a pair of close absorption bands (in neutral alc. solns.) in the ultra-violet which are sepd. on the av. by about 100 m μ .⁻¹. Similar solns. of compds. known to be quinoid do not show the bands. A table presents a list of the compds. and the positions of their absorption bands.

C. C. KIESS

The spark spectrum of neon. H. N. RUSSELL, K. T. COMPTON AND J. C. BOYCE. *Proc. Nat. Acad. Sci.* **14**, 280-3(1928); cf. *C. A.* **22**, 1728.—A new series of Ne lines has been discovered which appear strongly only when the gas is excited by electron impacts at 80 v. The wave nos. of the new lines exhibit differences already known for the Ne II spectrum and lead to a classification of the lines as combinations between higher terms and the ground terms 2P_1 and 2P_2 with values 329647 and 330429, resp. A table contains values for quartet and doublet system terms now established.

C. C. KIESS

The origin of the spectrum of the glow phosphorous. H. J. EMBELUS AND H. R. PURCELL. *J. Chem. Soc.* **1928**, 628-30.—Some of the ultra-violet bands previously described (*C. A.* **21**, 2435) as originating in the mol. of some oxide of P appear to agree with bands of the singly ionized mol. of O observed by Johnson (*C. A.* **18**, 2469). It is concluded that the origin of the glow spectrum of P must be regarded as still unsettled, requiring more accurate and more extensive knowledge of the spectra than is now available.

C. C. KIESS

Composition of the Kundt displacements in absorption spectra with several maxima. P. VAILLANT. *Compt. rend.* **186**, 755-7(1928).—The absorption spectra of solns. of erythrosin and malachite green in H $_2$ O and benzene + alcohol were measured spectrophotometrically throughout the interval from 450 m μ to 700 m μ . Each exhibits two bands, those of erythrosin overlapping and being shifted together with change in solvent; those of malachite green being widely sepd. and shifting independently of each other as the solvent is varied. These facts should be of service in explaining the deviations from Kundt's law which are ordinarily attributed to a change in the nature of the absorbing particles as the solvent is changed.

C. C. KIESS

The absorption of carbon K radiation in carbon, nitrogen and oxygen. HEINRICH KURTZ. *Ann. Physik* **85**, 520-51(1928).—An exptl. procedure is described for detg. the absorption coeffs. of various gases for the soft K radiation of C by measuring directly the ionic current produced in the gas by the absorbed radiation. By proper dimensioning of the ionization chamber the ionic current is made proportional to the intensity of the incident radiation which emanated from a C deposit on the anti-cathode and was transmitted into the chamber through a thin celluloid membrane. The gases for which the mass absorption coeffs. were thus detd. were air, O, N, CO, CO $_2$ and C $_2$ H $_6$. From these were derived the atomic absorption coeffs. of O, N, C $_1$, C $_2$ and C $_3$, on the assumption that the same simple additive rule holds for them as for substances of higher at. no. when harder x-rays are used. The at. coeffs. may be represented by the formula $\alpha = 1.7 \times 10^{-23} \times Z^{4.4}$ where Z is the at. no.

C. C. KIESS

The polarization of the iron K α -ray. HANNS HAAS. *Ann. Physik* **85**, 470-82(1928).—The K α -ray of Fe is spectrally sepd. from the rays sent out by an Fe anti-cathode. It is unpolarized in the tension interval 12.6-7.4 kv.

M. F.

The band spectrum of water vapor. II. DAVID JACK. *Proc. Roy. Soc. (London)* **A118**, 647-64(1928).—The methods of analysis already applied to the H $_2$ O vapor band at 2608 A. U. (*C. A.* **21**, 3157) are here extended to the band at 3428 A. U. The analysis is based on new wave-length measurements. The band corresponds to the transition

$0 \rightarrow 1$ of the vibrational quantum no. New values of the moments of inertia of the mol. system concerned in the emission of all the bands have been calcd. and for the vibrationless state are $I_0' = 1.633$ and $I_0'' = 1.498$, in units of 10^{-40} gm. cm.² These correspond to nuclear sepsns. of $r_0' = 1.022 \times 10^{-8}$ cm. and $r_0'' = 0.979 \times 10^{-8}$ cm. C. C. K.

Studies in the behavior of hydrogen and mercury at the electrode surfaces of spectrum tubes. M. C. JOHNSON. *Proc. Roy. Soc. (London)* **A118**, 695-708(1928).—A series of expts on Doppler effects, on current and potential relations, and on cathode disintegration was performed to det. the effect of Hg on the positive rays of H. The predominance of the Hg spectrum over that of H, and the increase in rate of disintegration of the Al cathode, noted when the cathode is exposed to Hg vapor, are accounted for as follows. The presence in the discharge tube of a gas, Hg, liable to multiple ionization causes a more violent bombardment of the cathode, with the result that the protective film of oxide on the cathode is broken through and the occluded gases diffuse out. This diffusion is accompanied by a weakening of the Al structure and a consequent increase in cathode disintegration. The Hg is evapd. from the cathode material and on account of its greater ability to capture electrons its spectrum appears to dominate over that of H.

C. C. KIESS

Analysis of spectra arising from quadruply ionized tin, Sn V. R. C. GIBBS AND H. E. WHITE. *Proc. Nat. Acad. Sci.* **14**, 345-8(1928).—New wave lengths of Sn observed in the extreme ultra-violet with a vacuum spectrograph have been classified as combinations between 3F , 3D , 3P , 1F , 1D and 1P terms with a common 3D term of Sn V. The analysis was aided by the linear relation which exists between the terms arising from the same electron transition of the iso-electronic systems Pd, Ag⁺, Cd⁺⁺, In⁺⁺⁺ and Sn⁺⁺⁺⁺.

C. C. KIESS

Band fluorescence of mercury vapor. PETER PRINGSHEIM AND A. TERENIN. *Z. Physik* **47**, 330-43(1928).—An investigation by subjective photometry of the visible band fluorescence and by the spectroscope of the ultra-violet bands and line 2537 Å. U produced in Hg vapor by an uncooled Hg lamp and by an Al spark (λ 1854-1862 Å. U of the latter the effective radiation). The two sources produce the same fluorescence spectrum; the intensity of fluorescence produced by the Hg lamp does not increase as the square of the intensity of the exciting beam, which indicates that only 1 quantum of 2537 Å. U. radiation is required. At low pressure the fluorescence increases very rapidly with Hg pressure, then more slowly; the addn. of inert gases and of N₂ increases the intensity at low Hg pressure, but not at larger, addn. of very small amts. of H₂ and O₂ suppresses the fluorescence; the half value pressure for H₂, 3×10^{-3} mm., indicates an av. life for the excited state of some 10^{-9} sec. The visible fluorescence is accompanied by the emission of the line 2537 Å. U., whose behavior runs parallel to that of the band. The suggested explanation is that Hg mols., raised to a non-metastable excited state, undergo a transition on collision with a Hg atom or a foreign gas mol. to a metastable state, which is the same whether the initial excitation is produced by the Hg lamp or the Al spark. The energy of this state must be nearly 4.9 v., the atomic resonance potential. Whether this excited state loses its energy spontaneously after an av. life of about 10^{-9} sec., or whether a further collision must occur before emission can take place is not decided by these expts.

W. WEST

Luminescence of mercurous chloride of standard purity. J. KŘEPELKA. *Nature* **121**, 457(1928).—Pure and dry HgCl shows a greenish white luminescence when stirred with a dry glass rod. This phenomenon occurs in glass, porcelain or metal and lasts about 5 secs.; a clean rod is required to reproduce it. The dryness of the sample plays an important role. The phenomenon is not caused by elec. charge produced by rubbing, nor is it a case of phosphorescence or crystalloluminescence, since it is affected neither by a previous illumination nor by a perfect pulverizing.

A. L. HENNE

Photoluminescence of esculin solutions at low temperatures. J. STARKIEWICZ. *Bull. intern. acad. Polonaise* **1927A**, 459-71.—Investigation of photoluminescence of solns. has drawn attention to progressive phosphorescence. Certain analogies have been observed between phosphorescence and fluorescence spectra of benzene derivatives at ordinary temps. Phosphorescence was considered as a stage in the evolution of fluorescence phenomena, the important factor being variation in viscosity of solvent due to lowering of temp. The facts observed agree with the supposition that the duration of phosphorescence varied with the viscosity of the soln. and increased with decreasing mol. agitation. Thus there appears no essential difference between fluorescence and phosphorescence. Nevertheless it is not certain that it is possible to pass gradually from fluorescence to phosphorescence with fall in temp. Vavilov and Levisin did not find an intermediate state of relatively long duration between fluorescence and phosphorescence. Pringsheim and Vavilov found phosphorescence occurring at low

temps. in a sugar soln. is not polarized, while phosphorescence is partially polarized. Hence recent results on the effect of increasing viscosity on certain characteristics of luminescence are not favorable toward the hypothesis of a gradual transition from fluorescence to phosphorescence. Since phosphorescence and fluorescence spectra have now been found to be different in almost all cases, this too disagrees with the hypothesis. Owing to the occurrence of secondary phenomena at low temps. such as crystn., etc., which can exert a considerable influence on luminescence spectra, S employed anhydrous glycerol as a solvent. This has a relatively large viscosity at ordinary temps., which increases with reduction in temp., and at -80° gives a glassy solid. Photographic observations were made of the changes in luminescent spectra of glycerol solns. of esculin at -12° , -80° and at -180° . Luminescence was induced by an incandescent lamp and phosphorescence by the C arc and observed 0.005 sec. after excitation. Jongla plates of great sensitivity were used which could be sensitized by the use of "pinacol" and "pinacol" for green or red light. A Moll type registering microphotometer was used to study every photograph photometrically. Solns. of esculin probably possess two distinct phosphorescences. One is a large continuous band, the other consists of narrow bands which do not appear except at low temps. (liquid air). However, new work on the phosphorescence between -80° and -180° will show whether the maxima of the phosphorescence spectra at very low temps. may be considered as due to the evolution of phosphorescence spectra at -80° . A weak phosphorescence was noticed at -80° lasting for several seconds and an intense and more prolonged phosphorescence at -180° . Observations on the duration of luminescence confirm above conclusion.

S. I. B. ETHERTON

The yield of photochemical reactions with pulsating light. M. PADOA AND NERINA VITA *Atti II congresso naz. chim. pura applicata* 1926, 1256-S.—Substantially the same as C. A. 21, 2104; 22, 1913.

C. C. DAVIS

Remarks on the contribution "the photochemistry of chlorine" by F. Weigert and M. Nicolai. G. KORNFIELD. *Z. physik. Chem.* 132, 460-1 (1928); cf. C. A. 22, 1544.—K.'s objections referred to by Weigert (*Z. physik. Chem.* 108, 118 (1924)) did not refer to luminescence in itself but its general use on photochem. reactions sensitized by Cl_2 . Energy will not be transmitted by radiation. The sensitized reaction will take place just as little through isochromatic fluorescence as through short wave rays. It can be shown by simple calcns. that even with intensive radiation the no. of mols. brought to a higher electron level is much too low appreciably to decrease the no. of unaffected mols., and therefore their absorption; but on the other hand if the energy density is sufficiently great the no. of mols. may be considerable which may be changed from the stationary basic condition to one with a higher quantum no., for example, through local increase in temp. corresponding to the absorption. Kuhn (C. A. 21, 19) showed that the absorption at the convergence wave length (478 $\text{m}\mu$) must be assocd. with the single quantum vibration condition of Cl_2 because at the following convergence wave length the intensity is so low as to be covered up by the general radiation accompanying the above wave length. If at these places the 2 general radiations overlap, the transition probability for the stationary condition is not essentially greater than for the single quantum condition; therefore, increase in temp. cannot decrease absorption. An expt. is suggested to det. the temp. necessary to produce the observed effect.

O. A. NELSON

The photochemical synthesis of phosgene. JH. CATHALA. *J. chim. phys.* 24, 663-711 (1927).—Com. COCl_2 is purified over Cu amalgam subsequently decomposed thermally in a quartz tube, and exposed to radiation of a quartz mercury arc. C. demonstrates the poison effect of the presence of small quantities of CO_2 . COCl_2 is purified by fractioning in vacuum-tight app. to vapor pressure 554.9 mm. at 0° . The reaction velocities of photochem. reaction are shown to be identical with thermal reaction. The influence of varying amts. (0-21%) of CO_2 is studied; the retarding action is approximately linear for low concns. but apparently an inverse exponential function of CO_2 concns. for higher values. The retarding effect is considerably diminished for $\lambda < 3500$ A. U.; the influence may be due to CO_2 dissoen. with liberation of O_2 . At the temp. of Hg ebullition (357°) however, the retarding action of CO_2 disappears, similarly as in the thermal synthesis.

J. L. COSTA

The measurement of the kinetics, the quantum effect and the influence of light intensity on the reaction between chromic and several organic acids. A. K. BHATTACHARYA AND N. R. DHAR. *Z. anorg. allgem. Chem.* 169, 381-93 (1928); cf. C. A. 12, 111; 16, 4116; 17, 2520, 3837; 19, 925; 20, 3644.—The org. acids used in this investigation were citric, tartaric and lactic acids. The reactions were studied with or without MnSO_4 in the dark and in light (sunlight) at 30° , 40° and 50° . The reaction between citric acid and chromic acid in the dark is very slow and has a high temp. coeff. ($k_{40^{\circ}}/$

k_{300° is 3.8). In the light this coeff. is reduced to 1.05, which is in accord with the general rule. The order of the reactions is diminished in the presence of MnSO_4 or light. A large no. of mols. react for a quanta of energy, the no. increasing with increasing temp. and concn. This is in accordance with the fact previously noted that exothermic reactions do not obey the Einstein photochem. law. For the most light-sensitive reactions, such as citric and chronic acids, the velocity varies as the square root of the light intensity; for the others it is directly proportional to light intensity. A. FLEISCHER

Effect of radiation on the decomposition of ozone and nitrous oxide. J. H. HIBBEN. *J. Am. Chem. Soc.* 50, 937-40 (1928).—Exposure of N_2O at 883°K . to the infra-red radiation from a C arc which is transmitted through quartz or fluorite does not alter the rate of decompn., nor is the low-temp. heterogeneous decompn. of O_3 influenced by this radiation. It is concluded that mol. activation through the absorption of single or multiple frequencies seems improbable. W. W.

Kinetics of the action of iodine on potassium nitrite in the light and in the dark. A. BERTHOUD AND W. BERGER. *Helv. Chim. Acta* 11, 354-63 (1928).—In a study of the reaction, $\text{KNO}_2 + \text{I}_2 + \text{H}_2\text{O} \longrightarrow \text{KNO}_3 + 2\text{HI}$, in the presence of KI it was found that the course of the reaction could not be followed by titrating the unreacted I_2 with $\text{Na}_2\text{S}_2\text{O}_3$ in the presence of NaOAc . The error under certain conditions was as high as 50%. Titrations with 0.005 *N* As_2O_3 gave correct results. Mixts. of mono- and disodium phosphates repressed the H-ion concn. better than NaOAc . In the dark, the rate of reaction (k) is proportional to the concns. of I_2 and KNO_2 . The KI has a marked retarding action and the increase in I^- concn. corresponds to the decrease in the values for k . The temp. coeff. for a concn. of KNO_2 of 0.5-1 *N* and for a temp. of $45-60^\circ$ varies from 3.66 to 4.36 for a 10° rise in temp. In yellow light the velocity const. k_1 (corrected to represent the effect of light only) is large as compared to k and bears the same relation as k to the concn. of KNO_2 , I_2 and KI. In blue light k_1 is practically const. during the course of the reaction, it varies directly with the intensity of the light. The temp. coeff. ($35-45^\circ$) is 1.30. With violet light ($\lambda = 435 \mu\mu$) 22 quanta are required for one mol. of I_2 to react in a soln. contg. 0.1 mol. KI and 1 mol. KNO_2 . The reactions are presented as follows: (a) $\text{I}_2 + h\nu \longrightarrow 2\text{I}$, (b) $2\text{I} + \text{H}_2\text{O} \longrightarrow \text{HIO} + \text{H}^+ + \text{I}^-$; (c) $\text{HIO} + \text{I}^- \longrightarrow \text{I}_2 + \text{OH}^-$; (d) $\text{HIO} + \text{NO}_2^- \longrightarrow \text{NO}_3^- + \text{I}^- + \text{H}^+$; (e) $\text{I}_2 + \text{I}^- \longrightarrow \text{I}_3$. In the absence of light (a) and (b) become $\text{I}_2 + \text{H}_2\text{O} \longrightarrow \text{HIO} + \text{II}^+ + \text{I}^-$. J. S. REICHERT

The photochemical decompn. of hydrogen-iodide - mode of optical dissociation. BERNARD LEWIS. *J. Phys. Chem.* 32, 270-84 (1928), cf. *C. A.* 21, 1760; 22, 356.—Expts. with HI are carried out at pressures neighboring 0.1 mm., at which only 3.5% of mols. should collide during their mean life in an electronic excited state of the order of 10^{-7} sec. Bands 2080 A. U. and 2530 A. U. from a condensed zinc spark are selected by a quartz prism and lenses. A quartz reaction cell is used, the residual I_2 and HI being frozen by a trap and H_2 pressure measured by a MacLeod gage. Radiation measurements are affected by a sensitive galvanometer and a calibrated Moll thermopile with fluorite window. Results corrected for quartz absorption and cell area give mol. HI decompd. = 2.35 mol./*h.v.* The corresponding calcd. absorption coeffs. from Beer's law are 0.0427 and 0.0251 for $\lambda = 2080$ and 2530, of the same order as Warburg's 0.0270 and 0.0139 (cf. *C. A.* 10, 1299, 12, 2490). HI dissociates without collision as result of radiation absorption into a normal H atom and an excited I atom in the metastable 2P_1 state, any excess energy being dissipated as kinetic energy. The time between absorption and decompn. may be less than 2×10^{-10} sec. H. B. WEISER

Structure of the arc spectra of the elements of the nitrogen group. J. C. McLENNAN AND A. B. McLAY. *Trans. Roy. Soc. Can.* [3], 21, Sect. 3, 63-71 (1928)—A theoretical consideration of the arc spectra of N , P, As, Sb and Bi, which shows that the Pauli-Henisenberg-Hund theory is in agreement with the spectra observed. J. W. SHIPLEY

The photochemical decomposition of nitrous and nitric oxides. J. Y. MACDONALD. *J. Chem. Soc.* 1928, 1-14.— N_2O and NO at various pressures were illuminated by a condensed Al spark through a fluorite lens in a reaction vessel of quartz or glass with fluorite window. A series of runs was made with N_2O at 21-607 mm. pressure and $0-40^\circ$, time 2 to 66.5 min. and a number of runs with NO under less varied conditions. The wave lengths employed were 1860-1990 A. U. The decompn. proceeds $4\text{N}_2\text{O} \longrightarrow 2\text{NO} + \text{O}_2 + 3\text{N}_2$. The deduced quantum efficiency is calcd. to be 3.9 ± 0.3 and was fairly independent of temp. and pressure. The absorption coeff. increases 1.47 ± 0.05 times for each 10° rise in temp. 90% of the NO decomposes according to $2\text{NO} \longrightarrow \text{N}_2 + \text{O}_2$; 10% according to $3\text{NO} \longrightarrow \text{N}_2\text{O} + \text{NO}_2$. The quantum efficiency in this case is 0.73 ± 0.05 . Beer's absorption law holds for both gases, N_2O however absorbing more strongly than NO. Reaction mechanisms are proposed. J. L. COSTA

The influence of very low radiant energies on silver bromide; a contribution to the question: Is light undulatory or corpuscular? A. MARCH. *Z. Physik* **46**, 759-63 (1928).—The effect on the photographic plate of x-radiation of intensities calcd. to be less than one quantum per grain are studied. Hauff ultra-rapid plates are used and observations and calcs. based on grains of 3μ mean diam. A Coolidge tube with a W anticathode operating at 50 kv. and 1 milliamperes is employed as source and the plate in a Pb box is half exposed to the radiation at a distance of 3 m. Calcn. from input and radiant efficiency for $\lambda = 0.40$ A. U. sinusoidal wave form, gives $h\nu = 0.49 \times 10^{-7}$ ergs, and 5 to 6 quanta per sec. per grain area. With allowance for possible efficiency in secondary radiation effects, at least 10^{-1} secs. should be required to furnish 1 quantum per grain. M. exposed plates $1/80$, $1/60$, $1/40$ and $1/20$ sec., and compares unexposed and exposed portions. For $1/20$ sec., darkening is visible to the naked eye. In the case of expts. less than $1/20$ sec., darkened grains are counted under the microscope with use of a shield. Results: $t = 1/80$, exposed 16.3, unexposed 15.0; $t = 1/60$, 13.2, 11.4; $t = 1/40$, 19.5, 15.7. The results are inexplicable by undulatory theory; the acceptance of corpuscles must be inhibited by photoelec. and Compton effects. J. L. COSTA

Absorption of x- and γ -radiations and the secondary radiations which accompany them. DUC DE BROGLIE. *Brit. J. Radiology* (Roentgen Soc. Sect.) **23**, 55-62 (1927).—The therapeutic effect of any radiation is due to the energy absorbed, and depends to some extent on the wave length of the rays and the state of division of the cell, as well as on the intensity of the radiation. Absorption of radiant energy is accompanied by ionization of the absorbing material. A homogeneous beam of rays is transformed into a wide range of secondary radiation, all of longer wave length than the primary. Electrons liberated in the matter traversed produce the ionization to which therapeutic effects are attributed. As the wave length of the incident rays becomes less, the second method becomes more important. For a given wave length, heavier atoms in the medium will contribute a larger proportion of fluorescent effects. Thus in biol. material, with a predominance of light atoms, the few heavy ones will be the seat of greater absorption. Gamma rays, being relatively shorter than x-rays, are mostly absorbed by the second method. It is possible that there is also some kind of trigger effect in the action of radiations on living cells. E. H. QUIMBY

The basis of the selective chemical action of x-rays and light. LEWIS SIMONS. *Brit. J. Radiology* (Roentgen Soc. Sect.) **23**, 124-34 (1927).—In absorption of x-ray or light energy by atoms the significant thing is the displacement of electrons. Atoms in this transitory state can enter into chem. reactions with the surrounding atoms or mols. that were previously impossible. Electrons may be disengaged from atoms in 2 ways: (a) by impact of another electron or atom; (b) by the absorption of a light quantum. Simons investigates, from a phys. standpoint, the basis of any possible selective action that may occur in these complex processes between the energies available and the atoms absorbing them. In the case (a), only impact by electrons need be considered. It is shown that there is very little variation in the ionization produced by complete absorption of corpuscular radiation in a number of org. vapors, H_2 , air and SO_2 , that is, there is no selective action. In case (b) the actual no. of atoms included in the class will be very small in comparison to the other class. The generating beam of x-rays was made to vary in wave length over the crit. K-range for Ag. No selective change was observed in the average energy of the photoelectrons. The selective rise in absorption observed is due to an increase in the no. of atoms thus ionized. Since the mean energy required to ionize any atom is but a few volts, and the mean energy of the photoelectrons in the case of x-rays is several thousand, the primary ionization in which selective effects are shown will always be negligible in comparison with the total ionization, which includes ionization by impact. The author's conclusion is that to det. the activity of radiation on a mixed substance, all that need be known is the true absorption coeff. of the whole, then the chem. change will be proportional to the product of the absorption coeff. into the energy density of the x-rays at each point. The possibility of a "trigger action" of the radiation is mentioned. E. H. QUIMBY

MORTON, R. ALAN: **Radiation in chemistry.** London: Baillière, Tindall & Cox. 284 pp. 15s., net. Reviewed in *Chem. News* **136**, 239; *Chem. Trade J.* **82**, 406 (1928).

4—ELECTROCHEMISTRY

COLIN G. FINK

Electric heat-treating furnaces. H. TAMELE. *Siemens Z.* **8**, 162-71(1928).—A review of present practice in the construction and operation of elec. heat-treating equipment. Ni-Cr heating units are most generally used. The resistor "silit," having a carborundum-like compn plus some oxides and nitrides, is applicable to temp. up to 1300°. It is very resistant to corrosive gases but is as yet used only in small installations. C. G. F.

A test run on ferro-silicon in the electric furnace. ANON. *J. four élec.* **37**, 108 (1928).—The elec. arc furnace was of 4500 kw. capacity; 205 kg. of 45% ferro-Si were produced. Charge (in kg.) 225 SiO₂ (97% SiO₂); 102 steel scrap (98% Fe, 0.5 C, 15% FeO); 90 anthracite (8% ash); 43 charcoal (80% fixed C, 3.4% ash); 14 coke (90% fixed C, 7% ash). The ash of the coke and anthracite ran about half SiO₂. Electrode consumption, 11 kg. per ton of ferro-Si. 88% of the SiO₂ introduced into the furnace entered the alloy; the rest, 12%, was volatilized. Fe losses were 2%; C losses 33%; energy losses in transformers, 4%, in cables and contacts, 4%; radiation losses 20%; with volatile Si, etc., 9%, leaving 63% useful energy for chem. reactions. Total consumption of energy, 5,900 kw. for the 205 kg. of ferro-Si. C. G. F.

The magnesium industry. ANON. *J. four élec.* **37**, 112-3(1928).—A review with particular emphasis on costs. C. G. F.

The production of magnesium. RICHARD THIEWS. *Metallborse* **15**, 1350-51, 1406-7(1925); *J. Inst. Metals* **36**, 563—Various electrolytic methods are described. H. G.

The electrochemical production of ammonium phosphate. ANON. *J. four élec.* **37**, 115-6(1928).—A review. C. G. F.

The validity of Faraday's laws to currents due to ionization by collision. P. KOREKO AND I. KURCHATOV. *Compt. rend. Republ. Soviet* **1928**, 7-8(1928).—It has previously been shown by Kurchatov, *et al.*, that in an elec. field exceeding 2×10^6 v./cm. new "charges" arise due to collision. Whether these "charges" are ions or electrons had not been detd. Accordingly, K. and K. filled a glass bulb (soda glass) having 0.003 to 0.005-mm. wall, with 0.02 N Na₂SO₄ soln., surrounding the outer wall of the bulb with the same soln. The cathode (not divulged but probably Pt) was introduced into the little bulb. A coulometer was connected in series. The increase in Na ions in the bulb after the passage of definite amounts of current was in full accord with Faraday's law, the "new charges" are sodium ions. C. G. F.

Common defects in nickel deposits. D. J. MACNAUGHTAN. *Metal Ind.* (London) **32**, 326-7, 331(1928).—A general discussion of porosity, pitting, the effect of impurities and dirt, growths and spontaneous stripping or peeling. Factors influencing stripping are: the stress, the adhesion, and the causes of local rupture. Growths are caused by: the use of excessive c. d., or by the pressure of particles of impurities at the cathode surface during deposition. W. H. BOYNTON

Electrolytic pressure decomposer for the production of hydrogen and oxygen at high pressures without a compressor. J. E. NORRGERATH. *Z. Ver. deut. Ing.* **72**, 373-8(1928).—The app. described electrolyzes KOH under pressures up to 200 atm., the electrode compartments being arranged in such manner that no mixing of gases occurs, the O obtained having a purity of 99.1% and the H 99.9%. The gases are passed directly into cylinders. At high current densities the energy consumption is 3-3.5 kw. hr./cu. m., and very small space is occupied, a machine which will give 120 cu. m. per hr. taking only 2 sq. m. of floor space. As the pressure rises, the voltage required for decompn. drops from over 3 v. at 25 amp./sq. dm. at 1 atm. to about 2.5 v. at 100 atm., and about 2.4 v. at 1000 atm. H. STOERTZ

Electrosyntheses (of organic compounds). Z. YOVITCHITCH. *Bull. sci. acad. roy. Belg.* **13**, 365-70(1927).—Y. considers the phenomenon that hydrocarbons, either satd. or unsatd., on exposure to silent elec. discharge give condensed products whose C and H content total less than 100% or show a deficit. In some cases this change may be due to combination with O, N or H₂O, but in other cases it is due to the action of the discharge. Samples of C₂H₄ (I), C₆H₆ (II) and C₂H₂ (III) were exposed to elec. discharge for 18 to 40 hrs. The app. consists of 2 concentric glass tubes hermetically sealed and set in a cylinder filled with dil. H₂SO₄ (1:12). One Cu electrode dips in the cylinder and the other in the inner tube. The current is supplied by a Ruhmkoff coil with an interrupter of 1300 to 1400 interruptions per min. furnishing 130 to 140 v.

The C and H values of the condensation products were detd. microanalytically. Two l. of I after 32 hrs. exposure gave 1.67 g. of liquid condensate (IV), contg. 68.95% C and 10.26% H. IV after exposure to air for 8 hrs. gave 70.60% C and 10.41% H. II on exposure to the elec. discharge for 40 hrs. gave a black thick liquid contg. 87.91% C and 7.85% H. On exposure to air for 12 days it lost 9.7% by wt. A small amt. of solid was also isolated in the treatment of II and contd. 75.94% C, 6.78% H and 7.63% N. III after 18 hrs. gave a liquid contg. 76.81% C and 7.24% H. **The relation between the electrical energy and the deficit.** *Ibid* 371-6.—A series of hydrocarbons exposed to the elec. discharge from 20 to 40 hrs. give liquid or solid condensation products whose C and H content is less than the original material. This deficiency varies from 1 to 20% and is usually around 4%. This deficiency is believed to be due to the exposure to the so-called "electric rays." These rays are believed to be capable of building up or breaking down the molecules. It is possible that HCHO is formed from CO₂ and H₂O under their influence, or HCONH₂ from CO₂ and NH₃ or the higher hydrocarbons from the lower.

D. H. POWERS

Contact resistance. B. W. JONES. *Gen. Elec. Rev.* 30, 85-6(1927); *Science Abstracts* 30B, 299-300.—If Cu contacts increase abnormally in resistance, with attendant temp. rise and oxidation, the resistance and temp. will suddenly decrease almost to normal and then repeat the cycle. The sudden decrease in resistance may be due to the conversion of CuO to Cu₂O when a certain temp. is reached, there being an excess of Cu and a deficiency of air in the contact. When the temp. decreases the Cu₂O is gradually reconverted to CuO with the increase of resistance to an abnormal value. The initial value of the resistance of the working contact of contactors and circuit breakers is often from 5 to 20% of the total resistance of the device. A contact between two solid blocks is preferable to one between subdivided blocks because in the first case, the whole of the block conducts heat away from hot spots. The oxide film on Cu contacts may be removed by wiping or by arcking. Ag has a higher cond. than Cu and Ag₂O is a good conductor. The drawbacks of cost and inability to withstand arcing may be overcome by the use of auxiliary arcing tips and by using Ag only for facing the contacts.

Storage battery. OLDHAM & SON, LTD., and G. L. DARBY. *Brit.* 275,418, Aug. 11, 1926. Structural features.

Electrolyte for storage batteries. A. DEMBOWICK. U. S. 1,669,393, May 8. H₂SO₄ (1.835 sp. gr.) 82.5, water 75.5, powd. alum 1, Epsom salts 1, NH₄HSO₄ 1, Hg bisulfate 1 and glycerol 0.25 part.

Storage battery electrolyte. L. R. STEELE. U. S. 1,668,740, May 8. Na silicate or other sol. silicate is used with (NH₄)₂SO₄ and H₂O to form an aq. suspension for use instead of H₂SO₄ in batteries of the Planté type. U. S. 1,668,741 specifies substituting such an electrolyte in the battery after discharging a battery, contg. H₂SO₄ electrolyte, to a voltage of 1.7 per cell.

Storage battery plates. J. H. CALBECK and J. A. SCHAEFFER. U. S. 1,668,801, May 8. Durable porous plates of high capacity are formed with substantial quantities of fumed basic Pb sulfate and derivs. of the basic sulfate which are produced in the development of the plate.

Storage battery electrodes. W. HADDON and J. M. BURNETT. Brit. 275,392, July 7, 1926. Electrodes are pasted with a mixt. of lower oxides of Pb and a soln. of S in NaOH. After standing for 2-3 days, the electrode material is hardened by immersion in a mixt. of PbO_2 and H_2SO_4 or PbO_2 and a soln. of a sulfate such as that of NH_4 or Mg.

Electrode for luminous arcs. W. IRBY. U. S. 1,669,129, May 8. Electrodes are formed contg. ilmenite, chromite, magnetite, NaF and LiF.

Anodes for electroplating. A. P. MUNNING & Co. Brit. 275,359, May 26, 1926. Anodes for depositing metal, e. g., Ni, are formed so that the crystals making up the major active portions of the anode are substantially perpendicular to the main path of current travel at each point.

Casting metal crowns on hollow carbon electrodes. T. POGANY and E. BAGOTA. Brit. 274,735, Jan. 28, 1927. Mech. features.

Electrodeposition of thin easily separable metal layers. E. BREUNING and O. SCHNEIDER. Brit. 275,221, July 27, 1926. Thin separable layers of Ni, Co, Fe or other metals are produced by electrodeposition, the surface being rendered passive after each deposition, e. g., by treatment with concd. HNO_3 or chromic acid soln. or by electrolytic treatment in a 5% NaOH soln. To facilitate sepn., the layers may be treated with a 0.1% H_2SO_4 soln. to generate H between the layers.

Electrodeposition of copper, etc. H. E. SUNDBERG. Brit. 274,477, July 13, 1926. An electrolyte contains Cu_2Cl_2 or other cuprous halide, a chloride or other halide of an alkali or alk. earth metal or of NH_4 and a third substance which increases the cathode potential such as gelatin or peptone or org. amino-, quinone-, aromatic or aliphatic compds. or their derivs. or alkaloids or dyes. Alloys of Cu with Zn, Sn or Ni may be similarly deposited from baths of mixed salts.

Electrodeposition of chromium. R. APPEL. Brit. 274,882, July 21, 1926. The electrolyte comprises chromic acid or an acidified soln. of a chromate, to which is added a small quantity of a borate or iodate. Anodes of sheet Pb are used. Cf. C. A. 22, 358.

Electrodeposition of chromium, etc. C. G. FINK. Brit. 275,223, July 27, 1926. In deposition of Cr or other metal requiring a high c. d., current is passed from an anode to a portion only of the object to be plated at a time while other parts are protected from oxidation by the electrolyte or by H or by both. An app. is described.

Electrodeposition of chromium, etc. H. E. SUNDBERG. Brit. 274,913, July 24, 1926. Cr is deposited from a soln. of Cr compds., which may be in different states of oxidation, in water, glycerol or pyridine. Oxycompds. contg. H, B, C, Si, N, S, Se, Te or P may be used, such as fluoborate, fluosilicate or selenate. Bromo-chromate or iodo-chromate also may be used and Al, Mg or other metal compds. may be added to enable use of a low c. d. Numerous details and modifications are described and the process is stated to be suitable also for deposition of metals of groups IV to VII, e. g., deposition of Ta from a partially reduced tantalate and also of alloys or anodic pptn. of oxides.

Apparatus for electroplating articles carried by conveyers through the plating bath. H. GÖTHE. Brit. 274,671, Sept. 14, 1926.

Electric induction furnace. P. H. BRACE. Brit. 275,189, July 27, 1926.

Electric induction furnace. R. DUFOUR. Brit. 275,611, Aug. 4, 1926.

Electric induction furnace. SIEMENS & HALSKE AKT.-GES. Brit. 274,888, July 24, 1926.

Electric induction furnace. SIEMENS & HALSKE AKT.-GES. Brit. 275,249, July 29, 1926. A modification of the furnace described in Brit. 274,888 (preceding abstr.)

Electric induction furnace. J. M. WEED. U. S. 1,669,109, May 8.

Electrolytic rectifier. W. MORRISON. U. S. 1,668,863, May 8. One electrode is formed of a filming metal such as Al and the other electrode is formed of an alloy of a filming metal and a noble metal, e. g., an alloy of Al and Au. These may be used with an electrolyte such as H_3PO_4 or phosphate or Na, K or NH_4 . Cf. C. A. 22, 196.

Rectifiers for alternating electric currents. D. G. ACKERLY. Brit. 275,152, July 29, 1926. A Cu blank is oxidized to produce Cu_2O and the oxidized blank is then heated in an atm. contg. little or no O to improve the crystal structure of the oxide layer.

Current-rectifying material. E. R. GILL. U. S. 1,668,201, May 1. A rectifying material such as Fe pyrites is moistened with water or a dil. acid and an elec. current is passed through its surface to render the more sensitive areas visible.

Electric resistances. S. LOEWE. Brit. 274,505, July 19, 1926. A soln. of colloidal C contg. a protective colloid is sprayed on a glass support and the deposit may be heated to 420° for 15-30 min. to form a resistance suitable for use in "multiple valves."

Tubular electric resistance heating unit. C. C. HARPSTER and W. R. KING. U. S. 1,667,857, May 1. A coil which may be formed of nichrome is packed, both within and without the coil, with material such as Mg which expands on oxidation and this material is then oxidized.

Electric conductors for overhead wires, etc. FELTEN & GUILLEAUME CARLSWERK, AKT.-GES. Brit. 275,322, May 3, 1926. Cores of non-magnetizable or only slightly magnetizable alloy such as an Fe alloy contg. Ni and which may also contain Mn and Cr are used for central supporting strands carrying cond. wires of metal such as Cu, bronze or Al.

Protecting oil-filled electric transformers. AKT.-GES. BROWN, BOVERI, ET C^{IE}. Brit. 274,495, July 16, 1926. A fuse or like device is placed in the oil at the spot where a gas bubble would form by overheating and this fuse serves to give a warning signal or to operate a safety device.

Apparatus for purifying oils, etc., by electric treatment. F. J. SIMINGTON. U. S. 1,667,954, May 1.

Acetylene and carbon black, etc. C. LONGHILL. Brit. 275,281, March 1, 1926. A liquid hydrocarbon oil is decompd. to form C_2H_2 and C black by the action of an arc which is formed within the liquid and which, by rotation of the electrode, is caused to elongate and is then quenched, a second arc is struck at the point where the first arc was formed. An app. is described.

Apparatus for pasteurizing milk or for other similar electric treatment of liquids. F. F. VAN TUYL. U. S. 1,668,293, May 1.

Forming filaments of tungsten or similar metal. M. HAUSCHILD and W. BERGER. U. S. 1,668,016, May 1. Ready-formed long-crystal wire such as W is bent over a mandrel of triangular or other non-circular shape and allowed to relax after removal from the mandrel and before mounting in a lamp.

Carbon for lamp filaments or other purposes. A. LEDERER. Brit. 274,883, July 21, 1926. C compds. such as CS_2 are decompd at temps. of 1100–1750° (preferably about 1600–1700°) to obtain a black C which is hard, coherent and brittle. Various details are given.

5—PHOTOGRAPHY

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

Reform of the nomenclature of inorganic chemistry. Report by MARCEL DELÉPINE. *Bull. soc. chim.* 43, 289–300 (1928).—Definitive decisions of the Committee of the International Union of pure and applied Chemistry on this subject are stated as follows: *I. Classification for indexes.*—For formula indexes, the system used by C. A. is adopted. In word indexes the name of the metal or positive group should come first. *II. Indication of valence.*—The valence of elements in names of compds. is indicated by Roman numerals; as, antimony-III sulfide, Sb_2S_3 . Formular names may also be used; as diantimony trisulfide (or, for indexes, antimony-2-sulfide-3). *III. Writing of formulas.*—This will harmonize with the spoken language (SO_4K_2 in French, K_2SO_4 in English) but should be consistent. For compds. of metalloids the order of increasing negativity is fixed

as: Si, C, Sb, As, P, N, Te, Se, S, I, Br, Cl, F, O. IV. *Oxygen acids*.—The customary names of 37 common acids are recognized. "Anhydride" names should be reserved for oxides that form acids with water (but these may also be named as oxides). V. *Names of salts*.—The usual endings -ate, -ite and -ide are retained. Acid salts are named from the number of unreplaced hydrogen atoms of the acid; *e. g.*, $\text{Ca}(\text{H}_2\text{PO}_4)_2$ is diacid calcium phosphate or (in English) dihydrogen calcium phosphate or even dihydrocalcium phosphate. Superacid salts will be named thus: hydrofluoric potassium fluoride, KHF_2 ; or designated as superacid salts, the formulas being stated. VI. "*Acid*" and "*basic*."—The adjectives "monoacid," "diacid," "triacid," etc., are reserved for acids and "monobasic," "dibasic," etc., for bases. To avoid "diacid acid," "monobasic base," etc., the nouns "diacid," "monobase," etc., may be used. VII. *Water in compds.*.—"Hydrate" should not be used to mean "hydroxide." VIII. *Complex compds.*.—Modifications of the Werner naming are approved but not finally adopted. These include use of Roman numerals instead of special endings to indicate valence, substitution of "ammonio" for "ammino," placing the name of the central metal first in the name of the complex ion, etc. IX. *Sulfur compds.*.—The prefixes thiono, thiol and thio will be used as in organic names. The names dithionic, trithionic, etc., are retained. "Thiosulfuric" (not "hyposulfurous") and "thiosulfate" (not "hyposulfite") should be used for $\text{H}_2\text{S}_2\text{O}_4$ and its salts. The sulphydrates, MHS, should be called acid sulfides [in English they may be called hydrosulfides.—ABSTR.]. X. *Basic salts and salts of complex acids*.—For the present general names, as basic sulfate, basic nitrate, accompanied by the formulas, will suffice for basic salts, though no objection is seen to such names as lead hydroxyacetate, $\text{Pb}(\text{OH})\text{C}_2\text{H}_3\text{O}_2$, and mercury-II trioxydichloride, $\text{Hg}_2(\text{O})_2\text{Cl}_2$. The consideration of complex acids, such as phosphotungstic, is postponed.

AUSTIN M. PATTERSON

Contributions to the study of the rare earths. ERNST WILKE-DÖRFURT and OTTO SCHLIEPHAKE. *Z. anorg. allgem. Chem.* 170, 129-44 (1928).—The sepn. of Pr from La has been accomplished by the basic fractionation of their perchlorates in the presence of NH_4OH and without the aid of auxiliary metallic ions (cf. Prandtl, *C. A.* 19, 1826). In the presence of Cd ions the sepn. is somewhat better than that of the nitrates. Rose-colored $\text{Nd}(\text{ClO}_4)_3 \cdot 6\text{H}_2\text{O}$ was prepd. by dissolving the oxide in HClO_4 . At 170° the hydrate loses most of its water of crystn. and becomes exceedingly hygroscopic. The complex antipyrine salts of the rare earths were also studied with a view of obtaining stable water-free compds. of which the soly differences would permit sepn. of the earths. These were prepd. by mixing in soln. the calcd. quantities of the respective nitrates, antipyrine and HClO_4 or NH_4ClO_4 . The following hexaantipyrine perchlorates were obtained (the soly. is given in g. per 100 cc. of soln. at 20°): lanthanum ($\text{La}[(\text{COC}_6\text{H}_4\text{N}_2)_6](\text{ClO}_4)_3$), colorless hexagonal crystals, m. $290-5^\circ$ (decompn.), soly. 1.48; neodymium, rose-colored hexagonal crystals, m. $285-9^\circ$ (decompn.), soly. 0.98; cerous, colorless hexagonal crystals, m. $295-300^\circ$ (decompn.), soly. 1.07; praseodymium, green hexagonal leaflets, m. $286-91^\circ$ (decompn.); and yttrium, colorless hexagonal crystals, m. $293-6^\circ$ (decompn.), soly. 0.55 g. The following complex hexaantipyrine iodides were made by adding the calcd. amt. of antipyrine to aq. solns. of the respective iodides. cerous, large yellow crystals, m. $268-70^\circ$ without decompn., soly. 13.12; lanthanum, yellow crystals, m. $268-9^\circ$ (decompn.), soly. 29.5; neodymium, rose-colored crystals, m. $270-2^\circ$, soly. 11.3, and yttrium, colorless crystals, m. $280-2^\circ$, soly. 4.44. The salts were analyzed by heating with H_2SO_4 and weighing the sulfate, and by measuring the vol. of N given off when decompn. occurred. The stabilizing influence of antipyrine was shown by heating the cerous antipyrine perchlorate with water to 150° in a bomb tube for 4 hrs. On cooling the substance repptd. unchanged. An improved method for prepng CeI_3 is slining CeO_2 (small excess) and I_2 in water and treating with H_2S to complete decolorization.

H. F. JOHNSTONE

Note on the formulation of Lothar Wohler's conception of sub-compounds. ALFRED HETTRICH. *Z. anorg. allgem. Chem.* 170, 107-8 (1928).—Silver subfluoride is considered an example of the deposition of a salt in a metal, *i. e.*, AgF in Ag (cf. Brody and Millner, *C. A.* 22, 1924). When shaken with Hg at $200-300^\circ$, silver subfluoride apparently dissolves. The mixt. solidifies on cooling and with water produces Ag ions. H. views the action as the possible formation of an amalgam of AgF .

H. F. J.

The binary system: Mn_2SiO_4 - Ca_2SiO_4 . L. TOKOVY. *Z. anorg. allgem. Chem.* 169, 51-6 (1928).—The conclusion of Kallenberg (cf. *C. A.* 8, 3281) that the components of this system form an isodimorphous series and that the m.-p. curve is of the Bakhuis-Roozeboom type III has been confirmed. SiO_2 , CaCO_3 and Na_2CO_3 were well mixed in a mortar, formed into cylinders and sintered at $800-1000^\circ$ in an atm. of N in a resistance furnace. The sintered mass was first pulverized then and melted in a graphite crucible

in an atm. of N. Crystals formed during a period of 1-1.5 hrs. at a practically const. temp. The m. ps. were detd. on thin sections on Pt foil on the stage of a microscope; for high Ca content an optical pyrometer was used. A continuous m.-p. compn. curve is obtained with a min. (1160°) at 90 mol. % Mn_2SiO_4 and 10 mol. % Ca_2SiO_4 . The mixed crystals are rhombic Mn_2SiO_4 with γ Ca_2SiO_4 . They have a prismatic habit and cleavage, belong to the rhombic system, are biaxial, show parallel extinction and are optically negative. For pure artificial Mn_2SiO_4 d. = 4.05; 50 mol. % mixed crystal d. = 3.39; pure Ca_2SiO_4 exists in 3 forms: α d. = 3.27, m. p. 2080°; β d. = 3.28 (approx.), stable 675-1410°; γ d. = 2.97, stable at low temps. The α and β forms change to γ spontaneously on cooling.

E. R. SCHERZ

A practical application of the system: $\text{Na}_2\text{O}-\text{Al}_2\text{O}_3-\text{SiO}_2$. W. FISCHER. *Keram. Rundschau* 34, 849(1926); *J. Soc. Glass Tech.* 11, 145A.—In the triangular diagram $\text{Na}_2\text{O}-\text{Al}_2\text{O}_3-\text{SiO}_2$ the isothermals 1100°, 1200° and 1300° were inserted from analysis of published data on this system. From the diagram a table of mixts. melting at these temps. was drawn up.

H. G.

Water of crystallization of calcium citrate and the manner in which it is eliminated at different temperatures. FILIPPO PERCIABOSCO. *Atti II congresso naz. chim. pura applicata* 1926, 1368.—Expts show that data in the literature on the loss of H_2O from Ca citrate are erroneous (cf. Villavecchia, *Chimica analitica* 1, 130; Beilstein, *Handbuch der organischen Chemie* 3, 564, *Gazz. chim. ital.* 2, 489(1899)). Ca citrate loses all 4 mols. of H_2O of crystn. at 1:8-40° and turns yellow and begins to decomp. at 175-85°.

C. C. DAVIS

The thermal decomposition of the hydrates, nitrates and oxide of aluminum. N. PARRAVANO AND G. MALQUORI. *Atti II congresso naz. chim. pura applicata* 1926, 1131-4.— $\text{Al}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$ is formed when $\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$ is maintained at ordinary temp. over P_2O_5 in *vacuo*, or by repeated treatment of $\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$ with hot HNO_3 . $\text{Al}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$ has already been prepd. in other ways (cf. Inamura, *Mem. Coll. Sci. Kyoto* 4, 105(1919), *C. A.* 14, 2451). A new hydrate, $\text{Al}(\text{NO}_3)_3 \cdot 4\text{H}_2\text{O}$, was prepd. by maintaining $\text{Al}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$ in contact with excess N_2O_5 at ordinary temp. for 12 hrs. It remains unaltered up to 180°, at which temp. it decomps. to Al_2O_3 , N_2O_5 and H_2O . The thermal decompn. curve of $\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$ showed breaks at 73.5°, 140° and 200°, corresponding to fusion and conversion to $\text{Al}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$, to decompn. of the latter to the basic salt, $4\text{Al}_2\text{O}_3 \cdot 3\text{N}_2\text{O}_5 \cdot 14\text{H}_2\text{O}$, and to decompn. of the latter to Al_2O_3 . The curve of $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$ showed breaks at 122° and at 180°, the latter corresponding to decompn. of Al_2O_3 . $\text{Al}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$ behaves differently. At 105° it becomes anhydrous and at 760° the $\text{Al}_2(\text{SO}_4)_3$ decomps. to Al_2O_3 and SO_3 . Samples from various sources of Al_2O_3 contg. different proportions of H_2O of hydration were then heated, and the curves were compared with those of gibbsite, diaspore and bauxite. The results were complicated and difficult of interpretation but indicate that the breaks in the curve which were observed were caused by the formation of lower hydrates of definite chem. compn. and (2) by adsorption phenomena.

C. C. DAVIS

Glasses from sodium metaphosphate with oxides of lead, cadmium and manganese. FELICE DE CARLI. *Atti II congresso naz. chim. pura applicata* 1926, 1146-50.—The systems NaPO_3-PbO , NaPO_3-CdO and NaPO_3-MnO were studied by detg. the temps. of devitrification by a method already described (*C. A.* 20, 1963). Mixts. rich in PbO are cryst. and yellow; toward 60% PbO they are still cryst. but are white, and below 50% PbO the fused products do not crystallize but form vitreous masses sol. in warm very dil. HNO_3 . The diagram of state shows a max. at 950° with sepn. of the compd., NaPbPO_4 . Above this % NaPO_3 the temp. of devitrification decreases rapidly to 600°, then increases with the sepn. of the compd., $\text{Na}_2\text{PbP}_2\text{O}_7$, then decreases to a min. at 350° and finally increases to 600° for NaPO_3 . Between 650° and the eutectic the curve changes its slope abruptly at a point corresponding to the compd., $3\text{NaPO}_3 \cdot \text{PbO}$, (cf. *Z. anorg. Chem.* 9, 229(1895); 12, 444(1896)). CdO dissolves with difficulty in NaPO_3 , and no data were obtained above 40% CdO . The glasses are colorless and devitrify readily, and the diagram of state is similar to that of $\text{PbO}-\text{NaPO}_3$. The min. is at 380° and the max. at 580° for a mixt. contg. 37% CdO . In this zone the reactions of $\text{H}_2\text{P}_2\text{O}_7$ are positive. MnO gives glasses of a dark violet color, which easily devitrify with formation of violet cryst. masses. Because of the infusibility of MnO , mixts. rich in the latter could not be prepd. Qual. tests proved the sepn. of a mixed pyrophosphate and a mixed orthophosphate. The results show that NaPO_3 forms orthophosphates and metaphosphates with metallic oxides, and that glass beads owe their colors to the formation of pyrophosphates.

C. C. DAVIS

The crystallization of lead oxide-silica glasses. FELICE DE CARLI. *Atti II congresso naz. chim. pura applicata* 1926, 1141-5.—The system $\text{PbO}-\text{SiO}_2$ was studied

by a method already described (C. A. 20, 1963), temps. up to 1300° being used. The results are shown in tabular and diagrammatic form. The temps. of devitrification correspond to the zone of max. velocity of crystn. and furnish data which are more precise than those of the beginning of crystn., which are too much influenced by supercooling (cf. Hilpert and Nacken, C. A. 5, 40). The data obtained allow the construction of a diagram of state showing the individual compds. and the zones of concn. corresponding to mixts. having the max. tendency to devitrify and therefore to be avoided as components of smalts. At the max. points of the diagram the velocities of devitrification are much greater than at the min. points, and while in the former case abundant crystn. occurs in a short time, in the latter case traces of crystn. appear only after several days. The results confirm the existence of the ortho- and metasilicate and also show the existence of the compd., $\text{PbO} \cdot 2\text{SiO}_2$. Contrary to Hilpert and Nacken (*loc. cit.*) there was no evidence of the compd., $3\text{PbO} \cdot 2\text{SiO}_2$. Mixts. contg. 100–90%, 85–80% and 76–72% PbO are the most readily fusible, with the least tendency to devitrify. $\text{PbO} \cdot \text{SiO}_2$ has a max. velocity of devitrification around 1000° where the glass has hardly begun to soften.

C. C. DAVIS

The systems: $\text{NaPO}_3\text{-MoO}_3$ and $\text{NaPO}_3\text{-WO}_3$. FELICE DE CARLI. *Atti II congresso naz. chim. pura applicata* 1926, 1151–5.—The same method was used as before (cf. preceding abstr.). MoO_3 and WO_3 dissolve easily in fused NaPO_3 , giving glasses which devitrify without difficulty except with mixts. near the min. point, in which zone crystn. is slow. A pale green color with MoO_3 is due to partial reduction, but tests with KMnO_4 showed that this reduction is insignificant. Even this reduction may be avoided by fusion in an O atm. With small proportions of NaPO_3 the temp. decreases from 790° (MoO_3) to a min. at 540° for 25% NaPO_3 , then increases to a max. of 600° corresponding to the compd. $\text{MoO}_3 \cdot \text{NaPO}_3$, then decreases to a second min. at 320° and finally increases to 600° (NaPO_3). $\text{MoO}_3 \cdot \text{NaPO}_3$ dissolves easily and completely in hot water, the soln. giving the reactions of orthophosphates. The formula is probably $\text{Na-O-MoO}_3\text{-O-P-O}_2$. With WO_3 the glasses contg. not too much WO_3 are colorless, but with high proportions of WO_3 they are sometimes blue, owing to slight reduction. The max. is at 850° , corresponding to the compd. $\text{WO}_3 \cdot \text{NaPO}_3$ which is white and cryst. Because of the difficulty of fusing WO_3 , no mixts. contg. over 75% WO_3 were prepd. The min. is at 350° for a mixt. contg. 30% NaPO_3 .

C. C. DAVIS

Formation and stability of inorganic complexes in solution. P. JON. *Ann. chim.* 9, 113–203(1928); cf. C. A. 21, 2230—J. has made a study of a no. of "imperfect" complexes, i. e., those which in soln. are in mobile equil. with their constituents. The method used was the so-called method of continuous variations. Since in using this method the property to be measured should be additive, J. chose to study the absorption of light by solns. of the complexes. The method enables one to det. the formula of the complex formed by the mixt. of the two solns. and also to evaluate the equil. const. corresponding to its formation. The results of J.'s study indicate the existence of the following complexes: K_2CdI_4 , K_2CdBr_4 , KI_3 , KBr_3 , KClI_2 , KClBr_2 , KBrI_2 (a little more stable in EtOH than in H_2O), KHgCl_3 , K_2HgBr_4 , K_2HgI_4 , $\text{Ag}(\text{NH}_3)_2^+$, $\text{Ag}(\text{C}_2\text{H}_7(\text{NH}_2)_2)_2^+$, $\text{Ag}(\text{Et}_2\text{NH})_2^+$, $\text{Ag}(\text{EtNH}_2)_2^+$, $\text{Ag}(\text{Me}_2\text{NH})_2^+$, $\text{Ag}((\text{CH}_2)_6\text{N}_4)_2^+$. These Ag complexes are stable only in the presence of a sufficient excess of NH_3 or the amine. In more dil. soln. three of the amines form monoamine complexes: $\text{Ag}(\text{EtNH}_2)^+$, $\text{Ag}(\text{C}_2\text{H}_4(\text{NH}_2)_2)^+$ and $\text{Ag}((\text{CH}_2)_6\text{N}_4)^+$. Other complexes obtained were $\text{Cu}(\text{NH}_3)_4^{++}$, $\text{Cu}(\text{C}_2\text{H}_4(\text{NH}_2)_2)_2^{++}$, TiNH_3^+ , $\text{Ti}(\text{C}_2\text{H}_4(\text{NH}_2)_2)^+$. The Ti complexes are not very stable. The equil. const. corresponding to the formation of each complex is given.

LOUISE KELLEY

Cobaltic fluoride hydrate. G. A. BARBIERI AND F. CALZOLARI. *Z. anorg. allgem. Chem.* 170, 109–10(1928).—The authors hold that the work of Birk (C. A. 22, 922) forms a confirmation and completion rather than a correction of their (1905) work on cobaltic fluoride hydrate. They detd. only the ratio Co:F since their product was not completely dry. Their data for wt. % of Co and F are only slightly less than those required for Birk's formula, $\text{Co}_2\text{F}_6 \cdot 7\text{H}_2\text{O}$.

H. F. JOHNSTONE

A new method for the preparation of thiophosphoryl chloride. REMO DE FAZI. *Atti II congresso naz. chim. pura applicata* 1926, 1293–4.—Among at least 8 methods for prep. PSCl_3 described in the literature, that of Baudrimont (*Compt. rend.* 53, 468(1861)) seems the most practical, and yet it is not wholly satisfactory. The new method involves the direct reaction of CCl_4 and P_2S_6 , thus: $3\text{CCl}_4 + 2\text{P}_2\text{S}_6 \longrightarrow 4\text{PSCl}_3 + 3\text{CS}_2$. By varying the proportions of the reagents, the temp. and the time, it was found best to heat 220 g. of CCl_4 with 250 g. of anhyd. P_2S_6 in a closed tube at $180\text{--}200^{\circ}$ for 2 hrs. About 150 g. of PSCl_3 is obtained (60% yield).

C. C. DAVIS

A new molybdenum compound: the phospho-ceruleomolybdic conjugate of Denigès. A. VERDA. *Pharm. Acta Helv.* 3, 4-9(1928); cf. *C. A.* 21, 2442.—V. examd. the dictum of D. that whenever MoO_3 is reduced in the presence of phosphate ion, the ceruleo compd. (A) is formed, not the ordinary blue compd., $4\text{MoO}_3 \cdot \text{MoO}_2$ (B). Blue colorations by reduction of *phosphomolybdic acid* (5 g. of Na phosphomolybdate + 80 cc. H_2O + 7 cc. concd. HNO_3 ; cf. D.) with Zn, etc., have been obtained before by V. (*Thesis*, Lausanne, 1905), but no Et_2O -soly. test was then applied. V. now finds that most of the blue colors obtained by him failed to pass into Et_2O soln., except when Al, Sn or Pb is employed as reducing agents.¹ The intensity of the blue color in Et_2O decreases in the order of the metals named. It is notable that with Al, no heating is required in V.'s process to produce the Et_2O -sol. blue color. Conclusion: A being somewhat unstable, it is formed only under very special conditions of reduction which D. has correctly seized. When B is formed, the Et_2O remains colorless, except when certain org. reducing agents, e. g., PhNH_2 , $\text{C}_6\text{H}_4(\text{OH})_2$, etc., are employed; then the Et_2O solns. may present a veritable scale of color reactions.

S. WALDBOTT

Isomorphism relations between the hexachloro salts of pyridine with cerium, thorium, tin, lead and quadrivalent titanium: $(\text{C}_5\text{H}_5\text{NH})_2\text{XCl}_6$. V. CAGLIOTI. *Atti II congresso naz. chim. pura applicata* 1926, 1182-93.— $(\text{C}_5\text{H}_5\text{NH})_2\text{CeCl}_6$, prepd. by the method of Koppel (*Z. anorg. Chem.* 28, 305(1898)), had d_{18} 1.901. The microcrystals are probably monoclinic, and decomp. on exposure to air. $(\text{C}_5\text{H}_5\text{NH})_2\text{SnCl}_6$, prepd. by the method of Weinland and Barnes (*C. A.* 4, 879), had d_{18} 1.830. The crystals are probably monoclinic. $(\text{C}_5\text{H}_5\text{NH})_2\text{ThCl}_6$, prepd. by the method of Rosenheim and Schilling (*Z. anorg. Chem.* 35, 426(1903)), had d_{18} 2.148. The crystals are very deliquescent and could not be measured. $(\text{C}_5\text{H}_5\text{NH})_2\text{PbCl}_6$, prepd. by the method of Guthrie and Wissmüller (*C. A.* 9, 1014), had d_{18} 2.070. $(\text{C}_5\text{H}_5\text{NH})_2\text{TiCl}_6$, prepd. by the method of Rosenheim and Schlutte (*Z. anorg. Chem.* 26, 239), was so unstable in air that neither its d. nor its crystallographic characteristics could be detd. These compds. were chosen to study the formation of isomorphous mixed crystals because of the difficulty of prep. $(\text{NH}_4)_2\text{CeCl}_6$ (cf. C., *C. A.* 20, 2025). From SnCl_4 and CeCl_4 were obtained 3 series of *mixed crystals* which contained 3.25, 16.81 and 35.64% of $(\text{C}_5\text{H}_5\text{NH})_2\text{CeCl}_6$, resp., had d. 1.835, 1.845 and 1.855, resp., and were of a pale yellow, yellow and golden yellow color, resp. The method of Zambonini (*C. A.* 18, 947) was used to prove that all 3 crystals were true solid solns. The sp. vols. calcd. from the d. showed that the Retgers law was valid. The great difference in soly. between CeCl_4 and PbCl_4 was an obstacle in obtaining mixed crystals. One type of *mixed crystal* was obtained, which contained 14.39% $(\text{C}_5\text{H}_5\text{NH})_2\text{CeCl}_6$, d_{18} 2.041, and the color of which was between the colors of the components. Here the Retgers law held true. Because of the instability of $(\text{C}_5\text{H}_5\text{NH})_2\text{TiCl}_6$, mixed crystals of this and $(\text{C}_5\text{H}_5\text{NH})_2\text{CeCl}_6$ were prepd. by cong. a mixed soln. of the 2 salts and then adding $\text{C}_5\text{H}_5\text{NHCl}$. One type of *mixed crystal* was obtained, which contained 11.68% $(\text{C}_5\text{H}_5\text{NH})_2\text{TiCl}_6$. Its d. could not be detd., but it was orange-yellow and microcryst. From ThCl_4 and SnCl_4 were obtained 2 series of *mixed crystals* which contained 8.81 and 90.32% $(\text{C}_5\text{H}_5\text{NH})_2\text{ThCl}_6$, resp., and had d. 1.859 and 2.110, resp., the Retgers law being followed. Both were deliquescent. From ThCl_4 and PbCl_4 with a soln. very rich in ThCl_4 , was obtained 1 type of *mixed crystal*, which contained 71.5% $(\text{C}_5\text{H}_5\text{NH})_2\text{ThCl}_6$. It was pale yellow, was very deliquescent, had d_{18} 2.132 (conforming to the Retgers law) and the angle of its optical axes was between those of its components. Also from ThCl_4 and TiCl_4 was obtained 1 type of *mixed crystal* which contained 15.01% $(\text{C}_5\text{H}_5\text{NH})_2\text{TiCl}_6$ and was so extremely unstable in air that neither its d. nor crystallographic properties could be detd. The isomorphism of the various groups is confirmed by the almost identical mol. vols. of the individual members.

C. C. DAVIS

Di- and tetrasubstituted siloxenes. H. KAUTSKY AND A. HIRSCH. *Z. anorg. allgem. Chem.* 170, 1-17(1928); cf. *C. A.* 20, 3140.—Treatment of siloxene with dil. solns. of halogens in acid anhydrides gives di- and tetrasubstituted siloxenes contg. the halogen and acid residue. The simultaneous entrance of the two groups is explained by the presence of a complex between the halogen and the solvent. Because of the preferential adsorption of the hydrocarbon radical of the anhydride by the hydrophilic-SiH groups the reactions are slow compared to those between siloxene and the pure halogens. I in Ac_2O gives green *monoacetato-monoiodosiloxene*, $\text{Si}_2\text{O}_2\text{H}_2\text{I}(\text{CH}_3\text{COO})$. Br in Ac_2O gives yellow *diacetato-dibromosiloxene* provided the HBr formed in the reaction is carefully removed. If the HBr is not removed yellow *monoacetato-dibromosiloxene* is formed. Bromination with a dil. soln. of Br in CS_2 gives the yellow *tetrabromosiloxene*; with concd. solns. the orange-yellow *hexabromosiloxene* is given provided the HBr is removed. These compounds are easily hydrolyzed or

aminolyzed with the production of *hydroxy- or aminosiloxenes*, the colors of which are much darker and more intense than those of similar compds. prep'd. from the pure halogenated siloxene, possibly because of different relative positions of the substituent groups.

Intermediate products in oxidation with chromic acid (WAGNER) 2.

Dictionary of Inorganic Substances. London: Ernest Benn. Price, approx. 42s., net.

7—ANALYTICAL CHEMISTRY

W. T. IALI,

The use of liquid amalgams* in volumetric analysis. X. More new methods for the determination of vanadium, chromium, and several nitro compounds. KIN'ICHI SOMEYA. *Z. anorg. allgem. Chem.* **169**, 293-300(1928); cf. *C. A.* **19**, 224, 2614, 3229; **20**, 26, 2469; **21**, 1604, 2858.—Certain dyestuffs such as safranine, neutral violet, neutral red and methylene blue undergo a change of color when acted upon by the oxidants used in volumetric analysis and the reduction potentials of these dyes are such that they do not undergo color change until the usual oxidation has been accomplished so that they can be used as indicators. Thus in 10-12 *N* acid soln., tungstic acid can be reduced by liquid amalgam and the reduced soln. titrated with CuSO_4 soln. or with I_2 soln. using safranine as indicator. To det. V in an Fe alloy, evap. the acid soln. to fumes with H_2SO_4 , dil. to make the soln. 12 *N* in acid and shake with liquid Zn-Hg. Remove from the reductor, add 10 cc. of 0.1% safranine soln. and titrate in an atm. of CO_2 with I_2 soln. Cr can be det'd. similarly with KIO_3 , KBrO_3 or I_2 as oxidant. A nitro compd. can be also det'd. by reducing it with a known quantity of reduced Cr^{++} soln. and titrating the excess of the latter in the FeCl_3 . Also in *Sci. Repts. Tôhoku Imp. Univ.* [1], **17**, 131-9(1928).

ARTHUR FLEISCHER

Micro-Kjeldahl experiments. BERTA SAIKO-PITTMER. *Pharm. Presse* **33**, 60-1 (1928).—An attempt was made to develop Pregl's micro-Kjeldahl method to compds such as pyrimidone, PhN_2H_3 , semicarbazide, etc. With pyrimidone in 1% soln, addns of $\text{CuSO}_4 + \text{K}_2\text{SO}_4$, $\text{CuSO}_4 + \text{K}_2\text{SO}_4 + \text{PtCl}_4$, $\text{Fe} + \text{CuO}$, $\text{Fe} + \text{CuO} + \text{PtCl}_4$, $\text{Fe} + \text{CuO} + \text{PdCl}_2$ and $\text{Cd} + \text{K}_2\text{SO}_4$ were made to the conc'd. H_2SO_4 . It was found that the addn of PtCl_4 tended to boost the % of N slightly, but the best results were obtained with metallic Cd + K_2SO_4 . With PhN_2H_3 the Cd combination did not prove efficient but a suitable catalyst proved to be $\text{K}_2\text{SO}_4 +$ powdered Se + alc. With semicarbazide, the N % was raised appreciably by the use of Se + $\text{K}_2\text{SO}_4 +$ alc., but failed to reach the theory. With phenylsemicarbazide the above addn. yielded very nearly theoretical values.

W. O. E.

The adjustment of the reaction of indicator solutions and its importance in determining the hydrogen-ion concentration of slightly buffered solutions. W. H. PIERRE AND J. F. FUDGE. *J. Am. Chem. Soc.* **50**, 1254-62(1928).—The quinhydrone electrode can be used for detg. the p_{H} value of buffered solns. but the H_2 electrode is not absolutely reliable when indicators are present. The *varying drop method* is also useful for this purpose. It depends on the principle that if an indicator soln. is more alk. or more acid than the weakly buffered soln. to be tested, a different p_{H} value will be found when different quantities of the indicator soln. are used. Indicator solns. made up without neutralization, solns. adjusted to $p_{\text{H}} = 7.0$ and solns. made up according to Clark give erroneous results with solns. that are buffered slightly. With such solns. the indicator solns. require adjustment to the p_{H} corresponding to about the middle of the transition change.

W. T. H.

A demonstration of membrane hydrolysis on "indicator foils." [Colloid films containing indicators.], HANS KROEPFELIN. *Kolloid-Z.* **44**, 188-90(1928).—The accuracy of Wulff's "indicator foil" method (cf. *C. A.* **21**, 3855) has been investigated. Foil I shows an error toward the alk. side; it is affected by the presence of a buffer. Foil II and foil III show an acid error, due to hydrolysis of their indicator; the addition of a neutral salt, 35 millimolal KCl for instance, corrects the discrepancy. A. L. H.

The correctness of acid and alkali titers. TADEUSZ MIŁOBĘCNDZKI. *Roczniki Chem.* **7**, 295-308(1927).—The errors involved in the titration of HCl , $\text{H}_2\text{C}_2\text{O}_4$ and glyceric-boric acid, the errors due to instability or impurity of acidimetric or alkali-metric standards, the satn. point as distinct from the neutral point, the indicator error and the CO_2 error are discussed and familiar conclusions drawn. For titrations in which

the end point is at about $p_H = 7$, the indicator "kap" from red cabbage is recommended. It is blue at $p_H = 6.8-7.4$, purple in more acid solns. and red in more alk. ones. *

Detection and determination of barium, calcium and strontium. O. MACCHIA. *Chem.-Ztg.* 52, 281-2(1928).—The paper was originally published in Italian (cf. C. A. 21, 3030).
W. T. H.

An improved test for borates. A. GABRIEL AND H. G. TANNER. *J. Am. Chem. Soc.* 50, 1385(1928).—A modification of the flame test depending upon the formation of Me_3BO_3 by which 0.2 mg. of H_3BO_3 can be detected.
W. T. H.

Ceric sulfate as a volumetric oxidizing agent. I. Preparation and standardization of solutions. Determination of calcium. II. Determination of iron. III. The titration of iodide. IV. Determination of arsenic. V. Determination of antimony. VI. Volumetric determination of cerium. H. H. WILLARD AND PHILENA YOUNG. *J. Am. Chem. Soc.* 50, 1322-38, 1368-85(1928).—These interesting papers show that the oxidation potential of Ce^{++++} to Ce^{+++} is similar to that of MnO_4^- to Mn^{++} . For this reason a soln. of $Ce(SO_4)_2$ easily prepd. by oxidation with $NaBiO_3$ or by $(NH_4)_2S_2O_8$ in the presence of Ag^+ , can be standardized, like $KMnO_4$, against $Na_2C_2O_4$ and can be used for the detn. of Ca after prior pptn. as CaC_2O_4 . Just as $KMnO_4$ oxidizes Fe^{++} to Fe^{+++} , As^{+++} or Sb^{+++} to quinquivalent As or Sb and I^- to I_2 , so Ce^{++++} can be used for the titration of Fe^{++} , As^{+++} , Sb^{+++} or I^- and accurate results obtained. Moreover, Ce itself can be detd. by oxidizing it to Ce^{++++} and titrating with standard $FeSO_4$, KI or $NaNO_2$ solns. In all the work described, the end points were detd. by potentiometric titration although it was possible in some cases to detect the end point by the color change. As an oxidizer, quadrivalent Ce has an advantage over $KMnO_4$ with respect to the fact that there is no possibility of any intermediate reduction and the disadvantage that the equivalent wt of Ce is nearly 5 times as large as that of $KMnO_4$. Moreover, some of the end points are not obtained very rapidly. Inasmuch as the other rare earths do not show properties simulating Ce^{++++} as an oxidizer, these papers represent a valuable increase to our knowledge of the reactions of the element Ce.
W. T. H.

An innovation in the determination of ferrous oxide in rocks. E. SALVATORE AND A. SQURO. *Z. Krist.* 66, 162-6(1927).—The method is essentially the same as that used by Mellor, C. A. 4, 1440 and by Barnebey, C. A. 10, 3003.

The estimation of hydrogen in complex gaseous mixtures by absorption in colloidal palladium solution. A. E. BERT. *Fuel in Science and Practice* 7, 44(1928).—Application of the method of absorption of H by colloidal Pd (cf. C. A. 4, 1006) to the Bone-Wheeler app.
D. A. REYNOLDS

Determination of the nitric and sulfuric acid content of the nitrating acid for use in the preparation of Gossypium collodii. S. G. CATH. *Pharm. Weekblad* 65, 332-3(1928).—The concn. of the acid. mixt. for use in the nitration of cellulose for the prepn. of collodion may be detd. by Ulsch's method of electrolytic reduction (*Z. Elektrochem.* 3, 546), whereby the HNO_3 is converted into NH_3 . Dil. 2 cc. of the acid to 100 cc. and titrate 20 cc. with N KOH (titer = a). Titrate another aliquot of 20 cc. after electrolytic reduction (titer = b). $(a - b)/2 = \text{cc. } N HNO_3$, and $(a + b)/2 = \text{cc. } N H_2SO_4$. The reduction is performed at 4 v. and 1-1.25 amperes, in a test tube 20 \times 170 mm. A Cu spiral of about 40 turns serves as the cathode and a Pt wire as the anode. The reduction requires about 20 min.
A. W. DOX

New micro-phosphorus determination. ADALBERT ELEK. *J. Am. Chem. Soc.* 50, 1213-4(1928).—The method consists in fusing 3-6 mg. of the substance in a Ag crucible with 0.2 g. KNO_3 and 1 g. KOH and pptg. the P as NH_4 phosphomolybdate essentially according to Lieb.
C. J. WEST

Variation of the Carius method for the determination of sulfur. V. C. ROGERS AND GREGG DOUGHERTY. *J. Am. Chem. Soc.* 50, 1231-2(1928).—The use of $BaCl_2$ or NaCl with the HNO_3 in the Carius method for S is advocated.
C. J. WEST

Determination of sulfur dioxide in small amounts in the atmosphere. R. J. MCKAY AND D. E. ACKERMAN. *Ind. Eng. Chem.* 20, 538-42(1928).—A modified, detailed description of the rapid Selby method is given (cf. A. E. Wells, C. A. 10, 404, 447). Emphasis is placed upon the manipulation in taking the sample.
W. T. H.

Potassium ferrocyanide as a qualitative test for zinc. GEORGE W. BENNETT AND F. C. MCKEE. *J. Chem. Education* 5, 473-5(1928).—The formation of $K_2Zn_3[Fe(CN)_6]_4$, the basis of the well-known volumetric method for detg. Zn, is recommended as a confirmatory test for Zn in qual. analysis.
W. T. H.

Studies on the changeability of the thiosulfate titer. C. MAYR AND E. KRESCHBAUM. *Z. anal. Chem.* 73, 321-52(1928); cf. C. A. 21, 29.—Although it is true that

CO_2 in water can accomplish decompn. of $\text{S}_2\text{O}_3^{--}$ with liberation of S, and there is likely to be a little H_2S in freshly prepd. solns. of this reagent, these effects are of minor importance with respect to the permanence of the $\text{Na}_2\text{S}_2\text{O}_3$ titer. The chief cause of trouble is bacterial action and the best way to keep the titer permanent is to keep the soln. sterile by adding 1% of amyl alc. by vol. It is seldom that the titer increases on standing. When Cu^{++} makes the titer of the soln. more permanent it is because of its germicidal effect. The fact that a small quantity of base is likely to make the soln. more stable is due to the fact that the bacteria are not very active when the pH value of the soln. lies between 9 and 10. W. T. HALL

Iodometric determination of vanadium in alloy steel and in ferro-vanadium. K. ROESCH AND W. WERZ. *Z. anal. Chem.* **73**, 352-5 (1928).—In the presence of H_3PO_4 , HVO_3 is reduced quantitatively to quadrivalent vanadyl salt by KI and the liberated I_2 can be titrated with $\text{Na}_2\text{S}_2\text{O}_3$. By means of this reaction it is a simple matter to det. the V content of Fe-V because the V is obtained as water-sol. NaVO_3 by fusion with NaOH while interfering Mn and Fe are left insol. An analysis can be made in 2 hrs. The method is somewhat more involved in the analysis of alloy steels. For them, take 3-5 g. of filings and dissolve in 30-50 cc. of HCl. Oxidize with HNO_3 and evap. to 25 cc. Filter off the WO_3 and for the most accurate work, ignite the ppt. in a Pt crucible, remove SiO_2 by fuming with HF and H_2SO_4 and fuse the residue with KHSO_4 . Ext. the melt with $(\text{NH}_4)_2\text{CO}_3$ soln. and unite the residue with the ppt. obtained later in the analysis. Conc. the filtrate from the WO_3 and treat the HCl soln. with ether to remove FeCl_3 . Treat the ethereal soln. with a little H_2O_2 to remove a little V. Evap. the aq. soln. to remove ether and HCl and take up the residue in 6 N HNO_3 . Dil. with water and a little 10% MnSO_4 soln. and make ammoniacal. Filter and ignite the ppt. in an Fe crucible. Add to it the residue from the WO_3 and fuse both ppts. with 2-4 g. of NaOH in an atm. of H_2 to prevent oxidation of Cr. Ext. the NaVO_3 with water, filter, add 75 cc. of H_3PO_4 and 0.5 g. of $(\text{NH}_4)_2\text{S}_2\text{O}_8$. Boil 15 min. to decomp. the persulfate, cool, add KI and titrate. W. T. H

Rapid method for the determination of zinc. G. SPACU AND J. DICK. *Z. anal. Chem.* **73**, 356-9 (1928).—If a soln. of Zn salt is treated with alkali thiocyanate and pyridine, the Zn is pptd. completely as $[\text{ZnPy}]_2(\text{SCN})$. The ppt. is finely cryst. when produced in the cold and after washing successively with dil. alc. contg. pyridine and KCNS, a soln. of pyridine in abs. alc., and finally with ether contg. a little pyridine, the ppt. can be dried in a vacuum at room temp. and weighed (cf. *C. A.* **17**, 3464; **18**, 1250). The ppt. contains 18.25% of Zn. Excellent results were obtained with 0.16-0.89 g. of Zn vitriol. W. T. H.

Iodometric determination of glucose. P. F. NICHOLS. *Ind. Eng. Chem.* **20**, 553 (1928); A. M. ALVARADO AND ALEXIS VOORHIES. *Ibid.*—As comment upon the paper of Voorhies and Alvarado (*C. A.* **21**, 2635) 8 references are given to similar studies. To this A. and V. reply that they made no claim to priority with respect to the direct oxidation of glucose in alk. soln. W. T. H.

Unification of bromination methods of analysis as applied to phenols and aromatic amines. A. R. DAY AND W. T. TAGGART. *Ind. Eng. Chem.* **20**, 545-7 (1928).—By treatment with KBrO_3 and KBr in the presence of HCl, a part of the nuclear H in phenols and aromatic amines is replaced by Br. Then by adding KI the excess reagent can be titrated with $\text{Na}_2\text{S}_2\text{O}_3$. In this way excellent results were obtained in the analysis of some 25 aromatic amines and phenols. W. T. H.

Smooth platinum wire for electrometric titrations in neutralization reactions. STEPHEN POPOFF AND M. J. MCHENRY. *Ind. Eng. Chem.* **20**, 534-8 (1928).—The detn. of total acidity or basicity in the presence of oxidizing agents, certain metal ions, phenol, cresol and varnish can be solved easily by using a smooth Pt electrode instead of the usual H_2 electrode. In this case the smooth Pt wire is essentially an O_2 electrode. Sufficient breaks at the end point can be obtained to permit the titration of acid or base in the presence of MnO_4^- to within 1×10^{-4} milli-equivalent. The method applied to the analysis of alkaloids gives greater precision than has been obtained hitherto. W. T. H.

The spectrophotometric evaluation of mixtures of methylene blue and trimethylthionine. W. C. HOLMES. *Stain Tech.* **3**, 45-8 (1928).—Spectrophotometric analysis affords the most convenient means for detg. the proportion of methylene blue and trimethylthionine (azure B) present in a mixt. of these 2 dyes. The proposed method depends upon the detn. of an absorption ratio. A suitable ratio for the purpose is that of the extinction coeff. at $64\text{m}\mu$ to that at $670\text{m}\mu$. On account of the differences in the absorption max. of the 2 dyes, this ratio increases as the % of methylene blue decreases. The ratio value for 11 different mixts. is given together with a graph by

means of which the proportions of the 2 dyes present in any mixt. can be calcd. from the absorption ratio detd.

8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

Potarite, a new mineral discovered by the late Sir John Harrison in British Guiana. L. J. SPENCER. *Mineralog. Mag.* 21, 397-406 (1928).—This white mineral, PdHg, previously erroneously described as "allopalladium," has sp. gr. 15-16.1, hardness $3\frac{1}{2}$, and is sol. in HNO_3 to a brown soln. It shows cryst. crusts with angles that suggest cubic crystn., and occurs as small nuggets in the diamond washings in the Kangaruma district on the Potaro River.

W. F. HUNT

Carrollite (synchodymite). W. F. DE JONG AND A. HOOG. *Z. Krist.* 66, 168-71 (1927).—Synchodymite and carrollite should be considered identical unless the former term be reserved for the Ni-bearing variety of the latter. An analysis of synchodymite from Katanga is given. It has the spinel structure, like linnæite and polydymite, with $a = 9.458$ A. U. and u about $\frac{1}{8}$. The distance Cu to S is 2.05 and Co to S 2.36 A. U.

L. S. RAMSDELL

A study of bauxite. T. V. M. RAO. *Mineralog. Mag.* 21, 407-30 (1928).—From an intensive study of bauxite, including expts. extending over a period of 6-9 months in which alkali carbonates, H_2SO_4 , "humic acid," and H_2CO_3 were permitted to act upon granulated basalt and dolerite at various temps. and pressures, it is concluded that bauxite ($\text{Al}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$) is an independent mineral species and the chief constituent of laterite. The gibbsite present is secondary and is formed by the hydration of bauxite. Lateritization results from the action of alkali carbonates on the Al silicates forming hydrated Al carbonate, which breaks down into hydrated Al oxide which is deposited as bauxite. This with the undecompd. minerals of the rock comprises laterite.

L. S. R.

The symmetry of orthoclase. TOM BARTH. *Norsk. Geol. Tids.* 9, 398-400 (1927).—As shown by A. Hadding (*Lunds Universitets Årsskrift* II, 1921, No. 6), the ordinary cross-hatched microcline gives Laue diagrams completely similar to those of orthoclase. However, when using a simple microcline consisting of a single crystal individual and thus without the common cross-hatching on (001) a somewhat different Laue diagram is obtained. B. presents and discusses such a diagram and concludes: Since all the spacings of microcline, as accurately as they can be detd. on an ordinary Laue photograph, are equal to the corresponding spacings of orthoclase, these 2 minerals cannot be different modifications of K feldspar. As the orthoclase gives a Laue photograph identical with that of a cross-hatched microcline the former must consist of submicroscopically twinned lamellas of the latter.

C. A. ROBAX

The crystal structure of zircon, and criteria for the special position in tetragonal space groups. R. W. G. WYCKOFF AND S. B. HENDRICKS. *Z. Krist.* 66, 73-102 (1927).— ZrSiO_4 is tetragonal and has the symmetry of space group 4 Di-19 (D_{4h}^{19}). There are 4 mols. in the unit cell which has $a = 6.60$ and $c = 5.88$ A. U. Zr atoms are in special positions (b) Si atoms in (a) and O atoms in (h) with u about 0.20 and v about 0.34. Distinguishing criteria for all the special positions in tetragonal space groups are tabulated.

L. S. RAMSDELL

The structure of monticellite (MgCaSiO_4). G. B. BROWN AND J. WEST. *Z. Krist.* 66, 154-61 (1927).—Monticellite is orthorhombic, with 4 mols. in the unit cell where $a = 4.815$, $b = 11.08$ and $c = 6.37$ A. U. The space group is V_h^{16} , and the structure is isomorphous with that of olivine (cf. C. A. 20, 3668; 21, 1907). The O atoms ap-

prox. a close-packed hexagonal arrangement, with the remaining atoms in the interstices. L. S. RAMSDELL

• **The space group of staurolite.** C. GOTTFRIED. *Z. Krist.* **66**, 103-7(1927).— $\text{HFe}_2\text{Al}_3(\text{SiO}_4)_3$ is orthorhombic and belongs to space group V_{11}^h . There are 2 mols. in the unit cell, which has $a = 7.84$, $b = 16.52$ and $c = 5.61$ A. U. L. S. R.

The occurrence of tourmaline in Norwegian pyrite deposits. C. W. CARSTENS. *Norsk. Geol. Tids.* **9**, 331-6(1927).—A review. C. A. ROBAX

The first occurrence of pisanite in Hungary. GABRIEL VAVRINECZ. *Z. Krist.* **66**, 167-8(1927).—A description, with analyses, of 3 crystals of pisanite, $(\text{Fe}, \text{Cu})\text{SO}_4 \cdot 7\text{H}_2\text{O}$, is given. L. S. RAMSDELL

The constituents and genesis of a few minerals produced from hot springs and their vicinities in Japan. I. The Akita hokutolite. ICHIZO SUGANUMA. *Bull. Chem. Soc. Japan* **3**, 69-72, 73-6(1928).—A heavy cryst. mineral produced by a sulfurous spring in Akita-Ken (Japan) has been called Akita hokutolite, and compared with Taiwan hokutolite. It consists chiefly of BaSO_4 and PbSO_4 , the proportions of which vary widely. The elements contained only in small amounts are Sr, Ca, Mg, Ba, Al, Fe, Ti, Zr, Th, Ce, La, Pd, Nd, Ra, Rn, Po. In regard to the genesis of the mineral, S. finds that it is deposited only on the rock surface which is covered or washed by the spring water cooled to 40° ; this temp. highly favors the growth of Cyanophyceae; the gelatinous matter contained in this organism causes the coagulation of SiO_2 hydrosol from the acidic soln. containing Al ion just as ordinary gelatin or albumin does. Tables give complete analysis of the white and brown layers of the mineral and of the water of the spring. II. **Composition and genesis of soluble sulfates produced in the environments of a sulfurous spring.** *Ibid.* 73-6.—Natural halotrichite can be reproduced by passing steam with H_2S and CO_2 over finely powdered Hakone andesite. Clay poor in Fe will form alunogen, while clay rich in Fe produces halotrichite. Melanterite is formed only on clays or rocks very rich in Fe; usually it is contaminated with halotrichite. A. I. HENNE

Present condition of knowledge of the composition of meteorites. G. P. MERRILL. *Proc. Am. Phil. Soc.* **65**, 119-30(1926), *Science Abstracts* **30A**, 261.—The results of many analyses have shown that meteorites come from a basic group of rocks, mainly peridotites, with an elemental compn. essentially the same as allied terrestrial rocks but with a deficiency of O. The presence of some doubtful elements was confirmed, but others were not found, while a few were found in traces for the first time. The percentages of various gases in stony and iron meteorites are given, while other tables show the geographical distribution in North America, and the annual falls, geographical distribution, and no. of siderites, siderolites and aerolites over the world. No signs of animal or vegetable life have been found in meteorites, and all are of volcanic material, while their absence from all but the most recent geological deposits indicates that if any fell earlier they were of a different type, or have decomposed and become unrecognizable. H. G.

Phosphate minerals in the province of Lecce. G. TARULLI AND A. MARCUCCI. *Ann. chim. applicata* **18**, 40-6(1928).—Examn. and analyses of minerals, in conjunction with a crit. review of earlier work, show that the subsoil of the Tallone is filled with phosphates to a considerable depth, but with a rather low P content. Phosphate sands at a low depth are most promising as a source of superphosphate. C. C. D.

Celestites of the Archangel province. M. B. FIDEMSKII. *Bull. acad. sci. union rep. soviet social.* **1927**, 185-94.—Celestite deposits unusually rich in Sr were discovered in the regions of the rivers Pinega and Kuloi, where they are disposed in nests. The quantity of the mineral is roughly estimated at about 500,000 tons. Compn.: SrSO_4 97.49-98.82%, BaSO_4 0.64-0.97%, CaSO_4 0.66-0.78%, loss on ignition 0.24%. B. N.

The properties of magnesites. HANS HIRSCH. *Arch. Eisenhüttenwesen* **1**, 439-44 (1927); *Stahl u. Eisen* **48**, 371-2(1928).—A classification of the different brands of magnesite, based on their phys. and chem. examn. J. A. SZILARD

Norwegian feldspars. OLAF ANDERSEN. *Norges Geol. Unders.* No. **128**, 142 pp. (1926).—A description of the properties, geological mode of occurrence, exploitation and uses of feldspar with special reference to the Norwegian industry. C. A. ROBAX

Lignin and oxycellulose theory (of the origin of coal). III. J. MARCUSSEN. *Z. angew. Chem.* **40**, 1233-4(1927).—Further expts. (C. A. **21**, 1784) are given which indicate the role of lignin and oxycellulose in the formation of coals. The action of a large mass of wood-destroying fungus enclosed in a flask, air excluded, produced a dark brown acidic fluid; a portion of it gave the naphthoresorcin reaction for a water-sol. carbonyl acid. On adding $\text{Pb}(\text{AcO})_2$ to an AcOH soln. of the fluid the larger portion of the

dark material was pptd. in a manner similar to the pptn. of glucuronic acid. Both acids are produced from cellulose through the life processes of the fungus, building up from unchanged cellulose by coupling with oxycellulose. That cellulose has played a like role in the formation of coals is shown by studies on lignites. Data from expts. with 3 lignites are tabulated as follows: source, color, apparent structure; and % of: bitumen, free humic acids, humic acid anhydride, humic-ketones, cellulose, lignin, water-sol. carbonyl acids, volatile fatty acids (acetic), water and ash. Lignites Nos. 1 and 2, brown, hard, firm, woody masses, had lignin contents of 28 and 30%, resp., about the same as that of the original conifers; also their contents of humic acids, anhydrides and ketones (22 and 41%) could not have come from lignin, but must have been formed from cellulose. The sum of the humic materials, cellulose and water-sol. carbonyl acids in lignite No. 1 was 55%, of No. 2, was 54%, which is only 10% less than the amt. of cellulose in fresh wood. Lignite No. 3, dull, light brown, was alkali sol. and contained 15.3% cellulose, all but 1.9% of it dissolved in cold 1% soda soln., so it is present essentially as oxycellulose. Apparently with few exceptions the brown coals are lignitic and the study of lignites should help to clear the question as to the chem. processes in coal formation. As further evidence that the greater part of the humic acids and coals are formed from carbohydrates 2 expts. are described in which humic acid and grape sugar were separately oxidized by 30% H_2O_2 in the presence of Fe sulfate soln. A "caramel acid" resulted in each case; it was sepd. as the Pb salt on adding $\text{Pb}(\text{AcO})_2$. The pptd. brown mass was extd. with alc. and the ext. treated with H_2S which liberated the free "caramel acid." The formation of "caramel acid" from humic acid and from grape sugar is held to throw new light on the humic acids obtained from coals. The expts. of Bray and Andrews (*C. A.* 18, 901) on chem. changes in wood during decay are discussed and the use of 72% sulfurous acid in detg. lignin is criticized.

W. W. HODGE

The granite of precarpathian southwest Poland and its relation to adjacent granites. STEFAN KREUTZ. *Bull. intern. acad. Polonoise* 1927A, 395-446.—Descriptions of a number of cryst. precarpathian rocks from southwest Poland are given. The very old intrusives are rich in alkali but a genuine lime-granite was also found. The former constitute a connected series of gneiss, granite and granite-porphry to true porphyry, and show characteristics of Caledonian rocks. A special structure often met with among these rocks has been designated "granite-pegmatite-porphyritic." Characteristic albitization processes were studied and myrmekite formation has been linked with them. The relation of precarpathian granite to continuous massifs is discussed and the successive and distinct periods of occurrence of intrusion and eruption are studied, and a double cyclical change of magma has been established. S. L. B. ETHERTON

Sagvandite, a magnesite-bearing igneous rock. TOM BARTH. *Norsk. Geol. Tids.* 9, 271-303(1927).—An occurrence of a rare igneous rock, called sagvandite, in northern Norway is described. Its chief constituents are the minerals bronzite (about 90%) and magnesite (about 10%). The bronzite contains 86.2 MgSiO_3 , 11.8 FeSiO_3 and 2% Al_2O_3 (AlAlO_3), while the magnesite approx. corresponds to 9 MgCO_3 , FeCO_3 . A noticeable amount of Pt was found in this rock, namely 0.73 g. per ton, and as much as 1.22 g. per ton in the chlorite-bearing rocks of the contact zone. C. A. ROBAX

Studies of the petrology of Kittilä-Lappmark. VICTOR HACKMAN. *Bull. Comm. Geol. Finlande* No. 79, 105 pp.(1927).—H. has studied the eruptive and sedimentation formations of the central district of Kittilä-Lappmark (Finland); 43 references are given. A. L. HENNE

The alkaline rocks of the Merapi Volcano, Java, and their genesis. H. A. BROUWER. *Verslag Akad. Wetenschappen Amsterdam* 37, 130-6(1928).—Descriptive. A. L. HENNE

The biotite-bearing greenstones and a rhyolitic pumice in the metamorphic aureole of the Falmouth granite. P. K. GHOSH. *Mineralog. Mag.* 21, 436-9(1928).—The biotite in the greenstone is not considered the result of contact metamorphism by the granite but due rather to the assimilation of slate by the basic magma. Rhyolitic pumice is recorded for the first time from this region. Some cordierite showing sector twinning, porphyritic feldspar, quartz, brown hornblende and pyrite were observed in the glass. The gas holes are empty in most cases but a little chalcedony and tridymite (?) were found in some. W. F. HUNT

Diabases and melanocratic rock veins of Sardinia. U. PANICHI. *Atti acad. Lincei* [6], 7, 71-5(1928).—Various rock formations are described, with a bibliography. C. C. DAVIS

Contribution to the study of the geochemical laws of distribution of elements on the basis of metallurgical experience concerning the chemical equilibrium in the three-

phase system: metal-sulfide-silicate. H. SKAPPEL. *Norsk. Geol. Tids.* 9, 239-57 (1927).—V. M. Goldschmidt (*C. A.* 17, 3664; 20, 3415) does not satisfactorily explain why in the interior of the earth there is a sharp limit, definitely proved by seismic expts., between the metal kernel and the sulfidic zone, when from metallurgy it is known that Fe and FeS at high temp. are perfectly sol. in each other and have no tendency to sep. in 2 phases. From his own metallurgical experiences S. explains the sharp limit between the metal and the sulfide phase by the presence in the latter of considerable amts. of "non-metallic" sulfides, particularly those of the alkali metals, but also some CaS, BaS, MgS, etc. If it may be presumed that the silicate phase of the earth has a compn. about equal to that of the crust as stated by G. (*loc. cit.*) namely: SiO_2 59.09, Al_2O_3 15.35, $(\text{Fe}_2\text{O}_3 + \text{FeO})$ 6.88, CaO 5.08, MgO 3.49, Na_2O 3.84, K_2O 3.13, H_2O 1.14, TiO_2 1.05 and P_2O_5 0.3%, then the sulfide phase will contain at least 4% of $(\text{Na}_2\text{S} + \text{K}_2\text{S})$ and most probably between 5 and 12%. Metallurgical expts. have shown that the chalkophile tendencies of Na and K in the 3-phase system lie very near that of Fe, and in a 3-phase system where the content of O is so limited as to correspond to a Fe content of only 6.88% $(\text{Fe}_2\text{O}_3 + \text{FeO})$ in the silicate phase, a degree of reduction has been reached where not only Na and K but also Ca and Mg begin to show considerable chalkophile tendencies. This statement stands in opposition to G. (*loc. cit.*) who classifies the alkali metals as distinctly lithophile elements. Direct expts. have shown that this is not correct. In the 2-phase system silicate-FeS, S. has numerous times observed that a slag contg. much FeO is able to stay in contact with a mat contg. considerable amts. of Na_2S , for instance (1) a slag contg. SiO_2 55.68, FeO 13.5, Al_2O_3 15.1, CaO 5.7, Na_2O 8.5% stood in chem. equil. with a mat contg. about 2.5% Na_2S ; (2) a slag contg. SiO_2 43.1, FeO 24.4, Na_2O 3.9% in contact with a mat contg. 3.97% Na_2S , and (3) a slag contg. SiO_2 60.43, Al_2O_3 14.9, CaO 16.3, FeO 6.84 and Na_2O 3.74% stood in contact with a sulfide phase contg. about 2% Na_2S . In all these cases the sulfide phase consisted chiefly of Fe sulfide satd. with S at a temp. of 1100-1200°. The conditions change much by varying the ratio between metal and S in the sulfide phase, the chalkophile tendency of Na decreasing with increasing S content. In the 3-phase system the S content is low owing to the contact with metal; thus in the case of FeS and Fe the sulfide phase has a little lower content of S than corresponding to FeS. Skappel has worked out a process aiming to reduce the amt. of O and S in a 3-phase system silicate-sulfide-metal and while experimenting with this process has had opportunity to observe different chem. equil. resulting. The process consists in using the silicate phase as electrolyte with the metal and sulfide phases connected as cathode while as anode is used a C electrode dipping into the silicate phase through the roof of the furnace. The chem. reactions taking place during electrolysis may be expressed by the equation: $\text{FeS} + \text{MO} + \text{C} = \text{Fe} + \text{MS} + \text{CO}$. In one expt. carried out with a current of 1000-1500 amp. for 19 hr. at a temp. of 16-1800° the resulting phases had the following compn.: silicates, SiO_2 26.7, Al_2O_3 14.4, MgO 24.7, MgS 7.4, CaO 5.3, CaS 8.0, FeO 4.0, FeS 2.5, Na_2O 1.1 and Na_2S 3.0%. Sulfides, FeS 75.16, metallic Fe 3-4, Cu_2S 3.38, Na_2S 8.0, CaS 4.77 and MgS 4.56%. Metal phase, Si 1.24, C 0.38, Cu 0.2, S 0.3, Fe rest. From this it may be deduced that with increasing degree of reduction of the silicate phase, the chalkophile tendency of all the components increases and so does the lithophile tendency of the S. Under certain conditions this may go so far that the 2 phases swallow up each other, forming only one phase. S. is of the opinion that the influence of electrolytic currents has played and still plays an important part in the magmatic differentiation of the silicates, especially as a means of splitting up a magma into a basic and an acid part. C. A. ROBAK

9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, R. H. ABORN

Fundamentals in the flotation of sulfidized and oxidized ores. F. A. BIRD. *Eng. Mining J.* 125, 652-4(1928).—Higher recoveries and higher-grade concentrates are invariably obtained by pebble-mill pulverizing than by ball-mill pulverizing. Also the formation of deleterious Fe compds. cannot occur and the amt. of sulfidizing and promoting agents required is less. A bibliography is given. J. W. BOECK

Notes on flotation practice in Canada. B. W. HOLMAN. *Mining Mag.* 38, 21-7, 82-7(1928).—Lab. and government testing is discussed, and practice at the Sullivan mill (with flow-sheet), Blue Bell mine, Allenby mill, and the Britannia mill (with flow-sheet). At the Sullivan over 1,000,000 tons were treated in pilot plants before the mill was built. Outstanding features of Canadian practice are use of but few reagents and in small quantities, due to care and skill in control. A. BUTTS

Cementation practice in Spain. J. H. FENNEL. *Mining Mag.* 37, 207-14, 275-84(1927).—Operation is divided into (1) formation of heaps, (2) leaching and (3) pptn. of Cu from leach liquors. (1) includes laying of ore, ventilation, and prepn. for distribution of water. In (3) the liquors are passed through a "filter" to reduce the Fe^{+++} salts, then passed over scrap Fe. Heaps are of 10,000 to several hundred thousand tons, usually 100,000 to 150,000 tons. When possible the liquors are cascaded from one heap onto another at a lower level. Depth of heaps is 3.5 to 20 m.; there is little channeling even in the deepest. The ore is crushed to 1.5-3 in. size. Ventilation of the heap sets the rate of oxidation and therefore the speed of extn. Ventilation is of 2 kinds, natural and controlled. As soon as the heap is completed it is covered with $\frac{1}{2}$ to 1 m. of fines to prevent natural ventilation, so that the temp. rise in the heap may be limited. Controlled ventilation is provided by a network of flues and cross-flues on the ground, made of coarse stone, with chimneys at the intersections reaching to the surface of the heap. FeS_2 is oxidized to $Fe_2(SO_4)_3$, which in turn oxidizes Cu_2S and $CuFeS_2$ to $CuSO_4$. The only danger of too much ventilation is that of fire by spontaneous combustion. Leaching is done with either fresh H_2O or Fe^{+++} liquors. The latter are either from another heap or from a storage dam above the heap supplied with the liquors from which the Cu has been pptd. The latter, however, are used only when the H_2O supply is short, as at the end of a dry season. The leach water is applied by (1) irrigation or (2) spraying. (1) is done by means of ditches in the fines on the top of the heap; a long ditch at the back feeds into squares constructed over the entire surface. Leaching is intermittent, being applied to the heap in sections and moved from day to day. Oxidation is by water and air aided by the rise in temp. After several days the oxidized part is ready for the rush of fresh water which carries out the $CuSO_4$ and leaves the heap ready for further oxidation. Heaps are leached 4 years or more. The temp. is 40° to 80° and the amt. of water 3 to 15 l. per ton of ore per 24 hr. The necessary reduction of Fe^{+++} before pptn. is done with FeS_2 , sometimes with SO_2 , which at first was not successful. The pptn. is carried out in long narrow canals. The extn. is from 1.4% Cu in the raw ore to 0.25% in the residue. The ppt. carries 84-92% Cu. A. BUTTS

Absorption of atmospheric moisture by molten metals. P. KOSOVSKII. *Messageur russe ind. métaux* 1927, 50-1, *Rev. métal.* 25, (Extraits), 45(1928).—In the case of low-m. metals (Sn, etc.), relatively large amts. of H_2O may sometimes be found in the cavities formed by shrinking on cooling. As much as 10 cc. H_2O has been found at the Huta-Bankowa plant in a conical ingot 100 mm. high by 100-25 mm. in diameter. The phenomenon is much more serious with high-m. metals such as Fe and its alloys or Cu, in which case there is dissociation of the absorbed H_2O by the molten metal with production of H. Such metals are liable to develop cracks on rolling. K. considers that the casting of Fe or Cu should be carried out in as dry an atm. as possible. A. PAPINEAU-COUTURE

Reduction and oxidation of metals. A. A. BAIKOFF. *Métallurgiste* (Russian) No. 3, 1926; *Rev. métal.* 25 (Extraits), 47-54(1928).—A general discussion and review, dealing particularly with reduction of Fe oxides by H and by CO and with the oxidation of Fe. A. PAPINEAU-COUTURE

Metallurgical considerations of brass melting. FR. DOERINCKEL. *Metallbörse* 15, 57-8, 165-6, 278-9, 390-1 (1925); *J. Inst. Metals* 36, 636-7.—The importance of the homogeneity on the rational working of brass is discussed, and the influence of the reactions between the molten metal and the combustion products, such as CO_2 , CO , SO_2 , H , N and O , on the mech. and chem. properties of the brass described. The relation of melting and casting temps. to properties, difficulties of measurement of molten brass, and various furnace constructions for melting of brass and their relation to the homogeneity of metal are discussed. H. G.

Sand control methods and their developments in a light casting foundry. W. G. REICHERT. *Trans. Am. Foundrymen's Assoc.* 1928, (preprint) 213-34.—R. covers the practical application of the standard methods of sand testing to the control of molding sand in a light casting foundry of the mech. handling type, also developments directly associated with these tests. The following tests were applied for control and investigation of the sand: (1) tensile strength on green sand, (2) dry strength, (3) permeability, (4) moisture, (5) grade, (6) durability, (7) relative fusion point and (8) microscopic examin. Proper sand testing decreases foundry losses, produces a better surface quality, and effects an economy in the use of sand. Investigation of the milling action of molding sands in a mech. system shows the following advantages: (1) a uniform distribution of green sand and moisture, (2) good distribution of clay over the sand grains, (3) increase in tensile strength of the sand and (4) a breakdown of clusters or balled sand particles arising from mech. handling. Balling may be counteracted by the addn. of a fine sand, a lower clay sand content, milling, improved handling conditions or a combination of these. Balling action, moisture control and conservation and reclama- tion are briefly discussed and numerous tables and curves are shown. W. H. B.

Testing molding sands for durability. M. A. BLAKEY. *Trans. Am. Foundrymen's Assoc.* 1928, (preprint) 213-34.—In addn. to the standard A. F. A. bond strength and permeability tests, a simple mold, lab. made, is taken to the foundry, and several pourings are made of regular iron from a hot hand ladle. Before each cast the bond strength and permeability are detd. The pattern, stripper plate, flask on bottom board, rammer mold ready for shaking out, and a casting made in the test mold are illustrated, and the procedure is described. These durability tests furnish other information. Some sands burn on and some peel nicely, some give a smooth finish and some a rough one, etc. Results on natural sands from Wisconsin, Indiana, Illinois and Ohio and on commercial clay bonds are charted. W. H. BOYNTON

Mills-Crowe cyanide-recovery process in Honduras. P. T. BRUHL. *Eng. Mining J.* 125, 658-9 (1928).—The difficulties encountered in the process and their solution are given. Some of the advantages and disadvantages of the process are outlined.

J. W. BOECK

Speiss and the metals of the platinum group. H. RUSDEN AND J. HENDERSON. *J. Chem. Met. Mining Soc. S. Africa* 28, 181-98 (1928).—Speiss is produced in pan furnace and Pb blast furnace when As is present in the charges. It possesses a remarkable affinity for the Pt metals. Inconsistencies in the results of speiss analyses by different analysts led to the evolution of a method of obtaining total Pt metals in speiss. The speiss is ground to —90 mesh, and $\frac{1}{4}$ A. T. mixed with 70 g. litharge, 30 g. Na_2CO_3 , 15 g. borax, and 15 g. silica. The mixt. is fused, poured and the slag returned to the pot and washed twice with a mixt. of litharge 45%, silica 5%, Na_2CO_3 31%, borax 15% and meal meal 4%. The resulting button weighs about 26 g. and is assayed as usual. Two methods are suggested for large-scale extn. of precious metals from speiss: (1) soln. in acids to obtain the precious metals in the residue, and (2) fusion with litharge and fluxes for the production of Pb bullion. The bullion can be greatly reduced by scorification without loss of precious metals. The advantages and disadvantages of the fusion method are summarized. Decomposition of speiss by electrolysis showed recoveries as follows: Pt metals 95.7% and Au 94.6% in the anode sludge; As evenly divided between all products; Fe 80% in soln.; Cu 47.6% remained in anode sludge; Ni 75% passed into soln., Pb in the anode sludge as sulfate; and S in the sludge. The electrolyte contained 5% by wt. of 90% H_2SO_4 (commercial), and the anode sludge was 25.5% of the wt. of the speiss decomposed. Three methods of treating the anode sludge were tried: (1) treatment with acids, (2) fusion for the production of an enriched speiss to be further treated by electrolysis for the production of a very rich anode sludge; and (3) fusion for the production of a Pb bullion to collect the precious metals. It has not been established whether the Pt metals are mixed in the speiss or are in some form of combination. No reliable method of speiss assay is yet available. Tabulated data and a brief discussion of the paper are included.

The cleaning of blast-furnace gas. I. A. J. BOYNTON. *Blast Furnace Steel Plant* 16, 482-6, 488 (1928).—Uses to which blast-furnace gas are put are listed and the benefits derived from cooling to 32° and from fine cleaning are pointed out. The conditions of gas cleaning necessary or desirable are: (1) cooling to 94° for the condensation of slag and metal vapors; (2) further cooling to the lowest practicable temp. for water-vapor removal; (3) classification of dust to permit economic recovery of values; and (4) the reduction of the amount of dust necessary to handle as wet sludge. German blast-furnace plants conduct a secondary washing of the entire blast-furnace gas production. This permits refinement and control of every operation in which the gas is used. The mech. conditions within the system, such as size of orifice, cond. of refractory surfaces, frictional resistance and direction and intensity of gas currents, are const. and the conditions of operation are capable of continuous study and gradual improvement. Estd. savings to the German steel industry, produced largely by improved use of blast-furnace and coke-oven gas, are 200,000,000 gold marks. In every case, secondary washing is employed. W. H. BOYNTON

Review of iron and steel literature for 1927. E. H. McCLELLAND. *Blast Furnace Steel Plant* 16, 20-3, 33 (1928).—A classified list of the more important books, serials and trade publications during the year; with a few of earlier date, not previously announced. E. J. C.

Changes in structure and electrical resistance by cold working metals. G. TAMMANN and M. STRAUMANIS. *Z. anorg. allgem. Chem.* 169, 365-80 (1928).—The mechanism of the changes in the orientation of crystallites in the rolling and drawing of Cu is discussed. Cold-drawn Cu and Ag wires were heated at various temps. up to 800°, and elec. resistance and orientation were detd. In the Cu wires the decrease in resistance is a max. between 350° and 450° (about 2.5%), while in the Ag wires the max. decrease occurs between 200° and 250° (about 7.5%). With the Cu wire, practically no change in crystallite orientation takes place below 250°, although a considerable change in resistance has occurred at this point. After heating at 350°, about 38% of the crystallites have changed in orientation, at 400° about 48% and at 500° about 58%. Such properties as tensile strength and elongation change at about the same rate as crystal orientation. The elec. resistance of a cold-drawn Al wire (99.5%) changes in about the same manner as Cu and Ag, decreasing about 10% at 350° and then rising again, but with quite pure Al no change in resistance occurs on heating, because of the absence of intercryst. material. With W, the change in resistance on cold drawing is greater than with other metals, an increase in sp. resistance of 1.6 times being observed. H. STORITZ

The photomicrography of metals. H. WRIGHTON. *J. Roy. Microscop. Soc.* [3], 47, 107-15 (1927).—The general principles of critical illumination for max. resolving power are discussed. Analogies are drawn between transmitted illumination and reflected illumination as applied to metallography. A simple illuminating app. and photomicrographic camera are described. C. W. MASON

Unusual features on the microstructure of ferrite. H. S. RAWDON and TORKEL BERGLUND. *Bur. Standards, Sci. Paper* No. 571, 649-717 (1928).—The unusual features which are revealed by etching are of 3 types and are named, resp., α veining, γ network and δ network. These features exist throughout the body of the metal and appear to be associated in their origin with the 3 allotropic forms of Fe. The γ and δ networks can usually be associated with tiny inclusions distributed in such a manner as to record the grain structure which existed in the high-temp. allotropic conditions. In the α (ordinary) condition there often appears within the grains a "veining" which gives the metal a pseudo-fine-grained appearance. Ferrite stressed or forged at a temp. close to the α - γ transformation shows veining exceptionally well. Additions of Al or Mn to Fe had no pronounced effect on α veining, whereas ferrite contg. Si in amount sufficient to suppress the transformation showed no veining. The ordinary mech. properties of Fe are affected little, if any, by α veining. The δ network appears to be associated with the hot-shortness of Fe. The real nature of α veining is still in question. WILLIAM F. EBBERT

The best method of illumination of metallurgical specimens with the vertical illuminator. CONRAD BECK. *J. Roy. Microscop. Soc.* [3], 47, 116-27 (1927); cf. preced-

ing abstr.—Diagrams and discussion emphasizing the theoretical relationships between transmitted and reflected illumination. To obtain max. resolution the light must be centered, focused on the prep., fill the back lens of the objective and illuminate only the field under examn. Stops giving unsymmetrical illumination are recommended for enhancing the appearance of "relief" and contrast in metal specimens.

H. G.

Passivity limits in solid solution series. G. TAMMANN. *Z. anorg. allgem. Chem.* 169, 151-6(1928).—In Fe-Cr alloys, on the assumption that a Cr atom in the surface can render 1 adjacent Fe atom passive to the action of dil. acids, the (101) crystal face should become passive to solvent action with a Cr content of $\frac{2}{8}$ mol., while the (100)- and (111)- faces should first become passive with $\frac{3}{8}$ mol. Cr. Exptl. results show that passivation takes place at lower Cr content than that predicted, occurring at 0.16 to 0.28 mol. Cr. It is concluded that passivity is affected by various factors, such as the nature of the solvent, previous treatment of the alloy, and the nature of the second component. In Ni-Cr alloys, 10% Cr (0.11 mol.) is sufficient to make the alloy passive. In general the passivity limit is independent of time of action, temp., concn. of the chem. agent and particle size.

H. STOERTZ

The transformation of austenite into martensite in liquid air. KURT SCHROETER. *Z. anorg. allgem. Chem.* 169, 157-60(1928).—A Mn steel contg. 1.89% C and 2.22% Mn, on immersion in liquid air together with a small magnet, is seized by the magnet shortly after immersion. Measurements of magnetic satn. gave the following results. A water-hardened specimen gives 1070 gauss before immersion in liquid air and 11380 after immersion, while with an oil-hardened specimen these values are 2410 and 14670 gauss. Similar results are obtained with a 25% Ni steel, and S. concludes that the transformation of austenite into martensite has taken place.

H. STOERTZ

Recent development in cast iron. II. J. G. PEARCE. *Metallurgist* (Suppl. to *Engineer* 145, 13) 38-42(1928); cf. C. A. 22, 1310.—A review of recent patents with illustrations

D. B. DILL

Temperature measurements of molten cast iron. H. T. WENSEL AND W. F. ROESER. *Trans. Am. Foundrymen's Assocn.* 1928 (preprint) 191-212.—Measurements of the true temp. with a thermocouple and the apparent temp. with an optical pyrometer on molten cast Fe show that the character of the surface undergoes a change in the neighborhood of 1375° (true temp.). Observations on streams and ladles all indicate that the uncorrected optical pyrometer reading is approx. 40° lower than the true temp. below 1375° when the bright (presumably oxidized) surface is observed. This corresponds to an emissivity of 0.7 in this region. Above this region the emissivity is approx. 0.4, corresponding to a correction of 110° at 1400° and 140° at 1600° true temp. The change in emissivity is attributed to the formation of Fe oxides below 1375°. Above this temp. the difference between true and apparent temp. corresponds to the emissivity found for pure Fe.

S. G. SIMPSON

Equilibrium in the reduction, oxidation and carburization of iron. V. R. SCHENCK. *Z. anorg. allgem. Chem.* 167, 315-28(1927); cf. C. A. 22, 937.—A summary of the previous papers in this series is given. The three-dimensional equil. model of the system Fe-C-O₂ is discussed, the system being under an atm. of CO and CO₂ and at various temps. from 500° to 1000°. An isobar at 1 atm. shows the concns. of CO and CO₂ and the temps. at which the following will be stable: Fe₃C, Fe₃O₄, wustite, oxoferrite and oxo-austenite. Isotherms at 50° intervals from 542° to 1000° show the range of stability of the above-mentioned substances when under pressures ranging from 0 to 1200 mm. The remarkable influence which impurities have upon the equil. is again stressed. The effect of MgO is given in detail. Problems for future solution are: (1) the systematic investigation of the influence of impurities, and (2) the detn. of the compn. of the solid solns. oxoferrite and oxo-austenite as they exist under various gas pressures and compns.

WILIAM F. EHRET

Intricate spun-sorbite castings. J. E. HURST. *Iron Age* 121, 1007-8(1928).—A centrifugal casting process is described which yields castings having a tensile strength around 60,000 lb. per sq. in. The Si content of the cast Fe can be kept low, a desirable feature where the castings are to be machined. By carefully controlling the cooling of the castings there results a microstructure which is distinctly sorbitic.

W. F. E.

Properties of ferrous metals at elevated temps. A. E. WHITE AND C. L. CLARK. *Univ. Michigan Dept. Eng. Research Reprint Series* 1928, No. 3, 16 pp.—Short-time tensile and expansion tests were run on: (1) plain C-steels of tubular stock contg. 0.13 and 0.38% C, (2) Enduro, an alloy contg. 16.7% Cr and 0.09% C. The tensile

strength and proportional limit of the steels considered decrease steadily with increasing temps. The range covered was from 20 to 800°. The Enduro metal showed superior proportional-limit values over practically the whole temp. range. By a comparison of the proportional-limit values of various steels at corresponding temps. it is brought out that the steels possessing the best properties at elevated temps. are a 20.0% Cr, a 1.55% Mn, a 4.96% Co and a Cr-V. The 20% Cr seems to have advantages above 538° whereas the 1.55% Mn, because of its good qualities and relative cheapness, possesses decided advantages at temps. lower than the above. WILLIAM F. EHRET

Recrystallization of steel used for transformer sheets. M. VON MOOS, P. OBERHOFFER AND W. OERTEL. *Stahl u. Eisen* **48**, 393-403(1928).—The recrystn. of steel with 4% Si and from 0.05 to 0.12% C was investigated and the recrystn. diagram, after cold working, showing the grain size as a function of the annealing temp. and rate of reduction, for annealing periods of 1 and 4 hrs., was developed. The laws governing recrystn. were found to be valid, although the process is shifted into temp. ranges several hundred degrees higher. No crit. ratg. of reduction was observed. In addn. to the old grain boundaries, the gliding planes were found to be the nuclei of recrystn. The form of C in transformer sheets is illustrated by numerous photomicrographs. The recrystn. expts. following warm working showed that in a coarse-grained material, with few gliding planes, the recrystn. is very slow, because of the lack of recrystn. nuclei. By refining the structure of the starting material, complete recrystn. can be obtained in a short time. J. A. SZILARD

The fragility of steel. P. RÉGNAULD. *Rev. métal.* **24**, 509-15(1927).—Some varieties of special steels after hardening develop internal fissures on keeping or during use, greatly reducing resistance to shock with little or no change in tensile strength. From a theoretical discussion of the phenomenon from the standpoint of hidden internal stress and mol. de-cohesion, it is suggested that the mechanism is analogous to that of season-cracking in brass. A. PAPINEAU-COUTURE

Heat-resisting and non-corrodible steels. S. A. MAIN. *J. Inst. of Aeronautical Eng. (British)* **1**, 5-44(1927). *Fuels in Science & Practice* **7**, 4-20(1928).—A popular discussion of the various uses to which some special English steels are adaptable. The steels are referred to by trade names only. D. A. REYNOLDS

Manganese steel. H. P. EVANS AND A. F. BURTT. *Trans. Am. Foundrymen's Asscn.* **1928** (preprint) 129-40.—A brief outline of the historical development, common heat treatments, properties and structure of Mn steel. S. G. SIMPSON

General characteristics of alloy steel castings. J. W. FRANK. *Trans. Am. Foundrymen's Asscn.* **1928** (preprint) 119-28.—An outline of practical modern uses of alloy steel castings together with a brief discussion of some of their outstanding characteristics. S. G. SIMPSON

Hydrogen overvoltage on alloys. M. G. RAEDER AND J. BRUN. *Z. physik. Chem.* **133**, 15-30(1928).—The c. d.-potential curves were detd. during contact with H₂ for the following alloy types. Single-phase system of homogeneous solid soln., Cu-Ni; two-phase systems. (a) simple eutectic, Ag-Pb; (b) eutectic system with incomplete solid soln. formation, Pb-Sb, Bi-Sn; (c) system contg. a compd., Ag-Sb. In a solid soln. system the overvoltage may vary continuously between the limiting values of the components or it may be greater than the normal values of the components. In eutectic systems the overvoltage is not detd. by the component which has the lower overvoltage but varies more or less regularly between the values characteristic of the components. In the Pb-Sb system the overvoltage values appear to confirm the existence of the compd. Pb₃Sb. In the system Sb-Ag the compd. Ag₃Sb has practically the same overvoltage as the component of higher overvoltage, Sb. Overvoltage measurements may be used at times to det. structural relations in alloy systems. E. R. SMITH

Peritectic transformations of ternary alloy systems. HIDEO NISHIMURA. *Suiyō-Kwaishi* [7], **4**, 1139-46(1924).—In Japanese. H. G.

The theory of the Heusler alloys. A. KUSSMANN AND B. SCHARNOW. *Z. Physik* **47**, 770-85(1928).—The magnetic anomalies which appear in Heusler alloys on aging have been explained heretofore by the theory that the elementary magnets undergo a reduction in their freedom of orientation due to the formation of "complexes." This theory has been supported by the behavior of the alloys in the neighborhood of 400°. K. and S. describe expts. which demonstrate the existence of a transformation at 160 to 150°. It is still uncertain whether this is due to a change in the mutual solubilities of the components or whether it represents an allotropic transformation. In either case, however, a different magnetic satn. value, and hence a different Curie point, would correspond to the two phases, above and below 130°. As several hrs. are re-

quired for the completion of this transformation, different values for the satn. intensity of magnetization and for the Curie point can be obtained for the same specimen by varying the heat treatment. W. W. STIFLER

The effect of heat treatment on some mechanical properties of 85:15 copper-tin alloy. R. J. ANDERSON. *Am. Metal Market* (Magazine Section), reprint from August, 1927.—The first of a series of articles on the effect of heat treatment on some mech. properties of sand-cast Cu-rich alloys. Expts. are described and tables given which show: (1) That simple annealing above 400° produces slight changes in tensile properties, *i. e.*, increased strength, elongation, reduction in area, decrease in yield point. Such annealing relieves quenching strains without impairing the tensile properties. (2) That quenching from 600° (the optimum temp.) causes marked improvement in tensile strength, elongation, reduction in area, with slight decrease in yield point, and that such quenching may be applied commercially with good results. ROBERT F. MEHL

The effect of heat treatment on some mechanical properties of 88:10:2 copper-tin-zinc alloy. R. J. ANDERSON. *Am. Metal Market* (Magazine Section), reprint from December, 1927; cf. preceding abstract.—Annealing below 700° followed by air cooling is harmful. Annealing at 750° improves the strength and elongation slightly. Quenching from any temp. within the range 400–700° is harmful. The effect of heat treatment is quite dependent upon the condition of the alloy prior to the treatment. The time for heating and rate of cooling are important in detg. the resultant properties. The article is accompanied by tables, photomicrographs, and curves. ROBERT F. MEHL

The effect of heat treatment on some mechanical properties of 88.7:11:0.3 copper-tin-phosphorus alloy. R. J. ANDERSON. *Am. Metal Market* (Magazine Section), reprint from Nov., 1927, cf. preceding abstract.—Annealing at temps. below 600° has little effect; at 600° the ductility is increased. Max. elongation is obtained by annealing at 650–700°. Annealing to remove casting strains does not materially alter mech. properties. Quenching in water from 600° and above is harmful. Annealing for 30 min. at 700° followed by air cooling gives the best properties. The article is accompanied by tables, photomicrographs and curves. ROBERT F. MEHL

The effect of heat treatment on some mechanical properties of 90:10 copper-tin alloy. R. J. ANDERSON. *Am. Metal Market* (Magazine Section), reprint from Oct., 1927; cf. preceding abstract.—Simple annealing followed by air cooling on the sand-cast alloy has little effect upon yield point and tensile strength until 700° is reached when the strength is considerably improved. Annealing above 600° results in marked improvement in elongation and reduction of area. Annealing below 600° for short periods (to relieve casting strains) does not affect the mech. properties appreciably. Quenching in water from below 550° results in little change in properties. Quenching from above 550° causes increased elongation and reduction in area but the strength is little affected until 700° is reached, the yield pt. is but little affected by quenching in the range 400–700°. Tables, photomicrographs, and curves accompany the article. ROBERT F. MEHL

Miscibility gap in liquid iron-copper alloys. A. MÜLLER. *Z. anorg. allgem. Chem.* 169, 272(1928); cf. *C. A.* 21, 2245, 3591, 3879.—A reply to R. Ruer. H. S.

Mother-of-pearl alloys. W. HANNICH. *Allgem. Glas. Keram. Ind.* 18, 5(1927); *J. Soc. Glass Tech.* 11, 344–5A.—About 90 parts of tin and 10 of Cu can be used in making artificial mother of pearl. The alloy is cooled from 500° down to 220°, thereby being obtained in a plastic condition. It is then mixed with powd. opal glass, the temp. being kept const. The resulting mass can be molded and pressed when cold and ground and polished. Mixts. of Cu, Ag and Mn give brilliant colors which are greatly enhanced by the Sn salt iridizing process by exposing the semi-soft glass in closed chambers to the vapor produced by heating one or other of the following mixts.: (1) SnCl₂ 90, BaCl₂ 5, Ba(NO₃)₂ 2, (2) SnCl₂ 20, BaCO₃ 10, Cu(NO₃)₂ 10, SrCO₃ 5; (3) SnCl₂ 90, Sn(NO₃)₂ 5, BaCl₂ 5; (4) SnCl₂ 100, Sn(NO₃)₂ 3, BaCl₂ 8. Another way of producing mother of pearl is to take suitable blast-furnace slag rich in iron oxide, coat with crystal or colored glass, etch with acid lightly, and expose to the atm.; an iridescent surface develops. H. G.

Hardness, microstructure and electrical conductivity of platinum-silver alloys. N. S. KURNAKOV and V. A. NEMILOV. *Z. anorg. allgem. Chem.* 168, 339–48(1928).—See *C. A.* 21, 2654. H. STORRTZ

Transformation in β -brass and the demagnetization of ferromagnetic metals. C. H. JOHANSSON. *Ann. Physik* 84, 976–1008(1927).—The transformation in β -brass, which proceeds continuously over an extended temp. interval, is caused by heat vibrations about an axis of inertia perpendicular to the axis of symmetry of the Zn atom. Similar transformations involved in the demagnetization of ferromagnetic

elements can likewise be ascribed to heat vibrations about an axis of inertia perpendicular to the magnetic axis of the atom. The magnetic moment of an atom or mol. is independent of heat motion, but changes of phase or chem. reactions in which alteration of the electron configuration is involved can alter the atomic moment discontinuously. Solid solns. of a weakly magnetizable metal and small quantities of a ferromagnetic metal give a weakly magnetizable alloy, even if the moments of the ferromagnetic atoms are unchanged. This is to be expected from *Larmor's theorem*. The ferromagnetic atoms are so widely sepd. that an external field has no directional effect upon the individual atoms.

H. STÖRZT

Aluminum bronze. II. ANON. *Metallurgist* (Suppl. to *Engineer* 145, No. 13) 42-3(1928).—Self-annealing in large castings can be reduced by addition of Fe up to 4%. Zn also reduces self-annealing but adversely affects physical properties. Mn raises tensile strength without reducing ductility and increases resistance to sea water corrosion. However, sound castings are difficult to obtain when more than 1% Mn is present. Pouring temp. should be near incipient solidification temp. The addition of 1-2% Pb improved machinability without leading to segregation. Difficulties in casting are discussed.

D. B. DILL

A study of the tin bronzes. M. HANSEN. *Z. anorg. allgem. Chem.* 170, 18-24 (1928).—A study of the fringes obtained on quenching Cu-Sn alloys of 15-25% Sn shows: (1) that under the same conditions of quenching the width of the fringes increases as the temp. of quenching decreases and becomes greatest when the temp. is nearest 520°; (2) that at the same quenching temp. the fringes are wider the slower the quenching. These results are interpreted as showing that the fringes are connected with the transformation at 520° and not with that at 587° as has previously been assumed. The fringes are probably due to an intermediate product between the α and β mixed crystals and the ($\alpha + \delta$) eutectoid formed at 520°.

H. F. JOHNSTONE

The effect of small additions of tin and cadmium on the qualities of lead. JEAN COURNOT. *Compt. rend.* 186, 867-9(1928).—Pure lead used as a covering for telephone cables possesses certain unfavorable qualities. C. discusses the effect upon lead for cable covers of small additions of several metals, including lead and tin.

L. B. M.

The Parkerization method for protecting ferrous alloys against corrosion. GOURNOT. *J. usines gaz* 52, 137 8(1928); *Memoires et compte-rendu des travaux de la Societe Ingenieurs Civils de France* 1927, 1071.—The method consists of immersion in a hot soln. of complex phosphates of Fe and Mn. It is superior to other phosphate methods in that the bath is easily replenished and the metal is not discolored. The metal is superficially attacked, liberating H_2 , only until the surface is completely covered. The extreme adherence of the coat is due to a slight initial etching. It is insol. in water and very resistant to normal atm. corrosion and, in general, equal or superior to other methods. It does not alter the physical properties of the metal and is applicable regardless of physicochem. state. If scratched, the rusting does not spread beyond the exposed surface. It is not applicable to non-ferrous metals and electrolytic deposits will not adhere to it. It has been applied extensively in the U. S. for nails, screws, machine parts, etc.

F. S. GRANGER

Practical problems of corrosion. III. Formation of rust and its consequences. U. R. EVANS. *J. Soc. Chem. Ind.* 47, 55-62T(1928); cf. *C. A.* 22, 1318.—The compn. of, and vol. occupied by rust, are discussed. The mechanism of the formation of rust varies for different waters, rust in general not being formed at the seat of corrosion. Hard waters produce rust films contg. Ca and Mg compds. which, being deposited at cathodic portions, decrease corrosion by obstructing the diffusion of O_2 . $MgSO_4$ was found to reduce corrosion of partially immersed specimens. Loose rust films if continuous will protect the underlying metal, otherwise will promote pitting. The formation of voluminous corrosion products may cause disintegration of coatings or the metal itself. IV. **The corrosion of wrought iron in relation to that of steel.** *Ibid* 62-9T.—Wrought iron immersed in dil. H_2SO_4 showed rapid attack on cut edges and on planes parallel to the surface, with the surface only slightly attacked. Protection of the edges decreases the acid attack, while polishing with emery increases the attack. The initial attack of acids on wrought iron is much slower than on steel, but the velocity increases with time until the attack is much more rapid. Loss of wt. is no indication of the depth of pitting. Corrosion by rain water is not usually of the H_2 evolution type; consequently the acid type of attack on wrought iron does not take place in this case. The resistance of wrought iron in atm. corrosion is attributed to the plugging up of pits by corrosion products, this action being more effective on wrought iron because of the form of the pits. Under anodic corrosion produced by stray currents, wrought iron will form shallower and broader pits than steel because of resistant planes

of silicate. For this reason wrought iron possesses an advantage over steel in resisting corrosion by stray-current electrolysis underground, although extra precaution in providing protective coatings might possibly show better economy in the use of steel pipe. It is concluded that in general under favorable conditions steel and wrought iron will have equal life, but that because of its structure wrought iron will have the advantage in deflecting attack of intense localized character. **V. Corrosion and protection at the contacts of dissimilar metals.** *Ibid* 73-7T.—Cu and Ni are usually cathodic to steel, Zn and Cd usually anodic, while Sn, Pb and Al are variable. Contact of steel with Cu in salt solns. accelerates corrosion of the steel, with Ni to a less extent, while Pb causes only slight acceleration. Hardness of water decreases contact effect. Zn affords complete protection to steel in most liquids, although at the expense of the Zn in salt solns.

Ore flotation. G. G. GRISWOLD, JR., and G. E. SHERIDAN. U. S. 1,668,202, May 1. An ore contg. sulfides of Pb, Cu, Zn and Fe is treated with a halogen in such a quantity as will substantially inhibit the flotation of Zn and Fe sulfides and the treated ore is then subjected to a flotation in which Cu and Pb sulfides are in large part removed and recovered from the froth.

Ore flotation. D. GUGGENHEIM, M. GUGGENHEIM, S. GUGGENHEIM, S. R. GUGGENHEIM and E. A. C. SMITH. Brit. 275,561, Aug. 3, 1926. Derivs. of thiocarbonic acid such as dioxanthogen and xanthic anhydride or similar compds. are used as flotation agents, *e. g.*, in soln. in oils such as kerosene, and flotation may be effected in acid or alk. liquid and in the presence of a frothing agent such as pine oil. Brit. 275,562-3 also relates to similar process and to the prepn. of the xantho compds. used.

Ore flotation. C. P. LEWIS. U. S. 1,668,917, May 8. A pulp of oxidized ore is agitated with a xanthate and a sol. silicate to effect froth flotation of Cu values or other constituents.

Reducing calamine or other ores. H. WITTEK. Brit. 274,803, July 26, 1926.

Ore reduction is effected in connection with the manuf. of Ca cyanamide from carbide and N in order to utilize the C and H and other reducing gases.

Agglomerating tin ore. METALLBANK UND METALLURGISCHE GES., AKT.-GES. Brit. 275,618, Aug. 9, 1926. Sn ores are briquetted or agglomerated with Sn oxide and preferably also with lime or an oxide or hydrate of Mg or Al and sufficient water to facilitate pressing the mixt.

Treating ores to facilitate magnetic separation. R. RADEMACHER and E. GOEBEL. Brit. 274,889, July 23, 1926. The material is roasted either at 300–600° or at a temp. above 1100°, or it may be successively roasted at both temp. ranges specified with an intermediate magnetic sepn.

Cupola furnace. O. WEICHEL and W. HOLLINDERBAUMER. U. S. 1,668,133, May 1. A furnace is specified adapted for *melting Fe*.

Furnace for annealing or other heat-treatments of metals in an inert atmosphere. A. SMALLWOOD and J. FALLON. Brit. 274,730, Jan. 22, 1927.

Furnace for heating metal plates. BRITISH FURNACES, LTD., AND E. W. SMITH. Brit. 275,513, March 23, 1927.

Rotary furnace for melting or refining metals. W. BURSS. Brit. 274,451, July 16, 1926.

Rotary furnace for roasting or other operations. A. F. MEYERHOFER. Brit. 275,222, July 27, 1926.

Blast-furnace operation. FREYN ENGINEERING CO. Brit. 275,289, April 7, 1926. To avoid choking of hot-blast stoves fired by washed blast-furnace gases, the gas is preliminarily passed through a heater which serves to remove dust not already removed by the washer. An app. is described.

Operating blast furnaces or similar furnaces. F. KRUPP AKT.-GES. FRIEDRICH-ALFRED-HUTTE Brit. 275,601, Aug. 6, 1926. In connection with utilization of a portion of the waste gases in the furnace, the blast is supplied "at the highest possible temp." and the coke charge used is correspondingly small, and changes in the temp. equil. of the process are compensated for by varying the quantity of waste gas supplied. Coal dust also may be supplied and may serve as an addnl. means of temp. control.

Casting metal containers. E. GALASSINI. Brit. 275,621, Aug. 4, 1926. Engine cylinders, containers for chem. synthesis at high temps, ordnance projectiles, etc., are cast around an integral metal core having a m. p. at least equal to that of the cast metal, in order to provide a nonporous lining or one with other desirable properties.

Apparatus for casting melted metals under pressure. E. BRUMM. U. S. 1,669,323, May 8.

Joining cast iron or other metals. B. RACHIEFF and M. GOFMANN. Brit. 274,481, July 15, 1926. A mixt. of powd. Fe 85 and a preformed mixt. of powd. Al 9 and Ca 6 parts may be formed into a paste with water or grease and placed between surfaces of cast Fe to be united which are then heated to about 700° to effect welding. The Ca and Al with addn. of metal corresponding to the surfaces to be joined may also be used for joining other metals.

Hot top for ingot molds. E. L. MESSLER. U. S. 1,668,567, May 8.

Rotary table apparatus for making gray iron castings or other castings in molds. E. WILL. Brit. 274,522, Jan. 16, 1926.

Cast iron. E. PIWOWARSKY. Brit. 274,457, July 15, 1926. Molten Fe is freed from gases and other non-metallic impurities in the fore hearth of a furnace or a ladle which is rotated at high speed.

Iron low in carbon. F. WÜST. Brit. 275,646, Aug. 6, 1926. Scrap Fe after smelting in a cupola is delivered into a reverberatory furnace in which a sufficiently high temp is maintained to ensure formation of eutectic graphite. Waste heat from the reverberatory furnace is utilized for heating the cupola and gases from the latter heat air supplied to the reverberatory furnace. The app. is described.

Purifying iron scale. A. LUCAS. Brit. 275,099, Feb. 14, 1927. See U. S. 1,631, 423 (C. A. 21, 2538).

Uniting iron and aluminum by cold rolling. O. JAEGER and E. LUETH. U. S. 1,667,787, May 1.

Refining iron and steel. B. ZWIEBEL. Brit. 275,002, June 28, 1926. Fe or steel melts in furnaces or converters are protected from oxidation and absorption of gases by forming a reducing atm. over the surface of the slag above the melt; for this purpose a heavy hydrocarbon in small pieces or atomized state is introduced above the slag towards the end of the process (the particular time of introduction depending on the character of the product which is to be produced). An app. is described.

Drill steel. W. H. WINEMAN. U. S. 1,668,442, May 1. In shanking drill steel, the steel is quenched at one end after heating near this end, the heated portion near the end is upset by striking the quenched end while the heated portion is held in suitable dies and the upset portion is then swaged into the desired form. An app. is described.

Alloys for tools, etc. W. SCHROBSORFF. Brit. 274,866, July 21, 1926. At least 50% of Ta or Nb or both is alloyed with a metal which does not form carbides such as Co, Cu or Ni, or a metal of the Pt group, or with a carbide of Cr, U, Mo or W, or with both a metal and carbide as specified. The products may be cast in C molds.

Magnetic alloys. W. S. SMITH, H. J. GARNETT and J. A. HOLDEN. U. S. 1,667,746, May 1. Alloys which have high elec. resistance comprise Ni together with Fe 10-17, Si 1.5-4, Cr, W, V or Mo 1-4%, and are substantially free from C.

Magnetizable alloy. E. GUMLICH. U. S. 1,668,115, May 1. Fe is alloyed with at least 40% Ni and Mn 2-20% is added, to produce an alloy which is suitable for use with various elec. app. Cf. C. 1. 21, 3596.

Bronze. M. G. CORSON. U. S. 1,667,966, May 1. A bronze which is highly resistant to corrosion comprises Al not more than 9%, Cr in solid soln. over 0.5% and sufficient Ni (suitably about 6% with 2% Cr) to hold the Cr in soln.

Refractory copper alloy. J. G. DONALDSON and H. L. COLES. U. S. 1,668,306, May 1. An alloy which resists high temps. and is suitable for vaults and safes comprises Cu together with Si 0.60-0.75 and less than 1% C. U. S. 1,668,307 specifies forming safe or vault plates or similar articles with a core of alloy contg. Cu 99.385-99.230, C 0.015-0.020 and Si 0.60-0.75% united with an encasing metal of different character such as cast Fe.

Alloy of nickel and zinc. W. M. GROSVENOR and V. P. GERSHON. U. S. 1,668,642, May 8. A substantially uniform and homogeneous alloy contg. Ni about 80 and Zn about 20% may be further alloyed with 3 times its wt. of Au to form an alloy resembling Pt and suitable for making jewelry.

Hollow bars or rods. H. S. POTTER. Brit. 274,978, May 4, 1926. Prior to rolling it into bar form, the bore of a metal billet may be lined with a metal such as Cu, Ni or "rustless" Fe or steel by spraying or by electrodeposition to protect the surface of the bore from damage during working.

Hollow steel bars. T. S. WHEELWRIGHT. U. S. 1,668,705, May 8. A hollow metal core is surrounded by a jacket of metal rods. The hollow core is packed with refractory material and an ingot is cast around the core at a temp. to fuse with the core; the ingot is rolled to desired dimensions, and the refractory core is removed.

Producing pipe or other hollow articles by centrifugal casting and alternating vibrations in different directions. C. HUMPERDINCK. U. S. 1,668,318, May 1. An app. is described.

Coating metal articles with nickel, cobalt or chromium, etc. GENERAL ELECTRIC CO., LTD., and E. WEINTRAUB. Brit. 275,233, July 27, 1926. Metal coatings are welded to the foundation metal, e. g., by heating *in vacuo* or a reducing atm. With Ni-plated Cu, a temp. of 700° is suitable.

Corrosion-resisting linings of hollow drill shanks, etc. L. PRYCE. Brit. 275,560, Aug. 9, 1926. The bore of a drill shank is coated with metals such as pure Fe, Ni or Cr-Fe alloy or with paint or varnish which may be renewed as required.

Annealing box for holding metal sheets, etc. F. H. CLAY. U. S. 1,668,230, May 1. Structural features.

Apparatus for pickling metal sheets. W. J. COOK. U. S. 1,668,355, May 1.

Stitching wire. J. B. GREEN. U. S. 1,667,730, May 1. A flat C steel wire suitable for stitching cardboard or fiber receptacles, etc., contains the carbide in pearlitic form and is 1.75-3 times as wide as thick.

Flux for soldering metals such as iron or brass. J. BLACKFORD. Brit. 274,693, Nov. 16, 1926. Anhyd. ZnCl_2 1 oz., finely ground NH_4Cl 8 oz. and NaF 1.25 oz. are used together.

10—ORGANIC CHEMISTRY

CHAS. A. ROULLIER AND CLARENCE J. WEST

Oxidation of alcohols to aldehydes and condensation of aldehydes and alcohols to mixed esters. I. S. N. DANILOV. *Trans. State Inst. Applied Chem. (Moscow)* 1927, No. 5, 66-88.—Expts. were instituted in order to find the best operating methods of transforming of alcs. into the corresponding aldehydes. The alcs. (chiefly Am and

iso-Bu) were passed at various rates of speed over various catalyzers through tubes (2–3 cm. in diam. and 80–100 cm. long) made of glass or of various metals and placed in an elec. furnace. The catalyzers tried were Cu, brass, Zn, Zn-Fe, Cu-Zn, adsorptive charcoals. With Zn as catalyzer, aldehyde yields of 40–70% were obtained by operating at 580° and maintaining the speed of introducing the alc. at a rate of 50–100 g. per hr.; in this case about 10–15% of alc. was destroyed. By using birch charcoal as catalyzer and operating at 320–30° yields of 56–7% of aldehyde were obtained. The results given by other catalyzers were not so good. To find a convenient industrial method of prepn. of mixed esters from aldehydes D. made a series of expts. designed to improve Tishchenko's method (cf. T., C. A. 9, 1749; 19, 2640; Childs and Adkins, C. A. 18, 1814; 19, 1247) so as to obtain the best yields and no evil-smelling and colored by-products. One expt. (no. 17) was made thus: 0.4 Al turnings was placed in an app. provided with a stirrer, a funnel with a stopcock for dropping in liquids, a thermometer and a tube for introduction of the gases. Dry H was lead into the app. for 5 min., then a stream of HCl, then the latter was displaced by H. After thus activating the Al, 18 cc. AmOH was introduced. The reaction began in the cold and became energetic on heating. In 20 min. the Al dissolved and formed an alcoholate. The soln. was cooled to 5°, whereupon it partly solidified. 100 g. BuCHO was added with cooling and stirring. After an hr. the stirring was continued without cooling. To end the reaction the app. was heated for 30 min. at 80°. The product was distd. under 100 mm. Yield of ester 94–6%. Other expts. were made with iso-BuCHO and iso-PrCHO, the alcoholates used being Al(OAm)₃ and Al(OCHMe₂)₃ and the yields of esters reaching 94 and 96% of the theoretical. Very slight differences in the operating method have a considerable influence on the yield.

BERNARD NELSON

Equilibrium in the reaction $\text{CH}_4 + 2\text{H}_2 \rightleftharpoons \text{CO}_2 + 4\text{H}_2$. R. N. PEASE AND P. R. CHESBRO. *J. Am. Chem. Soc.* 50, 1464–9(1928).—The reaction $\text{CH}_4 + 2\text{H}_2\text{O} \rightleftharpoons \text{CO}_2 + 4\text{H}_2$ has been studied at 500° and atm. pressure. Equil. was approached from both sides and the value of the const. found to be 0.037 (partial pressures being expressed in atms.) at 505°. This is in excellent agreement with the value calcd. from Lewis and Randall's free-energy equations and thus supports in particular their equation for CH_4 in the low temp. region. It is pointed out that the reactions $\text{CH}_4 + \text{H}_2\text{O} \rightleftharpoons \text{CO} + 3\text{H}_2$ and $\text{CO}_2 + \text{H}_2 \rightleftharpoons \text{CO} + \text{H}_2\text{O}$ are also to be taken into account at higher temps. Equil. consts. at 500°, 600° and 700° are given for reference. Attention is called to the CH_4 -steam reactions as a source of H and of H-CO mixts.

C. J. WEST

Synthesis of 1-butene. H. J. LUCAS AND R. T. DILLON. *J. Am. Chem. Soc.* 50, 1460–4(1928).—1-Butene is conveniently and rapidly prepd. by adding $\text{CH}_2\text{:CHCH}_2\text{Br}$ to MeMgBr at 70° with stirring; the Grignard reagent should be previously heated at 130° in order to remove as much Et_2O as possible. The yield is about 40%. Dil. HClO_4 is effective in removing Et_2O from the gas stream. A detailed description of the app. and method is given.

C. J. WEST

The preparation and physical properties of isobutylene. C. C. COFFIN AND O. MAASS. *Trans. Roy. Soc. Can.* [3], 21, No. 3, 33–40(1928); cf. C. A. 15, 2369.—Isobutylene was prepd. by dehydrating iso-BuOH by alumina at 250–300°. The product was dried by freezing out the H_2O by means of CO_2 -ether. Final purification was secured by fractionation *in vacuo*. The middle fraction b. $-6.6^\circ \pm 0.1^\circ$. The dibromide of this butylene was prepd. and its v. p. detd. over the temp. range 54.0°–149.0°. The detns. of d., surface tension, f. ps. and critical temp. were by the methods used by Maass and Wright (ref. above). The results are given in the following table:

	MP	t_B	t_o	ML	d_B	$\frac{\Delta V}{\Delta T}$	γ_B
Ethylene	–169.4 C	–103.9	9.9	3510	0.5699	0.0045	16.50
Propylene	–185.2	–47.0	92.1	4600	0.6095	0.0034	16.70
Isobutylene	–146.8	–6.6	143.5	5240	0.6268	0.0011	15.72
	$\frac{dV}{dT}$	U	K	$\frac{ML}{T}$	T_B/T_o	$V_m - V'_m$	(calcd.)

Isobutylene is a normal unassociated liquid in which the phys. consts. have reached the limiting values which will be found for the higher members. J. W. SHIPLEY

Preparation and physical properties of α -, β - and γ -butylene and normal and isobutane. C. C. COFFIN AND O. MAASS. *J. Am. Chem. Soc.* **50**, 1427-37(1928).—Data are given for vapor pressure, d., and surface tension for α -, β - and γ -C₄H₈, C₄H₁₀ and iso-C₄H₁₀, over a wide range of temp. These quantities, together with those previously obtained for C₂H₄, C₂H₆, C₃H₆ and C₃H₈, are discussed. C. J. WEST

Decomposition of methyl chloride at elevated temperatures. KARL WIESSLER. *Chem.-Ztg.* **52**, 182-3(1928).—MeCl was led over quartz at various temps., being heated for 4-5 min. Decompn. becomes important above 500° and is nearly complete at 900°. Diln. with CH₄ had little effect; H₂O raised the rate of decompn. slightly and CO₂ increased it greatly. All detns. were by absorption and detn of the HCl produced. At 800-900° formation of C₁₀H₈ was observed. FOSTER DEB SNELL

Reaction of the Grignard reagent with γ -chloropropyl *p*-toluenesulfonate. A method of lengthening carbon chains by three carbon atoms. S. S. ROSSANDER AND C. S. MARVEL. *J. Am. Chem. Soc.* **50**, 1491-6(1928).—Details are given for the prepn of *p*-MeC₆H₄SO₂O(CH₂)₃Cl (I), b_p 188-92°, d₂₅²⁵ 1.2396, n_D²⁵ 1.5225, the yield being 50-5%. I (1 mol) and 1 mol. of RMgX give the following products: 93 g. C₄H₉Cl, 27 g. (CH₂)₃Cl₂ (II); 137 g. C₄H₉Br, 50 g. Cl(CH₂)₃Br (III); 184 g. C₄H₉I, 60 g. Cl-(CH₂)₃I; 179 g. C₇H₁₅Br, 63 g. III and 20 g. (11.44%) C₇H₁₅(CH₂)₃Cl, 163 g. C₆H₁₁Br, 73 g. III and 24 g. (14%) C₆H₁₁(CH₂)₃Cl, b_s 76.9°, d₂₅²⁵ 0.9977, n_D²⁵ 1.4660; 127 g. Ph(CH₂)₃Cl, 34 g. of a mixt. of II and PhMe and 72 g. (42%) of Ph(CH₂)₄Cl, 169 g. Ph-(CH₂)₄Cl, 36 g. II, 50 g. Ph(CH₂)₃Me and 53 g. Ph(CH₂)₇Cl, b_s 131-6°, d₂₅²⁵ 0.9899, n_D²⁵ 1.5152. One mol. RMgX with 2 mols I gives the following products: 127 g. PhCH₂-Cl, 50 g. II and 99 g. Ph(CH₂)₃Cl; 157 g. PhBr, 51 g. II and 93 g. Ph(CH₂)₃Cl; 109 g. EtBr, 100 g. III and 25 g. (23%) of Et(CH₂)₃Cl; 55 g. C₁₂H₂₅Br, 33 g. III and 20 g. C₁₂H₂₅(CH₂)₃Cl; 163 g. C₆H₁₁Br, 98 g. III and 100 g. (62%) of C₆H₁₁(CH₂)₃Cl, 173 g. Ph(CH₂)₃Cl, 60 g. II, 62 g. Ph(CH₂)₇Cl and 28 g. Ph(CH₂)₃Me; 179 g. C₇H₁₅Br, 101 g. III and 87 g. (50%) of C₇H₁₅(CH₂)₃Cl. One mol. PhCH₂MgCl and 1 mol I give 18 g. BuCl, 22 g. PhMe and 45 g. PhAm; with 2 mols. I there result 24 g. BuCl and 74 g. PhAm. This method of lengthening C chains by 3 CH₂ groups is satisfactory when a Grignard reagent with 6 or more C atoms is used as the starting material. C. J. WEST

Catalytic oxidation with air of ethyl, isopropyl and butyl alcohols. R. M. SIMINGTON AND HOMER ADKINS. *J. Am. Chem. Soc.* **50**, 1449-56(1928).—EtOH (I), iso-PrOH (II) and BuOH (III) have been mixed with air and passed over a no. of catalysts with the production of aldehyde or ketone, acid, CO₂, CO, satd and unsatd. hydrocarbons and H. The oxidation of III resulted in the formation of a small quantity of ester with all catalysts and some HCHO with the mixed oxide catalysts. The following catalysts were used: Ag, Ni, Cu and Pt gauzes; Cu wire, Ag pellets, pellets of alloys of Cu and Zn, Ni, Bi, Pd, Pt, Au and Bi; oxide mixts of U and Cu, W and Cu, Mo and Cu, V, Fe and Cu. Ag and Ag-Cu alloys produced better than 70% yields of aldehyde or ketone. I has been found to produce approx. 3 times as much CO₂ as III and twice as much as II. The amt. of H in the effluent gases was found to be small except when brasses were used as catalysts. Large quantities of Zn apparently promote dehydrogenation but not oxidation of the H.* III was found to produce more unsatd. hydrocarbons than either I or II except with oxide catalysts, which caused the production of 10-15% of unsatd. compds. with iso-PrOH. This latter fact indicates that the oxide catalysts were not completely reduced to the metals. The production of satd. hydrocarbons is rather small in all other cases. Acid production was found to be small and fairly const. for the same alcs. over different catalysts. The plated catalysts are unsatisfactory because the high temp. of reaction apparently caused soln. of the plated metal into the supporting metal. It also seems likely that the reaction takes place throughout the catalyst. Evidence for this view is found in the change in the mech. properties of the gauzes, wire and pellets and in the reduction of CuO to metallic Cu in the center of the pellets of a CuO-V₂O₅ mixt. The temp. of the reaction varied with the alc-air ratios and with the catalysts employed. The Cu-V, Cu-Mo and Cu-W oxide mixts. were comparatively inactive and external heating was necessary. Heat was also applied to maintain a reaction at the surface of the 50% Zn-Cu alloy. The fact that small quantities of material incorporated into the metallic catalysts produce no marked effect indicates that a large portion of the surface of the catalyst is active in the catalytic oxidation of alcs. C. J. WEST

New method for the preparation of *O,N*-dialkylhydroxylamines. R. T. MAJOR AND E. E. FLECK. *J. Am. Chem. Soc.* **50**, 1479-81(1928).—*O,N*-Dialkylhydroxyurethans have been prepd. by the action of alkyl sulfates on HONHCO₂Et; hydrolysis

of these compds. with EtOH-KOH gives *O,N*-dialkylhydroxylamines, RONRH. A soln. of mol. equivs. of EtONeH and H₂O distils at 74°; no corresponding mixt. could be detected in the case of MeONMeH and H₂O.

C. J. WEST

Reactions relating to carbohydrates and polysaccharides. XIII. Properties of γ,δ -dihydroxycarbonyl derivatives and their bearing on the polymerization of polysaccharides. HAROLD HIBBERT AND C. P. BURT. *J. Am. Chem. Soc.* **50**, 1411-6 (1928); cf. *C. A.* **22**, 867.—Oxidation of Δ^6,δ -hepten-2-one with 2% aq. KMnO₄ gives 54% of *Me* γ,δ -dihydroxyamyl ketone, pale yellow, b_D^{20} 139-43°; with a trace of concd. H₂SO₄ at 90° this gives a resin (loss of 1 mol. H₂O₂ per mol. ketone), insol. in dil. acid and alkali but readily sol. in concd. HCl or H₂SO₄, mol. wt. in C₆H₆ 590, in camphor, 3706. *Me* γ,δ -dihydroxyisovaleryl ketone under the same conditions gives 60% methylheptenone and shows little tendency towards polymerization. The introduction of the 2nd Me group in the δ -position thus facilitates to a pronounced degree the splitting off of H₂O from the 2 adjacent HO groups.

Preparation and properties of the 2-methyl-5-isopropylphenylamides of some higher fatty acids. R. M. HANN AND G. S. JAMIESON. *J. Am. Chem. Soc.* **50**, 1442-3 (1928).—The compds. were prepd. by treating the acid chloride in Et₂O with an excess of cyminidine; 2-methyl-5-isopropylphenylamide of l^{aric} acid, m. 82-3°; myristic acid, m. 88-9°; palmitic acid, m. 90-1°; stearic acid, m. 93-4°; arachidic acid, m. 81-2°; lignoceric acid, m. 84-5°.

C. J. WEST

Gossypol. III. The oxidation of gossypol. E. P. CLARK. *J. Biol. Chem.* **77**, 81-7 (1928); cf. *C. A.* **22**, 772.—Among the reaction products of the oxidation of gossypol with alk. KMnO₄, were identified HCO₂H, AcOH and Me₂CHCO₂H. Assuming 1 mol. of gossypol to contain 1 mol. of the acid, 92.1% of this calcd. amt. of Me₂CHCO₂H was obtained. This is taken to indicate the presence in the gossypol mol. of a side chain consisting of at least the iso-Bu group.

ARTHUR GROLLMAN

The synthesis of monobenzoylcadaverine. S. I. KANEVSKII. *J. Russ. Phys.-Chem. Soc.* **59**, 649-52 (1927).—Benzoylchloroamylamine (prepd. according to Gabriel from benzylpiperidine and PCl₅) was treated with KCN (cf. *C. A.* **3**, 2137) and 10 g. of the nitrile heated with 20 cc. concd. H₂SO₄ on the water bath for 10 min. The resulting oil was poured into snow and benzoylcaproic amide, m. 126-30°, sepd. (yield close to the theory). Recrystd. from hot water it m. 140-1°. The amide (4.7 g.) was added in small portions to 9 g. KOH and 3.2 g. Br in 50 cc. cold water. After 5-15 min. on a water bath at 80° an oily layer sepd., was extd. with CHCl₃ and dried. The product (monobenzoylcadaverine) was sol. in water and acids, sparingly in Et₂O, it could not be crystd. or distd. *in vacuo*. The HCl salt (m. 159-60°; yield 90%) was prepd. by the action of HCl in EtOH. To 1 g. of this salt was added 1 cc. concd. HCl and the mixt. refluxed for 3 hrs.; 0.7 g. of cadaverine HCl resulted which when recrystd. m. 255°. Dibenzoylcadaverine, prepd. by adding BzCl to a 1% soln. of the mono deriv. in water, m. 135-55°.

B. C. S.

Chemical constitution of pentaerythritol. HANS BINCER AND KURT HESS. *Ber.* **61B**, 537-42 (1928).—The present work confirms the correctness of Tollens and Wigand's formula, C(CH₂OH)₄, for pentaerythritol (I) and rigorously excludes any other possible formula. From I and H₂ was obtained the diiodohydrin (ICH₂)₂C(CH₂OH)₂ (II), the yield of which was increased to 45% by modifying the conditions of prepn.; in II the C skeleton of the I remains unchanged, for II with AgOAc and subsequent exhaustive acetylation gave the tetraacetate of I. In alc. at 50-5° in the presence of C₆H₅N and MgO the I in II is quant. replaced by H by means of H₂ and Pd-BaSO₄, giving Me₂C(CH₂OH)₂, identical with the product obtained by Apel and Tollens from Me₂CHCHO and HCHO, its dibenzoate m. 52-4°. Contrary to the statement of Zelinskii, in the prepn. of the dibromohydrin of I there is also formed the tribromohydrin (9.2 g., together with 5.9 g. of the dibromohydrin, from 20 g. I heated 8 hrs. at 125° in 120 g. aq. HBr satd. at 0°), m. 70-1°; it is best obtained (44%), together with 5% of C(CH₂Br)₄, by heating 25 g. I 20 hrs. at 140° in 150 g. HBr satd. at 0°.

C. A. R.

Condensation of hydroxy acids by the simultaneous action of several catalysts under a high hydrogen pressure; α -hydroxybutyric acid and α -hydroxyisovaleric acid. V. IPAT'EV AND G. RAZUVAEV. *Ber.* **61B**, 634-7 (1928); cf. *C. A.* **22**, 386.—It has been shown that solns. of the Na salts of α -HO acids (glycolic and lactic) heated with NiQ and Al₂O₃ under a high H pressure at 250-70° yield dibasic acids by condensation of 2 mols. of the original acid. When the C chain in the acids is longer, the condensation is more complex. EtCH(OH)CO₂H yields about 10% of a dibasic acid (II) which seems to be HO₂CCH₂EtCHMeCO₂H; the mechanism of its formation cannot be explained. There are also formed about 25% of PrCO₂H and higher monobasic acids.

$\text{Me}_2\text{CHCH}(\text{OH})\text{CO}_2\text{H}$ does not condense under the above conditions but considerable CO_2H is split off, with the formation of about 40% carbonate and a considerable quantity of HCO_2H , together with $\text{Me}_2\text{CHCH}_2\text{OH}$, satd. acids (EtCO_2H) and CH_4 ; no $\text{Me}_2\text{CHCH}_2\text{CO}_2\text{H}$ could be isolated in pure form.

C. A. R.

Condensation of hydroxy and keto acids; β - and γ -hydroxy and keto acids and acids with tertiary hydroxyl groups. G. RAZUVAEV. *Ber.* 61B, 637-40(1928); cf. preceding abstr.—It was assumed that in the formation of dibasic acids from the Na salts of α -HO acids heated under a high H pressure with NiO and Al_2O_3 there is first formed a dibasic HO acid by elimination of H_2O from 2 mols. of the original acid. This work was undertaken to det. whether the reaction takes place with (1) β - and γ -HO and keto acids, and (2) acids with a tertiary HO group where a cleavage of H_2O from 2 mols. in the above sense is not possible. None of the 3 acids tried ($\text{MeCH}(\text{OH})\text{CH}_2\text{CO}_2\text{H}$ (I), levulinic acid (II) and $\text{Me}_2\text{C}(\text{OH})\text{CO}_2\text{H}$ (III)) yielded a dibasic acid. I gives about 35% PrCO_2H , along with HCO_2H , AcOH , CO_2 (up to 12%), CH_4 and an oil of pleasant odor. II is reduced with considerably greater difficulty (the temp. has to be kept relatively low—not above 230°); it gives BuCO_2H (not above 20%) through $\text{MeCH}(\text{OH})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$, and about 20% decomps. into carbonate, CH_4 and other products. If the temp. is raised to only 250° , the II undergoes deep-seated decompn.; the yield of carbonate increases to 48%; the gaseous products contain CO_2 and much CH_4 , and acids ppt. a tar from the soln. III gives 60% $\text{Me}_2\text{CHCO}_2\text{H}$ and the remainder loses CO_2H with formation of carbonate, formate, CH_4 and other products.

C. A. R.

Catalytic reduction of hydrophthalic anhydrides. F. P. MAZZA. *Atti II congresso naz. chim. pura applicata* 1926, 1340-1.—A summary of work by M. and his collaborators (cf. M. and de Mase, *C. A.* 21, 2676-7; M. and Cremona, *C. A.* 21, 2678; M. and Cato, *C. A.* 21, 2677).

Biochemistry of sulfur. II. The isolation of ergothioneine from ergot of rye. B. A. EAGLES. *J. Am. Chem. Soc.* 50, 1386-7(1928); cf. *C. A.* 21, 915.—The original procedure of Tanret was followed up to the sepn. of the compd. as the HgCl_2 salt, instead of isolating the compd. as the HCl salt at this stage, the procedure of Hunter and Eagles for its isolation from blood was then used and the substance isolated in the pure state as the free base; 1 kg. ergot of rye gave 0.65 g. pure ergothioneine.

C. J. WEST

Addition of sodium malonic ester to aliphatic mustard oils. D. E. WOKRALL. *J. Am. Chem. Soc.* 50, 1456-9(1928).— $\text{NaCH}(\text{CO}_2\text{Et})_2$ and MeNCS give the addn. product $\text{CH}(\text{CO}_2\text{Et})_2\text{C}(\text{SNa})\text{:NMe}$, sol. in cold H_2O ; HCl gives $\text{CH}(\text{CO}_2\text{Et})_2\text{C}(\text{SH})\text{:NMe} = \text{CH}(\text{CO}_2\text{Et})_2\text{CSNHMe}$; the yield in all cases is about 80 %. On heating with dil. acid or alkali there results AcOH , CO_2 , H_2S , MeNH_2 and EtOH . *Et carbethoxymalonate monothiomethylamide*, m. $49-50^\circ$; *ethylamide*, m. $51-2^\circ$; *propylamide*, m. 11° ; *butylamide*, oil; *Me carbethoxymalonate monothioisopropylamide*, m. $42-3^\circ$; *butylamide*, m. $62-3^\circ$; *amylamide*, m. $52-3^\circ$; the Na salt of malonic acid monothioethylamide, decomp. $148-9^\circ$; *propylamide*, decomp. $155-6^\circ$; *butylamide*, decomp. $156-7^\circ$; *amylamide*, decomp. $157-8^\circ$; the benzylamide of the free acid, m. $95-6^\circ$, with loss of CO_2 , forming thioacetylbenzylamide, m. $62-3^\circ$.

C. J. WEST

An activated form of oxalic acid. F. OBERHAUSER AND W. HENSINGER. *Ber.* 61B, 521-33(1928).—In spite of the great amount of study which has been devoted to the reaction between $(\text{CO}_2\text{H})_2$ and KMnO_4 it has as yet not been possible to work out a complete picture of its chem. mechanism. The present work was undertaken to fill up some gaps in the earlier investigations and led to entirely unexpected results. Having observed that the previous presence of a Mn salt may bring about an almost spontaneous reduction of Hg^{++} salts, proceeding within a few sec., O. and H. undertook to det., by a careful study of the behavior of $(\text{CO}_2\text{H})_2$, whether a reactive intermediate form of the acid might not make its appearance along with the Mn salts of higher valence. It was first established, by systematic expts., that, contrary to previous indications, the greatest part of the peroxide is formed only when the action of the Mn salts of higher valence on an excess of the acid has come completely to an end. The reaction was allowed to proceed in CO_2 or N_2 at about 60° until the cherry-red color of the $(\text{C}_2\text{O}_4)_2\text{Mn}$ had disappeared; the absence of Mn^{+++} salt was shown by means of KI, that of peroxide with the $\text{Ti-H}_2\text{SO}_4$ reagent. If, however, air was passed through the soln. immediately after it became completely colorless, distinctly detectable quantities of a peroxide (intense yellow color with $\text{Ti-H}_2\text{SO}_4$) were produced. On shaking the mixt. with CrO_3 and Et_2O , the blue color of perchromic acid could be detected only when the concn. of $(\text{CO}_2\text{H})_2$ was small; with higher concns. the perchromic acid immediately reacts with the $(\text{CO}_2\text{H})_2$ without visibly going into the Et_2O . Consider-

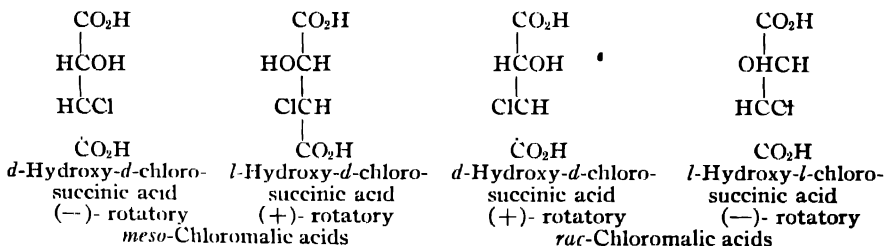

ably larger quantities of H_2O_2 were found when O_2 was used instead of air (with 30 cc. 0.1 N $(\text{CO}_2\text{H})_2$ and 2 cc. 0.1 N KMnO_4 treated 1 hr. with air, 0.28 cc. 0.1 N H_2O_2 ; with O_2 , 0.83 cc. H_2O_2). The same values are obtained when the reaction is carried out from the very beginning, under otherwise identical conditions, in air or O_2 . The yield of H_2O_2 is somewhat increased, but only to a definite optimum not far from the above values, when either the quantity of KMnO_4 is increased or a Mn^{++} salt is added. The velocity of the absorption of O_2 increases at first rapidly to a sharp max. and then rapidly decreases. The magnitude of the surface does not influence the yield of H_2O_2 . Contrary to previous indications, there is no induced participation of the atm. O during the reaction between $(\text{CO}_2\text{H})_2$ and KMnO_4 , for treatment of the $(\text{CO}_2\text{H})_2$ with KMnO_4 shortly before the treatment with air or O_2 produces the same result and for each mol. $(\text{CO}_2\text{H})_2$ disappearing as the result of auto-oxidation exactly 1 mol. H_2O_2 is formed. Since under the same conditions of time and temp. $(\text{CO}_2\text{H})_2$ itself, even in the presence of an amount of MnSO_4 corresponding to the KMnO_4 used, forms no H_2O_2 , it must be assumed that the treatment with KMnO_4 produces a reactive form of $(\text{CO}_2\text{H})_2$ which can react more rapidly with atm. O . It is worthy of note that no H_2O_2 is formed if the O_2 is passed through the soln. only some hrs. after the $(\text{CO}_2\text{H})_2$ has been treated with KMnO_4 , nor if such nitrates are present. The formation of this activated $(\text{CO}_2\text{H})_2$ is manifested with extraordinary distinctness by its behavior with other oxidizing agents. Even in almost neutral soln. CrO_3 , Br_2 , KBrO_3 , I_2 , etc., are almost instantly reduced; under special conditions, a quant. reduction of Ag , Pt and Hg^{++} salts and even a distinct reduction of nitrates can be effected. The extent of reaction with Hg salts is conditioned by the concn. of the reactants and also of the other acids and salts present. Under favorable conditions it apparently reaches an end when the activated $(\text{CO}_2\text{H})_2$ is used up. An exact, simple, quant. sepn. of Hg from Bi and Cd and a very exact volumetric method for the detn. of the Hg^{++} ion, which can be used for the detn. of Hg in org. compds., has been worked out and will be described elsewhere. Although $(\text{CO}_2\text{H})_2$ and $(\text{CO}_2\text{Na})_2$ with or without Mn^{++} salts react exceedingly slowly with Hg^{++} salts even in high concns. and on long boiling, on heating with small quantities of KMnO_4 to 60° there results a very energetic reduction to HgCl , the nature of the acid, along with the concn. of the reactants, playing an important part in the reaction. Expts with HCl , H_2SO_4 , H_3PO_4 , AcOH , HNO_3 , KNO_3 and KCl showed that the extent of the reaction depends in the 1st place on the acidity of the soln. Thus, HCl , which favors the formation of complexes of the type $\text{X}_2[\text{Hg}(\text{C}_2\text{O}_4)\text{Cl}_2]$, $\text{X}_2[(\text{HgC}_2\text{O}_4)_2\text{Cl}_2]$, and diminishes the concn. of oxalate ions, decreases the reduction to HgCl . KNO_3 and KNO_4 , like HCl and KCl , decrease the concn. of oxalate ions but, by formation of the more highly dissociated $\text{Hg}(\text{NO}_3)_2$, increase the concn. of Hg ions (with consequent increase in the reduction to HgCl) up to a certain point until, as the concn. of NO_3 ions is increased, the dissocn. of the $\text{Hg}(\text{NO}_3)_2$ is repressed. The reduction reaction, then, is ionic; everything which favors dissocn. accelerates the reaction and *vice versa*. CO_2 also accelerates the reduction; it is not to be assumed that there is formed a CO_2 deriv. which is more easily reduced than $(\text{CO}_2)_2\text{Hg}$, nor that CO_2 acts catalytically as a weak acid, for AcOH retards the reaction, if anything, probably as the result of complex formation. Moreover the same results are obtained with N_2 . It seems more probable that the formation of peroxide in the air retards the reduction to HgCl and that the accelerating action of CO_2 and N_2 results from the prevention of the peroxide formation. At room temp., more rapidly at higher, more slowly at lower temps., the activated $(\text{CO}_2\text{H})_2$ mols. revert to their original condition, although at least 24 hrs. is required at room temp. for complete disappearance of activation. Addn. of CaCl_2 at once destroys the reducing power of the activated acid. The ratio of activated to inactive acid (as detd. from the quantity of HgCl_2 reduced to HgCl) formed by treating $(\text{CO}_2\text{H})_2$ with varying quantities of KMnO_4 diminishes at first very rapidly, then more slowly with increasing quantities of KMnO_4 (1:36.86 with 50 cc. 0.1060 N $(\text{CO}_2\text{H})_2$, 1.25 g. HgCl_2 and 0.1 cc. 0.1 N KMnO_4 made up to 160 cc. and heated 15 min. in a H_2O bath; 1:10.37 with 0.5 cc. KMnO_4 ; 1:2.84 with 1 cc.; 1:1.61 with 22 cc.) and approaches an almost const. value 1:1 shortly before the point where MnO_2 is formed. For the reduction of HgCl_2 to HgCl , MnSO_4 can be used instead of KMnO_4 , HgCl being pptd. quant. on heating to $60-70^\circ$ and adding a few cc. of NaOH several times; probably the MnSO_4 takes up O when the NaOH is added, with formation of $(\text{C}_2\text{O}_4)_2\text{Mn}$. The reducing action of the activated acid towards HgCl_2 is maintained even after the Mn has been removed by pptn. Quant. pptn. of HgCl can also be secured with $\text{K}_2\text{Mn}(\text{C}_2\text{O}_4)_2$ (Kehrmann, *Ber.* 20, 1594(1887)), for the prepn. of which O and H . have devised a greatly improved method. Activated $(\text{CO}_2\text{H})_2$ can also be produced with $\text{Ni}(\text{OH})_2$ and $\text{K}_2\text{Co}(\text{C}_2\text{O}_4)_2$, although not as satis-

factorily as with the Mn salts of higher valence, but it is never formed with CrO_3 and Au salts unless Mn^{IV} salts are also present. Attempts to isolate the activated acid (e. g., by shaking out with org. solvents) have failed.

• **Cleavage of diethyl α,α' -dibromosuccinate by diethylamine.** R. C. FUSON. *J. Am. Chem. Soc.* 50, 1444-9 (1928).—von Braun, Leistner and Münch (*C. A.* 21, 60) showed that $(\text{CH}_2\text{CHBrCO}_2\text{Et})_2$ with excess of Et_2NH gives AcCO_2Et and $\text{MeC}(\text{NEt}_2)\text{HCO}_2\text{Et}$; it is shown that $\text{CH}_2\text{C}(\text{NEt}_2)\text{CO}_2\text{Et}$ is probably an intermediate in the formation of the AcCO_2Et . A mechanism involving the intermediate formation of a cyclobutane ring is suggested to explain these results.

Stereochemistry of the tetrahedral carbon atom. VII. The number of isomeric chloromalonic acids. RICHARD KUHN AND THEODOR WAGNER-JAUREGG. *Ber.* 61B, 481-3 (1928), cf. *C. A.* 21, 3180.—According to the van't Hoff and LeBel theory, chloromalonic acid (I) should exist only in 2 inactive and 4 optically active forms, whereas 6 active forms are described in the literature. Sonn and Rosinsky obtained optical antipodes of Lössen's I by means of brucine and Kuhn and Zell (*C. A.* 21, 569) by addn. of HCl to (—)-ethylene- α,α' -dicarboxylic acid (II) obtained an optically active acid which should have been identical with 1 of S and R's acids (for *dl*-II with HCl gives Lössen's I), but such did not prove to be the case. A repetition of S. and R.'s work showed that in the resolution of L.'s I the more difficultly sol. brucine salt yields a (+)-I which, from all its properties, is the antipode of K. and Z.'s (—)-I; the statements of S. and R. could in no respect be confirmed. From 31.3 g. of the salt was obtained 2.5 g. of the pure (+)-acid, decomp. $166-7^\circ$, $[\alpha]_D^{19}$ in H_2O , 6.80° (c 3.73), 7.07° (c 1.87), converted quant. by *N* NaOH at room temp. into (+)-*trans*-II, $[\alpha]_D^{20}$ 98.3° (H_2O), and by long boiling in H_2O into *l*-tartaric acid, $[\alpha]_D^{18}$ 5° -6.87° (H_2O). The mother liquors from the (+)-I yielded crystals m. 151° (the m. p. given by S. and R.), but their optical consts. showed that they consisted of a mixt. of the *dl*- and (+)-I.

VIII. Configuration of the chloromalonic acids. *Ibid.* 483-504.—To det. the configuration of the chloromalonic acids (I) as many different phys. consts. as possible of the 2 inactive I and their di-Et esters were compared with the corresponding consts. of the *meso*- and *dl*-dichloro- (II) and dihydroxysuccinic acids (III). Below are given the consts. in the order *dl*-III, *meso*-III, I m. 157° , I m. 145° , *dl*-II, *meso*-II. M. p. of the acids, 205° , 140° , 157° , 145° , 173° , 215° . B. p. of the di-Et esters, 158° (14 mm.), 157.5° (14), 153.5° (14), 151.5° (14), 129.5° (12.5), 125.5° (12.5). n for the esters at 64.5° , 1.4246, 1.4315, 1.4305, 1.4321, 1.4296, 1.4266, $n_F - n_C$ at 64.5° , 0.0069, 0.0076, 0.0075, 0.0074, 0.0076, 0.0076; $n_F - n_C$ at $19.5-20^\circ$, 0.0076, —, 0.0082, 0.0079, 0.0081, —. d_4^{20} for the esters, 1.246, 1.1350, 1.1496, 1.1560, 1.1636, 1.1490. In freezing C_6H_6 the esters of the two II are monomol. up to a concn. of about 3% but the mol. wt. of the esters of the I increase considerably with increasing concn., being about 1.25 times the calcd. in 7% soln. and increasing in the same way for both forms of I. With the esters of *dl*- and *meso*-III the association is much greater and is considerably more pronounced in the *meso*-ester, being about twice as great in 7%

soln. as at great diln. Soln. of the acids in H_2O at 0° (g./100 cc soln.), 8.26, 50.7, 85.2, 85.0, 64.0, 12.0. From H_2O soln. Merck's Carbo medicinalis adsorbs the II best (59-60%), next the I (49-50.5%) and the III least (*dl* 42, *meso* 40.5%); the differences between the isomers are too small to establish any relationship with the configuration. Dissoen. consts. of the acids $K_1 \times 10^3$ 1.17, 0.775, 6.35, 4.90, 37.2, 36.1; $K_2 \times 10^4$ 0.589, 0.160, 2.65, 1.01, 18.0, 9.40. $K_1 \times 10^3$ for the *dl*- and *meso*-forms of other disubstituted succinic acids: Br_2 , 41.5, 35.7; ClBr , 35, 37; Cl_2 , 37.2, 36.1; Ph_2 (in 50% MeOH), 0.0105, 0.0140, $K_2 \times 10^4$ Br_2 , 8.17, 23.9; ClBr , 17, 25; Cl_2 , 18.0, 9.40; Ph_2 , 0.00132, 0.00124. The results indicate that Lössen's I, m. 145° , is the *meso*-acid, and Kuhn and Ebel's isomer, m. 157° the *dl*-acid. Since the position in space of the HO groups

in the active I is established by the principle of optical superposition (C. A. 21, 569) the configuration of the 4 acids can be represented by the accompanying formulas, and as it is shown in the following abstr. that *d*-II is (+)-rotatory, it follows that the direction of the rotation of the I is detd. by the position of the Cl atom, a conclusion already reached by Kuhn and Zell on the basis of the principle of optical superposition. *Di-Me ester of dl-meso-I*, b_D^{25} 140.5–1.5°. IX. In which phase of the reaction does the rearrangement of the substituents in the Walden inversion take place? *Ibid* 504–21.—The method of detg. configurations used in this work is based on the principle that addn. of a 2nd asym. C atom to the compd. of unknown configuration will give 2 non-mirror image substances which will differ not only in rotation but in a large no. of physical properties. Representing the configuration of the HO groups by $\begin{smallmatrix} \text{H} \\ | \\ \text{C} \\ | \\ \text{H} \end{smallmatrix}$ and $\begin{smallmatrix} \text{H} \\ | \\ \text{C} \\ | \\ \text{H} \end{smallmatrix}$ that of the Cl atoms by $\begin{smallmatrix} \text{H} \\ | \\ \text{C} \\ | \\ \text{H} \end{smallmatrix}$ and $\begin{smallmatrix} \text{H} \\ | \\ \text{C} \\ | \\ \text{H} \end{smallmatrix}$, replacement of the Cl atoms in *d*- and *l*-chlorosuccinic acids (I) by the $\begin{smallmatrix} \text{H} \\ | \\ \text{C} \\ | \\ \text{H} \end{smallmatrix}$ -HO group of *d*-(+)-malic acid (II) gives 2 chloromalic acids (III) ($\begin{smallmatrix} \text{H} \\ | \\ \text{C} \\ | \\ \text{H} \end{smallmatrix}$ and $\begin{smallmatrix} \text{H} \\ | \\ \text{C} \\ | \\ \text{H} \end{smallmatrix}$), which can be differentiated by their m. ps., b ps of their esters, etc. That the configuration of the HO group is really the same in both is shown by their reduction with nascent H to the same *d*-(+)-II. Of the two III, the first must, as a whole, lie between *d*-tartaric acid ($\begin{smallmatrix} \text{H} \\ | \\ \text{C} \\ | \\ \text{H} \end{smallmatrix}$) (IV) and *d*-dichlorosuccinic acid ($\begin{smallmatrix} \text{H} \\ | \\ \text{C} \\ | \\ \text{H} \end{smallmatrix}$) (V) in its phys. properties, the 2nd between *meso*-IV ($\begin{smallmatrix} \text{H} \\ | \\ \text{C} \\ | \\ \text{H} \end{smallmatrix}$) and *meso*-V ($\begin{smallmatrix} \text{H} \\ | \\ \text{C} \\ | \\ \text{H} \end{smallmatrix}$). The *rac*-forms ($\begin{smallmatrix} \text{H} & \text{H} & \text{H} & \text{H} \\ | & | & | & | \\ \text{C} & \text{C} & \text{C} & \text{C} \\ | & | & | & | \\ \text{H} & \text{H} & \text{H} & \text{H} \end{smallmatrix}$) can also be compared; those III whose const. lie between those of the *rac*-forms of the sym. disubstitution products will have the configuration $\begin{smallmatrix} \text{H} & \text{H} \\ | & | \\ \text{C} & \text{C} \\ | & | \\ \text{H} & \text{H} \end{smallmatrix}$, the others $\begin{smallmatrix} \text{H} & \text{H} \\ | & | \\ \text{C} & \text{C} \\ | & | \\ \text{H} & \text{H} \end{smallmatrix}$. The inactive III, whose configuration is thus established, are converted, by replacement of the HO group by Cl, into the V; whether or not a Walden inversion occurs can be established directly by resolution of the resulting *rac*-V. The relationship between the active IV and V with the active I and II is established by reduction, optical superposition, optical comparison of the esters, etc. The configuration of the inactive III had already been established experimentally (preceding abstr.) and that of the HO groups in the active acids detd. by reduction to the corresponding II (C. A. 21, 569). *d*-IV di-Et ester is converted in 1 operation, with 1 mol. SOCl_2 in $\text{C}_6\text{H}_5\text{N}$, into di-Et *d*-hydroxy-*l*-chlorosuccinate. The corresponding racemate (*dl-meso*-III di-Me ester) was converted with a 2nd mol. of SOCl_2 into the well-crystd. *rac*-V di-Me ester, m. 42–3°. *d*-(+)-IV di-Me ester with 2 mols. SOCl_2 gives the (–)-V di-Me ester, m. 62–3°, a reaction which, as shown by carrying it out stepwise, proceeds through the *meso*-III ester. Therefore, in the conversion of the *d*-(+)-IV ester into the (–)-V ester a double inversion takes place; in the (–)-V the Cl atoms have the same configuration as the HO groups in *l*-(–)-IV and the (–)-V is to be designated as *l*-(–)-V. Comparison of the rotatory power of the I and V and their di-Me and di-Et esters in various solvents and at different temps. indicates, in harmony with the principle of optical superposition, that (–)-I and (–)-V have the same configuration. (–)-I is *l*-(–)-I. The last step in the cycle, reduction of an active V to I, could not be effected. In the catalytic hydrogenation of *l*-(–)-V di-Me ester with Pd-BaSO₄ in MeOH and NaOAc, which proceeded very smoothly, 0.5 of the V ester remained unchanged after 1 mol. H₂ had been absorbed, both Cl atoms being removed simultaneously. These results, in connection with those reported in Papers I, IV, VII and VIII, show that in the conversion of *d*- into *l*-II and *vice versa*, the inversion occurs in the replacement of the HO group by Cl (with PCl₅) and not in that of the Cl atom by OH (with Ag₂O). The detn. of the configuration of the III also affords an insight into addn. and cleavage reactions of inactive compds., the mechanism of which, in a spatial sense, was hitherto unknown. Addn. of HOCl to maleic acid, which yields *dl-meso*-III exclusively, is a *cis*-addn. To fumaric acid, on the other hand, HOCl adds chiefly in the *trans*-position and only about 20% *dl-rac*-III is formed by *cis*-addn. The formation of chloromaleic acid from *meso*-III seems to be a *trans*-splitting off of H₂O, i. e., the elimination of H₂O does not proceed as would be expected from a consideration of the tetrahedral models. The hydrolysis of *rac*-III to *meso*-IV proceeds quant., that of the *meso*-III to the extent of about 90%, with inversion. Maleic acid with Cl₂ gives 100% *meso*-V, fumaric acid 82% *meso*- and 18% *rac*-V (Terry and Eichelberger, C. A. 19, 1559, say that under the same conditions Cl adds to fumaric as well as maleic acid exclusively in the *cis*-position); it is a striking fact that Cl adds in the same way as HOCl to the 2 acids. *l*-(–)-V di-Me ester (19.5 g. from 47 g. *d*-IV di-Me ester), b_D^{25} 117–8° (cor.), $[\alpha]_D^{25}$ –114.1°

(CS₂, c 6.63), -69.5° (CHCl₃, c 13.04), -63.07° (AcOEt, c 6.75), -42.97° (MeOH, c 6.42), all at 21° except in CHCl₃ (22°), dispersion coeff. ($\alpha_D:\alpha_{586}$) in CHCl₃ (c 18.1) at 22° , 1.00, 1.28, 1.72, 2.64 for 656, 589, 527, 486, resp. *Di-Et ester*, from the di-Me ester in 99% MeOH satd. with HCl at 0° , b_D 127– 30° (cor.), d_4^{20} 1.2784, $[\alpha]_D^{20}$ -53.6° (no solvent), $[\alpha]_D^{22}$ -104.8° (CS₂, c 5.06), $[\alpha]_D^{22.5}$ -61.0° (CHCl₃, c 5.05), $[\alpha]_D^{22.5}$ -49.40° (96% alc., c 8.97), dispersion coeff. 1.00, 1.27, 1.69, 2.00, 2.6 for 656, 589, 527, 486, 436. The rotation of the ester decreases with increase in temp.: α_D (0.7-dm. tube), -48.00° , -47.68° , -47.55° , -47.48° at 20° , 35° , 40° and 45° , resp. C. A. R.

The influence of the temperature on the rotatory powers of active compounds. RENÉ LUCAS. *Compt. rend.* 186, 857–9 (1928).—In order to explain variations in the rotatory power of certain compds. in soln (tartaric or camphor derivs.), L. proposes the following mechanism: the mols of the compds are capable of existing in several monomol. forms; passage from 1 form to another occurs in a discontinuous manner. The solvents and the temp. modify the proportions of the various forms in equil. If the rotatory power of a compd. is modified by solvents, it will also be modified by temp. The study of the modification permits the detn. of the no. of forms in equil. Mathematical developments are given which deal with an equil. of 2 and one of 3 forms. Et tartrate, iso-Bu tartrate and iso-Bu diacetyltartrate are examples of a 3-form equil.

A. L. HENRI

Thiocyanoacetone and derivatives. J. TCHERNIAC. *Ber.* 61B, 574–9 (1928).—Reply to Hantzsch (*C. A.* 22, 1158). C. A. R.

Interaction of hydrogen sulfide with certain amino and imino acid nitriles. ELIZABETH GATEWOOD AND T. B. JOHNSON. *J. Am. Chem. Soc.* 50, 1422–7 (1928).—Three characteristic types of reaction of H₂S towards nitriles of NH₂ acids have been observed: Formation of a dithiopiperazine (H₂NCH₂CN); mol. condensation with formation of an imino nitrile (MeCII(NH₂)CN); formation of a thiodesoxyhydantoin (Me₂C(NH₂)-CN). 2,2,4,4-Tetramethyl-5-thio-2-desoxyhydantoin, m. $153-5^\circ$, results from the action of H₂S upon Me₂C(NH₂)CN or NH(CMe₂CN)₂. NH(CH₂CN)₂ gives iminodiacetothioamide, 5-thio-2-desoxyhydantoin and an amorphous product. Thus it is impossible to predict the course of the reaction which will take place when a given nitrile in this series of compds. is exposed to the action of H₂S. C. J. WEST

Red compounds of barbituric acid, picric acid and sodium, or lead hydroxide. ISIDOR GREENWALD. *J. Am. Chem. Soc.* 50, 1469–74 (1928).—By the addn of EtOH to a mixt. of solns. of barbituric acid (I), picric acid (II) and NaOH a red ppt. is obtained, which contains 3 mols. I, 2 mols. II, 9 mols. NaOH and 1–2 mols. H₂O. The addn. of basic Pb(OAc)₂ to a soln. of the new Na compd. yields a red ppt. which contains 3 mols. I, 2 mols. II and 11 mols. Pb(OH)₂. C. J. WEST

The action of phosphorus pentachloride and trichloride on acetone cyanohydrin. ANNA CHRZASZCZEWSKA AND WACŁAW SOBIEŃSKI. *Roczniki Chem.* 7, 470–6 (1927).—To a soln. of 255 g. Me₂C(OH)CN (I) in 255 cc. pure benzene 312 g. PCl₅ is added with efficient stirring at $25-30^\circ$ (cooling). The product is then heated to 50° until the HCl stream has ceased, poured into ice water and the benzene layer washed with Na₂CO₃ and fractionated. α -Chloroisopropyl cyanide is obtained in poor yield as a liquid of fairly pleasant odor, b_D 51.5– 2.5° , d_4^{13} 1.0641, n 1.43482, 1.43242, 1.44021, 1.44498 for D, H _{α} , H _{β} and H _{γ} at 13.8° . With excess or equimol. quantities of PCl₅, products with a higher Cl content were obtained. α -Cyanoisopropyl phosphite, [Me₂C(NC)]₂-PO₃, prepd. in 69 g. yield by 2 hrs. refluxing of 85 g. I and 45.8 g. PCl₅ in 130 cc. benzene, oil, scarcely sol. in water, b_D 153– 4° , n 1.4467, 1.4442, 1.4528 for D, H _{α} and H _{β} at 12° , d_4^{12} 1.082. MARY JACOBSEN

Mechanism of carbohydrate oxidation. VIII. The action of potassium hydroxide on fructose. WM. L. EVANS AND J. F. HUTCHMAN. *J. Am. Chem. Soc.* 50, 1496–503 (1928); cf. *C. A.* 22, 1138.—The action of aq. KOH of various concns. on fructose was studied at 25° , 50° and 75° for the purpose of ascertaining whether the character and the quantities of the reaction products obtained under these conditions were in harmony with the commonly accepted views with reference to the presence of equilibrated systems of certain isomeric hexoses and enediols in such solns. The equilibrated systems should be disturbed by such exptl. conditions as temp. and concn. of alkali. Since glucose is 1 of the carbohydrates formed from fructose in alk. soln., then these 2 hexoses should show the same general relationship to the exptl. factors of temp. and concn. of alkali. The general results show that this is true. If the hexose-3,4-enediols in alk. solns. of appropriate concn. rupture at the double bond to form 2 mols. of HO-CH₂CH(OH)CHO, then the reaction products obtained from fructose should be the same as those obtained from HOCH₂CH(OH)CHO under similar conditions and they

should bear the same general relationship to each other and to the variable exptl. conditions. The exptl. data bearing on the formation of lactic acid, AcOH and HCO_2H and also the production of AcCHO are in harmony with this statement. The max. yields of AcCHO occur at approx. the same alkali normality as that at which appreciable amts. of lactic acid were first observed. This max. point for AcCHO production from fructose at 25° was approx. N and at 50° $0.5\ N$. This is also true for $\text{HOCH}_2\text{CH}(\text{OH})\text{CHO}$, $(\text{HOCH}_2)_2\text{CO}$ and galactose. The max. yields of AcCHO from fructose and glucose should be different by reason of the difference in the concn. of the $\text{HOCH}_2\text{CH}(\text{OH})\text{CHO}$ in each case, which is due in turn to the fact that equilibria in the case of each carbohydrate are not quant. identical. Max. yields of AcOH and HCO_2H are also obtained with fructose, as has been observed for glucose. The quant. differences are probably due to the differences in the equil. conditions noted above. C. J. WEST

Constitution of pine-wood lignin. VII. β -Lignosulfonic acid. PETER KLASON. *Ber.* 61B, 614-5 (1928); cf. C. A. 22, 1361.— β -Lignosulfonic acid (I) differs from the α -acid chiefly in that it is not pptd. from acid soln. by β - $\text{C}_{10}\text{H}_7\text{NH}_2 \cdot \text{HCl}$ and it also forms no insol. basic Ba salt. In paper I it was stated that on complete extrn. of the lignin from the wood with SO_3 , 70% of the lignin is found in the waste liquor as the α -acid. A repetition of the expt. has given the value 67%, the lignin content of the wood being taken as 27%. β -Lignin must, therefore, constitute about 30% of the total lignin. After the α -acid has been completely removed from the waste liquor, I is pptd. by $\text{Pb}(\text{OAc})_2$ in almost white amorphous form. To test the earlier suggestion that lignin may contain not only the complex $\text{RCH}:\text{CHCHO}$ but also the alc. $\text{RCH}:\text{CHCH}_2\text{OH}$, 50 cc. was treated with 2 cc. of 30% H_2O_2 and 0.2 cc. FeCl_3 and when the H_2O_2 had disappeared (12 hrs.) addn. of β - $\text{C}_{10}\text{H}_7\text{NH}_2 \cdot \text{HCl}$ gave at once a yellow ppt. with the same properties as the $\text{C}_{10}\text{H}_7\text{NH}_2$ salt of the α -acid but contg. only 0.5 as much MeO , i. e., the complex in the resulting acid was $\text{C}_{10}\text{H}_{18}\text{O}_6$ instead of $\text{C}_{20}\text{H}_{20}\text{O}_6$. I itself, therefore, probably contains a combination of coniferyl aldehyde and alc. of the type $\text{RCH}(\text{OH})\text{OCH}_2\text{R}$ with the compn. $\text{C}_{10}\text{H}_{18}\text{O}_6$. In the salt $\text{C}_{10}\text{H}_{18}\text{O}_7 + \text{H}_2\text{SO}_4 + 2\text{C}_{10}\text{H}_7\text{NH}_2 + \text{H}_2\text{O}$ of I previously described it seemed that there must be a CO_2H group but treatment with alkali gave no non-volatile CO_2H acid and K. therefore thinks it more probable that it is a salt $\text{C}_{10}\text{H}_{18}\text{O}_6 + \text{H}_2\text{SO}_4 + 2\text{C}_{10}\text{H}_7\text{NH}_2 + \text{H}_2\text{O}$. β -Lignin is probably that more easily sol. part of the lignin which, according to Kullgren (*Ingeniör-vetenkaps Akad. Handl.* No. 65 (1927)) is dissolved out in the 1st stage (at 130°) of the boiling of the wood with NaOH . C. A. R.

Synthesis of a truxinic acid. F. BACHÉR. *Ber.* 61B, 543-7 (1928).—This preliminary communication is published now because of the appearance of Vogel's paper (C. A. 21, 3603). $\text{PhCH}:\text{C}(\text{CO}_2\text{Me})_2$ in Et_2O with activated Al-Hg and a little H_2O gives, along with $\text{PhCH}_2\text{CH}(\text{CO}_2\text{Me})_2$ as the chief product, 5-15% of the 2 isomeric *tra*-*Me* 2,3-diphenylbutane-1,1,4,4-tetracarboxylates, sepd. by tedious crystn. from Et_2O into the 2 forms, m. $163-4^\circ$ and 167° (about 5.5 and 2.8 g., resp., from 10 g. of the mixt.). The lower melting form in xylene- PhMe in ice-salt added to a cold suspension of NaOMe (prepd. by pulverizing Na under xylene, adding PhMe and MeOH and warming) and then treated with Br in PhMe gives, together with about 20% of unchanged material and a brominated compd. insol. in Na_2CO_3 , *tetra*-*Me* 3,4-diphenylcyclobutane-1,1,2,2-tetracarboxylate, m. 148° , which is completely sapon. only with extreme difficulty; heated a short time with KOH in MeOH and then 3 hrs. with aq. NaOH it yields the *di*-*Me* ester, m. $203-5^\circ$ (decompn.), losing 2 mols. CO_2 and yielding *di*-*Me* γ -truxinate, m. $116-7^\circ$ (free acid, m. 238°). C. A. R.

Cyclohexyl- and cyclohexylmethylalkylacetic acids and their action towards B. leprae. ROGER ADAMS, W. M. STANLEY AND H. A. STEARNS. *J. Am. Chem. Soc.* 50, 1475-8 (1928); cf. C. A. 22, 228.—By the previously described methods, the following *di*-*Et* cyclohexylalkylmalonates, $\text{C}_6\text{H}_{11}\text{C}(\text{CO}_2\text{Et})_2\text{R}$, were prepd.: R is C_6H_{11} , b_2 121-5°, n_D^{25} 1.4553, d_4^{25} 0.9850 (this order will be used below); C_6H_{13} , b_2 128-30°, 1.4559, 0.9755; C_7H_{15} , b_2 135-9°, 1.4562, 0.9685; C_8H_{17} , b_2 144-8°, C_8H_{19} , b_2 149-54°, 1.4567, 0.9574; $\text{C}_{10}\text{H}_{21}$, b_2 157-61°, 1.4570, 0.9540; $\text{C}_{11}\text{H}_{23}$, b_2 170-5°, 1.4574, 0.9532; $\text{C}_{12}\text{H}_{25}$, b_2 185-9°, 1.4589, 0.9466. *Di*-*Et* cyclohexylmethylalkylmalonates, $\text{C}_6\text{H}_{11}\text{CH}_2\text{C}(\text{CO}_2\text{Et})_2\text{R}$: R is *Et*, $b_{4.5}$ 143-5°, 1.4542, 1.0104; *Pr*, b_3 154-5°, 1.4529, 1.0062; *Bu*, $b_{4.5}$ 157-9°, 1.4548, 0.9910; *Am*, b_4 159-60°, 1.4558, 0.9853; C_6H_{13} , $b_{2.5}$ 160-3°, 1.4544, 0.9721; C_7H_{15} , b_4 183-5°, 1.4560, 0.9679; C_8H_{17} , b_4 178-81°, 1.4570, 0.9612. Cyclohexylmethylalkylmalonic acids, $\text{C}_6\text{H}_{11}\text{CH}_2\text{C}(\text{CO}_2\text{H})_2\text{R}$: R is *Et*, m. 127.5-30°; *Pr*, m. 145-7°; *Bu*, m. 132-4°; *Am*, m. 132-5°. Cyclohexylalkylacetic acids, $\text{C}_6\text{H}_{11}\text{CH}(\text{CO}_2\text{H})\text{R}$: R is C_6H_{11} , b_2 136-9°, n_D^{25} 1.4640, d_4^{25} 0.9544; C_6H_{13} , b_2 145-9°, 1.4641, 0.9449; C_7H_{15} , b_2 148-52°, 1.4641, 0.9350; C_8H_{17} , b_2 158-61°, 1.4642, 0.9298; C_8H_{19} , b_2 167-71°, 1.4645,

0.9245; $C_{10}H_{21}$, b_2 165–9°, 1.4649, 0.9224; $C_{11}H_{23}$, b_2 173–7°, 1.4650, 0.9166; $C_{12}H_{25}$, b_2 187–91°, 1.4653, 0.9129. *Cyclohexylmethylalkylacetic acids*, $C_6H_{11}CH_2CH(CO_2H)R$: R is *Et*, b_2 131–2°, 1.4623, 0.9814; *Pr*, $b_{4,5}$ 141–3°, 1.4628, 0.9720; *Bu*, b_3 133–6°, 1.4620, 0.9564; *Am*, b_2 139–42°, 1.4630, 0.9516; C_8H_{17} , b_4 174–5°, 1.4627, 0.9448; C_7H_{15} , b_3 202–4°, 1.4632, 0.9393; C_8H_{17} , b_4 186–90°, 1.4640, 0.9331. Those acids having 16–18 C atoms were especially effective towards *B. leprae*. C. J. WEST

Cyclopentylalkylacetic acids and ω -cyclopentylethylalkylacetic acids and their bactericidal action towards *B. leprae*. G. R. YOHE and ROGER ADAMS. *J. Am. Chem. Soc.* **50**, 1503–8 (1928); cf. preceding abstr.—Cyclopentylethanol, b_{24} 96.5–7°, n_D^{20} 1.4577, d_4^{20} 0.9180; bromide, b_{19} 75–7°, 1.4863, 1.2860. Cyclopentylbutanol, b_2 88–92°, 1.4613, 0.9033 (70–5% yield); bromide, b_{17} 110–1°, 1.4820, 1.1872 (60–5% yield); cyanide, b_{17} 124–6.5°, 1.4542, 0.8887 (80–5% yield); hydrolysis with NaOH in 60% EtOH gives 80–5% of δ -cyclopentylpentanoic acid, b_2 124–8°, 1.4594, 0.9752. *Di-Et δ -cyclopentylbutylmalonate*, $b_{2,2}$ 154–60°, 1.4493, 0.9934 (40% yield); the acid, m. 121–4° (85% yield); heating the acid 2 hrs. at 160–80° gives 75% of ϵ -cyclopentylhexanoic acid, $b_{1,8}$ 133–5°, m. 33 3.5°, n_D^{36} 1.4549, d_4^{35} 0.9518. The following *di-Et cyclopentylalkylmalonates* were prep'd where R in the formula $C_5H_9C(CO_2Et)_2R$ is: C_7H_{15} , b_1 143–6°, n_D^{20} 1.4548, d_4^{20} 0.9749; C_8H_{17} , b_1 160–5°, 1.4553, 0.9659; C_9H_{19} , $b_{0,5}$ 152–5°, 1.4567, 0.9617; $C_{10}H_{21}$, b_1 169–71°, 1.4571, 0.9560, $C_{11}H_{23}$, b_1 186–9°, 1.4580, 0.9522. *Di-Et β -cyclopentylethylalkylmalonates*, $C_5H_9(CH_2)_2C(CO_2Et)_2R$: R is *Et*, b_2 125°, 1.4478, 1.0082; *Et*, $b_{1,9}$ 126–9°, 1.4511, 0.9924; *Pr*, $b_{1,7}$ 134–5°, 1.4510, 0.9873; *Bu*, $b_{1,8}$ 136–40°, 1.4523, 0.9783; *Am*, $b_{1,1}$ 148–50°, 1.4526, 0.9688; C_8H_{17} , 157–62°, 1.4531, 0.9624; C_7H_{15} , b_2 172–4°, 1.4541, 0.9563; C_8H_{17} , $b_{1,2}$ 182–4°, 1.4548, 0.9524. β -Cyclopentylethylalkylmalonic acids, $C_5H_9(CH_2)_2C(CO_2H)_2R$: R is *Et*, m. 126.5°, *Et*, m. 141–3°, *Pr*, m. 137–8°, *Bu*, m. 139–40.5°, *Am*, m. 124–7°, C_8H_{17} , m. 129.5–30°. β -Cyclopentylalkylacetic acids, $C_5H_9CH(CO_2H)R$: R is C_7H_{15} , $b_{1,4}$ 155–60°, 1.4594, 0.9312; C_8H_{17} , b_2 166–9°, 1.4609, 0.9279; C_9H_{19} , $b_{1,4}$ 177–8.5°, m. 37–7.5°; $C_{10}H_{21}$, $b_{1,7}$ 189–90°, m. 34 5–6°; $C_{11}H_{23}$, b_3 193–7°, m. 43.5–5.5°. β -Cyclopentylethylalkylacetic acids, $C_5H_9(CH_2)_2CH(CO_2H)R$: R is *Et*, $b_{2,4}$ 115–8°, 1.4575, 0.9849; *Et*, $b_{1,3}$ 122–4.5°, 1.4590, 0.9602; *Pr*, $b_{1,9}$ 130–2°, 1.4595, 0.9533; *Bu*, b_1 136–7°, 1.4608, 0.9435; *Am*, $b_{1,9}$ 150–4°, 1.4610, 0.9360; C_8H_{17} , $b_{1,9}$ 157–61°, 1.4616, 0.9303; C_7H_{15} , b_2 167–9°, 1.4621, 0.9252; C_8H_{17} , $b_{1,5}$ 173–6°, 1.4629, 0.9210. Undecyl bromide, $b_{1,8}$ 134–7°, 1.4571, 1.0521. *Di-Et cyclopentylmalonate*, b_2 115–7°, 1.4440, 1.0325. The greatest bactericidal action is found in the acids contg. 16–18 C atoms; the β -cyclopentylethylalkylacetic acids are slightly more effective than the isomeric cyclopentylalkylacetic acids; a similar slight difference could be detected in the cyclohexyl series. Cyclopentylnonylacetic acid and cyclopentylethylheptylacetic acid, isomeric with dihydrohydnoacarpic acid, are far more bactericidal than the latter compd. There is no significant difference in bactericidal effect between the cyclohexyl and cyclopentyl compds. of equal mol. wt. or of equal length side chain, though the figures appear to favor the cyclohexyl compds. The bactericidal action is not affected markedly by the presence of the double bond. C. J. WEST

Heat treatment of cyclic ketones. WILHELM TREIBS. *Ber* **61B**, 683–7 (1928); cf. Ipat'ev and Petrov, *C. A.* **22**, 1135.—The ketones were heated in a 500-cc. autoclave with 0.5 their wt. of unglazed clay plate fragments. There occurred (1) Polymerization of 2 and 3 mols. with elimination of H_2O and formation of unsatd. ketones and hydrocarbons of higher mol. wt.: $2C_{11}H_{16}O - H_2O = C_{20}H_{30}O$. (2) Formation of phenols, especially at high temps.: $C_{10}H_{16}O - H_2 = C_{10}H_{14}O$. (3) Formation of cymene: $C_{10}H_{16}O - H_2O = C_{10}H_{14}$. (4) With fenchone and camphor satd. hydrocarbons, C_8H_{16} , were formed by elimination of CO. Cyclohexanone in 6 hrs. at 300° gave about 25% of higher polymerization products, chiefly cyclohexylidene cyclohexanone, b. 274–8°; the higher fractions deposited cryst. triphenylene dodecahydride, m. 226°. At 250° about $1/3$ of the ketone O was split off as H_2O in 18 hrs., $1/2$ in 30 hrs. Only small quantities of low boiling hydrocarbons were formed; cyclohexene, b. 80–6°, was identified. No gases were formed at 250° but considerable quantities (especially CO) were evolved after 3 hrs. at 350°; after 7 hrs. the CO production was diminished and there were formed low-boiling, chiefly satd. products from which a hydrocarbon $C_{12}H_{22}$ (probably cyclohexane), b. 74–80°, was isolated in considerable quantity. Methylcyclohexanone (a mixt. of the 3 isomers) split off no CO at 300–50° but formed considerable quantities of a dimol. unsatd. ketone $C_{14}H_{22}O$, b. 290–3°, b_{20} 160–4°, d_{20} 0.9771, high-boiling, strongly unsatd. compds (the highest-boiling fractions of which were O-free) and small quantities of low-boiling products, among which was identified methyleyclohexene, b. 105–10°. At 375–400° were formed

CO and low-boiling, chiefly satd. hydrocarbons. With piperitone, splitting off of CO began at 400°. After 3 hrs. at 420° 0.2 of the ketone O was eliminated as GO and *p*-cymene was detected in the products; 17% of the ketone was converted into phenols, b. 200–40° (*m*-cresol and thymol were isolated). Thymol itself at 500° yielded *m*-cresol and MeCH:CH₂. Carvacrol decomp. in the same way but less easily, and cymene still less readily, slowly decomp. to C₆H₆ only at 600°. Carvone in 6 hrs. at 450° gave 25% phenols, b. 190–235° (the higher-boiling fractions contained carvacrol). Citronellal in 3 hrs. at 420° gave very small quantities of cymene and phenols, b. 190–215°. Fenchone lost CO above 400° (0.2 of the ketone O in 15 hrs.). The elimination of H₂O was very irregular and amounted up to 0.25 of the ketone O. Phenols were formed in relatively small and varying quantities (5% after 8 hrs., 10% after 16 hrs. at 450°). There were also obtained *m*-cymene, a small quantity of hydrocarbons b. 130–40°, consisting of about 2/3 satd. compds. C₈H₁₈ and 1/3 unsatd. compds. C₈H₁₄, and higher, unsatd. polymerization products, b. 220–370°, whose O content and rotatory power decrease with increase in the b. p. Camphor lost CO at 380° until about 1/3 of the ketone O was eliminated and then chiefly easily volatile satd. hydrocarbons were formed. In 6 hrs. at 420° it gave 8% phenols, in 14 hrs. 15% (*m*-cresol and carvacrol were isolated). There were also obtained satd. hydrocarbons (C 88.1, H 11.3%), b. 188–98°, d₂₀ 0.8797, and *p*- and *m*-cymene. The product obtained by heating 10 hrs. at 420° yielded a ketone identical in all of its properties and those of its derivs. with fenchone. C. A. R.

The Friedel and Crafts reaction and organometallic aluminum compounds. PIETRO LEONE. *Atti II congresso naz. chim. pura applicata* 1926, 1332–7.—A compilation of work described in sep. articles elsewhere (cf. C. A. 19, 2929; 20, 1065).

The mechanism of the Claisen reaction. FRED. SWARTZ. *Atti II congresso naz. chim. pura applicata* 1926, 1322–5 (in French).—See C. A. 21, 898.

C. C. DAVIS

The nitration of *m*-acetaminotrifluorotoluene. H. ROUCHE. *Bull. sci. acad. roy. Belg.* 13, 346–57 (1927).—R. studies the nitration of *m*-CF₃C₆H₄NIHAc (I), m. 203°. Dissolving I in 20 parts of H₂SO₄ (II) and adding fuming HNO₃ in 4 parts of II at –5°, gives 1,3,6-C₆H₃(CF₃)(NIH₂)NO₂ (III), m. 129° (84%), and the 1,3,4-isomer (IV), m. 101° (6%). I with 2 moles of AcNO₃ at –5° gives IV (61%) and 1,2,3-C₆H₃(CF₃)(NO₂)NIH₂ (V), m. 64° (25%). III and V have been characterized by their amides, m. 123.5° and 171°. The structure has been detd. by deamination with EtNO₂ and II in EtOH. III gives *o*-CF₃C₆H₄NO₂ (VI), m. 32.5°, b₇₆₅ 216.3°. V on deamination also gives VI. IV gives *p*-CF₃C₆H₄NO₂ (VII), m. 41.5°. VI on reduction with Sn and HCl gives *o*-CF₃C₆H₄NIH₂ (VIII), b₂₁ 73°, amide, m. 94°. VIII by the Sandmeyer method with KCN gives *o*-CF₃C₆H₄CN, m. 7.5°, which on hydrolysis with 75% II gives *o*-C₆H₄(CO₂H)₂. III in a similar manner has been identified by conversion to the following compds: 1,3,6-C₆H₃(CF₃)(NIH₂)₂, m. 58°, to 1,3,6-C₆H₃(CO₂H)(NH₂)₂, to *p*-C₆H₄(NH₂)₂. D. H. POWERS

Solubility of *m*-nitroaniline in water. J. H. WALTON AND T. G. FINZEL. *J. Am. Chem. Soc.* 50, 1508–10 (1928).—The soly. of *m*-O₂NC₆H₄NH₂ in H₂O is reported from 0° to 83.4°. In agitating *m*-O₂NC₆H₄NH₂ and H₂O it is shown that the solid phase settles with such difficulty and is so finely divided that either an asbestos or Mandler filter must be used as a sampler. At 25° the rate of soln., near the satn. point, is extremely slow. The av. soly. at 83.4° is 1.23%. A comparison between the TiCl₃ and the NaNO₂ method for the analysis of *m*-O₂NC₆H₄NH₂ is made, the former giving the more concordant results. C. J. WEST

***p*-Nitrophenylnitrosohydroxylamine.** DINO BIGIACI. *Atti II congresso naz. chim. pura applicata* 1926, 1315–21.—No nitronitrosophenylnitrosohydroxylamines are mentioned in the literature. They cannot in general be prepd. by the method of Baudisch for nitrosoarylhydroxylamines, for *o*- and *p*-O₂NC₆H₄NHOH are unknown. On the other hand the method of Angeli is applicable. *p*-ONC₆H₄NO₂ (I) (1 g.) in boiling EtOH (30 cc.), dild. with water (50 cc.), concd. aq. ON:NONa (II) (1 g.) slowly added, filtered (residue of 0.2 g. of (*p*-O₂NC₆H₄)₂N₂O (III)), the filtrate concd. to 20 cc., again filtered while warm, let cool, the ppt. filtered and washed with a little water yields *Na p*-nitrophenylnitrosohydroxylamine, *p*-O₂NC₆H₄N(O):NONa. 5H₂O (IV); in powder form it is maroon-yellow, adheres to the m. p. tube at 80–100°, forms a compact mass at 110°, which becomes light yellow at 140°, darkens toward 200°, blackens at 260° and fuses to a black liquid, deflagrates on Pt foil, gives a brown-yellow soln. in hot water, is not hygroscopic, is stable in air when not in soln., loses 4H₂O in a desiccator and all 5H₂O at 100°. The formation of both III and IV shows simultaneous reduction and oxidation, like the Cannizzaro reaction. If in the reaction with I a large

excess of II is added rapidly, instead of III being formed, $(p\text{-O}_2\text{NC}_6\text{H}_4\text{N})_2$ is pptd. No $p\text{-C}_6\text{H}_4(\text{NO}_2)_2$ is formed under any condition. Its absence is due to the fact that it is capable of reacting with $\text{ON}:\text{NOH}$, being reduced for the most part to $p\text{-ONC}_6\text{H}_4\text{NO}_2$, which in turn reacts with the Angeli acid, probably by a mechanism analogous to that observed by Meisenheimer with H_2NOH and $p\text{-C}_6\text{H}_4(\text{NO}_2)_2$ (cf. C. A. 14, 52). Ba $p\text{-nitrophenylnitrosohydroxylamine}$, prepd. from IV, m. 260° , suspended in ice-water, acidified with dil. HCl, filtered, the residue dissolved in dil. KOH and repptd. with dil. HCl, yields $p\text{-nitrosophenylnitrosohydroxylamine}$ (V), also formed by acidifying aq. IV at 0° with dil. H_2SO_4 , m. $78\text{--}80^\circ$ (decompn.), reacts with HNO_2 like other compds. of its type; with PhHNHNH_2 in Et_2O it forms the addn. compd. $p\text{-O}_2\text{NC}_6\text{H}_4\text{N}(\text{O})\text{PhHNHNH}_2$, light yellow, with pearly luster, softens 88° , m. 90.5° to an orange-red liquid with evolution of gas, unstable *in vacuo* in darkness. NiH_4 salt of V prepd. from the acid in Et_2O and NH_3 gas, yellow, becomes rose-colored around 80° , m. 145° to a brown liquid with evolution of gas. The Sn, Ag, Hg and Li salts were prepd. by pptn. from aq. IV. Aq. CoCl_2 added slowly to aq. IV gives an orange ppt. which redissolves in excess IV, but with enough CoCl_2 is formed a permanent ppt. of the Co salt, $(\text{C}_6\text{H}_4\text{O}_4\text{N}_3)_2\text{Co}$, orange-yellow, turns brown at 215° and m. 222° (decompn.) to a black liquid. It gives in Me_2CO , a brown-red soln. which on concn. deposits maroon-red crystals. In hot $\text{C}_6\text{H}_5\text{N}$ it gives a dark red soln. which on cooling deposits violet-red crystals of a $\text{C}_6\text{H}_5\text{N}$ addn. compd., loses $\text{C}_6\text{H}_5\text{N}$ on exposure to air, becoming maroon-red. Ni salt, $(\text{C}_6\text{H}_4\text{O}_4\text{N}_3)_2\text{Ni}$, light green from Me_2CO , darkens at 225° , turns brown at 240° , m. 249° to a black liquid (decompn.). Crystd. from $\text{C}_6\text{H}_5\text{N}$, a grass-green compd. is formed, while the mother liquor acquires a maroon-green tone. Aq. CuCl_2 added to an aq. suspension of IV ppts. the Cu salt, $(\text{C}_6\text{H}_4\text{O}_4\text{N}_3)_2\text{Cu}$, blue-green; its $\text{C}_6\text{H}_5\text{N}$ soln. deposits a compd. contg. $\text{C}_6\text{H}_5\text{N}$, green, becomes greenish gray at 100° . The Cu salt turns brown at 200° and m. 250° (decompn.). Aq. FeCl_3 added to an aq. suspension of IV, and the ppt. recrystd. from hot Me_2CO , yields the Fe salt, $(\text{C}_6\text{H}_4\text{O}_4\text{N}_3)_3\text{Fe}$, dark maroon-red, m. 202° (decompn.); its Me_2CO soln. dild. with water and acidified with dil. HCl gives almost no color with KSCN, no immediate reaction with $\text{K}_4\text{Fe}(\text{CN})_6$ and no immediate ppt. with $(\text{NH}_4)_2\text{S}$ from its neutral aq.- Me_2CO soln. Water (300 cc.) added to $p\text{-C}_6\text{H}_4(\text{NO}_2)_2$ (1.75 g.) in boiling EtOH (75 cc.) to give extremely fine crystals, IV (5.3 g.) added in 5 portions during 1.5 hr., the greater part of the EtOH distd. *in vacuo* and the ppt. in the residual soln. recrystd. from EtOH , yields 0.75 g. of $p\text{-HOC}_6\text{H}_4\text{NO}_2$, while the mother liquor when filtered and concd. yields 1.4 g. of IV.

C. C. DAVIS

Aliphatic-aromatic arseno compounds. II. β -Hydroxyethylarsonic acid and some arsenoethanols. R. H. EDDE. *J. Am. Chem. Soc.* 50, 1394-9 (1928); cf. C. A. 21, 1627.—In the 1st series of compds. reported all of the members were sol. because of the presence of a CO_2H group in the aliphatic part of the mol.; the present series contains the $\text{CH}_2\text{CH}_2\text{OH}$, as the aliphatic portion and various aryl groups as the aromatic part of the arseno mol. An improved method is given for the prepn. of $\text{H}_2\text{O}_3\text{AsCH}_2\text{CH}_2\text{OH}$ (I), which crysts. after standing about 1 yr. with 1 mol. H_2O , lost *in vacuo* at 80° and m. $157\text{--}9^\circ$; its metallic salts are all extremely sol. and decomp. on evapn. of their solns. Reduction of a mixt. of $\text{H}_2\text{O}_3\text{AsC}_6\text{H}_4\text{OH}$ and I gives 67% of 4-hydroxyphenylarsonoethanol, orange powder; oxidation with alk. H_2O_2 gives the 2 original acids. I and arsanilic acid give 4-aminophenylarsonoethanol, orange powder; the HCl salt is orange-yellow. 4-Acetoxypheylarsonoethanol, yellow (36% yield); if the reaction product is heated to 60° for 10 min. after standing 3 days, there results the unsymtriarsenoethanol, $\text{C}_{10}\text{H}_{12}\text{O}_4\text{As}$, yellow; both are alkali-sol. Reduction of 3,4- $\text{H}_2\text{N}(\text{HO})\text{C}_6\text{H}_3\text{AsO}_3\text{H}_2$ and I gives 11.2% of 3-amino-4-hydroxyphenyltetraarsenoethanol, orange. 4-Glycinephenyltetraarsenoethanol, orange.

C. J. WEST

A new method for the preparation of organic aliphatic selenium, tellurium and arsenic compounds. GIULIO NATTA. *Atti II congresso naz. chim. pura applicata 1926*, 1326-31.—See C. A. 20, 3273.

C. C. DAVIS

Cyclic organo-metallic compounds. IV. Tellurylum compounds. H. D. K. DREW. *J. Chem. Soc.* 1928, 506-10; cf. C. A. 21, 1251.—Further study of the compd. previously named diphenoxytellurylum hydroxybisulfate monohydrate shows that the decompn. by H_2O is quant.; the % of phenoxtellurine present as acceptor in this compd. is 53.5; the % in the donor form is 27.9; the compd. is therefore triphenoxytellurylum dibisulfate. The same method has been applied to the parent compds. of the series and the structures previously assigned to them have been confirmed. The previously described compd. of phenoxtellurine and 2-chloro-8-methylphenoxtellurine in mol. equiv. proportions has now been sep'd. into its constituents by the fractional pptn. of its CHCl_3 soln. with Br; the phenoxtellurine is pptd. first as the dibromide.

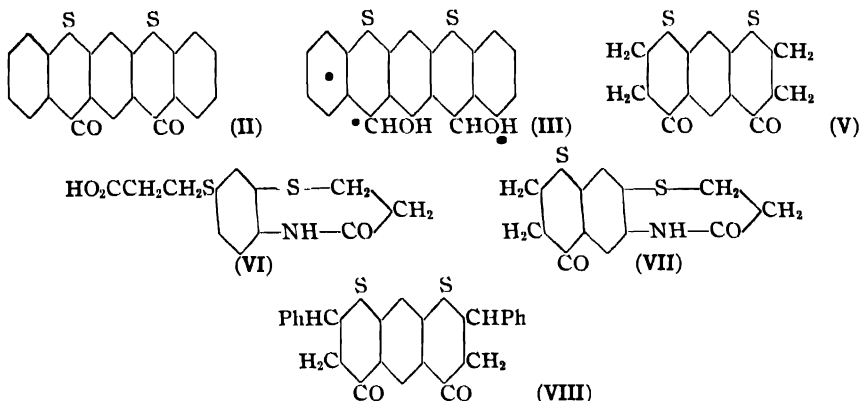

Chloromethylphenoxtellurine dibromide, yellow, m. 315° (decompn.); reduction to the *tellurine*, pale yellow, m. 46–7°, takes place very slowly; the *dichloride*, pale yellow, m. 300° (decompn.); *diacetate*, m. 230–2° (decompn.); *bisulfate*, cream-colored. In cold concd. H_2SO_4 the tellurine gives a deep maroon-red soln., which evolved SO_2 ; a little H_2O gives a dark red product, crystg. from AcOH as a dark blue-black powder with greenish bronze luster; the AcOH soln. is intense reddish purple, which becomes pale yellow on diln. or heating (reversible change). The di- α -bromocamphor- π -sulfonate was prepd. but could not be purified because of its tendency to hydrolyze.

C. J. WEST

Cresolarsonic acids. C. FINZI. *Atti II congresso naz. chim. pura applicata* 1926, 1302–11.—Of the 10 possible cresolarsonic acids, only 3 are definitely known (cf. Jacobs and Heidelberger, *C. A.* 13, 2371; Christiansen, *C. A.* 17, 2109). The most direct way to prep. these compds. should be to apply the Bart method (*C. A.* 17, 82) to the corresponding aminophenols. Expts., however, with 3,2-, 5,2-, 4,3- and 2,5-Me(HO)- $\text{C}_6\text{H}_3\text{NH}_2$ under various conditions gave only in the first 2 cases an appreciable yield of the $\text{AsO}(\text{OH})_2$ acid, the 1st already known, the 2nd a new compd. The Bart reaction is therefore not suitable for prep. cresolarsonic acids, and resort was had to the prepn. of the aminomethylphenylarsonic acids. This involved the prepn. of 3 of the latter which were not known. 3,2-Me(HO) $\text{C}_6\text{H}_3\text{NH}_2\text{Cl}$ (6.4 g.) diazotized with NaNO_2 , poured into a soln. prepd. from As_2O_3 (3.96 g.), NaOH (11.25 g.) and water (750–800 cc.), let stand overnight, heated to 60–70°, concd., the excess arsenite oxidized with H_2O_2 , the arsenate pptd. with BaCl_2 , filtered, excess BaCl_2 eliminated with Na_2SO_4 , concd. until NaCl seps., acidified with HCl , the ppt. crystd. repeatedly from boiling water, with purification by animal charcoal, yields 3,2-Me(HO) $\text{C}_6\text{H}_3\text{AsO}(\text{OH})_2$, m. 205° (cf. 198–200° of Christiansen), gives a color with FeCl_3 . 4,3-Me(H_2N) $\text{C}_6\text{H}_3\text{AsO}(\text{OH})_2$ (cf. *C. A.* 12, 2550) (5 g.) in N H_2SO_4 (25 cc.) diazotized with NaNO_2 , warmed to 50–60°, dild., the H_2SO_4 pptd. with $\text{Ba}(\text{OH})_2$, filtered, made alk. with Na_2CO_3 , concd., acidified with HCl and the ppt. recrystd. from boiling water, yields 3-hydroxy-4-methylphenylarsonic acid, m. 174–5°, gives no color with FeCl_3 . Two g. dissolved in 5–6 cc. of a H_2SO_4 - HNO_3 mixt. (3 parts concd. H_2SO_4 + 2 parts HNO_3 of d. 1.40) cooled with ice, let stand at room temp., poured into ice water (20–25 cc.) and the ppt. recrystd. from boiling water, yields 3-hydroxy-4-methylnitrophenylarsonic acid, yellowish, m. toward 237° (decompn.), gives no color with FeCl_3 . From 4,2-Me(H_2N) $\text{C}_6\text{H}_3\text{AsO}(\text{OH})_2$ (2.3 g.) was obtained 2-hydroxy-4-methylphenylarsonic acid, 4,2-Me(HO)- $\text{C}_6\text{H}_3\text{AsO}(\text{OH})_2$, H_2O , softens at 125°, then solidifies, and the anhyd. acid, m. 173°, gives an intense red color with FeCl_3 . Four g. treated with 7–8 cc. of the same H_2SO_4 - HNO_3 mixt. used before yielded 2-hydroxy-4-methylnitrophenylarsonic acid, 4,2-Me(HO)- $\text{C}_6\text{H}_3(\text{NO}_2)\text{AsO}(\text{OH})_2 \cdot 2\text{H}_2\text{O}$, contracts around 120°, and the anhyd. acid, m. 193°, gives a purplish red color with FeCl_3 . Prepd. in the same way as 3,2-Me(HO) $\text{C}_6\text{H}_3\text{AsO}(\text{OH})_2$, 5,2-Me(HO) $\text{C}_6\text{H}_3\text{NH}_2$ (8 g.) and Na_3AsO_3 (from 4.95 g. As_2O_3) yielded 2-hydroxy-5-methylphenylarsonic acid (1.5H \cdot O), softens at 90–100°, solidifies at higher temps., and the anhyd. acid, m. around 218°, gives a color reaction with FeCl_3 . From 2,5-Me(H_2N) $\text{C}_6\text{H}_3\text{AsO}(\text{OH})_2$ (cf. *C. A.* 9, 1333; 12, 2550; 19, 478) was prepd. 5-hydroxy-2-methylphenylarsonic acid, m. 184–5°, gives no color with FeCl_3 . 4,3-Me(HO)- $\text{C}_6\text{H}_3\text{AsO}(\text{OH})_2$ (2 g.) heated on the water bath with a few cc. of H_3PO_2 (d. 1.27) ppts 3,3'-dihydroxy-4,4'-dimethylarsenobenzene, m. 192–7°, sol. in aq. alkalis. In the same way from 4,2-Me(HO) $\text{C}_6\text{H}_3\text{AsO}(\text{OH})_2$ was prepd. 2,2'-dihydroxy-4,4'-dimethylarsenobenzene, amorphous, orange-yellow, m. 108–10° (decompn.), sol. in aq. alkalis. Similarly from 4,2-Me(HO) $\text{C}_6\text{H}_3(\text{NO}_2)\text{AsO}(\text{OH})_2$ was prepd. 2,2'-dihydroxy-4,4'-dimethyldinitroarsenobenzene, amorphous, canary-yellow, turns brown toward 189°, m. 191° (decompn.), gives intense orange-red solns. in aq. alkalis. Only the cresolarsonic acids with the OH in the *o*-position to the $\text{AsO}(\text{OH})_2$ group give a color reaction with FeCl_3 . The position of the NO_2 in the nitro derivs. described above was not detd. C. C. DAVIS

Thiophenols. Formation of heterocyclic sulfurated nuclei. C. FINZI. *Atti II congresso naz. chim. pura applicata* 1926, 1312–5.—An outline of researches on derivs. of thiophenols, but without exptl. data. The diazo deriv. of $\text{H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{H}$ reacts with $m\text{-C}_6\text{H}_4(\text{SH})_2$ (I) to form thioresorcinol-*o*-dibenzoic acid $m\text{-C}_6\text{H}_4(\text{SC}_6\text{H}_4\text{CO}_2\text{H-}o)_2$. The position of the 2 CO_2H groups allows the formation of 2 hexatomic sulfurated nuclei by elimination of water from each CO_2H group and H in the I nucleus, so that by dissolving I in concd. H_2SO_4 , dithioxanthone (II) is obtained directly. Reduced in alk. soln. II forms dithioxanthidrol (III). By condensation of I with $\text{ClCH}_2\text{CO}_2\text{H}$ thioresorcinoldipropionic acid, $m\text{-C}_6\text{H}_4(\text{SCH}_2\text{CH}_2\text{CO}_2\text{H})_2$ (IV), was formed. Thioresorcinolacetic acid does not with strong dehydrating agents form the corresponding compd. with pentatomic sulfurated nucleus, a compd. of great importance because of

its relation to thioindigo, but IV with concd. H_2SO_4 loses $2\text{H}_2\text{O}$, forming *dithiochromanone* (V). IV also forms a compd. with a heptatomic sulfurated nucleus, a structure which is little mentioned in the literature (cf. Mayer and Horst, *C. A.* 17, 3344; Braun, *C. A.* 20, 905). On nitration IV forms the *nitro deriv.* $2,4\text{-(HO}_2\text{CCH}_2\text{CH}_2\text{S)}_2\text{C}_6\text{H}_3\text{NO}_2$, which by reduction gives the corresponding *amino deriv.* The latter heated above its m. p. loses H_2O , forming *heptaketodihydrothiazinethiopropionic acid* (VI). By dehydration with concd. H_2SO_4 VI retains its thiazine group but forms a sulfurated nucleus from the lateral chain, corresponding to that of V, giving *thiochromanoneheptathiazine* (VII). By condensation of I with α -bromohydrocinnamic acid or by the action of HBr gas on I and $\text{PhCH:CHCO}_2\text{H}$ in AcOH , *thioresorcinolhydrocinnamic acid* is formed, which with POCl_3 or P_2O_5 gives *dithioflavonone* (VIII).

C. C. DAVIS

The condensation of pyruvic acid with amines and aromatic aldehydes. ST. WEIL AND FR. GOLDBERZANKA. *Bull. trav. inst. pharm. état.* No. 6, 1-6(1927).—W. and G. condensed AcCO_2H and $p\text{-H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{Et}$ in alc. with various compds. with results as follows: BzH yielded $\text{C}_{20}\text{H}_{26}\text{O}_5\text{N}_2$, m. $203\text{--}4^\circ$; vanillin gave $\text{C}_{27}\text{H}_{28}\text{O}_7\text{N}_2$, m. $202\text{--}3^\circ$; piperonal gave $\text{C}_{29}\text{H}_{26}\text{O}_7\text{N}_2$, m. 219° ; $o\text{-HOC}_6\text{H}_4\text{CHO}$ gave $\text{C}_{28}\text{H}_{26}\text{O}_6\text{N}_2$, m. 219° ; $\text{Me}_2\text{NC}_6\text{H}_4\text{CHO}$ gave $\text{C}_{30}\text{H}_{31}\text{O}_5\text{N}_3$, m. 176° .

Decomposition of acid anhydrides. Preparation of the anhydrides by direct dehydration of the acids. J. CAMPARDOU AND M. SÉON. *Compt. rend.* 186, 591-3(1928).—By passing Ac_2O (I), over thoria at 300° complete decompn. is obtained at a temp. 100° lower than that required to decomp. the acid. When 2 moles of I and 1 mole of Bz_2O are mixed and passed over the catalyst the chief liquid fraction is BzMe . It is suggested that the decompn. of acids goes through the anhydride and that their higher temp. of decompn. is only the temp. of anhydride formation. Passing pure AcOH over TiO_2 at 300° gave a product contg. 12.8% I.

D. H. POWERS

Parachor and chemical constitution. VII. Further examples of semipolar bonds. ADOLPH FREIMAN AND SAMUEL SUGDEN. *J. Chem. Soc.* 1928, 263-9; cf. *C. A.* 22, 768.—The parachor const. for the semipolar double bond is found to be -1.6 from measurements on 5 carefully purified sulfones and related compds., which agrees with earlier work. CrO_2Cl_2 contains 2 semipolar bonds and $\text{K}_2\text{Cr}_2\text{O}_7$ 4 such linkages. The parachor for Cr is assigned the value 54 units. Sulfonal and trional give a large negative anomaly in their parachors, which may be because of the production of a cyclic phase by the formation of singlet linkages between O atoms of the SO_2 groups. $p\text{-MeC}_6\text{H}_4\text{SO}_2\text{Cl}$, m. 68° (cor.), $d_4^{25} = 1.333 - 0.000961t$, γ 35.54, 31.82 at 74° and 103.5° ; $p\text{-MeC}_6\text{H}_4\text{SO}_2\text{Et}$, m. $33\text{--}4^\circ$, $d_4^{25} = 1.206 - 0.000862t$, γ 40.62, 39.18, 37.62 and 36.14 at 40° , 53.5° , 70° and 83° ; $\text{PhCH}_2\text{SO}_2\text{Me}$, m. 124.5° , $d_4^{25} = 1.246 - 0.000825t$, γ 35.92,

C. J. WEST

Action of mixed organomagnesium compounds on some *N*-diethyl aromatic amides and on the *N*-tetraethylphthalic diamides. N. MAXIM. *Ann. chim.* 9, 55–111 (1928); cf. *C. A.* 21, 1980, 3346.—M. studies the action of RMgX on di-Et aromatic amides and the effect of varying the position of the benzene nucleus. The amides were prepd. by adding the acid chloride in C₆H₆ slowly to Et₂NH in C₆H₆ agitated under a reflux. The following new amides were prepd. in this way: $\text{PhCH}_2\text{CH}_2\text{CONEt}_2$ (I), b_{11} 170°; $\text{Ph}_2\text{CHCONEt}_2$ (II), m. 64–5°; $(\text{PhCH}_2)_2\text{CHCONEt}_2$ (III), b_{18} 225°, m. 56°; *o*-HO₂C(C₆H₄)CONEt₂ (IV), b_{14} 177°, m. 153°; *o*-C₆H₄(CONEt₂)₂ (V), b_{16} 204°, m. 36° (prepd. by carrying out the reaction at 60°); *m*-C₆H₄(CONEt₂)₂ (VI), b_{12} 242°, m. 85°; *p*-C₆H₄(CONEt₂)₂ (VII), m. 127°. The organo-Mg halide was prepd. in Et₂O and the amide slowly added to it (in Et₂O if sol.). The mixt. was heated on a water bath for 4 hrs. and allowed to stand for 12 hrs. at room temp. The product was then hydrolyzed with 20% H₂SO₄. EtMgBr (VIII), with PhCONEt₂ (IX), gave PhCOEt in the following yields with the different solvents: 31% in Et₂O; 56% C₆H₆; 60% PhMe. VIII was always prepd. in Et₂O. PhCH₂MgCl (X), with IX gave PhCOCH₂Ph 21%, 31%, 33%; a small quantity of what may have been Ph(PhCH₂)C:C(COPh)Ph was also formed. PhMgBr (XI) with IX gave no reaction. XI with PhCH₂CONEt₂ (XII), gave PhCH₂COPh (37%). VIII with XII gave PhCH₂COEt (39%). VIII with I gave PhCH₂CH₂COEt (50%); semicarbazone, m. 131–2°. IX with I gave PhCH₂CH₂COPh (69%); semicarbazone, m. 140°. PhEtCHCH₂CONEt₂ did not react with VIII. II with VIII gave Ph₂CHCOEt (31%), b_{14} 186°; oxime, m. 110°; semicarbazone, m. 189–90°. II with XI gave Ph₂CHCOPh (42%). III with VIII gave (PhCH₂)₂CHCOEt (32%), b_{17} 205°; semicarbazone, m. 160–1°. IV reacted with VIII vigorously with the evolution of H₂ and gave not the usual ketone but

o-O:C(C₆H₄)CEt₂O (XIII) (80%). V with VIII gave XIII and *o*-EtCOC₆H₄CONEt₂, b_{18} 186°; oxime, m. 110°; semicarbazone m. 195°. V and XI did not react. VI with VIII gave *m*-C₆H₄(COEt)₂, b_{10} 182°, m. 34° (disemicarbazone, m. 222°), and *m*-EtCO-C₆H₄CONEt₂, b_{10} 205° (semicarbazone, m. 145°). VI did not react with XI. VII with VIII gave *p*-C₆H₄(COEt)₂, m. 100° (disemicarbazone, m. 260°; dioxime, m. 226°) and *p*-EtCOC₆H₄CONEt₂, m. 82° (semicarbazone, m. 175°; oxime, m. 105°). VII and XI did not react. VIII with PhCH:CHCONEt₂ (XIV), gave PhCHEtCH₂CONEt₂ (80%), b_{11} 174°. XI with XIV gave Ph₂CHCH₂CONEt₂ (83%), b_{10} 225°.

D. H. POWERS

Syntheses in organic chemistry with radiant energy. II. The photosynthesis of α -phenyl- β -diphenyllactic acid. REMO DE FAZI. *Atti II congresso naz. chim. pura applicata* 1926, 1287-92.—The expts. are an amplification of previous ones (cf. *C. A.* 20, 594). $\text{PhCH}_2\text{CO}_2\text{H}$ (20 g.) and anhyd. C_6H_6 (50 cc.) exposed in a sealed tube to sunlight for 6 months evolved CO_2 and became an intense yellow. The reaction mixt. agitated repeatedly with 10% aq. Na_2CO_3 , extd. with C_6H_6 , the C_6H_6 ext. evapd., gave a trace of an unidentified neutral oil. The aq. layer yielded unaltered $\text{PhCH}_2\text{CO}_2\text{H}$. Exposed in a similar way for 228 days, $\text{PhCH}_2\text{CO}_2\text{H}$ (20 g.) in C_6H_6 (50 cc.) and U acetate (0.2 g.) gave an intense yellow reaction mixt., with evolution of CO_2 and the sepn. of a trace of oil as before. $\text{PhCH}_2\text{CO}_2\text{H}$ in C_6H_6 exposed to an "Osram" lamp (2000 c. p.) for 280 hrs evolved CO_2 and became yellow. Treated as before, the reaction mixt. gave a trace of oil and unaltered $\text{PhCH}_2\text{CO}_2\text{H}$. The oil when chilled yielded a trace of a cryst. compd., m. $51-2^\circ$, which may have been $\text{PhCH}_2\text{CH}_2\text{Ph}$, formed by the reaction: $2 \text{PhCH}_2\text{CO}_2\text{H} \rightarrow \text{H}_2 + 2 \text{CO}_2 + \text{PhCH}_2\text{CH}_2\text{Ph}$. No PhMe was identified in any of the 3 cases above. $\text{PhCH}_2\text{CO}_2\text{H}$ (26 g.), Ph_2CO (30 g.) and C_6H_6 (30 g.) exposed to sunlight for 112 days, became orange-yellow, evolved CO_2 , and deposited 2.5 g. of α -phenyl- β -diphenyllactic acid, and from the mother liquid was recovered unaltered Ph_2CO and a viscous oil, b. $818-22^\circ$, identical with that obtained in the previous work (*C. A.* 20, 594). With equal quantities of $\text{PhCH}_2\text{CO}_2\text{H}$, C_6H_6 and Ph_2CO under the same conditions, 0.5 g. of α -phenyl- β -diphenyllactic acid, a trace of benzopinacol and a trace of oil were recovered. No PhMe was recovered in either case. $\text{PhCH}_2\text{CO}_2\text{H}$ (13 g.), C_6H_6 (50 cc.) and Ph_2CO (15 g.) exposed in a quartz receptacle to ultra-violet light became greenish yellow after 100 hrs, evolved only a trace of CO_2 , and the initial reagents were recovered unaltered in practically their original quantities. No trace of α -phenyl- β -diphenyllactic acid could be detected, even by the sensitive test already described (*C. A.* 9, 3063). The results indicate that the course of the reaction between $\text{PhCH}_2\text{CO}_2\text{H}$ and Ph_2CO varies with the radiation, and that probably the difficulties frequently encountered in studying photochem. reactions arise from secondary products formed by transformation of the primary products of the reactions.

5-Bromo-2,4-dimethoxybenzoylacrylic acid and its esters. II. GRACE POTTER RICE. *J. Am. Chem. Soc.* 50, 1481-91 (1928); cf. *C. A.* 22, 407.-5,2,4-Br(MeO) $_2$ - $\text{C}_6\text{H}_2\text{COCH}_2\text{CHCO}_2\text{Me}$ and Br in CHCl_3 give quant. *Me* α,β -dibromo-5-bromo-2,4-dimethoxybenzoylpropionate; extg. with MeOH and recrystg the residue with MeOH gives 70-80% of an ester m. $150-5^\circ$; a small quantity of a 2nd isomer, m. $149-50^\circ$, was isolated but most of the remainder crystd. as mixed crystals, m. 127° ; the mixt., however, showed the same behavior as the pure isomer, m. 150.5° . With AcOK in MeOH there results 80% of *Me* bromo-5-bromo-2,4-dimethoxybenzoylacrylate (I), which crysts. from MeOH as lemon needles, m. 139° , and on concn. of the filtrate, as transparent crystals, m. 164° ; sunlight transforms the yellow into the colorless form. With MeONa (0.4 g. Na in 10 cc. MeOH) 4 g. I in 70 cc. MeOH gives 60% of the α -MeO deriv. (II), m. 157° ; with Br in CHCl_3 at 0° there results an unstable di-Br ester, $\text{C}_{14}\text{H}_{10}\text{O}_6\text{Br}_2$, which changes into a high-melting solid on standing; on recrystn. from MeOH HBr is lost, giving the ester, $\text{C}_{14}\text{H}_{14}\text{O}_6\text{Br}_2$ (III), m. 123° ; hydrolysis of II with concd. HCl gives the α -HO deriv. of I, brilliant yellow, m. 168° ; $\text{Cu}(\text{OAc})_2$ gives an olive-green Cu compd.; FeCl_3 gives a brownish green color; the ester is 100% enol. Two mol. equivs. of MeONa give *Me* α,α -dimethoxy-5-bromo-2,4-dimethoxybenzoylpropionate, m. 128° , with Br at room temp. III is formed. If the heating is continued for 1 hr., there results the free acid (IV), m. 152° , and a smaller quantity of α -hydroxy-5-bromo-2,4-dimethoxybenzoylacrylic acid (V), yellow, m. 179° (decompn.), which also results from IV by soln. in AcOH; V and Br in CHCl_3 at 0° give a di-Br compd., m. 170° . V and CH_2N_2 give the *Me* ester, bright yellow, m. 168° , further changed by CH_2N_2 into the *Me* α -HO deriv., m. 113° , which is the geometrical isomer of III; it is an enol or it rapidly enolizes at -5° to 0° . The reaction with aq. KOH in MeOH is also discussed. Et α,β -dibromo-5-bromo-2,4-dimethoxybenzoylpropionate exists in 2 isomeric forms, m. $160-1^\circ$ and 141° (the latter about 80% of the product); with KOAc 2 isomeric unsatd. esters result, yellow, m. 144° , and colorless, m. 114° . EtONa gives Et α -ethoxy-5-bromo-2,4-dimethoxybenzoylacrylate, m. 162° , and Et α,α -diethoxy-5-bromo-2,4-dimethoxybenzoylpropionate, m. 132° . Conc'd. HCl gives Et α -hydroxy-5-bromo-2,4-dimethoxybenzoylacrylate, yellow, m. 143° ; FeCl_3 gives a brownish green

color; $\text{Cu}(\text{OAc})_2$ an olive-green Cu salt. α, β -Dibromo-5-bromo-2,4-dimethoxybenzoyl-propionic acid, m. 184.5° ; with KOAc in AcOH there results α (or β)-bromo-5-bromo-2,4-dimethoxybenzoylacrylic acid, yellow, m. 200° , transformed by sunlight into the colorless isomer, m. 182° . Aq. KOH in MeOH or EtOH gives a small yield of α -methoxy-5-bromo-2,4-dimethoxybenzoylacrylic acid, pale yellow, m. 202° or the α - EtO deriv., m. 197° . C. J. West

Introduction to the study of tautomerism in the phthalonic and carboxyphthalide series. A. CORNILLON. *Ann. chim.* [10], 7, 227–73, 275–313 (1927); 8, 120–205 (1927); cf. Graebe and Trumpp, *Ber.* 31, 369; Tscherniac, *C. A.* 11, 253; Perkin and Kuroda, *C. A.* 18, 63.—From a very brief review of the chief hitherto known chem. properties of phthalonic acid (I) and its derivs., C. shows that they are characteristic of what is generally called "tautomerism." He then goes into an extensive philosophical discussion of tautomerism, starting from the phys. and chem. definition of an individual substance and showing that there seems to be an incompatibility between the phys. homogeneity and reactional multiformity of a tautomeric compd. The problem can be considered from the standpoint of systematics, but it must also meet the requirements of logic, at the basis of which are the purely chem. aspects of the question, such as: (1) how is a single compd transformed by a single reagent according to two entirely different reactions, without the coexistence of distinct functional groups to account for the duality of reactions? or (2) how do different reagents convert a single compd. into derivs. belonging to entirely different series between which there is generally no direct expl. method of transition? This problem is not specific of tautomerism but forms part of the general problem of migration of atoms or groups. Laar's theory of tautomerism by oscillation of certain atoms between the "bond zones" of certain others (*Ber.* 18, 648; 19, 730), when freed from certain apparently untenable features, is considered extremely original and fertile. C. then discusses tautomerism in the light of this theory from both the atomistic and the dynamic viewpoints. The reactional duality of a tautomeric substance depends on a peculiarity of its activation and is due to a distribution of its active structures into two groups differentiated by their action on the reagent which attacks them. The duality of a *desmotropic substance* is more deep-seated since it is the mean structure which is twofold; there is duality not merely of activation but of structure. The term *mesomerism* is proposed to designate allfinitive tautomerism and distinguish it from structural tautomerism (or desmotropism) and activation tautomerism (or tautomerism proper). A general plan is outlined for the dynamic study and differentiation of these phenomena. *Prepn. and purification of I.*—Oxidation of α -naphthol in the cold with KMnO_4 , without excess alkali, gives at most 15% of I contaminated with considerable phthalic acid; at 32° , with notable excess of alkali, the yield increases to 60% of similarly contaminated I. Oxidation of C_{10}H_8 with KMnO_4 via a modification of Graebe and Trumpp (*loc. cit.*), can give up to 50% of the theoretical yield (based on the KMnO_4 used) of perfectly colorless I, provided there is efficient agitation and the total amt. of KMnO_4 used does not exceed 100 g. Oxidation of tetrahydronaphthalene ("tetralin") in slightly alk. soln. was found most satisfactory under the following conditions: to a vigorously stirred mixt. of 1 g.-mol. of tetralin and 1 l. of H_2O at 64° add 1050 g. KMnO_4 in 20-g. portions, waiting for complete decolorization each time and maintaining the temp. at 64 – 8° , and eliminate any residual tetralin by steam distn. The mean yield of 10 such operations was 56% of theory (based on the KMnO_4) and the max. 75%. The crude (98–9%) I is best purified by converting into the anhydride, crystg. from Ac_2O , washing with C_6H_6 , allowing to hydrate spontaneously in the air and recrystg. from AcOEt containing a little C_6H_6 ; it m. 148 – 9° . Evapn. of solns. of pure I gives a product with a cont. m. p. of 144° . *Titration, acidity and structure of I.*—Titration with KMnO_4 (adding a slight excess and titrating back with $\text{Na}_2\text{C}_2\text{O}_4$) in the presence of considerable H_2SO_4 gives practically theoretical results according to: $\text{C}_8\text{H}_6\text{O}_4 + \text{O} = \text{C}_8\text{H}_6\text{O}_4 + \text{CO}_2$. Acidimetric titration (in approx. 0.1 *N* soln.) in the presence of thymol blue gives practically the same results as with KMnO_4 (e. g., 19.15, 19.3 cc., resp.); slightly lower results are obtained in the presence of phenolphthalein; with litmus the end point is rather indefinite with direct titration, but is sharp by back titration and the results are almost the same as with phenolphthalein; with helianthin the end point is rather indefinite, but somewhat better by back titration, and I acts as a monobasic acid. From a discussion of the titration curve, C. shows that $K = 9 \times 10^{-6}$ and that the formulas for anhyd. and hydrated I and for the mono- and diacid ions are,

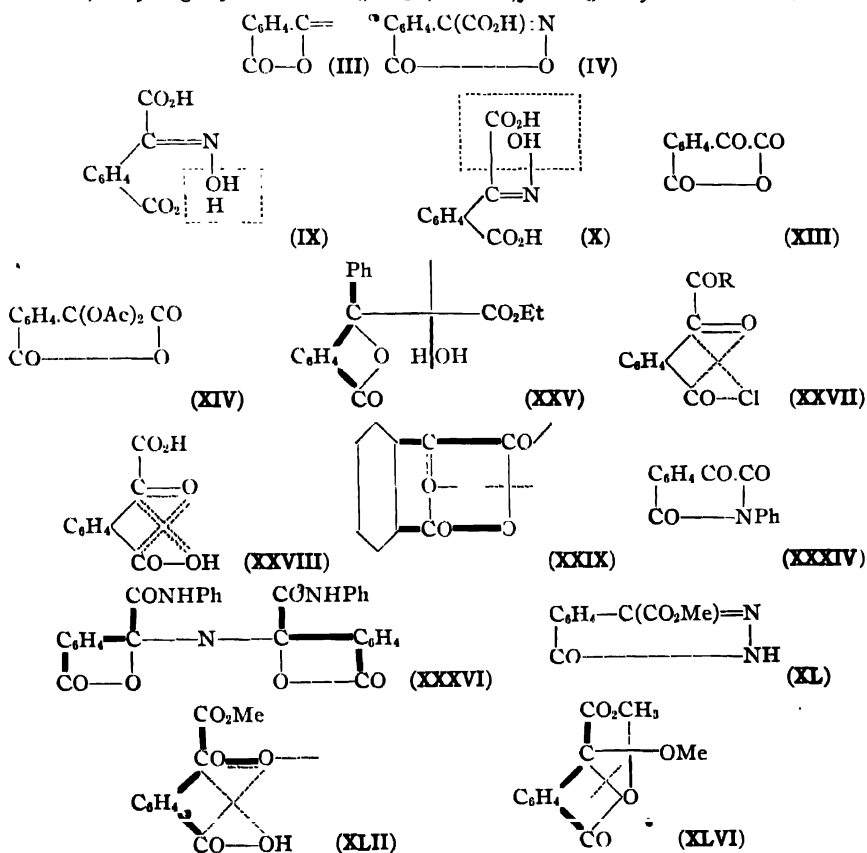

resp., $\text{HO}_2\text{CC}_6\text{H}_4\text{COCO}_2\text{H}$, $\text{HO}_2\text{CC}_6\text{H}_4\text{C}(\text{OH})_2\text{CO}_2\text{H}$, $\text{R}(\text{OH})\text{CO}_2^-$, $\text{R} \begin{array}{c} \text{O}^- \\ \diagup \\ \text{CO}_2^- \end{array}$ ($\text{R} = \text{III}$).

Action of nitrogenous reagents on I.—In neutral or acid soln. semicarbazide gives with I clearly defined crystals of the semicarbazone, $\text{HO}_2\text{CC}_6\text{H}_4\text{C}(\text{NNHCONH}_2)\text{CO}_2\text{H}$ (V), insol. in nearly all solvents, sol. in boiling H_2O (apparently undergoing some change, possibly dehydration to carbaminophthalazonecarboxylic acid), m. about 160° (decompn.), subsequently resolidifying and remaining unchanged up to 250° ; it is detd. quant. by acidimetric titration. According to Graebe and Trumpy (*loc. cit.*) at 100° NH_2OH reacts with I with evolution of CO_2 to give an oxime (VI) and phthalimide, of which they give the following explanation: the oxime VI spontaneously loses CO_2 being thereby converted into phthalaldehydeoxime anhydride, which is known to undergo transposition into phthalimide. C. found that under the same conditions there was produced K acid phthalate, the oxime VI (no definite m. p.) but no phthalimide, and the evolution of CO_2 was equiv. to about 75% of the I used. VI is quite stable in acid org. media and cannot therefore be involved in the reaction whereby CO_2 is evolved; on acidimetric titration it behaves as a dibasic acid and is unstable in alk. soln. Its transformations are as follows:

decrease in stability being accompanied by increased ionization and increased hydration, the 3 phenomena being intimately related to the p_{H} value of the medium. In 50% AcOH and in presence of AcONa , I and NH_2OH at the b. p. of the reaction mixt. give VI and a compd. corresponding to $\text{C}_{22}\text{H}_{14}$ (or 16) O_7N_4 , without definite m. p., sublimes at 250° , undoubtedly due to fixation of a 2nd mol of NH_2OH to I with elimination of CO_2 . NH_2OH and neutralized I at 0° give a very unstable addn. product having a homophthalic structure, $\text{HO}_2\text{CC}_6\text{H}_4\text{C}(\text{OH})(\text{NHOH})\text{CO}_2\text{H}$ (VII), which C. calls a *hydrate of the oxime*, easily transposed with loss of CO_2 into a phthalic deriv., not isolated sufficiently pure to permit of its analysis, readily combines with AcOH to give the *oxime acetate*, $\text{HO}_2\text{CC}_6\text{H}_4\text{C}(\text{OAc})(\text{NHOH})\text{CO}_2\text{H}$ (VIII), which decomps. about 100° into phthalimide, H_2O , AcOH and CO_2 , and which is also produced directly by the action of NH_2OH on I in AcOH at 0° (avoiding agitation which causes evolution of CO_2). C. considers that production of the oxime hydrate is the 1st stage in the reaction of NH_2OH and I at low temps. and is the intermediary through which phthalic derivs. are formed by transposition, the yield of the latter increasing with the length of time during which the reaction is allowed to proceed. The oxime acetate is extremely sol. in H_2O , alc., Me_2CO , considerably less sol. in AcOEt and AcOH , insol. in hydrocarbons and CHCl_3 , can be purified only by dissolving in exactly 10 times its wt. of cold AcOEt , adding 0.5 vol. of cold CHCl_3 , filtering, crystg. at 0° and drying at atm. pressure over H_2SO_4 , which gives $\text{C}_6\text{H}_4\text{O}_5 + \text{AcOH} + \text{NH}_2\text{OH}$; on further drying overnight *in vacuo* over H_2SO_4 it loses H_2O . Dehydration of the oxime hydrate by Ac_2O in the cold gives *phthalic acid nitrile* (on which C. could not obtain the characteristic m. p. 85°), instantly converted into phthalimide at $210-20^\circ$. These various phenomena are represented by a scheme which brings out that the degree of dehydration increases with the rate of transposition. There is introduced a hypothetical, intermediary, highly unstable oxime, the assumption of which is indispensable since the loss of H_2O from the oxime hydrate to convert it into phthalamic acid must take place before the transposition; this reaction takes place in all media in the cold and is therefore distinct from the cyclic oxime described above, which seems characteristic of reactions in hot media. The 2 are considered to be stereoisomeric: the *anti*-oxime (IX) cyclizes easily and must be the one which has been isolated; the *syn*-oxime (X) is the hypothetical oxime which, after elimination of its unstable CO_2H , can undergo only transposition or further dehydration to phthalic acid nitrile. C. concludes that the evolution of CO_2 when NH_2OH and I react at 100° is due to a reaction of the following type, which resolves itself into a straight oxidation of I by NH_2OH (similar to that produced by KMnO_4): $\text{HO}_2\text{CC}_6\text{H}_4\text{C}(\text{OH})(\text{NHOH})\text{CO}_2\text{H} \rightarrow \text{HO}_2\text{CC}_6\text{H}_4\text{CO}_2\text{NH}_2 + \text{CO}_2$. As to the oxime hydrate, which is admitted to be formed only transitorily as no useful purpose is served by assuming any form of isomerism, it must be considered to be produced in different states of activation in the hot and in the cold. A case has thus been found of a transposition (which is of the same nature as the Beckmann transpositions and is

characteristic of the keto-oxime function) affecting (certainly in the case of the ionized *anti*-oxime, and probably also in other cases) an oxime actually comtg. the double bond $C=N$. But there are also cases in which the same final products were obtained by a closely related transposition of a NH_2OH deriv. having a homophthalic structure. Two types of formulas can be imagined for addn. products obtained from NH_2OH and a phthalonic compd. with elimination of H_2O , one ketonic $HO_2CC_6H_4C(:NOH)COR'$ (XI), the other lactonic, $R(NHOH)COR'$ (XII). In H_2O both these types can give the same hydrate, with a homophthalic structure, which can undergo transposition as above described; but such transposition must not be considered as a characteristic Beckmann ketonic transposition. Hence, the choice between formulas XI and XII should be made only according to the acidity of the CO_2H linked directly to the C_6H_5 ring (unless the oxime is already cyclicized), which is possible only in XI. *Action of dehydrating agents on I.*—Phthalonic anhydride, best prepd. by means of $AcCl$ ($SOCl_2$ is unsatisfactory and Ac_2O is not as reliable, particularly when working on a relatively large scale) and best purified by rapid recrystn. from Ac_2O , m. fairly sharply $190-1^\circ$ (decompn.), sublimes without appreciable decompn. at about 170° *in vacuo*, very slightly sol. in C_6H_6 , Et_2O , $EtOAc$, $CHCl_3$, very sol. in ketones and

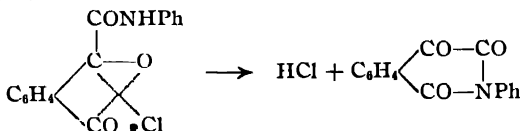

phenols, dissolves in most of the other common solvents by reacting with them, converted by H_2O into I. Its generally accepted structure (XIII) is confirmed. Prolonged action (48 hrs.) of Ac_2O on XIII at 100° gives diacetoxyhomophthalic anhydride (XIV), m. 240° (decompn.), instantly hydrolyzed by H_2O to I and $AcOH$ (which permits of its acidimetric titration), sublimes under 2 mm. about 160° with decompn. into XIII. Under conditions precluding a secondary hydration XIII gives with $AcOH$ α -acetoxyphthalidecarboxylic acid, $R(OAc)CO_2H$ (XV) (called *acetylpsuedophthalonic acid* by Perkin and Ku-

derivs. to the study of the constitution of I.—Treatment of I with boiling SOCl_2 , removal of the excess of SOCl_2 and treatment of the reaction product with PCl_5 gives XVIII. Taken in conjunction with the prepn. of the latter from XIII, C. assumes there is formed an intermediate unstable ketone chloride, $\text{ClOCC}_6\text{H}_4\text{COCOC}_6\text{H}_4\text{Cl}$, which is immediately

transformed into the lactone chloride. This explains both the internal migration of the hydroxylated link from a hexagonal to a pentagonal ring structure and also the apparent tautomerism of I (since it shows how I can react as ketone though its deriv. reacts as lactone). This theory, which has the advantage of conciliating under a single explanation all facts so far described, merely assumes the evolution of the mol. structures (after substitution of the acid OH by Cl) towards a static position of equil. corresponding to a min. thermodynamic potential, in which the energetic conditions of the bonds between the atoms, even after substitution of Cl by other radicals, exhibit the chem. properties represented by the lactone formula of chlorophthalidecarboxylic derivs. This constitutes what C. defined as "mesomerism"; and the conception is justified by the fact that the remainder of the work described shows it to be an essential characteristic of all the compds. of the series. As rigid formulas are doubtless insufficient to express all the properties of these compds. C. proposes formulas **XXVII**, **XXVIII** and **XXIX**, resp., for chlorophthalidecarboxy derivs., I and **XIII**. *Aniline derivs. of I.*—Heating **XIII** with excess PhNH_2 30 min. at 100° gives α -phenylaminophthalidecarboxanilide (**XXX**), m. $217-8^\circ$ (Perkin and Kuroda give $206-8^\circ$), also obtained by the action of PhNH_2 on α -chlorophthalidecarboxanilide (which confirms the lactone structure of both compds.), does not react with Ac_2O nor with semicarbazide, with PhNCO gives α -phenylurea, $\text{R}(\text{NPhCONHPh})\text{CONHPh}$ (**XXXI**), m. 203.5° , neutral to NaHCO_3 and Na_2CO_3 , sol. in NaOH from which on neutralization it is reprecipitated as an unstable hydrate which readily reverts to **XXXI**, resists sapon. by acids and alkalis under the most drastic conditions, showing that the fundamental phthalonic nucleus has been converted into an exceptionally stable lactone. Under milder conditions (in presence of C_6H_6 , at lower temp., and avoiding local excess of PhNH_2), PhNH_2 and **XIII** give quant. phthalooanilic acid, $\text{HO}_2\text{CC}_6\text{H}_4\text{COCONHPh}$ (**XXXII**), m. 180° , insol. in H_2O and hydrocarbons, more sol. in AcOH and EtOH , acid to NaHCO_3 , readily saponified by both acids and alkalis, resinified by Ac_2O or AcCl with production of unidentified compds., reacts with PhNH_2 in boiling abs. alc. to give **XXX** as main product together with a small amt. of colloidal phenylimine, $[\text{HO}_2\text{CC}_6\text{H}_4\text{C}(\text{NPh})\text{CONHPh}]_2$ (**XXXIII**), of **XXXII**, which shows that **XXXII** in this case reacts mainly as lactone, but also to a slight extent as ketone. The compd. (**XXXII** + $2\text{PhNH}_2 - \text{H}_2\text{O}$) obtained by Perkin and Kuroda on treating **XIII** in the cold with a very large excess of PhNH_2 is considered as merely intermediate and formed by addn. to the ketone function of **XIII**, and of no value in favor of the ketone structure of **XXXII**. Heating **XXXII** at 100° in 60% AcOH contg. a little HCl produces **XXX**, the HCl catalyzing the migration of the base between the mols. With SOCl_2 in boiling C_6H_6 **XXXII** gives mostly **XXII** with some *N*-phenylphthalonimide (**XXXIV**), m. 218.5° , showing that the structure of **XXXII** is intermediate between lactone and ketone, but closer to the former; in the absence of C_6H_6 the yield of **XXXIV** is smaller; in the cold there is a vigorous reaction giving unidentified viscous resinous reaction products. Boiling **XXXII** in alc. with NH_2OH gives phthalooanilic oxime (α -hydroxylaminophthalidecarboxanilide), $\text{R}(\text{NHOH})\text{CONHPh}$ (**XXXV**), with ill-defined m. p. in the neighborhood of 180° , and a smaller quantity of a substance, m. 168° , which is possibly that shown in formula **XXXVI**. On dissolving **XXXV** in dil. alkali and reprecipitating by careful neutralization it gains $1\text{H}_2\text{O}$, which is lost only on recrystg. from alc. but not on prolonged heating at 100° ; heating at 100° with a little concd. HCl decomposes it to phthalic acid, PhNH_2 , NH_3 but no NH_2OH ; sapon. by HCl should give a lactone-oxime of I, but the latter is instantly decomposed by transposition. **XXXVI**(?) is extremely stable, resisting prolonged action of acids, alkalis, Ac_2O , SOCl_2 , decomposed by HCl in a sealed tube at 150° to PhNH_2 , NH_3 , CO_2 and phthalic acid. In cold H_2O equimol. amts. of **XXXII** and NH_2OH give **XXXV**, **XXXVI** and very small quantities of PhNH_2 , NH_3 and CO_2 . In hot alc. **XXXII** and **XXXV** combine to give a reaction product in which no definite compd. could be identified and contg. no **XXXVI**. Excess NH_2OH (4 mols.) and **XXXII** in cold H_2O give no **XXXVI**, but apparently more PhNH_2 than with equiv. proportions of the reagents; with excess **XXXII** (2 mols. to 1 of NH_2OH) in 6 hrs. at 100° there is formed **XXXVI**, phthalanil (*N*-phenylphthalimide) (**XXXVII**), m. 206° (Maquenne block), but no **XXXV**. **XXXII** and 15% excess NH_2OH in 60% AcOH at 100° give about 50% **XXXVII**, which C. interprets as a new mode of reaction of NH_2OH towards which **XXXII** acts as ketone, and which shows the importance of the p_H of the medium, already brought out in the case of the oximes of I. Considerable work on the action of semicarbazide on **XXXII** gave very little definite result because of the complexity of the reactions and decompn. of the reaction products during purification (doubtless owing to the sensitiveness of the carbaminohydrazine chain). **XXXII** and free semicarbazide in 65% AcOH at 100° give crystals m. about 180° (decompn.), probably hydrated α -semicarbazidophthalidecarboxanilide (normal semicarbazone),

$R(NHNHCONH_2)CONHPh$ (XXXVIII), and a small quantity of a cryst. acid semicarbazide deriv., m. 250° (decompn.), the compn. and constitution of which could not be detd. There was recognized the very probable formation of a lactone compd., and possibly of traces of a true ketosemicarbazone, $HO_2CC_6H_4C(:NNHCONH_2)CONHPh$ (XXXIX). When treated with C_6H_5N under the same conditions which, with $PhNH_2$, had caused merely a substitution, XXII loses HCl and, by cyclicization gives *N*-phenylphthalonimide, thus disagreeing with the α -chlorolactone structure which the preceding work had led to be adopted. The reaction is best expressed by passage to a ketone reactivity, as follows:

C. considers that the chloroanilide does not possess a rigid ketone or lactone structure, its individuality depending on the distribution of the affinities between the groups of atoms; if Cl is replaced by $PhNH$ the only possible new (statistic) distribution is the one which brings out the characteristics of the lactonedianilide and the chem. functions of an α -anilinolactone. This is not a case of tautomerism proper (as previously defined) but of mesomerism. The only case of tautomerism proper encountered in the whole investigation was in the reaction of XXXII and $PhNH_2$ where, there was detected a trace of ketone substitution. *Phthalonic esters*.—Wegscheider and Glogau's method for the prepn. of acid *Me phthalonate* (*Monatsh.* 24, 915) gives a monohydrate of ill-defined m. p. owing to decompn; recrystn. from alc. gives an addn. compd. of 1 mol. of ester and 1 of alc., without definite m. p. owing to decompn., after heating the latter *in vacuo*, the residue after recrystn. from C_6H_6 m. 94° , has $K = 1.3 \times 10^{-4}$ (Suss), in cold dil. MeOH readily gives a normal semicarbazone with distinct acid properties, m. about 200° (decompn.). Together with the semicarbazone there is sometimes formed a small quantity of *carbomethoxyphthalazone* (XL), m. 207° , apparently very stable at high temp., also produced when the semicarbazone is allowed to stand a long time in MeOH with a trace of HCl , obtained quant. by trying completely to esterify the semicarbazone by MeOH satd. with HCl , which confirms the ketone structure of the semicarbazone. These properties refer to the ester in soln., where it probably has a homophthalic structure, $HO_2CC_6H_4C(OH)_2CO_2Me$ (XLI). Prolonged action (several days) of Ac_2O at 100° on the ester gives *methylacetoxycarboxyphthalide* (cf. XVII), m. 112° ; action of $SOCl_2$ or PCl_5 on the ester gives almost quant. the corresponding carboxychlorophthalide ester: these reactions indicate that in anhyd. or dehydrating medium the ester had a lactone structure. Its affinitive structure is therefore expressed by formula XLII. The two neutral *Me phthalonates* obtained by Wegscheider and Glogau (*loc. cit.*) on complete esterification of I with cold MeOH satd. with HCl are shown to be due to ketolactonic isomerism and are not desmotropic. The one m. 66° is the α -methoxycarboxyphthalide ester, $R(OMe)CO_2Me$ (XLIII), isomerized by $MeONa$ (or better by $MeOK$) into a true ketone ester, $MeO_2CC_6H_4COCO_2Me$ (XLIV), which m. considerably below 36° (which is the figure given by Wegscheider and Glogau), and gives a normal semicarbazone which is converted by PCl_5 into a neutral dichlorohomophthalic ester, $MeO_2CC_6H_4CCl_2CO_2Me$ (XLV). The affinitive structure assigned to the neutral esters is XLVI. (Even when not specifically mentioned in the abstr., considerable exptl. and theoretical evidence is adduced in support of practically all the structural formulas given; and in several cases alternative formulas are discussed and rejected.—Abstractor.)

A. PAPINEAU-COUTURE

Polish turpentine. J. FLATAU AND A. KORCZYNSKI. *Roczniki Chem.* 7, 246-60 (1927).—The turpentine from the eastern province of Białowiez had a $d_{20} 0.8793$, $[\alpha]_D^{20} 25.87^\circ$. The light fraction b. up to 150° , the main part of which, b. $50-70^\circ$ and $85-112^\circ$, resembles Finnish turpentine and the products of dry distn. of beech wood. It is a reddish brown liquid of pungent odor, distinctly acid to litmus and free from mineral acids. It resinifies with alkalis and concd. acids and reduces alk. $KMnO_4$ and NH_4Ag . Of the part sol. in 40% $NaHSO_4$ the fraction (f.) $45-50^\circ$ contains propionic aldehyde, $55-60^\circ$ traces of acetone, $80-90^\circ$ diacetyl, $105-110^\circ$ diketopentane, $140-50^\circ$ 2,5-diketohexane. The part insol. in $NaHSO_4$ b. $28-150^\circ$. The smallest f., b. $28-40^\circ$, yielded after 12 hrs. refluxing with Na a product b. $31-3^\circ$ with a distinct furan reaction. Methylfuran was isolated from f. $60-70^\circ$ by Harries' method (*Ber.* 31, 38(1894)). Traces of benzene were identified in f. $80-85^\circ$, *Me isobutyrate*

and α, α' -dimethylfuran in *f.* 90–95°. A definite % of *toluene* is present in *f.* 105–15°, and traces of *m-xylene* in *f.* 135–45°. The aq. ext. of the light fraction contained *MeOH* and *AcOH*. The higher *f. b.* 161–5° has a d_{20} 0.8619, $[\alpha]_D^{20}$ 28.77°. The *f.* 161–8° absorbed at 16° 25–30% dry *HCl*, yielding 39–50% bornyl chloride. The latter was not formed at 0° and 50°, and in the presence of *Al* or *AlCl₃* at 16°. It was found by control expts. that *AlCl₃*, *ZnCl₂*, *Al₂O₃*, and *Fe* decomp. bornyl chloride to products *b.* 160–345°, the effect decreasing in the above order. Terpinol hydrate and terpineol were formed in traces only, if at all, on shaking this *f.* with an equal quantity of 33, 45 and 60% *H₂SO₄* at 16° or with $\frac{1}{8}$ to $\frac{1}{4}$ of anhyd. *p-C₇H₇SO₃H* or in 75 and 5% solns.; about 4% was formed with 25 and 60% solns. Diln. with alc. or ether did not affect the reaction. When heated with 20–80% *PhOH* to 126–50° for 4–43 hrs., treated with *NaOH* and distd. with steam the *f.* yields 33–42% of a product of the *b. p.* of α -pinene; the yield is 47% after 4 hrs. heating with 20% *BzOH* to 126° and decreases with increasing temp., quantity of acid and length of heating. Salicylic acid yields under similar condition 10–16%. When allowed to react 15–29 hrs. at 16° with 0.5 part *p-C₇H₇SO₃H* (60% soln.) the product of isomerization with phenol *b.* 150–4° formed about 40% terpinol hydrate (the terpineol although present was not detd.). Although it absorbed 40% *HCl* it gave no bornyl chloride, while American turpentine gave under the same conditions a very good yield. Attempts at the identification of nopinene by means of the *KMnO₄* oxidation (Wallach, Baeyer) and the *AcOHg*-compd. (*C. A.* 21, 400) failed, apparently because of the impurity of the compd. That nopinene reacts with *HCl* was ascertained by an expt. with technically pure French nopinene *b.* 162–5°, d_{20} 0.8806, $[\alpha]_D^{20}$, which at 16° reacted more rapidly than pure American pinene, yielding 32 g. bornyl chloride (from 50 g.) and 14 g. liquid *Cl* derivs. The constns. of Pomeranian (Czersk) turpentine are: crude: d_{20} 0.8622, $[\alpha]_D^{20}$ 20.52°, *f. b.* 162–5°, d_{20} 0.8608, $[\alpha]_D^{20}$ 22.65°. The *f.* 160–8° yielded no bornyl chloride after the absorption of 33% *HCl* at 16°. It gave 4% terpinol hydrate with *p-C₇H₇SO₃H* and after isomerization with phenol at 145° 15% terpinol hydrate. After the reaction with *PhOH* and *C₇H₇SO₃H* the product absorbs 40% *HCl* but gives no bornyl chloride. The *f.* apparently contains a compd. which is neither α - nor β -pinene but can be isomerized to the former.

MARY JACOBSEN

6-Methylbornylene. L. YA. BRYUSOVA. *J. Russ. Phys.-Chem. Soc.* 59, 653–8 (1927).—In the dehydration of bicyclic alcs. several products are known to be formed, isomeric hydrocarbons being among them; 6-methylborneol might thus be converted into 6-methylbornylene or into methylcyclohexene (cf. *C. A.* 21, 1809). The actual product *m.* 118.5–9°, was totally oxidized by *BzO₂H* (while tricyclic hydrocarbons are not acted upon) and with *KMnO₄* gave 6-methylcamphoric acid. It was therefore 6-methylbornylene. The exptl. details follow. *Me 6-methylbornylxanthate.*—To 38 g. of 6-methylborneol in 50 cc. boiling abs. xylene was added 9 g. *K*. After 10 hrs. the mixt. was cooled, treated with dry *CS₂* and heated on the water bath for 4 hrs. The xanthate was heated with *MeI*; a yellow oil was obtained which did not crystallize and could not be distd. Yield, 89%. *6-Methylbornyldixanthogenide* resulted upon the addn. of 1 mol. of *I₂* to the salt suspended in ether; pale yellow needles, *m.* 90.2–0.7°. *6-Methylbornylxanthamide.*—A mixt. of 10 g. of the *Me* ester and 200 cc. of 10% *NH₃* in *EtOH* was allowed to stand for 6 days, then poured into water and the amide filtered off. Recrystd. from 2 parts petrole ether + 3 parts benzene, *it m.* 126–7°; yield, 96%. *6-Methylbornylene.*—The *Me* ester was distd. Decompn. began at 60–70°, the main fraction *b.* 210–5°. The solid was 3 times dissolved in alc. *NaOH* (1:3) and reprecipd. with water, and finally recrystd. from *EtOH*. Yield, 52%. *Oxidation with BzO₂H.*—The reaction was carried out at 10–12° for 24 hrs. The quantity of *BzO₂H* which combined corresponds to 100.39–100.86% of an unsatd. hydrocarbon *C₁₁H₁₈*. *6-Methylcamphoric acid.*—6-Methylbornylene in *PhH* was allowed to react with 1% aq. *KMnO₄* for 19 hrs. Half of the hydrocarbon remained unchanged; the acid, sep'd. from the water layer by adding 20% *H₂SO₄*, *m.* 184–5°; 0.0960 g. neutralized 8.7 cc. 0.1 *N NaOH* (theory 8.76 cc.). B. C. S.

Camphorol. YASUHIKO ASAHINA and MORIZO ISHIDATE. *Ber.* 61B, 533–6 (1928).—The *d*-camphorol (I) prepd. from the *d*-camphoglucuronic acid mixt. excreted in the urine of dogs fed with camphor was found not to have a sharp *m. p.* Attempts to prep. a well-crystd. *Me* ether from the I with *MeOH-HCl* failed. Reduction of various preps. with *Na* gave ordinary camphor in satisfactory yield but with *HNO₃* only a relatively small quantity of camphoric acid was obtained. *K₂Cr₂O₇* in *AcOH* yielded a yellowish product which had the compn. *C₁₀H₁₆O₂* of camphorquinone but which was obviously a mixt. of isomers. The quinone with *H₂O₂* in *Na₂CO₃* was partly converted

into camphoric acid but there remained unchanged a portion which proved to be identical with Bredt and Goeb's 5-ketocamphor (*p*-diketocamphane). The so-called camphorol is therefore not a homogeneous substance but a mixt. of a modification of 3-hydroxycamphor and the 5-isomer. Whether the difference between the α - and β -camphogluconic acids is to be referred to the different aglucons 3- and 5-hydroxycamphor cannot yet be stated definitely, for according to Schmiedeberg and Meyer both acids give the same I. C. A. R.

Reactions of strongly electropositive metals with organic substances in liquid ammonia solution. VI. A. The reduction of benzophenone. B. The hydrolysis of metal ketyls. CHARLES BUSHNELL, WOOSTER. *J. Am. Chem. Soc.* 50, 1388-94 (1928), cf. *C. A.* 18, 1980.—Both mono- and di-Na derivs. of Ph_2CO can be prepd. readily by the action of Na in liquid NH_3 . Dimetallic derivs. may also result from the action of amides on the corresponding alc. The di-Na deriv., Ph_2CNaONa , reacts with H_2O or NH_4Cl to give Ph_2CHOH , EtBr gives Ph_2EtCOH , prolonged action of EtBr gives only the free alc., not the ester and some EtNH_2 ; PhBr does not react but PhI gives $\text{Ph}_2\text{C}(\text{NH}_2)_2\text{ONa}$, C_6H_6 and NaI , the 1st product decomp. with H_2O to give NaOH , NH_3 and Ph_2CO . The mono-Na deriv. forms in liquid NH_3 a blue soln., which is immediately decolorized by NH_4Cl , giving Ph_2CHOH and Ph_2CO ; EtBr gives as the final products Ph_2CO and Ph_2EtCOH . Evidence is presented to show that the occurrence of addn. reactions is a more general property of the metal ketyls than has been previously supposed. Even their decompn. by strong acids may be preceded by the formation of addn. products. C. J. WET

The Cannizzaro reaction in pinacolinic and benzilic transpositions. B. I. VANZETTI. *Atti II congresso naz. chim. pura applicata* 1926, 1928-301.—In the prepn. of veratrilic acid (cf. *C. A.* 21, 1974) there was isolated from the mother liquors of the reaction between veratril and KOH a neutral substance which was extremely stable toward oxidizing agents, sublimed without decompn. at a high temp. and which was probably an anthraquinone or a tetramethoxyphenanthrenequinone. Since it did not react with NaHSO_3 , could not be reduced, and did not give with *o*-diamines the known reactions of quinoxalines, it was probably an *anthraquinone*, particularly since it was also formed by oxidation of veratrilic acid. With the hope of studying its action with AlCl_3 , the attempt was made first to condense anisil with AlCl_3 to the corresponding phenanthrenequinone, but the OMe group seemed to oppose the condensation. No anthraquinone could be detected in the red resin from the thermal decompn. of benzilic acid. Further attempts are to be made to identify the nature of the new compd. The difficulties are considerable, since in spite of the numerous publications (Staudinger, Schoenberg, Lachman, Schenung, Tiffenau, Nicolet, etc.) in recent yrs., there is no satisfactory explanation of the benzilic transposition, though it probably resembles the Cannizzaro reaction (cf. Michael, *C. A.* 14, 1682). C. C. DAVIS

Cyclical thioureas derived from fluorene. LUIS GUGLIALMELLI AND ARMANDO NOVELLI. *Anales asoc. quim. Argentina* 15, 287-307 (1927).—From previous work (*C. A.* 20, 2325) and from results with other thioureas the resistance of amino-2-fluorene to the formation of the resp. sym. thiourea by the Hofmann method is due to its constitution. This amine should be regarded as a substituted deriv., since otherwise it would be not only the 1st example known of an unsubstituted amine which does not react with CS_2 and alc. but would also be a new, curious case of isomerism in position 2, like that apparently met in position 9 corresponding to the $>\text{CH}_2$ group. Assuming that this fluorenic amine is derived from the pentagonal hydrocarbon cyclopentadiene (dibenzocyclopentadienylamine) it seems to be the only case of a primary cyclical amine not reacting directly with CS_2 , even with the aid of catalysts very effective in the prepn. of thioureas of other aromatic amines. If fluorene is regarded as a deriv. of Ph_2 there is no explanation of the clear difference shown by amines analogous and corresponding to *p*- $\text{PhC}_6\text{H}_4\text{NH}_2$ whose thiourea has been prepd. with some difficulty. On the other hand, as a substituted deriv. of Ph_2 , methylene-2,2'-diphenyl explains this anomaly. The $>\text{CH}_2$ group, assuming an electronegative polarity, makes its influence felt in the same manner as the groups $>\text{CO}$, $-\text{CO}_2\text{H}$, $-\text{NO}_2$, etc., retarding or preventing the formation of thiourea, as with some substituted derivs. of other amines which are not converted into thioureas even by the best catalysts. The formula of 2-aminofluorene shows that if regarded as a substituted Ph_2 deriv. (2,2'-methylene-diphenyl) it is a *p*- and *m*-compd. as regards the amino function. All these derivs. of benzene and C_{10}H_8 offer no difficulty in combining with CS_2 by the Hofmann reaction. The curious theory of Kaufer on the constitution of Ph_2 , recently applied to fluorene, may explain the facts better. E. M. SYMMES

2,7-Dimethylsulfonefluoran, 2'-hydroxy-5'-methylbenzoyl-2-benzenesulfonic acid

and some of their derivatives. W. R. ORNDORFF and I. T. BEACH. *J. Am. Chem. Soc.* 50, 1416–21(1928).—Condensation of *o*-sulfobenzoic anhydride with *p*-MeC₆H₄OH gives after 15 hrs. at 121–3° approx. 20% II. *p*-MeC₆H₄OH and the chlorides of *o*-HO₂SC₆H₄CO₂H in alk. soln. give 70% of di-*p*-cresyl *o*-sulfobenzoate (I), triclinic, *m.* 95.5°; if the reaction mixt. is not heated, there is obtained *p*-cresyl benzoate-*o*-sulfone chloride. Equal quantities of I and ZnCl₂, with a few drops HCl heated at 175° for 45 min. and the aq. filtrate made alk. with NaOH, give the Na salt of the carbinol sulfonic acid of II, biaxial and probably monoclinic, which soon turns yellow on exposure to light and air; concd. HCl added to a hot, satd. soln. of the Na salt gives 2,7-dimethylsulfonefluoran (II), chars about 250°, orange, triclinic crystals; in thin fragments, yellow with a distinct pleochroism, yellow to orange; optically biaxial; the color changes sharply from yellow to colorless between *p*_H 9.6 and 10.0; concd. NaOH added to an aq. soln. gives a very transient deep blue color. Fusion with NaOH gives 2,7-dimethylxanthone and *p*-homosalicylic acid. II absorbs 1 mol. dry HCl, given off over NaOH; it does not absorb NH₃ and gives a Br addn. product of variable compn. The Ba salt crysts. with 4 H₂O; the Me ester and perchlorate (yellow) were also prepd. Reduction gives 2,7-dimethylhydrosulfonefluoran, which is unstable but was analyzed as the Zn salt. 2'-Hydroxy-5'-methylbenzoyl-2-benzenesulfonic acid, *m.* 90°, unstable, decomp. into *p*-MeC₆H₄OH and *o*-sulfobenzoic anhydride, from which it is prepd. by heating with AlCl₃ in C₂H₅Cl₄; *NH*₄ salt, monoclinic crystals with very strong double refraction. II and concd. H₂SO₄, heated 2 hrs. at 200°, give the brownish 2,7-dimethylsulfoneoctoxonol, sol. in acids with an intense red color. C. J. WEST

An improved method for the *C*-methylation of 1,3-diketones, and methyl-*p*-methoxydibenzoylmethane (1-*p*-methoxyphenyl-2-methyl-3-phenylpropane-1,3-dione). C. WEYGAND, WITH H. FORCKEL AND C. BISCHOFF. *Ber.* 61B, 687–90(1928).—In view of the inability of Bradley and Robinson (*C. A.* 21, 81) to prep. *p*-MeOC₆H₄COCHMeCOPh (I) from MeOC₆H₄COCH₂COPh (II) by the usual methods, the authors describe a new method of methylating 1,3-diketones and 3-ketonic acid esters which they have used to advantage in numerous cases. Instead of alc. they use Me₂CO or its homologs in which most alkali enolates dissolve well. Thus 3 g. of the Na deriv. of BzCH₂Ac (dried with P₂O₅) refluxed 4 hrs. with 1.9 g. MeI in 50 cc. Me₂CO gives up to 88% of BzCHMeAc, *b*_m 130–4°. MeCHBz₂, *m.* 82–3°, is similarly obtained in 92% yield from CH₂Bz₂ and MeI and BzCl gives 45% CHBz₂, *m.* 223–7°. The Na salt of II cannot be methylated even by this method and is quant. recovered, but 10 g. of the *K* salt, yellow cryst. powder prepd. from II in Et₂O-thiophene on the H₂O bath, yields 7 g. *p*-methoxymethyl-dibenzoylmethane (I), light yellow oil, *b*_m 249°, solidifies in a few days to an almost colorless mass, *m.* 71.5–2.0°, which gives no color with FeCl₃, but by allowing the distillate to stand 0.5 hr. in 1 equiv. of NaOMe and pouring the yellow filtered soln. into ice-cold 10 *N* H₂SO₄, it is converted into the *enol form*, faintly yellow, *m.* 80°, gives with FeCl₃ a blue-violet color, forms a *Cu* salt, *m.* 178°, and on recrystn. regenerates the original keto form, *m.* 72°. Bradley and Robinson's "α-anisoylpropio-phenone," prepd. by the condensation of *p*-MeOC₆H₄COEt and BzOEt with NaNH₂, has entirely different properties and it has not been possible to repeat their work. Further to confirm the correctness of the structure assigned to I, it was treated with PhNHNH₂ and found to yield, as expected, the 2 isomeric 3(5)-phenyl-4-methyl-5(3)-*p*-anisyl-*N*-phenylpyrazoles. C. A. R.

Chemical constitution and rotatory power. MARIO BETTI and G. B. BONINO. *Atti II congresso naz. chim. pura applicata* 1926, 1244–7.—There has been no relation established between the optical rotation of an active compd. and the chem. nature of the substituents on the asym. C atom, though it has been shown by Betti (*C. A.* 18, 194) that the character of the substituents often has more influence than their mass. There is a remarkable parallelism between the rotatory powers of aldehyde-amine derivs. and the dissoen. consts. of the corresponding CO₂H acids. When the sq. roots of mol. rotatory powers (*[M_D]*) are plotted as ordinates and the negative logs of the dissoen. consts. (–log *K*) as abscissae, and *m*- and *p*-acids plotted, each series of acids gives a smooth curve. By means of these curves it is possible to predict the dissoen. const. of an acid when its rotatory power is known. This is of special value when the soly. of an acid is so low that its dissoen. const. cannot be detd. directly. In the earlier work (*C. A.* 18, 194) the [*M_D*] value of β-naphtholbenzylamine and the dissoen. const. of *m*-BrC₆H₄CO₂H were not detd. Extrapolation of the curve indicated 278°, and when the acid was prepd., the exptl. value was 280.9°, which is considered to confirm the relation represented by the curves. The work proves that there is a simple relation between the rotatory power of aldehyde-amines and the log of the dissoen. consts. of the corresponding acids. Based on the recent theories of Debye and Hückel, this

dissoen. const. as used above must be regarded as an *activity const.* Since there is a relation between rotatory power and activity const., there should be a *relation between the rotatory power and the elec. moment of mols.*

C. C. DAVIS

α -Benzyl-naphthalene. I. 1-Benzyl-naphthalene-4-sulfonic acid and its transformations. KAROL DZIEWONSKI AND STEFAN DZIECIELEWSKI. *Bull. intern. acad. Polonaise* 1927A, 273-86.—The method used for the prepn. of α -C₁₀H₇CH₂Ph (I) was a modification of that given by Roux (*Ann. chim. phys.* [6], 12, 293(1887)). A mixt. of 150 g. C₁₀H₈, 50 g. ZnCl₂ and 100 g. PhCH₂Cl was warmed slightly to start the reaction. When evolution of H₂Cl had ceased, the mixt. was heated for some time at 125°. Unchanged C₁₀H₈ was removed by distn. with steam. The residue, distd. with superheated steam, gave a distillate contg. a yellow oil which solidified on cooling. Recrystd. from EtOH, it m. 59°. The yield of I was 40-5% of the PhCH₂Cl used. I (1 mol.), treated with concd. H₂SO₄ (2.5 mols.) at 66° and warmed until the product was almost completely sol. in H₂O, gave a red-brown melt, which was dissolved in H₂O. The soln. was filtered and NaCl added. Na 1-benzyl-naphthalene-4-sulfonate (II) crystd. II was also prepd. by the action of ClSO₃H on α -C₁₀H₇CH₂Ph in PhNO₂ at room temp., and treatment of the soln. of the acid with NaCl. The Pb and Ba salts were prepd. by neutralizing the free acid with PbCO₃ and BaCO₃. From the Pb salt by treatment with H₂S was obtained 1-benzyl-naphthalene-4-sulfonic acid, m. 70-80°. Chloride, from II and PCl₅, m. 104-5°. Amide, m. 164-5°. II, heated at 240° with fused KOH, gave 4-benzyl-1-hydroxynaphthalene (III), m. 125-6°, also made from α -naphthol and PhCH₂Cl in CHCl₃ in the presence of ZnCl₂. The following derivs. of III were prepd.: acetate, m. 87-8°; benzoate, reddish, m. 103°; Me ether, m. 85-7°, and a yellow NO₂ deriv. of it, m. 130-2°; 2-NO deriv., yellow, m. 170° (decompn.), sol. in cold H₂SO₄ and pptd. by H₂O. 2-Azo derivs. of III: Benzene, scarlet-red, m. 191-3°, almost insol. in alkalis; p-nitrobenzene, red, m. 252-3°, almost insol. in alkalis, sol. in cold concd. H₂SO₄ with red color; 1'-naphthalene, red, m. 201-3°, sol. in cold concd. H₂SO₄ with blue color; 2'-naphthalene, violet-red, m. 207-8°, almost insol. in alkalis, sol. in cold concd. H₂SO₄ with violet color and pptd. by H₂O. Other compds. prepd. were 4-benzyl-1-aminonaphthalene, m. 114.5°, and its Ac deriv., violet, m. 208-9°.

LOUISE KELLEY

Inner complex salts of diindyl- and dipyrrolymethenes. I. Constitution of the Kunz diindylmethene-copper compound. O. SCHMIDT-DUMONT AND E. MOTZKUS. *Ber.* 61B, 580-6(1928).—Kunz has recently (C. A. 20, 1880) expressed the opinion that in the blood pigment and in chlorophyll the metal is combined purely additively and that therefore the blood pigment is not an inner complex salt. He bases his views on the results of expts. with indigo and related indole compds. Indigo forms with metallic Cu a Cu compd. without evolution of H. The same compd. is obtained by treating indigo with Cu(OAc)₂, whereby AcOH is liberated, hence the interaction of indigo and similar compds. (diindylmethenes, dipyrrolymethenes, porphyrins) with heavy metal acetates is no sure indication that a substituting introduction of the metal has occurred. To obtain strict proof whether the theory of purely additive metal combination is correct, the simplest thing seemed to be to prep. the metal compds. in question by double decompn. with a metal salt of the K compds, whose nature as substitution products must first be proved. If the K is replaced by the metal and the product is identical with K's, there can no longer be any doubt that the latter is a salt-like compd. of the metal. K. found that bis-[α -methyl- β -indyl]methene (I), which with Cu(OAc)₂ in C₆H₅N forms a Cu compd. (II), reacts with K with evolution of H but was unable to isolate the K compd. S.-D. and M. have succeeded in prepg. this K compd. from I and metallic K in liquid NH₃. The I, which is very difficultly sol. in liquid NH₃, dissolves with orange-red color and vigorous evolution of H when treated with K and on filtering and concg. there remains an orange-red cryst. mass with bluish surface luster which can be purified by pptn. from C₆H₅N. If II is a substitution product, the Cu must have replaced a single H atom, i. e., it must be a Cu' salt, although it has been prepd. from a Cu'' salt. The apparent anomaly can be explained by assuming that the Cu'' salt is not stable but spontaneously decomps. into the Cu' deriv. If this is true, it should be formed from both Cu' and Cu'' salts by double decompn. with the K salt of I. Such proved to be the case. Of the Cu' salts, CuI and CuBr proved to be best adapted for the reaction. If the K salt in C₆H₅N is treated with 1 of these Cu' halides, the Cu compd. seps. instantly as a brown-violet ppt. with green surface luster; the same product is obtained in liquid NH₃, in which it is very difficultly sol. It is also formed from the K salt with a Cu' salt, viz., tetramminecupric nitrate (III); in this reaction there is also formed a Cu-free compd., equal in wt. to about 0.5 of the I employed and which is probably an oxidation

product of the indole base resulting from a spontaneous decompn. of the unstable Cu⁺ compd. From the Cu compd. the I can be quant. regenerated in pure form, either by long treatment with concd. HCO₂H at room temp. and pptn. with dil. NH₄OH or by treatment in C₅H₅N suspension with aq. KCN. That in the product obtained from both CuI and III the Cu is present in the univalent form was shown by heating a short time with dil. HCl under N and making ammoniacal; the resulting soln., filtered under N, was perfectly colorless but on shaking with air immediately became blue. The Cu compd. so obtained is identical with K.'s II. These facts seem to prove beyond doubt that II is a true Cu salt contg. the metal in the univalent form, and may be considered as an inner complex salt in which the Cu is fixed within an 8-membered secondary valence ring. Doubt is thus cast on the purely additive nature of the other metal compds. prepd. by K.; these are being studied by S.-D. and M. C. A. R.

The synthesis of indones. REMO DE FAZI. *Atti II congresso naz. chim. pura applicata* 1926, 1285-6; cf. C. A. 22, 234.—A continuation of expts. in which α -methyl- and α -ethyl- β -phenyllindone were prepd. by the action of concd. H₂SO₄ on the Et esters of α -methyl- and α -ethyl- β -diphenyllactic acids resp. (cf. C. A. 19, 2208) led to the discovery of the first known general method for the synthesis of indones. This method consists of treating the substituted β -phenyllactic ester at ordinary temp. with concd. H₂SO₄. After 1 hr. the reaction mixt. is poured on to ice, which gives a theoretical yield of the indone. The reactions comprise the following stages: $\text{RPh}(\text{HO})\text{CCH}(\text{R}')\text{CO}_2\text{Et} \rightarrow \text{RPh}(\text{HO})\text{CCH}(\text{R}')\text{CO}_2\text{H} \rightarrow \text{RPhC}(\text{CR}')\text{CO}_2\text{H} \rightarrow \text{C}_6\text{H}_4(\text{CR}')\text{CR}'\text{CO}_2\text{H}$.

The prepn. of the esters of β -phenyllactic acid contg. alkyl and aryl groups in α - and β -positions, necessary to the synthesis of indones, is very easy, since it is sufficient only to treat the aromatic ketones with acyclic α -Br esters in the presence of granulated Zn. Therefore the method is of practical application. C. C. DAVIS

Esters of furoylacetic acid. J. E. ZANETTI AND C. O. BECKMANN. *J. Am. Chem. Soc.* 50, 1438-42 (1928).—Et furoate and AcOMe are condensed by EtONa, giving 45-50% Me furoylacetate, b₁ 96-8°, b₂ 144-5°, turns yellow on standing; oxime, m. 124-5°, semicarbazone, m. 141-2°; the Na, K and Cu salts of the 3 esters were also prepd. Pr ester, b₁ 110-2°; oxime, m. 120-1°; semicarbazone, m. 137-8°. Bu ester, b₁ 136-8°, m. 25.2°; oxime, m. 102°; semicarbazone, m. 127-8°. The stability of the oximes is discussed and shown to be contrary to Hantzsch's theory and not fully explained by Abegg's theory. C. J. WEST

Studies on phenylcoumarins. GUIDO BARGELLINI. *Atti II congresso naz. chim. pura applicata* 1926, 1295-7; cf. C. A. 21, 1981, 3193.—A summary of various papers by B. and his collaborators. C. C. DAVIS

New reactions of indolenines and indolinols. HERMANN LEUCHS, DAVID PHILPOTT, PAUL SANDER, ARNOLD HELLER AND HERBERT KOHLER. *Ann.* 461, 27-46 (1928).—Ethylhydrindone (8 g.) heated with 5.5 g. PhNHNH₂ and 0.5 g. AcONa 2 hrs. at 100° and then 4 hrs. with 30 cc. EtOH and 50 g. ZnCl₂, gives 11-13 g. of the Zn compd., Zn(C₁₇H₁₅N)₂Cl₂; aq. NH₃ liberates the free base, 3-ethyl-3,2-[o-benzylene]-indolenine (I), b₁₄ 202-4°, which crysts. with 0.5 H₂O, m. 79-80°, decomps. 150°; the H₂O is retained in soln. as a part of the mol.; HCl salt, sinters at 78° and 15 mm. with loss of HCl, m. 124-6° (decompn.); picrate, m. 173-5°. I (1.5 g.) with Ac₂O and AcONa at 100° gives 1.8 g. 3-ethyl-3,2-[o-benzylene]-2-O-1-diacetyl-2-indolinol (II), m. 125-6°. Heating 1.5 g. II with 50 cc. MeOH 15 min. gives the 2-O-methyl-1-acetyl deriv., m. 105°; this is not unchanged by Ac₂O and is largely recovered unchanged after 4 hrs. heating with 20 parts NH₃-MeOH. Heating 0.6 g. II in 6 cc. AcOH with 3 cc. 12 N HCl at 60° gives 0.4 g. 3-ethyl-3,2-[o-benzylene]-1-acetyl-2-indolinol, m. 159-61°; this also results from the Me ether; it is unchanged by CH₃N₃ or Ac₂O and AcONa at 100°. Heating 1 g. II 4 hrs. with 20 cc. NH₃-MeOH at 100° gives 0.75 g. 3-ethyl-3,2-[o-benzylene]-2-amino-1-acetylindoline, m. 138-9°. Bz₂O and BzONa with I at 100° give the di-Bz deriv. corresponding to II, m. 179-81°, and a little of the 1-Bz deriv., m. 145.5-65°; the O-methyl-1-benzoyl deriv., m. 125-6°. 3-Ethyl-3,2-[o-benzylene]-1-benzoyl-2-aminoindoline, m. 130°; HCl salt, m. 231-3°. I (2 g.) and 12 g. C₆H₄(CO)₂O, heated 4 hrs. at 160°, give 1.1 g. 3-ethyl-[o-benzylene]-2-O-1-phthaloyl-2-indolinol, m. 200-1°. I (1 g.) heated with 20 cc. MeOH-NH₃ 4 hrs. at 100° gives 3-ethyl-3,2-[o-benzylene]-2-aminoindoline, crystg. with 1 H₂O, m. 95° (evolution of NH₃); in CHCl₃ soln. HCl ppts. NH₄Cl at 0°. I, reduced with HCl and Zn-Hg in EtOH, gives 3-ethyl-3,2-[o-benzylene]indoline, light green, m. 101-2°; HCl salt, decomps. 230-3°; picrate, yellow, m. 170-2°; Ac deriv., m. 128°. β -Phenylhydrindone phenylhydrazone in CHCl₃, shaken 0.5 hr. with 12 N HCl, gives 85% of 3-phenyl-3,2-[o-benzylene]indolenine (III), m. 182-3°; HCl salt, sinters 180°; picrate, yellow, m. 185-6°

(decompn.). Ac_2O and III give 3-phenyl-3,2-[o-benzylene]-2-O-1-diacetylindolinol, m. 168°; with MeOH at 100° this gives the 2-O-methyl-1-acetyl deriv., m. 160-1° and with HCl the 1-Ac deriv., m. 183-4°. With PhNHNH_2 III gives 3-phenyl-3,2-[o-benzylene]-2-phenylhydrazinindoline, m. 224-6°; the 2-amino deriv. m. 145° (evolution of NH_3). Heating diacetylindolinol with MeOH-NH_3 4 hrs. at 100° gives 3-benzyl-3,2-[o-benzylene]-2-amino-1-acetylindoline, m. 118-20° (decompn.) (Ac deriv., m. 174°); the corresponding 1-Bz deriv. m. 219-20° (Bz deriv., m. 255-8°). 3-Benzyl-3,2-[o-benzylene]indolenine-MeI, m. 165-8° (decompn.), from the base and MeI in MeOH at 100° (40% yield); $\bullet\text{Ag}_2\text{CO}_3$ in Me_2CO gives 3-benzyl-3,2-[o-benzylene]-1-methyl-2-indolinol, m. 147-8°. Na 3-benzyl-3,2-[o-benzylene]indoline-2-sulfonate, m. 115-20° (decompn.), results from the HCl salt and Na_2SO_3 in EtOH and crysts. with 4 H_2O . 3-Benzyl-3,2-[o-benzylene]-2-aminoindoline, m. 110-5° (decompn.). 3-Benzyl-3,2-[o-benzylene]indoline, m. 85-6° (Ac deriv., m. 85-6°; picrate, m. 184°); 1-Me deriv., m. 81°; picrate, m. 166-70°. β -Benzyltetralone phenylhydrazone and 12 N HCl give 3-benzyl-2,3-[o-phenyleneethyl]indolenine, m. 104-6°; HCl salt, pale greenish yellow, m. 194-6°; picrate, m. 180-2° (decompn.); this base does not react with PhNHNH_2 at 130° or with Ac_2O or Bz_2O at 100° or 140°. Reduction gives 3-benzyl-2,3-[o-phenyleneethyl]indoline, m. 84-6°; picrate, m. 179-81°. β -Phenethyltetralone, yellow oil, d_{12} 232-4°; semicarbazone, m. 166-7°; phenylhydrazone, m. 97-103° and gradually resinifies. 3-[β -Phenethyl]-2,3-[o-phenyleneethyl]indolenine, obtained only as a resin, HCl salt, greenish yellow, m. 215-23° (decompn.), picrate, yellow, m. 170-1°.

C. J. WEST

Thiazole derivatives by thiocyanation of amines. H. P. KAUFMANN, W. OEHNING AND A. CLAUBERG. *Arch. Pharm.* **266**, 197-218(1928).—The methods used in the present study were essentially the same as those previously employed by K. and O. (cf. C. A. **20**, 1603). The following compds. were prepd and characterized: *Et* 3-thiocyano-4-aminobenzoate, m. 97-8°; bis-[*Et* 4-aminobenzoate] 3-disulfide, m. 153°; 2-amino-6-carboxybenzothiazole, m. 241°, 2-amino-6-ethoxybenzothiazole, m. 161-2°, 2-amino-6-chlorobenzothiazole, m. 198°; 2-amino-4-methyl-6-chlorobenzothiazole, m. 206°; 1-methyl-3,5-dithiocyano-4-aminobenzene, m. 123°; 2-amino-6-methylbenzothiazole, m. 136°; 2-amino-4-thiocyano-6-methylbenzothiazole, m. 225°; 2-amino- α -naphthothiazole, m. 261°; 2-amino-6-thiocyanobenzothiazole, m. 198°; 1,4-dimethyl-2-amino-5-thiocyanobenzene, m. 65°; bis-[1,4-dimethyl-2-aminobenzene] 5-disulfide, m. 192°, 2-amino-4,7-dimethyl-6-thiocyanobenzothiazole, m. 231°; 2-amino-8-thiocyano- β -naphthothiazole, m. 272°.

W. O. F.

Molecular weight of hemocyanin. THE SVEDBERG AND EUGEN CHIRNOAGA. *J. Am. Chem. Soc.* **50**, 1399-411(1928).—The centrifugal methods have been applied to the study of the mol. wt of hemocyanin from *Helix pomatia*. The unexpected phenomenon of a strong variation of its diffusion const. with concn. down to a certain low limit of concn. has been encountered and an assumption has been put forward to explain it. Both the sedimentation velocity and sedimentation equil. methods for detg. the mol. wt have resulted in good agreement in the figure of $5,000,000 \pm 5\%$ as the most probable value in dil. soln. at p_H 4.7. Within the limits of exptl. error all the mols. of a dil. soln. of hemocyanin from *Helix pomatia* at p_H 4.7 are found to be of equal wt. and size and this protein is therefore probably to be regarded as a chem. individual. As to shape, the calcs. based on the exptl. data indicate that at p_H 4.7 the mols. are practically spherical with a radius of 12.1×10^{-7} cm.

C. J. WEST

Tautomerism in the pyridine series: diphenylpyridylmethanes and some of their derivatives. A. E. CHICHIBABIN AND S. V. BENEVOLENSKAIA. *Ber.* **61B**, 547-55 (1928).—Earlier work on the pyridonemethides would seem to indicate that replacement of the H atoms of the Me group by C_6H_5 residues facilitates the formation of the pyridonemethides and increases their stability. This has been further confirmed by the prepn. of *N*-methyl- α - (I) and γ -pyridonediphenylmethide (II), which are quite stable as compared with the corresponding monobenzyl derivs. They are red cryst. substances quite stable in the air when dry, only slowly sol. in H_2O , more rapidly on

heating, with formation of strongly alk. solns., the equil.
$$\text{CH}:\text{CH}:\text{C}:\text{CPh}_2 \rightleftharpoons \text{CH}:\text{CH}:\text{NMeOH}$$

$\text{CH}:\text{CH}:\text{C}:\text{CPh}_2$

\downarrow
 $\text{CH}:\text{CH}:\text{NMe}$ + H_2O being shifted far to the right. α - $\text{C}_6\text{H}_4\text{NCOPh}$ (III), the

starting material in the prepn. of I, had hitherto been obtained only in liquid form but 1 sample prepd. some yrs. ago solidified after being distd. to prisms m. 50° and all the prepn. on hand, some even 25 yrs. old, could then be made to cryst. by seeding;

now, they generally cryst. spontaneously. In the prepn. of derivs. of γ - C_6H_4NCOPh an unexpected phenomenon was encountered for which there is as yet no explanation; the $C_6H_4NC(OH)Ph_2$, prepd. from the ketone with $PhMgBr$, was obtained in 1906 as a cryst. powder (IV) m. 203° (C. A. 1, 2478) but on repeating the expt. many times there has always been obtained a product (V) of the same compn. but m. 235° (mixed m. p. with the older prepn., 203 – 20°). Both carbinols dissolve in H_2SO_4 with intense color. With HI - $AcOH$ V gives a $C_6H_4NCHPh_2$ m. 125° . IV an isomer m. 111 – 2° (mixed m. p., 103 – 16°). *Diphenyl- α -pyridylcarbinol* (12.8 g. from 9 g. III with $PhMgBr$ in Et_2O), m. 105° , easily sol. in dil. acids, sol. in concd. H_2SO_4 with intense red color; *chloroplatinate*, orange leaflets with 2 H_2O , loses its H_2O and apparently some of its HCl at 90 – 5° , then gradually blackens without melting; *picrate*, m. 173° (decompn.). *Diphenyl- α -pyridylmethane* (4.4 g. from 5 g. of the carbinol with HI - $AcOH$), m. 63° ; *chloroplatinate*, orange, m. 182° (decompn.); *picrate*, m. 172° ; *methiodide* (9 g. from 6 g. of the methane with excess of MeI at 100°), almost colorless leafy needles from H_2O , gradually becomes yellow, m. 222 – 4° , gives in H_2O with concd. KOH dark red-violet needles of I, m. 147° , which gradually darken and deliquesce in the air, dissolve with red color in alc., Et_2O , C_6H_6 and $AcOEt$, the solns. being decolorized by shaking with H_2O but again colored on addn. of alkalis; the colorless aq. solns. treated with HI and evapd. regenerate the original methiodide. *Chloroplatinate* of V, orange, m. 203° ; *picrate*, needles (probably solvated) from C_6H_6 , m. 101 – 3° (gas evolution). *Diphenyl- γ -pyridylmethane* (4.5 g. from 5 g. V); *chloroplatinate*, golden yellow, m. 201° ; *picrate*, m. 172° ; *methiodide* (7.5 g. from 5 g. of the methane), almost colorless needles from hot H_2O , gradually becomes yellow, m. 159 – 61° . II (1.19 g. from 2 g. of the methiodide), yellow, m. 113° , sol. in Et_2O , alc., C_6H_6 and $AcOEt$ with yellow color.

C. A. R.

Synthesis of pyridine analogs of quinizarin. STEFAN NIEMENTOWSKI, JÓZEF FRÜHLING AND RUDOLF JOSZT. *Koczniki Chem.* 7, 218–29 (1927); cf. Philips, *Ber.* 27, 1923 (1894).—5,8-Dihydroxy- α -anthrapyridinequinone (I) is obtained by immersing a well-triturated mixt. of equal parts of pure quinolinic anhydride, m. 130° , and p - $C_6H_4(OMe)_2$ and 3 parts dry distd. $AlCl_3$ in a metal bath at 200 – 15° . The violent reaction lasts 3–4 min. The mass is allowed to cool to 160° within 15 min, is kept so for 45 min., then cooled to room temp. After the addn. of 6–8 parts concd. H_2SO_4 the product is heated, first gently until the liberation of HCl ceases, then 1–2 hrs. to 130 – 40° . The red product is dild. with 10 parts water while still fairly hot and shaken out with benzene, avoiding emulsification. The color and fluorescence of the aq. layer suggest the presence of a *quinolein*, which however was not isolated. When concd., the benzene layer seps. bright red crystals of I with 0.5 mol. of benzene, which lose benzene at room temp., leaving c. p. I, m. 230° , scarcely sol. in water, sol. in dil. $NaOH$ with blue color. Yield 50% of the $C_{16}H_8(OMe)_2$. It drops to 25% when $C_6H_4(OH)_2$ is used. *Dihydroxymethyl- α -anthrapyridinequinone* was prepd. in poor yield from hydrotoluquinone. The small quantity did not permit examn. For the prepn. of 5,8-dihydroxy- β -anthrapyridinequinone (II) cinchomeric acid (III) was obtained by boiling 48 hrs. a soln. of 100 g. quinine- HCl with 3 g. HNO_3 (d. 1.4), until no quinine was liberated by NH_3 . After evapn. to a sirupy consistency and dildn. with water fairly pure III, m. 260° (decompn.), sep'd. Further III was recovered from the mother liquid by repeated treatment with HNO_3 and water. Yield, 26–7 g. III anhydride is obtained in 5.2 g. yield by heating 6 g. III with 30 g. Ac_2O , distg. *in vacuo* and drying 2–3 weeks *in vacuo* over CaO or KOH . It is very unstable. A well-triturated mixt. of 5.2 g. III anhydride, 3.3 g. p - $C_6H_4(OMe)_2$ and 24 g. dry distd. $AlCl_3$ is heated as under I. Condensation with H_2SO_4 is not necessary. A few cc. concd. H_2SO_4 is added to the soln. in 1 l. cold water until the fluorescence disappears. A slight ppt. of II seps. out; the main part is shaken out with benzene. The benzene ext. is recrystd. from alc. Red shining platelets, m. 209° . Yield 1.3–1.6 g. It is easily sol. in HCl and H_2SO_4 with a red, in alkalis with a blue color. The acid or neutral aq. soln. is orange-red. When shaken with Zn dust the blue NH_3 soln. turns red, the pink or orange soln. in glacial $AcOH$ turns blue, and on subsequent heating permanently colorless. The original colors are restored by contact with the air. II *diacetate* light, greenish yellow, sintering between 160 and 90° , m. 187.5 – 9.5° , is obtained by refluxing 10 min. 1 part II with 2 parts $AcONa$ and at least 10 parts Ac_2O . *Dihydroxy- β -anthrahydroquinone tetraacetate*, prepd. by 10 min. refluxing of 1 part II, 3 parts Zn dust, 2 parts $AcONa$ and 15 parts Ac_2O , yellowish, darkens at 250° , softens at 275° and m. 283° (decompn.). The mother liquids probably contain the *triacetate* of the anthranol analog.

MARY JACOBSEN

Oxidation of N -benzoylhexamethylenimine. ADOLF MÜLLER. *Ber.* 61B, 568–9

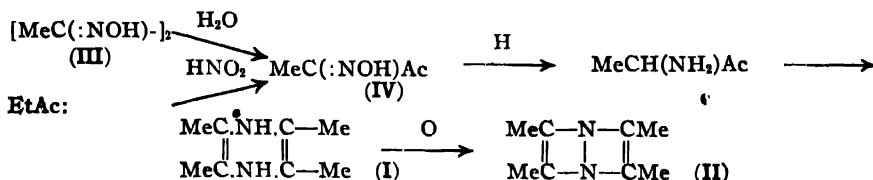

(1928).—It has been found (C. A. 22, 214) that $\text{Br}(\text{CH}_2)_6\text{Br}$ with $p\text{-MeC}_6\text{H}_4\text{SO}_2\text{NH}_2$ gives the N - $p\text{-MeC}_6\text{H}_4\text{SO}_2$ deriv. of hexamethylenimine (I), which is hydrolyzed to I-HCl by heating with concd. HCl, and that the N -Bz deriv. of the I is converted by the Braun P halide method into $\text{I}(\text{CH}_2)_6\text{I}$. While this seemed to be sufficient proof of the structure of the I, M. undertook to establish this with even greater certainty because, as shown in the following abstr., the action of $\text{I}(\text{CH}_2)_6\text{I}$ on amines does not, as hitherto assumed, give α -pipecoline derivs. but derivs. of I, and it was desirable that there should be no possible doubt as to the structure of the I derivs. used for comparison. He accordingly oxidized the N -Bz deriv. of I with KMnO_4 and obtained 44% of the expected $\text{BzNH}(\text{CH}_2)_6\text{CO}_2\text{H}$, m. $80\text{--}1^\circ$ (cor.), identical with the product obtained from $\text{BzNH}(\text{CH}_2)_6\text{Cl}$ (Gabriel, C. A. 3, 2137). C. A. R.

Action of 1,6-diiodohexane on amines. ADOLF MÜLLER AND ERICH RÖHL. *Ber. 61B*, 570-4 (1928); cf. preceding abstr.—According to v. Braun (C. A. 5, 490) when $\text{I}(\text{CH}_2)_6\text{I}$ reacts with MeNH_2 , PhNH_2 , Me_2NH and piperidine, no trace of hexamethylenimine derivs. is formed but the ring is shortened and α -pipecoline derivs. are obtained, whereas M. and Sauerwald found just the opposite with $p\text{-MeC}_6\text{H}_4\text{SO}_2\text{NH}_2$ and $\text{Br}(\text{CH}_2)_6\text{Br}$. A repetition of v. B.'s work with MeNH_2 and piperidine showed that the product obtained from $\text{I}(\text{CH}_2)_6\text{I}$ and MeNH_2 , with subsequent methylation, m. 265° (cor.) (v. B. gives 255°) and is identical with the N,N -hexamethyleniminium iodide prepd. from hexamethylenimine and MeI ; the corresponding chloroplatinate decomps. 233° (cor.), while N,N -dimethyl- α -pipecolinium chloroplatinate decomps. 246° (v. B., 222°). Similarly, $\text{I}(\text{CH}_2)_6\text{I}$ and piperidine give hexamethylenepiperidinium iodide (I), also obtained from $\text{I}(\text{CH}_2)_6\text{I}$ and hexamethylenimine, while $\text{I}(\text{CH}_2)_6\text{I}$ and α -pipecoline give the isomeric α -methylpentamethylenepiperidinium iodide (II). The $\text{I}(\text{CH}_2)_6\text{I}$, b₁₀ $141\text{--}2^\circ$, is obtained in 73% yield from $\text{HO}(\text{CH}_2)_6\text{OH}$ with red P and I. I m. 273° (cor.) (v. B., 263° , apparently uncor.). II, m. 268° (mixed m. p. with I, about 233°). Hexamethylenepiperidinium chloroplatinate, m. $240\text{--}1^\circ$ (cor., decomps.); v. B. gives 231° . C. A. R.

Amides of α -phenylcinchoninic acid. ST. WEIL AND A. KONÓWNA. *Bull. trav. inst. pharm. état* No. 7, 467-9 (1927).—W. and K. prepd. amides of α -phenylcinchoninic acid by the action of the acid chloride on the following amines. *o*-phenetidine, amide m. 130° ; aminodimethylphenylpyrazolone, m. 249° ; piperazine, m. 280° ; lysidine, m. 160° . WILLIAM J. HUSA

A few esters of phenylquinolinecarboxylic acid. ST. WEIL AND A. JOSKOWICZ. *Roczniki Chem.* 7, 362-7 (1927).—The esters of α -phenylcinchoninic acid with the following alcs. were prepd. by adding the calcd. quantity or a slight excess of POCl_3 to the melted equimol. mixts. of acid and alc. (on the water bath or oil bath according to the m. p.), shaking vigorously until HCl is no longer evolved, pouring into water, recrystg. from 95% alc., and finally from ligroin: *p*-chlorophenol, m. $117\text{--}8^\circ$; phenylethyl alc., m. 72° ; pyrocatechol, m. $178\text{--}9^\circ$; guaiacol, m. $104\text{--}5^\circ$; resorcinol, m. $193\text{--}5^\circ$; pyrogallol (prepd. from gallic acid), m. $170\text{--}1^\circ$; pyrogallol (prepd. from pyrogallol), m. $160\text{--}1^\circ$, apparently an isomer of the former; thymol, m. $110\text{--}11^\circ$, also sol. in oils, and the tri- $[\alpha$ -phenylcinchoninic acid]ester of quinide (from quinic acid), yellow, m. 208° . MARY JACOBSEN

The conversion of *o*-diketoximes into pyrazines. *O. WALLACH. *Nach. Ges. Wiss. Göttingen math. physik. Klasse* 1927, 238-44.—Dioximes of *o*-diketones do not usually yield diamines when reduced, but are first hydrolyzed to the mono-oximes, which are then reduced to *o*-amino ketones, 2 moles of the enolic form condensing with each other by loss of 2 H_2O to yield an easily oxidized dihydropyrazine (I), which is oxidized by air to a pyrazine (II). The mechanism of the reaction is:

These reactions readily take place during alk. reduction. II is obtained almost quant. when 5 g. III in 40 cc. 10% NaOH is warmed for 0.75 hr. with 40 g. Zn dust (previously etched with HCl) or better when 5 g. IV in 20 cc. 10% NaOH is treated with 10 cc. H_2O and 20 g. Zn for 10-15 min., filtered, the filtrate extd. with Et_2O , the ext. distd., then steam-distd. and the distillate extd. with Et_2O ; evapn. of the Et_2O gives colorless

crystals of II, m. 75–85°, which, recrystd. from H₂O and dried over CaCl₂, m. 86–7°; when dried by melting over K or Na, it b. 189–90°; *picrate*, yellow, m. 192–5°; the HgCl₂ and Hg(CN)₂ *double salts* were prepd. In accord with these reactions, the product obtained on reduction of the *dioxime* of cyclohexane-1,2-dione (cf. C. A. 18,

2336) is seen to be a *dihydropyrazine*, $C_4H_8 \begin{smallmatrix} \diagup C.NH.C \\ \diagdown C.NH.C \end{smallmatrix} \diagup C_4H_8$, which on oxidation

for several days with H₂O₂ in acid soln., filtering, pptg. with NH₄OH, steam-distg. the ppt., extg. the distillate with Et₂O or CHCl₃ gives the corresponding *pyrazine*, C₁₂H₁₆N₂, m. 108°; the *picrate*, HCl salt and *chloroplatinate* are sol. in H₂O.

N. A. LANGE

The resin acids of conifers. PAUL LEVY. *Ber.* 61B, 616–23(1928); cf. C. A. 22, 87.—In the earlier paper it was reported that oxidation of the so-called Steele abietic acid had given a hitherto unknown dihydroxyabietic acid. This, however, seems to be really dihydroxy-*d*-pimaric acid (I) (cf. Ruzicka and Balas, C. A. 22, 1587) and is also obtained by oxidation of abietic acid (prepd. according to Ger. pat. 221,889) and from crude American colophony, confirming the view of Dupont that the abietic acids, hitherto considered as being homogeneous substances, in reality still contain isomeric resin acids. A further confirmation of this is found in the fact that dihydro-*d*-pimaric acid has been identified among the products of the catalytic hydrogenation of abietic acid prepd. from American turpentine. Beyond doubt the formation of di- along with the 2 tetra-HO acids in the 1 case and only of the tetra-HO acids in others is intimately related with the quantity of oxidizing agent used. With a large excess of the oxidizing agent both tetra-HO acids were formed while with the quantity of KMnO₄ calcd. for 2 ethylene bonds in the abietic acid only the higher melting tetra-HO acid (along with I) was formed. All 3 products obtained by L. were homogeneous, as was established by special expts. to meet the criticism of Ruzicka (C. A. 18, 681)

C. A. R.

Catalytic hydrogenation of carotin. L. ZECHMEISTER, L. V. CHOLNOKY and V. VRABÉLY. *Ber.* 61B, 566–8(1928); cf. C. A. 21, 2919.—If a soln. or suspension of pure carotin (I), *e. g.*, in cyclohexane or Et₂O, is treated with Pt sponge and H₂, it soon becomes perfectly colorless (in 15 min. with 0.5 g. I and enough Pt) and takes up 22 atoms of H per mol. of I. Since under such mild conditions opening of ring systems is improbable, I must have essentially an aliphatic structure; in harmony with this view are the wax-like consistency of I, the ease with which it resinifies and its slight tinctorial power. The hydrogenation product, the study of which has not been completed, remains on evapn. of the solvent as a white transparent mass, which soon solidifies and resembles paraffin; pptn. from Et₂O-EtOH yields about 50% of needles, m. 65°; it is satd. towards halogens and does not give with H₂SO₄ the blue color characteristic of carotinoids.

C. A. R.

The photochemical oxidation and dehydrogenation of ergosterol. A. WINDAUS, P. BORGEAUD and J. BRUNKEN. *Nach. Ges. Wiss. Göttingen math. physik. Klasse* 1927, 313–4; *Pharm. Monatsh.* 9, 61(1928).—It has been found that light of the visible spectrum activates ergosterol (I) to which has been added a sensitizer but the photochem. rearrangements are of a different kind than that produced by ultra-violet light and do not seem to have any direct biol. significance. The effects of visible light are different depending upon the presence or exclusion of O₂ during the irradiation. When dyes having an absorption max. between 500 and 520μ (eosine and erythrosin) are the sensitizing agents and with exclusion of O₂, visible light causes a bleaching of the dye and dehydrogenation of I with the formation of a difficultly sol., cryst. product, m. 203°, which was identified as a *pinacol*, C₂₈H₄₂O; this cannot be activated by ultra-violet light and is not antirachitic; when carefully heated it is split into a monomol. product isomeric with I, m. 152°, forming an *Ac deriv.*, m. 122–3°. In the presence of O₂, the dye (methylene blue, eosin, erythrosin or hematoporphyrin) acts as an O₂ carrier and is not consumed during the photo-oxidation, whereby a cryst. *peroxide* (II) of I is formed, m. 178°, [α]_D²⁰ –36° (*Ac deriv.*, m. 202°); reduction with Na + EtOH converts II to I and finally to a *dihydroergosterol*, m. 174°, [α]_D²⁰ –20°; dihydroergosterol acetate when catalytically reduced with Pt and AcOH at 75° gives *γ-ergostyl acetate* (cf. Reindel, C. A. 21, 1464). Digitonin and II in hot EtOH form an insol. *addn. compd.*; AsCl₃ and SbCl₃ give color reactions with II which are similar to those with vitamin A. II is not antirachitic, cannot be activated by ultra-violet light, but can be reconverted to I, which shows that I does not owe its property of activation to an impurity.

Catalytic oxidation of hydrocarbons. E. I. DU PONT DE NEMOURS & Co. Brit. 275,321, May 3, 1926. In the production of phthalic anhydride from $C_{10}H_8$ vapor or in similar oxidations, a mixt. of the hydrocarbon gas or vapor and O-contg. gas is passed through a plurality of relatively small reaction zones arranged in a medium of high heat cond. such as molten metal or fused salts such as a mixt. of fused $NaNO_3$ and KNO_3 . An app. is described.

Addition products of unsaturated hydrocarbons. H. WALTER. U. S. 1,669,384, May 8. In producing AcH or in similar reactions in which C_2H_2 is passed into a dil. acid soln. contg. a catalyst such as a Hg compd., steam is added with the C_2H_2 , which enables the addn. of the components of H_2O to take place without impairing the catalyzer in any way. Examples are given for the production of acetaldehyde, ethylidene diacetate, propionic acid and ethylidene propionate, trichloroacetic acid and trichloroacetic acid vinyl ester.

1-Aminonaphthalene-8-carboxylic acid. R. HERZ and F. SCHULTE. U. S. 1,668,148, May 1. An 8-cyanonaphthalene-1-sulfonic acid compd. such as the 8,1-acid itself is treated with $Ca(OH)_2$ or other alk. earth hydroxide at temp. not exceeding 250° (suitably about $200-250^\circ$) and under pressure. Cf. C. A. 22, 91.

Concentrating acetic acid or similar acids. E. RICARD. U. S. 1,668,380, May 1. Dehydration is effected in 2 stages. In the first stage, a "withdrawing liquid" is used which has a relatively high b. p. and forms a binary mixt. contg. a large quantity of H_2O ; in the second stage a liquid is used which has a lower b. p. so that it can be more readily sep'd. from the anhyd. acid produced. Xylene and C_6H_6 may be used for the first and second stages, resp., in concg. $HOAc$. In dehydrating formic acid, Bu formate and gasoline may be used. In dehydrating acrylic acid solvent naphtha and $BuCl$ may be used. An app. is described.

Converting cyanonaphthalenesulfonic acids. R. HERZ, F. SCHULTE and W. ZERWECK. U. S. 1,669,307, May 8. Cyanonaphthalenesulfonic acids, contg. at least 1 sulfonic group in *o*- or *p*-position to the cyanic group, are heated with an alk. reagent such as alc. KOH to effect formation of various products, among which examples are given for the production of 2-methoxynaphthalene-1-carboxamide (m. 189°), the corresponding ethoxy and butyloxy compds., 1-methoxy naphthalene-2-carboxamide (m. $156-7^\circ$), 4-methoxy-1-naphthamide (m. 237°), 4-methoxy-1-naphthoic acid (m. 239°), 4-ethoxy-1-naphthoic acid (m. 214°), 4-butyloxy-1-naphthamide (m. 250°), 4-butyloxy-1-naphthoic acid (m. 208°) and similar compds.

Acenaphthenecarboxylic acids. I. G. FARBERIND. A.-G. Brit. 274,894, July 24,

1926. Acetyl-, diacetyl-, chloroacetyl- or dichloroacetyl-acenaphthene, or a substitution product of these compds., is treated with an alk. hypochlorite; CHCl_3 is eliminated. Several examples are given.

Acenaphthene derivatives. I. G. FARBERIND. A.-G. Brit. 274,902, July 24, 1926. 5-Acenaphthencarboxylic acid (which may be prep'd. as described in Brit. 274,894 (cf. above)) or other acenaphthene derivs. contg. a carboxylic or sulfonic acid group in the 5-position are nitrated and then reduced, so that the amino deriv. formed is further converted into the acenaphthostyryl with elimination of water.

Treating dilute acetic acid vapors with cresol to effect concentration by extraction. H. SUIDA. Brit. 275,158, July 31, 1926. A distg. system is described.

Alcohols, etc., by catalytic hydrogenation or carbon monoxide. I. G. FARBERIND. A.-G. Brit. 275,284, March 4, 1926. The CO_2 formed in the reaction is removed continuously or periodically by absorption in solvents such as water or by fixing it chemically under high pressures, e. g., by water contg. a small quantity of NH_3 . Several examples are given.

Methanol synthesis, etc. COMPAGNIE DE BETHUNE. Brit. 274,492, July 17, 1926. Catalysts for synthesis of alcs., especially of MeOH, by reaction of CO and H under the influence of heat and pressure, are prep'd. by depositing sol. salts such as formates of U, W, V, Zn, Be, Cr or Ti upon a porous support such as pumice, asbestos, charcoal or activated C.

Methanol synthesis, etc. COMPAGNIE DE BETHUNE. Brit. 275,600, Aug. 6, 1926. Catalysts suitable for use in hydrogenation of CO comprise irreducible oxides to which 2-10% of Ni, Ni oxide or a Ni salt has been added; e. g., a catalyst may be prep'd. by immersing heated active C in a soln. of Zn and Cr formates contg. a small quantity of Ni formate, and evapg. to dryness; this catalyst may be used for producing MeOH from a mixt. contg. CO, H, N and CH_4 at 800 atm. pressure and a temp. of 300° .

Methanol synthesis, etc. SYNTHETIC AMMONIA & NITRATES, LTD., AND H. G. SMITH. Brit. 275,345, May 12, 1926. A catalyst for production of MeOH, higher alcs. and other O-contg. org. compds from C oxides and H at elevated temps. and pressures comprises a basic Zn chromate of the formula $4\text{ZnO} \cdot \text{CrO}_3$. This catalyst enables a temp. of $300-400^\circ$ to be employed for the synthesis and is not poisoned by S. Volatile compds of Fe, Ni and Co should be excluded.

Crotonaldehyde, etc. SOC. ANON. DISTILLERIES DES DEUX-SEVRES. Brit. 274,488, July 14, 1926. Equal quantities of AcH and water are mixed, cooled and NaOH soln. is gradually added. The soln. is acidified and distd. α -Ethyl- β -propylacrolein is similarly obtained from butyraldehyde. Other alk. hydroxides or carbonates may be used in similar reactions instead of NaOH.

Aromatic amino compounds. I. G. FARBERIND. A.-G. Brit. 274,562, April 21, 1926. Reduction of PhNO_2 or other nitro compds. to the corresponding amino compds. is effected with Fe and an acid concd. aq. soln. of an easily sol. salt of a metal more electropositive than Fe such as a soln. of NaCl or CaCl_2 and HCl; the Fe is converted into a finely divided oxide suitable for use as a pigment.

Hydroxylic compounds from primary amines. J. W. C. CRAWFORD and F. G. WILLSON. Brit. 274,960, April 28, 1926. In producing PhOH from PhNH_2 , *p*-cresol from *p*-toluidine, *p*-chlorophenol from *p*-chloroaniline, *m*-hydroxybenzaldehyde from *m*-aminobenzaldehyde, 1-hydroxy-2,4-dimethylbenzene from 1-amino-2,4-dimethylbenzene, salicylic acid from anthranilic acid and in similar reactions the amines are treated with HNO_2 or a nitrite and decompn. of the resulting product is effected in the presence of an inert solvent for the hydroxylic compd. such as xylene so that the OH compd. is removed from the aq. medium immediately after its formation.

Methylamino compounds. A. MARKERT. Brit. 275,377, June 17, 1926. In order to effect methylation of NH_3 and primary and secondary amines they are passed in mixt. with dimethyl ether over dehydrating catalyzers such as oxides of Al, Ti, Zr or Th. Various details and examples are given.

Diaminopropanols. I. G. FARBERIND. A.-G. Brit. 275,622, Aug. 3, 1926. Unsym. substituted diaminopropanols are made by causing a secondary or primary base or NH_3 to react with α -tertiaryaminoepihydrins (which are obtained from epichlorohydrin and secondary bases). Examples are given of the production of 1-amino-3-diethylamino-2-propanol, 1-ethyl-amino-3-diethylamino-2-propanol, 1-amino-3-piperidino-2-propanol and 1-amino-3-(phenylmethylamino)-2-propanol.

Anthraquinone derivatives. I. G. FARBERIND. A.-G. Brit. 274,558, April 21, 1926. Homonuclear substituted anthraquinonesulfonic acids are converted into hydrogenated compds. by treatment with a hyposulfite in weak acid or weak alk. soln. The hydrogenated compds. revert to the original compds. by careful oxidation in acid

soln., *e. g.*, with persulfate, but on boiling their aq. solns. or adding alkali or heating with strong H_2SO_4 with or without H_3BO_3 , sulfonic groups are split off, leaving non-hydrogenated anthraquinone derivs. Several examples are given.

Anthraquinone derivatives. I. G. FARBENIND. A.-G. Brit. 274,966, April 29, 1926. Leuco-anthraquinones are made by heating a *p*-aminohydroxyanthraquinone or a deriv. substituted by sulfo groups or by halogen in the β -position with an alk. reducing agent such as NaOH and hyposulfite until NH_3 is evolved. Several examples are given.

Phenylglycine and its compounds. G. IMBERT. U. S. 1,668,964, May 8. An aq. soln. of $PhNH_2$ and an alk. substance such as NaOH or Na_2CO_3 is heated with trichloroethylene or tetrachloroethane.

Normal tributyl borate. W. J. BANNISTER. U. S. 1,668,797, May 8. This compd. is formed by heating H_3BO_3 with BuOH and distg. It is a colorless, nearly odorless liquid b. $230-5^\circ$.

Normal butyl lactate. C. L. GABRIEL and C. BOGIN. U. S. 1,668,806, May 8. This compd. is obtained by heating BuOH with lactic acid and distg. It is a colorless liquid b. $186-9^\circ$.

Stable preparations of diazo salts. I.-G. FARBENIND. A.-G. Brit. 275,245, Aug. 2, 1926. Diazo salts are mixed with a free arylsulfonic acid, alone or mixed with a readily sol. salt, *e. g.*, a mixt. of the acid and neutral 1,5-naphthalenedisulfonates of diazotized *o*-nitroaniline is mixed with free 1,5-naphthalenedisulfonic acid and Na benzylnaphthalenesulfonate. The products readily form clear solns. with water. Cf. C. A. 22, 1980.

Phenyl-*o*-tolylguanidine. R. V. HEUSER. U. S. 1,669,242, May 8. $PhNH_2$ and *o*-toluidine in mol. proportions are treated with CS_2 to form phenyl-*o*-tolylthiourea and the latter is desulfurized, *e. g.*, by use of alc. NH_3 and PbO.

Chloranil and bromanil. L. B. HOLLIDAY & CO., LTD. AND C. SHAW. Brit. 274,700, Nov. 26, 1926. *p*-Nitrosophenol is treated with Cl or Br in HCl or glacial HOAc; the chloranil and bromanil formed are sepd. and then purified.

Destructive hydrogenation. I. G. FARBENIND. A.-G. Brit. 275,248, July 28, 1926. The heat required for high-pressure reactions is supplied wholly or partially by injection of a preheated gas such as H or gas contg. H. The process may be applied to destructive hydrogenation of carbonaceous material or to the conversion of MeOH or EtOH into higher alcs.

Adsorption of indicators by body fluids. H. W. VAN URK. *Pharm. Weekblad* 65, 389-90(1928).—A cerebrospinal fluid of pH 9.6 gave no color with phenolphthalein until an excess of the latter was added. The phenomenon is attributed to adsorption of the indicator. A. W. DOX.

A new circulatory hormone. II. H. KRAUT, E. K. FREY AND E. BAUER. *Z. physiol. Chem.* 175, 97-114(1928); cf. *Z. physiol. Chem.* 157, 32.—The hormone which was obtained from urine and characterized by its power to increase the amplitude and accelerate the rhythm of the heart beat is present also in the blood. By pptn. of the urine with $UO_2(OAc)_2$ and adsorption on $Al(OH)_3$, a prepn. can be obtained of which 0.5mg. injected intravenously into a dog of av. size exerts a marked increase in pulse amplitude lasting 1 min. This amt. is taken as the standard unit to which other prepn. are referred. Dialyzed human urine contains an av. of 1 unit per 5 cc. From 60 to 80 cc of blood 140 mg. of a prepn. was obtained which corresponded to 1 unit. Serum contains an inactivator which is destroyed by boiling, addn. of EtOH, filtration with

kieselguhr, and especially by slight acidification. Inactivation of the hormone by serum is a reversible process. The hormone is probably present in the blood largely in the inactivated form and hence not so readily demonstrated as in the urine. One unit per 2 cc. of blood may, however, be demonstrated by digestion of defibrinated blood with papain at faintly acid reaction and simultaneous dialysis through parchment. The acid decomps. the compd. with inactivator and destroys the latter while dialysis removes the protein-cleavage products. Hormone thus obtained from blood is identical with that from urine. Both are destroyed by boiling, inactivated by serum and reactivated by acid. This behavior distinguished the substance from histamine. A further distinction is that histamine increases the vol. of the liver and raises the carotid blood pressure of the rabbit, while the hormone from urine and blood has the opposite effect. Although the amt. of hormone in the urine is fairly const., the amt. present in the blood is subject to wide variations. The substance thus occurs in the blood and is excreted by the kidney. It serves the purpose of regulating the blood circulation and the heart activity. It is controlled by the inactivator present in the serum and by kidney excretion. Some sera contained no inactivator, with others 1-5 cc. inactivated 1 unit of hormone. The greatest inactivating power was observed with horse sera where occasionally 0.1 cc. per unit of hormone caused complete inactivation. All the hormone preps. caused both increased heart activity and lowered blood pressure regardless of their source and method of purification; hence both types of action are believed to be due to one and the same substance. The effect of decreased blood pressure is counter-balanced by increased heart activity, so that the amt. of blood discharged through the aorta is not more than temporarily diminished.

A. W. DOX

Preliminary treatment (Aufschliessung) of keratin for tryptic digestion. III. ZDENKO STARY. *Z. physiol. Chem.* 175, 178-236(1928); cf. *C. A.* 19, 2504.—The compn. products obtained by treatment of human hair with Br in AcOH can be sepd. into a series of fractions, some of which resemble the higher proteins while others have the properties of peptones. All contain Br and are amenable to tryptic digestion. The individual fractions differ in elementary compn., soly., and behavior toward precipitants. The Br content varied from 9.9 to 34.3%, N from 4.78 to 13.20% and S from 1.68 to 4.38%. The constituents of these fractions are probably polypeptide-like substances. In the keratin itself it is possible that parallel polypeptide chains are bound together at intervals by the S-S groupings of cystine, like the rungs of a ladder. Such linkages would be disrupted by oxidizing agents but not by acid hydrolysis; hence the Br treatment renders keratin amenable to enzyme action while partial hydrolysis does not. The soly. and digestibility of all the fractions diminish during the treatment of fractionation, purification and drying, a peculiarity which has already been observed with the so-called heteroalbumoses. It is not improbable that human hair consists of a mixt. of individual keratins, a sepn. of which is effected in the fractionation of the brominated products.

A. W. DOX

Proteins and acids. W. PAULI. *Wochschr. Brau.* 44, 246-50, 257-60(1927); cf. *C. A.* 21, 3059.—The behavior of sol. proteins, such as albumins, towards acids is explained by the fact that the amino group has a positive ion and the COOH group has a negative ion. If equal in no. the mol. is negative. Mineral acids depress ionization of the COOH group and increase that of the amino group, and the mol. becomes a multi-valent positive ion.

C. N. FREY

The index of polypeptidemia and the index of deamination. M. PURCH AND CRYSTOL. *Bull. Soc. Sci. Méd.* 8, 63-9(1927); *Physiol. Abstracts* 12, 286.—The polypeptide index for serum is the difference between the trichloroacetic acid N and phosphotungstic N. This in normal and fasting condition is very low (0.003 to 0.02%). The claim of Fiessinger and his co-workers, that the deamination index—namely, polypeptide index divided by trichloroacetic N—is more significant in investigating liver function than the polypeptide index, is disputed. The claim is based on the view that the polypeptide index represents deamination, as it states a relation between non-protein amino N and non-protein total N. The question rests on the relative values of the indices as ureogenic coeffs., and it is argued in the present contribution that the introduction of total N as denominator is unnecessary, and leads to errors which are not assocd. with the polypeptide index.

H. G.

Relation of distention of cells to acidity of solutions. V. ULÉHLA. *Carnegie Inst. Washington Yearbook* 25, 170(1925-6); *Expt. Sta. Record* 57, 817.—In a study of the pH of the cell surfaces as related to distention in water, two maxima of action were found in most cases between which a point of min. action is located, usually about pH_{act}^6 , and this is considered the point of physiol. neutrality.

H. G.

Diffusion with chemical transformation. A contribution on the chemical analysis

of biological and periodically varied reactions. V. MORAVEK. *Carnegie Inst. Washington Yearbook* 25, 173-5(1925-6); *Expt. Sta. Record* 57, 817; cf. *C. A.* 21, 3637.—It is regarded as a safe conclusion that the behavior of every kind of cell is specific. Use is made of expts. on colloidal membranes, agar-agar and gelatin. "Diffusion, which brings about a chem. transformation in gel, depends in its progress on the structure of the gel and the concn. of the reacting ions." H. G.

The proteolytic enzyme of Hsiang-Kua, *Cucumis melo*. HSIANG-CHU'AN HOU AND CHIH-CH'EN CHEN. *Chinese J. Physiol.* 1, 33-6(1927); *Physiol. Abstracts* 12, 336.—This enzyme present in some varieties of the plant, chiefly in endocarp, slightly in mesocarp, but not in the seeds, behaves like an ereptase. H. G.

Certain physico-chemical characteristics of muscle globulin. W. T. SALTER. *Proc. Soc. Exp. Biol. Med.* 24, 116-9(1926); *Physiol. Abstracts* 12, 147.—An NH_4Cl soln., rendered alk. by excess of NH_3 , was used as solvent. The protein was pptd. by $(\text{NH}_4)_2\text{SO}_4$ dissolved in more dil. salt soln., and pptd. by further diln. The fraction studied is appreciably sol. only in the presence of salt. Although at reactions alk. to p_{H} 6.0 this globulin dissolves in salt solns., at more acid reactions the solvent action of neutral salts is greatly diminished. In this and in other respects the behavior of this muscle globulin resembles that of edestin. It appears to be of a type different from that of hemoglobin or the serum globulins. H. G.

Effect of varying hydrogen-ion concentration upon rate of action of proteolytic enzymes in gastric mucous membrane. G. M. KLOSTER. *Proc. Soc. Exptl. Biol. Med.* 24, 156-7(1926); *Physiol. Abstracts* 12, 140.—The inactive principle of an ext. of gastric mucosa can be activated to various degrees by varying the degree of original activity. The activity at a given degree of acidity can be destroyed by exposure to weak alkali, and cannot be restored on acidification to a point below or equiv. to the original H-ion concn. The effect of alkali on unactivated ext. is to lower the resultant activity after acidification. H. G.

Experiments on activation of cholesterol derivatives and allied sterols by ultra-violet irradiation. A. F. HESS AND A. WINDAUS. *Proc. Soc. Exptl. Biol. Med.* 24, 171-2(1926); *Physiol. Abstracts* 12, 156.— β -Cholesterol, heterocholesterol, α -phytosterol, cholesteryl chloride, cholesterylamine acetate, cholestene, pseudocholestene, cholesterolilene, cholestan-4,7-diol, cholestan 4- or 7-ol, cholestenone, stigmasterol, α -amyrol, cholesteryl ether, cholesterol dibromide, cholesterol ozonide (non-irradiated and irradiated), apocholic acid, were tested. None of these acquired antirachitic properties after irradiation, though some of them are so closely allied to cholesterol. H. G.

Current views concerning the mechanisms of biological oxidation. F. G. HOPKINS. *Skand. Arch. Physiol.* 49, 33-59(1926); *Physiol. Abstracts* 12, 113.—Beginning with the theories of Wieland and Warburg, outstanding evidence is reviewed for or against activation of org. mols. on the one hand, or of O on the other. H. believes that most, if not all, oxidations characteristic of the living cell are preceded by activation of the org. mols. concerned, this activation being due to agencies more individualized than non-specific surface capillary forces. In some cases, however, activation of O plays a part. H. G.

Studies on the effect of temperature on the catalase reaction. VI. Heat inactivation of catalase at different hydrogen-ion concentrations. SERGIUS MORGULIS AND M. BEBER. *J. Biol. Chem.* 77, 115-26(1928); cf. *C. A.* 21, 1996.—Catalase is very slowly inactivated at temps. below 50° , the inactivation becoming very rapid as the temp. is raised to 55° or above, especially at p_{H} less than 6.0. At p_{H} 4.5 the inactivation is instantaneous at temps. above 50° , while at p_{H} 8.0 this does not occur until 63° . The critical temp. of inactivation is 65° . This inactivation by heat is a bimol. reaction. The max. stability of catalase which occurs at p_{H} 6.0 is in marked contrast to its extensive p_{H} range of optimum activity. Catalase is considered as an ampholyte whose isoelec. point is near p_{H} 6.0. In the form of cations, catalase is inactive and the reaction whereby the combination in which catalase acts as the cation is formed, is irreversible. The catalytic activity, however, is shared by both mols. and anions, the latter being heat-labile. ARTHUR GROLLMAN

Observations upon the enzyme asparaginase. W. F. GEDDES AND A. HUNTER. *J. Biol. Chem.* 77, 197-229(1928).—Asparaginase was obtained by H_2O or glycerol extp. of disintegrated yeast cells or from calf's liver. It is very labile, being destroyed by heat or contact with cold alc. or acetone. It is adsorbed by kieselguhr and $\text{Fe}(\text{OH})_3$, and pptd. from its soln. at p_{H} 4.5. It may be concd. by pptn. with safranine. The active ppt. thus formed removes the amide N of asparagine, quantitatively, but leaves the NH_2 group intact. Only glutamine among a no. of other acid amides tested was

hydrolyzed by the enzyme. The equations $Kt = m \log a/(a - x) + x$ (in which m is an empirical const.) and $Kt = \sqrt{a - x}$ were found to be applicable to the rate of hydrolysis of asparagine by the enzyme. The range of enzymic activity was from p_H 5.5 to 10.3 while the max. activity was at about p_H 8.0. ARTHUR GROLLMAN.²

Studies on the oxygen-, acid- and base-combining properties of blood. III. The validity of hydrogen-ion activity determinations by the hydrogen electrode in systems containing carbonic acid, carbonates, hemoglobin, carbon monoxide hemoglobin and methemoglobin. W. C. STADIE AND E. R. HAWES. *J. Biol. Chem.* 77, 241-64 (1928) — The assumptions involved in calcg. the p_H in $\text{BHC}_3\text{O}_3\text{-CO}_2\text{-H}_2\text{CO}_3\text{-BCL-Hb}$ systems from electromotive force measurements with the H electrode are discussed. Approx. evaluations are made of the error involved in assumptions concerning the activity of the hydrogen ion (a_H^+) of the reference soln and the liquid junction potentials between 0.1 *N* HCl, satd. KCl and (BHC_3O_3 , BCL, Hb) || satd. KCl. The liquid junction potentials between solns. of $\text{BHC}_3\text{O}_3\text{-CO}_2\text{-H}_2\text{CO}_3\text{-BCL-Hb}$, of widely varying concns., and satd. KCl are negligible as indicated by Bjerrum's extrapolation, the error in relative p_H detns. being probably $< 0.016 p_H$ units. The H electrode is a reversible source of electromotive force in $\text{BHC}_3\text{O}_3\text{-CO}_2\text{-H}_2\text{CO}_3\text{-BCL-Hb}$ systems as shown by the applicability over a wide range of the relation $e. m. f. \propto RT/NF \ln P_{H_2}$, in which P_{H_2} is the H_2 pressure. The free energies of the ionization of H_2CO_3 calcd. from e. f. m. and cond. measurements agree at 38° but are not identical at all temps. The heats of ionization of H_2CO_3 calcd. from thermal and cond. data and those from e. m. f. data differ by 20%. The latter alone are identical when detd. in simple H_2O soln. and in 10 *m M* hemoglobin soln. There are no appreciable side reactions in $\text{BHC}_3\text{O}_3\text{-CO}_2\text{-H}_2\text{CO}_3\text{-BCL-Hb}$ systems giving rise to irreversible electromotive forces. The H electrode is reproducible to ± 0.5 millivolt in 0.1 *N* HCl and in 10 *m M* hemoglobin soln. Existing evidence also establishes the reversibility of the cell reaction in e. m. f. measurements of a_H^+ in $\text{BHC}_3\text{O}_3\text{-CO}_2\text{-H}_2\text{CO}_3\text{-HCL-Hb}$ systems. The relation of hydrated and unhydrated H^+ on hemoglobin solns. is discussed. **IV. The apparent first dissociation constant $p_{K'}$ of carbonic acid and the activity coefficient of the bicarbonate ion in solutions of hemoglobin, methemoglobin, cyano-hemoglobin and nitric oxide hemoglobin at varying ionic strengths.** *Ibid* 265-301.—The apparent first dissocn. const., $p_{K'}$, of H_2CO_3 was calcd. from elec. trometric p_H and stoichiometrical total CO_2 and P_{CO_2} in solns. of varying concns. of CO_2 , reduced-, met-, cyano- and NO-hemoglobin and varying ionic strengths. These values when plotted against \sqrt{I} , the square root of the ionic strength expressed as mols. per l., gave linear equations of the form $p_{K'} = p_{K^*} - \beta \sqrt{I}$. The total activity coeff. of HCO_3^- was calcd. from $p_{K'}$. These values of $\gamma_{\text{HCO}_3^-}$ are related to \sqrt{I} according to the linear relation $\log \gamma_{\text{HCO}_3^-} = -\beta \sqrt{I}$, which is the limiting equation of the Debye-Hückel theory. When $[\text{Hb}] = 0$, the theoretical value, $\beta = 0.54$, is obtained. With increasing $[\text{Hb}]$, β decreases and this can be expressed by the equation $\beta = \beta_0 - \sigma [\text{Hb}]$, in which $\beta_0 = 0.54$ and σ is a const. p_{K^*} , the value of $p_{K'}$ at finite $[\text{Hb}]$ and when $I = 0$ decreases according to the equation $p_{K^*} = 6.33 \rho [\text{Hb}]$, where ρ is a const. On the basis of the consts σ and ρ , both of which are characteristic of the derivs. of Hb, these derivs. may be divided into 2 groups: (1) HbCO and HbNO and (2) reduced Hb, meta-Hb and HbCN . The activity coeff., $\gamma_{\text{HCO}_3^-}$, can be equated to 2 activity coeffs. γ_* and γ_0 and calcd. by the equations $\log \gamma_{\text{HCO}_3^-} = \log \gamma_* + \log \gamma_0$; $\log \gamma_* = -\rho [\text{Hb}]$ and $\log \gamma_0 = -[0.54 - \sigma [\text{Hb}]]\sqrt{I}$. These coeffs. permit the calcn. of $p_{K'}$ over wide ranges of Hb and I ; γ_* measures the effect of $[\text{Hb}]$ on $\gamma_{\text{HCO}_3^-}$ and γ_0 , the effect of salt. The value of $p_{K'}$ in the red blood cells is calcd. as 5.98 and 5.87 for the oxidized and reduced states, resp. At const. I , $p_{K'}$ and $\gamma_{\text{HCO}_3^-}$ are const. in Hb solns. at p_H values above and below the isoelec. point, showing $\gamma_{\text{HCO}_3^-}$ to be the same whether HCO_3^- is combined with Na^+ or with Hb. **V. Extension of the Debye-Hückel theory of ionic interaction to hemoglobin, bicarbonate-sodium chloride systems.** W. C. STADIE. *Ibid* 303-23.—The Debye-Hückel theory is applied with special reference to concd. Hb solns. The assumption is supported that the colloidal Hb ion has an ionic strength valence of 1. The relations of the ionic collision sphere of HCO_3^- , the dielec. const. of $\text{NaHCO}_3\text{-NaCl}$ solns., the hydration of Hb, and the possible existence of X_{HbCO_2} to the activity coeff. of HCO_3^- are outlined. The functions γ_* and γ_0 are discussed from the theoretical standpoint. Values of the characteristic consts., b , the ionic diam. of HCO_3^- , and δ , the effect of the Hb on the dielec. const. of H_2O are calcd. and shown to be consistent with measurements by independent methods. Equations are given for calcg. the activity coeffs. of HCO_3^- and hence $p_{K'}$ in solns. of Hb varying from 0 to 20 *m M* per l. and of salt from 0 to 0.5 *M*

per l., in terms of universal consts. and b and δ . From these equations $p_{x_1} = 6.33 + \log \gamma_0$ and $b = 2 \times 10^{-8}$ cm.

Chemical constitution and toxicity. ERNEST WALKER. *Biochem. J.* **22**, 292-305 (1928).—The toxicity was measured against the unicellular organism, *Colpidium colpoda*. Among As compds. aromatic derivs. are more toxic than the aliphatic; the tervalent derivs. are more toxic than the quinquevalent; the secondary derivs. are more toxic than the primary and tertiary; the primary derivs. are more toxic than the tertiary. The most toxic compds. are the tervalent secondary derivs., particularly compds. of the diphenylarsene type. The toxicity of arsenicals is concerned with the sulfhydryl constituents of the cell.

ERNEST HENRY STARLING, 1866-1927. C. J. M. *Proc. Roy. Soc. (London)* **B102**, xvii-xxvii (1928).—This obituary note includes a picture of Starling and an account of his contributions to chem. physiology.

Heredity, development and chemistry of organisms. HANS SCHIMMELFUSS. *Naturwissenschaften* **16**, 209-19 (1928).—A lecture on the chem. aspects of heredity factors (genetical chemistry). It is pointed out that chem. and phys. chem. influences on the substances transmitting heredity (chromomers) may cause mutation or modification of species. Examples are cited of apparent polymerization of factors depending on the conditions of the medium, buffer action on or steric orientation of factors. The influence of the chromomers on the development of the cell is compared with that of a catalyzer of high local concn. From chem. action of the constituents of the progeny hybridization and Mendelian cleavage can be explained. Numerous schemes are developed including those for dominating factors.

The biological significance of the salt concentration of natural waters. CARL SCHLEIFER. *Naturwissenschaften* **16**, 229-37 (1928).—A review.

Occurrence and decomposition of pyrophosphate in the muscle. K. LOHMANN. *Naturwissenschaften* **16**, 298 (1928).—On digesting a muscle suspension at 40° to 45° for one to two hrs. with NaHCO_3 the total P_2O_5 increases with 0.7 to 0.9 mg. per g. muscle. This reaction, explained by Embden as decompn. of lactacidogen, is now ascribed for at least 75 to 90% to enzymic hydrolysis of $\text{K}_2\text{P}_2\text{O}_7$ to K_2HPO_4 and is assumed to be independent of lactic acid. In fresh muscle 0.6 to 0.7 mg. P_2O_5 is present as pyrophosphate, i. e., $1/4$ of the total acid-sol. phosphate. The acid was identified after sepn. as Cu salt from the $\text{CCl}_3\text{CO}_2\text{H}$ muscle ext. by its Na and by its diaquotetramminocobalt salt. Fresh muscle is able to perform hydrolysis of pyrophosphate; this function is destroyed by heating for 1 min. in a water bath. The lactacidogen, a hexose-monophosphoric acid, is not decomposed noticeably by NaHCO_3 autolysis or during a muscle cramp condition. However Embden's ester added to the muscle suspension decomposed completely. Fresh muscle tissue does not seem to contain any hexosediphosphoric acid; it is formed after prepn. of the ext.

The biological functions of the proteins. DOROTHY JORDAN LLOYD. *Biol. Rev.* **3**, 165-77 (1928).—The amphoteric nature of the proteins and the resulting high degree of sensitiveness to changes of reaction and compn. of cell fluids establishes a relation between the proteins of different cells and between the cell and the environment. The inertia of the colloidal particles ensures a certain stability to the system. The many possibilities of structural differences are the chem. basis of the differentiation of species. Proteins play an important role in metabolism as constituents of the respiratory pigments, enzymes, nucleoproteins (chromatin) and possibly also of insulin.

Researches on the combination between glucose and protein. P. DE LUCIA. *Boll. soc. ital. biol. sper.* **2**, 260-2 (1927).—Working with gelatin and egg albumin, L. failed to obtain any evidence that glucose combines chemically with either of these two proteins.

Oxidases and peroxidases not bound to hemoglobin in red bone marrow (oxone) and their properties. I. The technic of preparation of oxone. ALFRED NEUMANN. *Folia Hematol.* **35**, 30-7 (1927); cf. *C. A.* **21**, 2028. **II. Influence of oxone on the blood picture.** ALFRED NEUMANN AND ERWIN GRATZL. *Ibid.* 38-64.—Oxone or dried ext. of red bone marrow, injected intraperitoneally into dogs, produced a leucopenia. The effect on rabbits was similar but less marked. It seems to injure the function of the hematopoietic system.

The determination of osmotic erythrocyte resistance by the method of Cohnreich. F. ROUTER. *Folia Hematol.* **35**, 116-8 (1927).—The Cohnreich method gives slightly lower figures than the Hamburger method.

Infra-red absorption spectra of blood and of gelatin. J. RISLER AND POUVEAU DE COURMELLES. *Rev. pathol. comp. hyg. gén.* **27**, 957 (1927); *Bull. soc. hyg. aliment.* **16**, 33 (1928).—It follows from the observations of R. and C. that the heat emitted by the

human body (measured in wave lengths) corresponds to the heat absorbed by the constituent elements of living org. matter, which leads to the belief that one of the chief functions of proteins is to maintain the temp. equil.

Inorganic composition of human and animal tissues. L. LEMATTE, G. BOINOT AND E. KAHANE. *Rev. pathol. comp. hyg. gén.* 27, 1170(1927); *Bull. soc. hyg. aliment.* 16, 35-6(1928).—From detns. of the inorg. constituents of the chief human and animal tissues, no general conclusions could be drawn, and it is suggested that the problem might more profitably be attacked by prep. solns. of the lipoids, carbohydrates and proteins by extrn. with neutral solvents and examg. these solns.

Studies on crystalline insulin. III. Further observations on the crystallization of insulin and on the nature of the sulfur linkage. The isolation of cystine and tyrosine from hydrolyzed crystalline insulin. VINCENT DU VIGNEAUD, H. JENSEN AND OSKAR WINTERSTEINER. *J. Pharmacol.* 32, 367-85(1928); cf. *C. A.* 21, 2912.—Crystals of insulin obtained by the brucine method were redissolved in AcOH, the soln. was treated with pyridine, centrifuged and dil. NH₃ added to the supernatant fluid. Crystals of insulin, brucine-free, were obtained. Cryst. insulin, brucine-free, could also be obtained from the impure powder by the same general procedure. Cryst. insulin was heated on the water bath with HCl. Samples were analyzed at intervals of 4.5, 8.5 and 12.5 hrs. The total N and tyrosine content remained the same. Amino N increased slightly. The value for cystine by the Folin-Looney method decreased, while the cystine value by the Sullivan method increased. The latter is due to liberation of free cystine, while the decrease in the Folin-Looney value (which detns. free and dipeptide cystine) is probably due to a destruction of cystine by HCl. There is a significant difference between the Folin-Looney and Sullivan values, the latter being only about one-half the former. A mixt. of cystine and tyrosine obtained by hydrolysis of insulin with HCl was extd. with a mixt. of equal parts of BuOH and ether contg. one drop concd. HCl per 5 cc. This extd. practically all the tyrosine and only a trace of the cystine. The tyrosine could be obtained by evapg. the soln. to dryness, adding NH₄OH, and pptg. with AcOH. The insol. portion left after extg. with alc.-ether was dissolved in HCl and pptd. by addition of NaOH until only slightly acid to Congo red. Crystals of cystine were obtained. Analysis of the mixt. of amino acids and of the mother liquor showed the Folin-Looney and Sullivan values to be the same in the ppt. but the former was twice the Sullivan value in the mother liquor. Two subsequent crops of amino acid crystals were obtained from this mother liquor, and the latter again showed a Folin-Looney value twice the Sullivan value. This indicates the presence of another S compd. besides cystine, probably a dipeptide. IV. The isolation of arginine, histidine and leucine. H. JENSEN, OSKAR WINTERSTEINER AND VINCENT DU VIGNEAUD. *Ibid* 387-96.—Cryst. insulin was hydrolyzed by boiling with H₂SO₄ and from the hydrolyzate were isolated histidine, as the picrolonate, arginine as picrolonate and flavianate, lysine as picrate and leucine. Insulin was found to contain 2.57% histidine, estd. by the colorimetric method of Koessler and Hanke. V. The distribution of nitrogen in crystalline insulin. OSKAR WINTERSTEINER, VINCENT DU VIGNEAUD AND H. JENSEN. *Ibid* 397-411.—The N distribution in cryst. insulin was studied by the application, with some modifications, of the method of Van Slyke for the detn. of N distribution in proteins. Cryst. insulin was hydrolyzed with HCl and samples of the hydrolyzate were analyzed for total N, giving values of 15.72 and 15.68%. After the hydrolyzate was freed from HCl by distn. *in vacuo*, samples again analyzed for total N gave 15.68%. Arginine, cystine, lysine and histidine ppt. with phosphotungstic acid. This fraction, and filtrate were analyzed. Distribution was as follows: ammonia N 9.58, humin N 2.42, arginine N 6.60, cystine N 6.08, histidine N 7.60, lysine N 2.76, amino N in filtrate 56.30, non-amino N in filtrate 8.31%. The hydrolyzate was also analyzed for S by the method of Denis, giving a value of 3.16% S. The basic fraction gave 57.5% of total S, while the monoamino fraction gave 46.7%. The high value of the sum is probably due to the presence in both fractions of some phosphotungstic acid. By the Folin-Looney colorimetric method the S content was slightly higher than by the Denis method. The Sullivan method gave 1/2 the Folin-Looney value. In the basic fractions the three methods gave practically the same values, indicating that most of the S here was accounted for by cystine. The discrepancy between the Folin-Looney and Sullivan values in the hydrolyzate is accounted for in the monoamino fraction.

Study of the reducible and hydrolyzable sugar in blood plasma. GEORGES FONTES AND LUCIEN THIVOLLE. *Bull. soc. chim. biol.* 10, 262-71(1928); cf. *C. A.* 21, 231f.—The sugars in total blood after defecation with Hg(NO₃)₂ are from 50 to 85% of the immediately reducible sugars in the plasma defecated by tungstic acid. The hexoec-diphosphoric acid is not completely pptd. by Hg(NO₃)₂ at a p_H 6.5; it is not totally

hydrolyzed in 1 hr. on the water bath in a medium of $1/30$ N H_2SO_4 , and after this partial hydrolysis its reducing power increases. The hydrolyzable and reducing substance of the blood plasma is a sugar but it is not lactacidogen. L. W. RIGGS

• **The nonfermentable residue of free sugar of the blood.** E. J. BIGOOD AND (MLLE.) A. WUILLOT. *Bull. soc. chim. biol.* **10**, 272-3(1928); cf. C. A. **22**, 105.—The reducing power of a soln. of levulose contg. 0.25 g. per l. is not modified by the action of H_2SO_4 sufficient to make the soln 0.5 N, for 1 hr. at 100° . A similar treatment of the nonfermentable residue of the free sugar of the blood causes the reducing power to disappear. **Proteinic sugar in the blood plasma.** *Ibid* 274-8.—A review and discussion of the work of Condorelli are given. (Cf. C. A. **19**, 2961.) L. W. RIGGS

The protein group in hemoglobin. J. BARCROFT. *Bull. soc. chim. biol.* **10**, 279-81 (1928).—The questions reviewed are: the differences between the hemoglobins of different species, the causes of these differences and the biological signification of the specificity of hemoglobin. L. W. RIGGS

Preparation, by the bacterium of sorbose, of a new reducing sugar with seven atoms of carbon. GABRIEL BERTRAND AND GEORGES NITZBERG. *Compt. rend.* **186**, 925-8(1928).—By the action of the bacterium of sorbose upon α -glucoheptide, a new reducing cryst. sugar is obtained contg. 7 atoms of C and named α -glucoheptulose. It has a sweet taste, dissolves in a little more than its wt. of water at ordinary temp., but is much less sol. in alc. Elementary analysis and cryoscopic detns. indicate the formula $C_7H_{14}O_7$. The purified crystals m. 173.5° , $[\alpha]_D -67.8'$. Its osazone m. $209-210^\circ$. The reducing power of the sugar is 80% that of glucose. It does not undergo alc. fermentation, and probably contains a ketone group. L. W. RIGGS

Measure of the thickness of thin protoplasmic layers. FAURÉ-FREMIET AND (MLLE.) CHOUCROUN. *Compt. rend.* **186**, 979-82(1928).—An optical and histological study. L. W. RIGGS

The nucleo-plasmatic ratio in various mammalian organs. (MLLE.) M. ROWINSKA. *Compt. rend. soc. biol.* **98**, 783-4(1928).—The total and purine N was detd. in the pancreas, spleen, thyroid, suprarenal, kidney, intestine, lung, brain and muscle of the horse, liver of the ox and thymus of the calf. The nucleo-plasmatic ratio varies roughly as the purine N. In the fowl both purine N and the nucleo-plasmatic ratio were higher in white than in dark meat. L. W. RIGGS

Preparation of uricase. ST. J. PRZYŁECKI. *Compt. rend. soc. biol.* **98**, 787-8(1928).—To 300 g. of hashed frog tissue was added 60 cc. $CHCl_3$, 160 glycerol and 200 water. The mixt. was allowed to stand 2 days at 15 to 20° , when 2500 cc. of water were added and 24 hrs. later the liquid, called the ext., was collected and served as a source of the enzyme. Attempts were made to prep. a powder from the ext. but the product lacked the enzymic activity of the ext. from which it was made. A prepn. made by dialysis of the liquid after pptn. by acetone was more active than the powder. Uricase was also prepd. from mammalian liver and from wheat. **Mode of action of uricase.** ST. J. PRZYŁECKI AND R. TRUSZKOWSKI. *Ibid* 789-90.—To compare the action of uricase in anaerobiosis with its action in aerobiosis the following coeffs. were detd.: Q_1 = (uric acid degraded in anaerobiosis in presence of methylene blue $\times 100$)/uric acid degraded in aerobiosis without acceptor of H, Q_2 = (uric acid degraded in anaerobiosis in presence of methylene blue $\times 100$)/uric acid degraded in aerobiosis in presence of methylene blue. With uricase obtained from the frog $Q_1 = 3$, $Q_2 = 5$ to 10 . These coeffs. were not influenced by purification, heat or chem. agents. Uricase is inactivated by solns. of $HgCl_2$, NaF and by alcs. Inactivation by solns. of $HgCl_2$ or NaF is the same in the presence of an acceptor of H, or in the presence of air without this acceptor. KCN in concns. of M/500 to M/5000 totally inactivates uricase. It appears that uricase is not a dis-hydrogenase, but an oxidase in which its principal role is the activation of O. The action of cyanogen suggests that in the degradation of uric acid by uricase, a heavy metal in an ionized state intervenes in a great measure. **Properties of uricase.** *Ibid* 790-2.—The conditions of thermostability, thermostability and substrate of uricase are discussed at length. Chemically, all the prepn. of uricase give faint biuret and xanthoproteic reactions and the Millon reaction. The tryptophan reaction is almost negative. Uricase contains S, N and traces of P. The intensity of the biuret reaction is not in proportion to the activity of the uricase. It reduces Fehling and Nylander solns. The heavy metal which appears to be necessary for the activity of uricase is probably Cu. L. W. RIGGS

Recent work on the chemical determination of sex. PH. JOYET-LAVERGNE. *Rev. g n. sci.* **39**, 168-9(1928).—A review. L. W. RIGGS

The reducing power of blood in vitro. (MLLE.) E. SLUTTER AND J. KOK. *Arch. n erland. physiol.* **11**, 189-99(1926).—The reducing power of dog blood *in vitro* measured

by the Shaffer Hartmann-Tewaert method decreases at first, then rises at about the 5th hr. and then falls continuously. It is possible that the rise is due to the formation of glyceraldehyde, which is then converted to lactic acid, the degree of rise depending on the rates of the several reactions taking place simultaneously. In the presence of red cells, the phloroglucinol-HCl test for glyceraldehyde gave in several expts. a positive result. Since the reducing power of the blood is the balance of such processes as the combustion of glucose to CO_2 and H_2O , the formation of glucose, the synthesis of carbohydrates of high mol. wt., the combination of glucose with globulins or cholesterol and the formation of intermediary reducing compds. the authors postulate that the fluctuation of the quantity of reducing substances in the blood *in vitro* is due to the formation of intermediate reducing substances in the decompn. of glucose. M. H. SOULE

Differences between the mononuclear and polynuclear cells of exudates. A contribution to the knowledge of amoeboid motion in polynuclear leucocytes. A. BAKKER. *Arch. neerland. physiol.* 11, 234-305(1926).—White blood cells were examd. for phagocytic ability, glycogen content, consumption of O_2 , production of CO_2 , amoeboid motion and the effect of various physicochem. changes on this motion. The lymphocytes were obtained by adding 3 vols. of horse blood to a mixt. of 0.7% NaCl and 1.1% Na citrate (1 vol.). Mononuclear leucocytes were obtained by the injection of sterile liquid paraffin or milk into the peritoneal cavity of rabbits and a week later washing out with saline. Polymorphonuclears were obtained in the same manner by the injection of saline. The washed-out fluid was received in citrate mixt. The polymorphonuclears formed long pseudopodia in Ringer soln. or phosphate mixts., especially when the reaction of the solns. was below p_{H} 7.4. CO_2 was not a specific stimulant for pseudopodia formation. The leucocytes were capable of giving large extrusions in the phosphate mixts. The Na salts of the lower fatty acids (up to butyric) stimulated the production of pseudopodia due probably to the lowering of the surface tension. The undissocd. higher fatty acids were toxic. In solns. of colloids (serum gum arabic and gelatin) pseudopodia were also formed. The mononuclear cells showed no pseudopodia in any of the media but actively phagocytosed starch granules in spite of the absence of pseudopodia. The polymorphonuclear cells formed pseudopodia even in a 0.9% NaCl soln. After the mononuclear cells phagocytosed polymorphonuclear cells their granules gave the I_2 reaction but no glycogen could be demonstrated. The rate of O_2 consumption and CO_2 production was the same for both types of cells. The former action depends on the O_2 tension. Similarly the cells were capable of decomposing glucose with the formation of lactic acid under aerobic and anaerobic conditions. The quantities of O_2 consumed and CO_2 produced were of the same order as that found by Warburg for cancer cells. M. H. SOULE

Microchemistry and microphysics in biology. JOS. GICKLHORN. *Protoplasma* 2, 89-125(1927).—An excellent review in German covering the entire domain of cytology. References are made to about 100 original papers. M. H. SOULE

Recent advances in colloid chemistry and their biological significance. HERBERT FREUNDLICH. *Protoplasma* 2, 278-99(1927).—A critical review in German of the work of the last 15 years. Particular attention is given to the application of modern methods to the detn. of such data for biol. materials as the size of the colloidal particles; whether they are cryst., amorphous or mesomorphous; whether rod-like or plate-like; whether they are arranged in some definite manner, or are under the influences of stresses in definite directions; the elastic properties, etc. A very complete bibliography is given. M. H. SOULE

Studies on proteins. III. A comparative study of various meals; the influence of non-protein substance on the hydrolysis of proteins. T. YANAGIGAWA AND Y. NISHIDA. *Repts. Imp. Ind. Research Inst. Osaka Japan* 8, No. 14, 1-30(1928); cf. *C. A.* 21, 430.—Various vegetable and fish meals were analyzed for protein, fats, water and ash. They were also hydrolyzed with HCl and the N distribution was studied. The study on the influence of glucose, sucrose, starch and cellulose on the hydrolysis of casein showed that the above carbohydrates increased the human N content in the hydrolyzate in the inverse order of their mol. wt., while fats had no effect other than slightly retarding the speed of hydrolysis. NAO UYHI

A note on the calcium content of the serum of normal adults. ISADORE ROSEN AND FRANCES KRASNOW. *J. Lab. Clin. Med.* 12, 157-8(1926).—Ca was detd. by the Kramer-Tisdall method in sera from 50 normal persons and found to be definitely higher (10.7-13.2 mg. per 100 cc.) than the values usually accepted (9-11 mg. per 100 cc.) 91% of these cases had between 11.0 and 12.9 mg. of Ca per 100 cc. of serum, while only 7% had less than 11.0 mg. and none had less than 10.0 mg. E. W. WICKWIRE

The organic phosphorus of the cerebrospinal fluids. G. E. YOUNGBURG. *J. Lab.*

Clin. Med. 12, 845-49(1927).—It was impossible to point out any nerve tissue changes by the amt. of org. P. Change in the amt. of org. P after death is very slow. In 200 cerebrospinal fluids, between 0.06 mg. and 0.59 mg. % of P was found, the great majority being between 0.1 mg. and 0.3 mg. %. This P was not in lipid form but in all probability in protein combination. No diagnostic value can yet be attached to the detn. of org. P. Org. and inorg. P contents are independent of each other. STANLEY R. BENEDICT

Experimental investigation on the technic of hemoglobin resistance tests. M. WISSLER. *Zentr. inn. Med.* 49, 49-55(1928).—The hemoglobin resistance is measured by the time in seconds necessary for the disappearance of the oxyhemoglobin bands spectroscopically after the destruction of a blood soln. containing a definite amt. of this pigment by addn. of acid or alkali. It is as satisfactorily carried out by the detn. of the time necessary for the color loss with the naked eye. For const. results the soln. must be shaken at least 15 sec. and the temp. of the room must be uniform. Higher hemoglobin resistance was found with men than with women but no differences from the normal were observed in the case of icterus. H. J. DEUEL, JR.

Indican in urine investigations. CARL OTTO. *Pharm. Ztg.* 73, 439(1928).—Referring to a recent paper by Schlecht (cf. *C. A.* 22, 1788) the author describes his experience in detecting indican in various samples of urine, using as reagent a soln. of FeCl_3 in concd. HCl . W. O. E.

Histochemical detection of cholesterol. LÉVELIER AND NOEL. *Bull. hist. appl. physiol. path.* 3, 316-9(1927); *Physiol. Abstracts* 12, 193.—Cholesterol can be shown in sections (suprarenal) by slow pptn. with a 1% soln. of digitonin in weak alc. at 35°. The complex crystals of digitonin-cholesterol so formed were studied microscopically. H. G.

Method of vivi-dialysis. H. NECHLES. *Chinese J. Physiol.* 1, 69-80(1927); *Physiol. Abstracts* 12, 326.—The membrane is gold-beater's skin impregnated with gelatin and treated with dichromate. H. G.

A comparison of the Folin-Wu and new Benedict methods for the estimation of blood sugar. A. E. OSTERBERG. *J. Lab. Clin. Med.* 12, 278-82(1926); *Physiol. Abstracts* 12, 164.—Analysis in 194 consecutive blood specimens showed that the new method gives considerably lower results than the original Folin-Wu procedure. H. G.

A simpler method for the preparation of potassium pyrogallate solution for metabolic rate determinations. F. F. SCHWENTKER. *J. Lab. Clin. Med.* 12, 287-8(1926); *Physiol. Abstracts* 12, 136.—The KOH is dissolved in distd. water by heat, and the d. of the resulting soln. immediately detd. and brought to 1.517. The hot soln. is poured into a bottle contg. the requisite amt. of pyrogallic acid, and allowed to ripen for a month. H. G.

Modified digestion acid for non-protein nitrogen determination. M. DUPRAY. *J. Lab. Clin. Med.* 12, 387(1927); *Physiol. Abstracts* 12, 136.—A mixt. of H_2SO_4 , HClO_4 , and H_3PO_4 is used, the advantage being that no ppt. occurs in the cooled digest. H. G.

Oxalic acid, a good white cell diluting fluid. R. JONES. *J. Lab. Clin. Med.* 12, 614(1927); *Physiol. Abstracts* 12, 319.—A 2% soln. of oxalic acid destroys the red cells and renders the white cells more clearly defined than the usual acetic acid method.

H. G.

The determination of minute amounts of lead. P. SCHMIDT. *Deut. med. Wochschr.* 54, 520(1928).—A preliminary report of a combined electrolytic and colorimetric method for the detn. of small amts. of Pb in tissues.

ARTHUR GROLLMAN

The estimation of amino acid nitrogen in animal tissues. J. M. LUCK. *J. Biol. Chem.* 77, 1-12(1928).—The following procedure is described for detg. the amino-acid content of liver and muscle tissue. Excise 4 to 5 g. of the tissue and drop into liquid air. Powder the tissue and weigh a 3-g. portion to a mg. Transfer by means of 30 to 35 cc. of boiling 0.01 N AcOH to a tube 8 × 1 inches, graduated to 50 cc. Keep the tube at b. p. for 7 min. in a H₂O bath and shake from time to time. Cool, add 3 cc. of 50% CCl₃COOH and adjust the vol. to 50 cc. with H₂O. Mix the suspension and allow to stand for 30 min.; add 2 g. of infusorial earth; shake the mixt. vigorously for 10-15 sec. and filter. Measure 35 cc. of the filtrate into a 100-cc. beaker and evap. to about 10 cc. Add 10% NaOH until the soln. is alk. to phenolphthalein and boil the soln. for 2 min. Acidify by adding an excess of glacial AcOH and concentrate to a vol. of about 1 cc. Wash the residue into a Van Slyke app. and det. the amino acid as usual.

ARTHUR GROLLMAN

The determination of small amounts of lipid in blood plasma. W. R. BLOOR. *J. Biol. Chem.* 77, 53-73(1928).—The following procedure for detg. the lipids of blood plasma is described: Add slowly 3 cc. of the plasma to about 40 cc. of a 3:1 mixt. of redistd. alc. and ether, in a 50-cc. volumetric flask, while rotating the flask to give a finely flocculent ppt. Bring to a boil by immersing the flask in boiling H₂O, with const. rotation; maintain at this temp. for a few secs.; allow to cool, make up to vol. with the alc.-ether mixt. and filter through a fat-free filter. To a measured portion of this ext. contg. about 5 mg. of total lipid in a 100-cc. Erlenmeyer flask, add 2 cc. of an approx. N soln. of NaOEt made by dissolving 2 to 3 g. of Na in 100 cc. of abs. alc. Evap. the mixt. on the H₂O bath to absence of alc., leaving a pasty residue. Add 1 cc. of dil. H₂SO₄ (1 H₂SO₄:3H₂O), then heat on the H₂O bath for 1 min. and add 10 cc. of petr. ether (especially prepd. by fractional distn. and purification) to the hot mixt. Rotate the flask gently at the b. p. for 2-3 min. and pour the solvent completely into a 25-cc. volumetric flask. Heat and ext. again with 5-cc. portions of petr. ether until the flask is nearly full. Cool, adjust to the mark and mix the contents. Place 10-cc. aliquots of this soln. in 125-cc. glass-stoppered digestion flasks. Evap. the solvent and remove the last traces by a current of air. Add 5 cc. of *Nicloux'* Ag reagent and 3 cc. of N K₂Cr₂O₇ and set the loosely stoppered flasks in the oven for 5 min. Then rotate, stopper tightly and keep for 15-20 min. at 124° ± 2°. Without cooling add 75 cc. distd. H₂O and det. the excess K₂Cr₂O₇ with 0.1 N Na₂S₂O₃ by adding 10% KI and titrating the liberated I with 0.1 N Na₂S₂O₃. Cholesterol was detd. colorimetrically and the total fatty acids were calcd.

ARTHUR GROLLMAN

The determination of the circulating blood volume with carbon monoxide. H. C. CHANG AND G. A. HARROP, JR. *J. Clin. Investigation* 5, 393-405(1928).

A. G.

Can Dr. Einhorn's fermentation saccharimeter be used for the determination of sugar? TH. UMBACH. *Chem.-Ztg.* 52, 273(1928).—E.'s saccharimeter is used for detg. sugar in urine. Expts. with yeast and known amts. of sugar show that the cc. of CO₂ evolved varies unless a definite vol. of fermentable liquid is used. The instrument, therefore, as now calibrated is not reliable.

W. T. H.

Determination of amino acids in the blood: a note on Folin's method. S. H. EDGAR. *Biochem. J.* 22, 162-7(1928).—An increase in the amino-acid N follows from increasing the alkyl. The rate of increase falls off gradually, to give a const. value at an alkyl. higher than that used by Folin.

BENJAMIN HARROW

Estimation of hippuric and phenaceturic acids in urine. E. J. WAYNE. *Biochem. J.* 22, 183-87(1928).—A modification of Steenbock's method (*C. A.* 6, 2244).

B. J.

Accurate micro-determination of chlorine and iron in blood and other liquids. F. H. SMIRK. *Biochem. J.* 22, 201-7(1928); cf. *C. A.* 21, 2143.—Estn. of Fe and Cl₂ on 0.02 cc. of whole blood or corpuscles is described. For details the original must be consulted.

BENJAMIN HARROW

Further developments of rapid volumetric methods for the determination of amino acids, organic acids and bases. I. Rapid accurate determination of ammonia and volatile amines in fluids of biological interest, and the determination of the different classes of acid radicals represented in the total alcohol titration value. F. W. FOSMAN. *Biochem. J.* 22, 208-21(1928).—The original must be consulted. II. Rapid

quantitative removal and determination of the carbonic acid radical, especially in bacterial cultures, without exposing other constituents to risk of loss or change. F. R. FOREMAN. *Ibid* 222-9. —A strong alc. in which carbonic acid and small quantities of "free" volatile acids are dissolved parts with the CO_2 but retains the volatile acids on aeration. In alc., bicarbonates of "weak" nitrogenous bases and "free" carbonic acid lose their CO_2 on aeration. The estn. of the carbonic acid radical is based on these observations.

BENJAMIN HARROW
Chemical changes in muscle. I. Methods of analysis. ERIC BOYLAND. *Biochem. J.* 22, 236-44 (1928). —The methods of estg. glycogen, lower carbohydrates and lactic acid are critically examd. An improved method for detg. lactic acid, involving steam distn. combined with oxidation, is described.

BENJAMIN HARROW
A modification of the peroxidase reaction with sodium nitroprusside and benzidine. M. M. STRUMIA. *Arch. Path. Lab. Med.* 5, 447 (1928). —The method of Goodpasture (*C. A.* 13, 2224) for staining the oxidase granules of myelogenous cells has been modified by prepg. stock solutions A and B. A: Sodium nitroprusside, 5% aq. soln. B: Benzidine, 2.5% alc. soln. For use, mix 1 cc. of soln. A and 95 cc. of 95% alc., add 2 cc. of soln. B and 2 cc. of fresh soln. of H_2O_2 . While the mixt. keeps at least as well as the original Goodpasture soln., the stock solutions A and B keep indefinitely. The second modification is the substitution of any of the Romanowski stains for fuchsin. H. F. H.

T. PETERFI. *Z. wiss. Mikroskop.* 45, 56-9 (1928). —A micropipet filled with a gelatin gel contg. a high concn. of indicator is used to puncture the cell. The indicator diffuses into the cell contents, but the gel prevents other mixing or diln.

C. W. MASON
The staining of fixed tissues in relation to their isoelectric point. CLAUDIO PULCHER. *Boll. soc. ital. biol. sper.* 2, 223-4 (1927). —Studies were made to det. whether the electrochem. theory of adsorption could be applied to the staining of tissues. Slides streaked with frog blood, guinea-pig blood, egg albumin, fibrin, and hemolyzed blood were fixed with MeOH and heated. One group of slides was stained with an acid dye (acid fuchsin, eosin) and another with a basic dye (methylene blue) with solns. of the dye at p_H 1.4-12.5. Examns. of the preps. showed that the critical point for staining was displaced at $p_H + 0.7$ from the known isoelec. points. This displacement coincides to that of denatured egg albumin, which is displaced from p_H 4.7 to 5.4 and may be due to the fixation of the tissues. P concludes that the protein must be at the isoelec. point in order to take the stain.

PETER MASUCCI
Methods of determination of the p_H of liquids of the organism. E. J. BIGWOOD. *Bull. soc. chim. biol.* 10, 15-213 (1928). —This extensive paper reports a general examn. of all the methods in use for detg. p_H , the characters of the body fluids which must be taken in account in the detn. of their p_H values and the selection of methods for the different classes of fluids. Detailed lab. procedures are not given. The bibliography fills 27 addnl. pages.

L. W. RIGGS
Volumetric estimation of phosphorus and its application in biological analysis. M. JAVILLIER AND D. DJELATIDES. *Bull. soc. chim. biol.* 10, 342-53 (1928). —Various methods are discussed with 36 references to the literature. The authors' method was to ppt. the P with $(\text{NH}_4)_2\text{MoO}_4$ in a warm soln. in the presence of H_2SO_4 and the absence of HNO_3 . The washed ppt. was dissolved in NH_4OH , the soln. acidified with H_2SO_4 and the molybdate was reduced by Al foil and reoxidized by standard permanganate.

L. W. RIGGS
New procedure for the microestimation of free sugar and protein sugar in blood plasma. H. BIERRY AND A. VOSKRESSENSKY. *Compt. rend. soc. biol.* 98, 287-9 (1928); cf. *C. A.* 21, 2142; 22, 252, 790. —After hydrolysis the plasma is freed from albumin by $\text{Hg}(\text{NO}_3)_2$. Detailed directions are given.

L. W. RIGGS
Microestimation of free sugar and of protein sugar in the blood plasma. H. BIERRY AND A. VOSKRESSENSKY. *Compt. rend. soc. biol.* 98, 744-7 (1928); cf. preceding abstract. —The method consists in heating for 6 min. in the boiling water bath 5 cc. of the filtrate of disalbuminated blood with 2 cc. of an alk.-Cu soln. and measuring the Cu_2O produced by the Mohr-Bertrand method.

L. W. RIGGS
Distribution of uric acid in the blood and the cause of errors in its estimation. R. VLADESCO. *Compt. rend. soc. biol.* 98, 462-4 (1928). —The detn. of uric acid in the total blood is preferable to detns. in the serum, and should be preceded by a total hemolysis of the red corpuscles. Tungstic acid is always better than trichloroacetic acid as a defecating agent.

L. W. RIGGS
Cause of error in the application of the Hehner method of estimating the organic acids in the gastric juice. PAUL FLEURY AND PIERRE AMBERT. *Compt. rend. soc. biol.* 98, 503-4 (1928). —An artificial juice, consisting of 200 cc. of 4% egg albumin,

60 cc. N HCl, 2 g. NaCl, 1 g. pepsin and H_2O to 1 liter, none of the constituents of which gave an alk. ash, yielded by the Hehner method an ash with an alk. of 0.6 cc. 0.1 N NaOH. On evapn. of a soln. of egg albumin and NaCl and heating the residue to dull redness, an alk. ash is produced. Other proteins give a similar result. L. W. R.

A colorimeter for the determination of adrenaline by the method of Suto and Inouye. TAKEO KOJIMA. *Tohoku J. Exptl. Med.* 10, 281-92(1928).—The construction and use of the colorimeter are described. L. W. RIGGS

A simple method for the determination of calcium in whole blood. W. R. CAVEN AND A. CANTAROW. *J. Lab. Clin. Med.* 12, 76-77(1926); cf. *C. A.* 21, 3379.—To 2 cc. of 4% $(NH_4)_2C_2O_4$ in an accurately graduated centrifuge tube add 2 cc. of blood. Thoroughly mix, let stand 1 hr., then centrifuge at high speed for 10 min. Pour off supernatant fluid, invert the tube for 5 min. with the mouth on a pad of filter paper. Wash the ppt. once with 5 cc. distd. H_2O and once with 3 cc. dil. NH_4OH (2 cc. of concd. NH_4OH and 98 cc. distd. H_2O), centrifuging and draining each time as before. Add 2 cc. NH_2SO_4 , blown directly upon the ppt. to break up mat. Place the tube in a boiling water bath 1 min. and titrate oxalic acid with 0.01 N $KMnO_4$ in a water bath at 75°. This titration value multiplied by 10 gives Ca in mg. per 100 cc. of whole blood. E. W. WICKWIRE

A rapid method for the determination of chlorides in blood or urine. S. L. LIEBOFF. *J. Lab. Clin. Med.* 12, 702-6(1927).—Neutralize with $CaCO_3$ the soln. contg. chlorides and titrate with a standard $AgNO_3$ soln. with Na_2CrO_4 as an indicator giving a red color for an end point. For chlorides in blood place 5 cc. of tungstic acid filtrate of Folin-Wu (0.5 g. blood) in a small beaker. In a similar beaker place 5 cc. H_2O for control. Add to each beaker about 0.3 g. powdered $CaCO_3$ and 0.5 cc. of 0.25% aq. Na_2CrO_4 . Add 1 drop of the standard $AgNO_3$ soln. to the control, then add $AgNO_3$ standard to blood filtrate until change to color of control is produced. For chlorides in urine, place 5 cc. of urine in each of 2 small beakers and follow the same procedure as for chlorides in blood. If the urine is alk. acidify it with dil. AcOH before adding $CaCO_3$. E. W. WICKWIRE

Note on the tungstic acid precipitation of blood proteins. MICHAEL SOMAGYI. *J. Lab. Clin. Med.* 12, 800-1(1927).—To overcome incomplete protein pptn. in the prepn. of protein-free filtrates by the Folin-Wu method introduce the blood into 8 vols. of $1/11$ N H_2SO_4 . After laking, add 1 mol. of 10% Na tungstate. Shake, allow to stand about 5 min., then filter. E. W. WICKWIRE

A new standard for the Van Den Bergh test. B. W. RHAMY AND P. H. ADAMS. *J. Lab. Clin. Med.* 13, 87-9(1927).—It is found that 0.7 cc. 0.1 N stock $KMnO_4$ dild. to 50 cc. with distd. H_2O gives a color identical with azo-bilirubin soln. and is equiv. to 5 parts per million of bilirubin. 0.1 N $KMnO_4$ should stand a month to ripen. The top soln. is then siphoned off and the last 2 are discarded. The siphoned soln. may be standardized in the usual way and is stable, no appreciable change occurring under 4 months. The $KMnO_4$ soln. should be kept tightly corked, free from reducing vapors and in a dark bottle. E. W. WICKWIRE

Iodometric determination of glucose (NICHOLS) (ALVARADO, VOORHIES) 7. A modification of the Brown apparatus for the colorimetric determination of p_{H_2} (WRIGHT) 1. The spectrophotometric evaluation of mixtures of methylene blue and trimethylthionine (HOLMES) 7.

C—BACTERIOLOGY

A. K. BALLS

Autolytic power of *B. coli communis*. E. G. YOUNG. *Proc. and Trans. Nova Scotian Inst. Sci.* 17, 79(1927).—Sterile solns. obtained by alternately freezing and thawing emulsions of *B. coli communis* and then filtering through a Berkefeld filter have no action on dextrose in an atm. of N at 37° for several weeks, but effect a very slow hydrolysis of peptone as evinced by an increase in the free amino N. B. C. A.

A flagella staining technic. A. W. TURNER. *Rev. Hyg. Med.* 50, 318-9(1928).—A new, precise but rather difficult technic of especial value for *B. sporogenes*, *B. oedematus* and *B. tertius*. C. R. FELLERS

Further studies on a modification of the Gram stain. NICHOLAS KOPELOFF AND PETER COHEN. *Stain Tech.* 3, 64-9(1928).—As a substitute for acetone in decolorizing, equal parts of acetone and 95% EtOH for 10 sec. or less are now recommended. Aq. basic fuchsin (0.1%) serves as a strongly contrasting counter stain. Prolonged application renders Gram-positive organisms doubtful, or even Gram-negative, while short application renders Gram-negative organisms doubtful or Gram-positive. Exactly 20

sec. is recommended for counter staining. The method is of particular value in staining pure or mixed cultures, for org. materials such as acidophilus milk or feces.

C. R. FELLERS

A new substitute for ethyl alcohol in the Gram stain. H. J. CONN. *Stain Tech.* 3, 71-2(1928).—A mixt. of MeOH and isopropyl alc. in equal parts serves as a satisfactory substitute for EtOH in decolorizing in the Gram-stain technic. C. R. FELLERS

Rancidity of coconut oil produced by mold action. W. N. STOKOR. *Biochem. J.* 22, 80-93(1928).—The rancidity, caused by a *Penicillium* organism, is due to the presence of methyl amyl, methyl heptyl and methyl nonyl ketones. BENJAMIN HARROW

The metabolism of the *Bacillus tetani*. I. H. SIEVERS AND E. MÜLLER. *Z. Biol.* 86, 527-34(1927).—Exts. from large quantities of organisms yielded methylhydantoin (m. 165°, easily sol. in water, acid to litmus, sol. with difficulty in alc.), propionic, acetic, butyric and lactic acids.

• D—BOTANY

THOMAS G. PHILLIPS

Acidification of unbuffered salt solutions by plant tissue in relation to the question of tissue isoelectric points. F. E. DENNY AND W. J. YODEN. *Am. J. Botany* 14, 395-414(1927).—Studies were made of the effect of plant tissues upon unbuffered salt solns. Plant tissues such as thin disks of potato tubers, carrots, apples, whole seeds of corn, rye and wheat and corn seed powder were placed in various salt solns. of concns. varying from 0.1 M to 0.001 M. p_H detns. of the external liquid were made. These values varied with the salt used, the concn. of salt and especially with the nature of the cation. There was no characteristic p_H for a given tissue except as high diln. approached that of a water ext. of a tissue. The changes produced in the external soln. by salts were always in the direction of increased acidity. The effect was less marked for univalent cations, such as Na and K, than for the bivalent ions, Ca and Cu. Increases in acidity resulting from plant tissues placed in $CaCl_2$ were very great. The observed changes in p_H cannot be interpreted as indicating an isoelec. point for the tissue as a whole, nor do they furnish proof that a reaction has occurred between the ions of the salt solns. and the proteins with characteristic isoelec. points. In fact the increase in p_H may come primarily from non-protein non-colloidal substances which diffuse out of the tissue.

M. S. ANDERSON

The protein metabolism of the soy bean. O. K. STARK. *Am. J. Botany* 14, 532-47(1927).—Environmental factors are of great importance in protein metabolism. Frequent analyses are necessary in order to interpret the progress of protein hydrolysis since it may vary widely in different stages of growth. Temp. has a marked influence upon protein hydrolysis in early stages of growth but in later periods has no effect. Two varieties of soy beans are extensively compared. There is a great difference in N relationships of the 2 varieties; the Manchu is high in protein while the Midwest is low. Curves representing α -amino N content of the 2 varieties show much the same modes, but corresponding stages are reached earlier in the Midwest variety. Manchu seedlings are able to live longer on reserves in the seed than are those of the Midwest. This may be due to the kind of reserves rather than to the amt. During the period of growth the decrease in total N is both earlier and more marked in the Midwest. In both varieties, however, a part of the N reserve is finally respired. Contrary to the general hypothesis, no correlation exists between protein hydrolysis and growth except at very early periods. Respiratory intensity is unrelated to α -amino N content.

M. S. ANDERSON

Physiological aspects of the flow of latex in rubber plants. A. ZIMMERMANN. *Kautschuk* 1927, 95-8, 118-21, 147-9; *Brit. Chem. Abstracts* 1927B, 635.—A crit. review and discussion of the nature and phenomena of the flow of latex under different conditions.

C. C. DAVIS

A particular form of biological oxidation. II. An analysis of the generalization of different Bryophyta and their products of humification. J. HOUGHT, ANDRÉ MAYER AND L. PLANTÉPOL. *Ann. physiol. physicochim. biol.* 4, 123-8(1928); cf. C. A. 21, 3385, 22, 640.—The same technic was used as in the previous expts. The property of the *Hypnum triquetrum* to oxidize oxalic acid in soln. was found with some other aerial mosses of different species and genera. It was not found in the Sphagnes, an aquatic variety nor in some semi-aquatic Hepaticae although it was found in the aerial Hepaticae. The constituent which causes the oxidation resists the natural death of the plant and its decomposition. The humus shows the same activity. The property is

annuled by sunlight. The humus from other plants appears active or inactive, depending on how the whole plant behaves. H. J. DUGEL, JR.

Pentosan content in relation to winter hardiness in the apple. W. A. DELONG, *Sci. Agr.* 8, 501-23 (1928).—The least hardy varieties of apples have the greatest pentosan content as detd. by the HCl-phloroglucinol method. The correlation was not definite as marked inconsistencies occur. The results disagree with previous findings. There is no positive correlation between pentosan content and total loss of moisture or rate of loss of moisture at 75° in either the aerial or subterranean portions of the apple tree. The tops of trees contained 30% more pentosan than the roots, with the moisture loss the same in both cases. A critical review of pentosan literature indicates the indefiniteness of the product measured in the different analytical procedures and the obscurity of the origin of pentosans in plants. The discrepancy between results obtained by the HCl-phloroglucinol and the fermentation-Cu reduction methods is not due to any appreciable degree to substances precipitable by phloroglucinol and sol. in 95% EtOH at 60°. The small EtOH-sol. fraction of the phloroglucide ppt. is probably derived from hexoses rather than from methylpentosans since it gave color reactions characteristic of hydroxymethylfurfural. A list of 51 references is appended. C. R. FELLERS

The development of the wheat kernel. C. E. SAUNDERS. *Sci. Agr.* 8, 524-31 (1928).—In the development of the wheat kernel, protein was deposited throughout the whole period of development of the kernel, the rate of deposition being most rapid at the time when the kernel gained most rapidly in wt. During the first few days of the expt. the deposition of other material was relatively more rapid than that of the protein, so that the % of the latter actually decreased. The period of greatest physiol. activity was also the period of max. protein deposition. The % of protein remained relatively const. during the last 10 days of the expt. C. R. FELLERS

Staining cell constituents in diseased plant tissue. J. DUFRENOY. *Stain Tech.* 3, 57-63 (1928).—Staining with acid fuchsin and decolorizing with light green makes it possible in properly killed tissues to detect the slightest alteration in tissues and to observe the different parts of the cell, nucleus, mitochondria and plastids, even when excessive vacuolation compresses the cytoplasmic inclusions. Meves or Regaud fluids are considered best for tissue killing. C. R. FELLERS

Growth of seedling in relation to composition of seed. M. E. REID. *Botan. Gaz.* 81, 196-203 (1926); *Physiol. Abstracts* 12, 131.—Differences in different seedlings in their response to external influence were shown to be often correlated with the compn. of the seed. The investigations were carried out on several types of seedlings, and the chief chem. property of the seed investigated was the proportion of carbohydrates to N. H. G.

The absorption of water by plant tissue in relation to external hydrogen-ion concentration. W. H. PEARSALE AND J. EWING. *Brit. J. Exptl. Biol.* 4, 245-57 (1927); *Physiol. Abstracts* 12, 140.—The vol. of water absorbed by various vegetable tissues is a min. around p_H 3.2, 4.5, 5.5 and 6.6, whether fresh or dried tissue be used. Cellulose and starch do not show these turning points, which correspond closely to the isoelec. points of the vegetable proteins likely to be present. H. G.

Recent work on the localization of iodine and bromine in the cells of marine algae. MANGENOT. *Bull. hist. appl. physiol. path.* 4, 52-70 (1927); *Physiol. Abstracts* 12, 193-4.—Botanists have demonstrated the presence in algae of cells contg. I compds. in which the I is very loosely held. This is of great interest from the point of view of biology and of general cytology. The present review is devoted to the discussion of these facts and their consequences from the point of view of physiology in general. H. G.

The biology of the apple tree. G. RIVIÈRE AND G. PICHARD. *J. Soc. Nat. Hort. France* 25, 481-2 (1924); *Botan. Abstracts* 15, 1174-5.—This is a chem. study concerned especially with the glucoside, phlorhizin and malic acid. The authors believe that this glucoside is a reserve food which is used in starting growth in spring. During the growing season it is formed in the leaves and through hydrolysis furnishes glucose to the fruit. The glucose content of the fruit increases as the fruit ripens. H. G.

Plant distribution as affected by the hydrogen-ion concentration of the soil. F. G. GUSTAFSON. *Papers of the Michigan Acad. of Sci. and Letters* 6, 237-46 (1926); *Physiol. Abstracts* 12, 410.—A study of the H-ion concn. of the soil in the neighborhood of roots supports the view that plant distribution depends to a large extent on the acidity of the soil. Ways in which H-ion concn. may affect plant growth are noted. H. G.

The evidence for phosphatides in the external surface of the plant protoplast. F. C. STREWARD. *Biochem. J.* 22, 268-75 (1928).—There is no evidence that phosphatides are present in the surface layer of the protoplasm of various parenchymatous

tissues. Leaching expts. fail to show that the phosphatides diffuse from living tissues into distd. water. (Cf. Grafe, *C. A.* 21, 2912.)

Experimental semi-parasitism. COLLA SILVIA. *Boll. soc. ital. biol. sper.* 2, 225-8 (1927).—Expts. were made by introducing into the cut surface of potato tubers, wheat, corn and oat seeds. Under the exptl. conditions the seeds germinated and lived long after they had exhausted their food reserve, on the living but quiescent potato tubers.

PETER MASUCCI

Quantitative variations of enzymes in grains of wheat in the course of ripening, resting and germinating. A. M. BACH, A. I. OPARIN AND R. A. VENER. *Trans. Karpov Inst. Chem.* 1926, No. 5, 62-70; cf. *C. A.* 17, 1044.—Two sorts of wheats have been studied: *Triticum vulgare*, var. erythrospermum and *Triticum vulgare*, var. vebstinum. In the course of the growth samples of 100 grains each were taken every 1-2 days, dried in a vacuum desiccator over H_2SO_4 , weighed and used for detns of N (by Kjeldahl's method), and of the following 4 enzymes (by the authors' own method): catalase, peroxidase, amylase and protease. Curves have been drawn expressing these quant. changes as a function of time. The curves of enzymes at first mount irregularly, reach a certain max., then drop more or less abruptly. In the course of the ripening of the grains 2 opposite processes take place simultaneously: formation of active enzymes and their transition into inactive zymogens; the latter become transformed into enzymes in the course of germinating. It remains to be established how and from what materials enzymes are formed in ripening grains and how they turn into inactive zymogens. The comparison of curves shows that for all enzymes the max. in the course of ripening is always below the max. obtained in the course of germinating. Catalase and peroxidase decrease comparatively little in the course of ripening and increase 2-8 fold in the process of germinating; amylase and protease disappear in the process of ripening of grains, but show a phenomenal increase in the course of germinating.

BERNARD NELSON

Further contribution to the biochemistry and physiology of the cell phosphatides of plants. II. B. H. CRANNER. *Meldinger Norges Landbruks.* 7, 611-43(1927); cf. *C. A.* 21, 1290.—Phosphatide exts. from a number of diff. plants were prepd. especially from the blossoms and the fruits. The reactions with diff. reagents were studied, particularly the reactions with alk. and acid dyestuffs. Aq. exts. from peas, both the sol. and the insol. fraction, gave beautiful colored ppts. with 14 different alk. dyestuffs but no ppt. at all with acid dyestuffs. The insol. fraction was not attacked by pepsin even after several days at 30-35°. It was, however, readily dissolved in concd. HCl and also in satd. Na_2CO_3 . A great number of similar observations are reported.

C. A. ROBAK

Effect on plants of commercial brands of flowerpots. ARNE THURSRUD. *Meldinger Norges Landbruks* 7, 644-62(1927).—Expts. show a marked effect on the roots of the plants cultivated in new pots of certain brands. The harmful effect is probably due to basic matter, especially CaO. By elutriation of the pots for several weeks in running water the injurious substances are washed out and the harmful effect is reduced or removed. Still better is to elutriate the pots in dil HCl, for instance, 1-3 days in 0.1 N HCl. This treatment ought to be carried out by the potteries.

C. A. ROBAK

Contribution to the physicochemical analysis of the turgor mechanism in the separation-layer in plants. HANS PFEIFFER. *Protoplasma* 2, 206-38(1927).—A study was made of the morphology and physicochem. character of the various sepn. tissues. The sepn. and casting off of the male flowers of *Vallisneria spiralis* took place as a result of the increased turgidity and rounding up of the separation layer. There was a measurable increase in osmotic pressure and a diminution in the permeability of the cells of this layer. Treatment with narcotics, which was known to bring about increased turgor, was found to cause acceleration in the casting off of the flowers; other methods of causing increase in turgor, e. g., treatment with bases, isotonic sucrose solns., heat or CO_2 , had no effect on the time of casting off the flowers. It is suggested since there is some evidence that before sepn. the O_2 supply in the separation-layer is cut down that this partial anaerobiosis by altering the H/OH ratio is responsible for the phenomenon of increase in turgor.

M. H. SOULE

The relation between mechanical and chemical injuries to protoplasm and the action of some protective substances. V. V. LEPESHKIN. *Protoplasma* 2, 239-70 (1927).—The cells of *Spirogyra neglecta* were employed. The poisons act either on the disperse phase or on the dispersion medium. If the disperse phase coagulates a motion is set up which may exert a mech. action on the elements of the dispersion medium and cause death. The complete breaking down of the compds. of fats and proteins produces destruction of the cell. Acids, bases, salts of heavy metals, narcotics and

I_2 act directly on the dispersion medium, producing a chem. alteration of the proteins or fats. Neutral salts are poisonous only insofar as they produce coagulation of the disperse phase. The action of Al salts in aq. soln. is due to the pH as the non-hydrolyzed part of the electrolyte ($AlCl_3$) is not injurious. The protective action of Al salts is due to the removal of H_2O from the protoplasm.

E—NUTRITION

PHILIP B. HAWK

Studies on "salt ophthalmia." III. E. V. MCCOLLUM, N. SIMMONDS AND J. E. BECKER. *Proc. Soc. Exptl. Biol. Med.* **24**, 952(1927).—The $FeSO_4$ in Salt Mixture 20 is responsible for the ophthalmia noted in rats fed diets contg. it. The $FeSO_4$ appears to destroy the vitamin A when fats are allowed to remain mixed with the salt.

C. V. B.

Growth-promoting value of cod-liver oil irradiated by sunlight and the mercury vapor lamp. A. L. DANIELS AND L. M. BROOKS. *Proc. Soc. Exptl. Biol. Med.* **24**, 971-2(1927).—The irradiation of cod-liver oil did not increase its antirachitic potency.

C. V. B.

Influence of feeding mixture on the antirachitic potency of cod-liver oil concentrate. A. L. DANIELS AND L. M. BROOKS. *Proc. Soc. Exptl. Biol. Med.* **24**, 972-4(1927).—The most effective method of administering a cod-liver oil concentrate is to dissolve it in oil.

C. V. B.

Vitamin A deficiency and urolithiasis. E. C. VAN LEERSUM. *Brit. Med. J.* **1927**, II, 873-4; cf. *C. A.* **22**, 800.—In rats there is a definite connection between vitamin A deficiency and formation of phosphatic calculi.

A. T. CAMERON

Familial pellagra in Ireland. J. T. MACCARTHY. *Brit. Med. J.* **1927**, II, 1180.—Two sisters, adult, both showed typical pellagra. M. considers that this could not be traced to the diet but represented an acute exacerbation of a chronic condition, the disease being due to an inability of the patient to use biologically valuable protein.

A. T. C.

Rice in the chemistry of nutrition. L. BORASIO. *Notiz. chim. ind.* **3**, 142-3 (1928).—Samples of Italian white rice were analyzed with the following % results: moisture 13.87, 13.70, 13.20, 14.00, 13.39, 13.60; fats 2.26, 0.44, 1.85, 0.24, 0.30, 0.27; proteins 9.53, 8.39, 7.14, 6.05, 8.37, 6.20; cellulose 1.80, 0.70, 1.29, 0.32, 0.42, 0.30; ash 1.43, 0.58, 1.17, 0.51, 0.67, 0.53; non-N extractives 71.11, 76.19, 75.35, 78.88, 76.85, 79.10; total P_2O_5 0.81, 0.65, 0.38, 0.20, 0.20, 0.21; phytinic P_2O_5 0.48, 0.39, 0.13, 0.06, 0.10, 0.05; lecithinic P_2O_5 0.12, 0.10, trace, trace, trace, trace; vitamin units 0.42, 0.38, trace, trace, trace, trace; catalases (15 min.-cc. 0) 40, 40, 1.5, 1.0, 1.5, 1.0; calorific power 3725, 3685, 3631, 3631, 3631, 3631. The results indicate the general character of Italian rice and show that it is fairly rich in vitamins, mineral substances, P compds., org. P (phytin, lecithin, etc.), fats and proteins.

C. C. DAVIS

The vitamin content of mung bean sprouts. CAREY D. MILLER AND DORIS B. HAIR. *J. Home Econ.* **20**, 263-71(1928).—Compared with other common vegetables in feeding expts. on animals the sprouts of the mung bean (*Phaseolus mungo* or *P. aureus*) are a fair source of vitamin A (both raw and cooked) a very good source of B (raw and cooked) and an excellent source of C in the raw state and a good source when cooked.

L. D. ELLIOTT

The multiple nature of vitamin B. SYBIL L. SMITH. *J. Home Econ.* **20**, 241-4 (1928).—A plea for uniform nomenclature in distinguishing the two component factors of vitamin B. S. suggests the terms vitamin F and G.

L. D. ELLIOTT

A basal diet for nitrogen balance experiments. LOUISE M. PICKENS AND ROSSLENE M. ARNOLD. *J. Home Econ.* **20**, 250-2(1928).—A basal diet consisting of almonds, apple butter, cheese and crackers was found to be easily prepd., required a min. of analytical work and secured a uniformity of diet through the expts. The diet was palatable and satisfying and did not cause digestive disturbances.

L. D. ELLIOTT

Vitamins. ALEXANDER JANKE. *Deut. Essigind.* **32**, 49-51, 59-60(1928).—The general subject of vitamins is discussed in connection with the possibility of fermentation vinegar being a source or carrier of such substances.

W. O. E.

Biologic assays for vitamins. P. S. PITTINGER. *Am. J. Pharm.* **100**, 63-91 (1928).—The biologic assays for vitamins have been sufficiently developed to render it possible to det. the vitamin A, B, C and D content of a medicinal or food product. The details of these assay processes and of important general principles which must be applied to all assays of this type and with which the bio-assayist must be thoroughly familiar are given. The method employed for proving the presence or

absence of vitamin E in a given product is qual. only. It cannot readily be adapted to a quant. measurement of vitamin E owing to the variation in the symptoms of vitamin-E deficiency. There is at present no satisfactory method for biologically assaying a product for the P-P Factor. A description of the various vitamins and their sources together with a list of existing color reactions for their identification is also included.

W. G. GAESSLER

Limits and methods of influencing the mineral metabolism. A. VON KORÁNYI. *Deut. med. Wochschr.* 54, 297-9, 342-4(1928).—An address. ARTHUR GROLLMAN

Examination of yeast fat for the presence of vitamins A and D before irradiation and of vitamin D after irradiation. E. M. HUME, H. H. SMITH and IDA SMEDLEY-MACLEAN. *Biochem. J.* 22, 27-33(1928).—Vitamin A is absent from yeast fat (total fat). Vitamin D is absent from acetone-soluble fat obtained from yeast. (See, however, *Biochem. J.* 19, 47(1925)) Irradiation of the samples of fat before feeding it to the rats promoted growth and bone formation in the latter. BENJAMIN HARROW

Estimation of vitamin D. HARRY JEPICOTT and A. L. BACHARACH. *Biochem. J.* 22, 60-2(1928); cf. *C. A.* 21, 3938.—Further evidence that the extent of the lowering of fecal p_H , due to the administration of vitamin D to rats on a rachitic diet, is a function of the amount of vitamin D administered. (Cf. *C. A.* 21, 1833). B. H.

Vitamins of orange juice. S. G. WILLIMOTT. *Biochem. J.* 22, 67-76(1928).—Five cc. of orange juice (California navel and Valencia, Sunkist brand) contain sufficient vitamin A for growth and well-being in the rat. Ten cc. were required for the vitamin B needs. Vitamin D is absent. BENJAMIN HARROW

Rat technic for demonstrating the interfering effect of cereals on bone calcification. H. N. GREEN and EDWARD MELLANBY. *Biochem. J.* 22, 102-12(1928).—The finding of Mellanby (*Brit. Med. J.* 1922, II, 849) that cereals interfere actively with the calcification of bones of dogs has now been demonstrated by using rats. B. H.

Quantitative determination of vitamin D. EDVARD POULSSON. *Biochem. J.* 22, 135-41(1928).—The same rats are used for the preparatory period as for the test period. The rats are put on a Steenbock and Black diet 2965 (*C. A.* 19, 2690-1) and after 25 days a skiagram of the left knee joint is taken, and the rats are weighed. The antirachitic substance to be tested is given for 6 days and then another skiagram is taken and the rats are weighed again. The results are indicated in units per g. on a principle analogous to that adopted by the U. S. Pharmacopeia in its method for vitamin A assay. BENJAMIN HARROW

Chemical composition of the milk of cows receiving cod-liver oil. E. C. V. MATTICK. *Biochem. J.* 22, 144-9(1928).—The acidity of the milk is less when cows receive cod-liver oil, and the time of coagulation by rennet is increased. The total percentage of Ca is higher in the milk of cows receiving cod-liver oil and the fat content is lower. The total P and N appear unaffected. BENJAMIN HARROW

Influence of the cow's diet on the fat-soluble vitamins of winter milk. II. JOHN GOLDING and S. S. ZILVA. *Biochem. J.* 22, 173-82(1928); cf. *C. A.* 21, 1833.—Daily additions of 2 oz. cod-liver oil to rations of silage and hay did not materially depress the percentage of milk fat nor did it raise the vitamin D of the butter to any appreciable extent. Higher amts. of cod-liver oil depressed the percentage of milk fat and increased the antirachitic potency of the butter. BENJAMIN HARROW

Use of olive oil subcutaneously. ABRAHAM TOW. *Arch. Pediatrics* 45, 182-6(1928).—A child aged 2.5 yrs. received 95 cc. of olive oil subcutaneously in the abdominal region in doses of 5 to 30 cc. over a period of 9 days; a gain in body wt. of 17 oz. resulted. However, subcutaneous nodules formed. Histological examn. of these nodules, obtained by bioscopy, showed a typical foreign body reaction about the oil globules present in them. Since olive oil administered subcutaneously is but slowly if at all completely absorbed, the conclusion is drawn that its use in this manner should be considered in children with a lowered tolerance for food by mouth only if other procedures have failed or are unavailable. JOSEPH S. HEPBURN

The vitamin content of the technical soy phosphatide preparation used in the manufacture of margarine. ARTHUR SCHEUNERT. *Z. Untersuch. Lebensm.* 54, 302-7(1927).—The phosphatide mixt. obtained as a by-product in the manuf. of soy-bean oil and used in the margarine industry as a coloring agent and water binder contains no antirachitic vitamin and only negligible traces of vitamin A; it may be given antirachitic properties by irradiation with ultra-violet light. WILLIAM J. HUSA

Alimentary glucemia and pancreatic function in the dog. G. MARTINO. *Arch. sci. biol.* 10, 438-55; *Boll. soc. ital. biol. sper.* 2, 777-9(1927); cf. Ciaccio and Racchiusa, *C. A.* 22, 1794 and Martino (cf. following abstract).—Administration of 15 g. peptone to fasting dogs caused an increase of blood sugar which was proportional to

the duration of the fast. Peptone caused hypoglycemia in dogs with ligated pancreatic duct, and had no effect on the blood sugar when both pancreatic duct and veins were ligated. In dogs with ligated pancreatic veins the peptone hyperglucemia was more pronounced than in normal dogs, but ligation of the pancreatic duct reduced the sugar to the normal level.

MARY JACOBSEN

Effect of inanition on the behavior of the alimentary glucemia in doves. G. MARTINO. *Boll. soc. ital. biol. sper.* 2, 316-20(1927).—The glucose content of a dove's blood was detd. at the start, and after fasting one and five days, immediately before, and one half hour after injecting 5 g. of glucose in soln. Similarly Witte's peptone, olive oil, egg albumin, glycocoll and glucose were injected. Glucose increased the glucose in blood, 83-86%; glycocoll, 26%; egg albumin, 23%; olive oil, 0.0%. Fats, therefore, do not induce hyperglucemia as the carbohydrates do.

A. W. CONTIERI

The effect of ungerminated seeds, normal and autoclaved, on muscle contraction. GUIDO GUERRINI. *Biochim. terap. sper.* 15, 1-16(1928); cf. *C. A.* 21, 3933.—The exts. were prepd. by incubating whole rice 50 days at 37°, pressing the liquid out and filtering it through paper. Part of the ext. was autoclaved 180 min. at 150°. The physical and chem. properties were not perceptibly changed by autoclaving. Both exts. had a pronounced acid reaction, reduced Felling soln., gave positive Millon, biuret and xanthoprotein reactions and formed slight ppts. with HgK_2I_4 , NH_3 and $(NH_4)_2SO_4$ and more abundant ones with tannic acid. Neither became turbid on heating to the b. p. The effect was studied on the frog gastrocnemius immediately and 3 hrs. after the instillation of 1 cc./25 g. into the dorsal sac and 0.5 hr. after the last of 2-6 injections made at 24-hr. intervals. The normal ext. increased the height and length of the isotonic contraction curve (I) by 43.01 and 13.44%, resp., the no. of contractions in the automatic fatigue curve (II) by 22.14% and the mechanical work (III) (ergogram) by 39.15%. The increases caused by the non-autoclaved exts. of boiled rice were: I, 44.50 and 17.08%, resp.; II, 31.32, III, 27.56%. The autoclaved exts. from raw and boiled rice had no effect. In view of the behavior of boiled rice exts. the ineffectiveness of the autoclaved exts. cannot be attributed to the absence of vitamins, but is apparently caused by additional profound changes.

M. J.

Isolated vitamins as a therapeutic means of choice in specific and associated deficiencies. FRANCESCO CASSELLA. *Pediatria Arch.* 2, 49-85(1928).—Isolated vitamins (nature and proportions not stated) were given orally and subcutaneously over a long period of time. Latent deficiencies and indirect nutritive disturbances and dystrophias resulting from infectious diseases such as pneumonia or chronic gastroenteritis were cured. Dystrophias and anemias of nutritional origin and those incidental to toxic-infectious diseases (incipient tuberculosis, pretuberculous conditions, syphilis) were favorably influenced. Vitamin combinations may be used therapeutically in early tuberculosis, rickets and scurvy. The clinical experiences support the view of endocrine stimulation by the vitamins and indirect action through the hormones.

M. J.

The growth-promoting effect of irradiated foods. L. M. SPOLVERINI AND G. C. BENTIVOGLIO. *Pediatria Rivista* 35, 1110(1927).—Properly irradiated and administered powdered milk has a remarkable eutrophic effect on infants.

MARY JACOBSEN

Ozonized milk as infant food. A. MACCHI. *Pediatria Rivista* 35, 1113(1927).—Ozonization renders milk completely sterile and reduces the caloric value only by 5-8%. Remarkable effects on skeletal growth and condition and on the blood picture were obtained.

MARY JACOBSEN

Protein metabolism in bottle-fed infants and its relation to other fundamental factors. V. PINOZZI. *Pediatria Rivista* 35, 1115(1927).—Protein utilization may be enhanced by a high protein intake, up to a certain limit above which a paradoxical reaction ensues. There is a direct relation between growth and protein utilization. The latter is entirely independent of the nature and quantity of the fat taken. A high carbohydrate diet considerably reduces the protein absorption and utilization.

M. J.

Effect of vitamin B on fat tolerance. G. CAREDDU. *Pediatria Rivista* 35, 1116(1927).—Rats fed on a vitamin-B-free diet with an excess of cod-liver or soy-bean oil presented severe emaciation, lowered temp., exudative symptoms and the paralysis characteristic of beriberi. Rats with exudative symptoms had a very thin epidermis. The 1st 3 symptoms are not caused by vitamin-A excess as claimed by Franck, since cod-liver and soy-bean oils had the same effect. Frontali's assumption that vitamin-B deficiency lowers the fat tolerance seems more acceptable.

MARY JACOBSEN

Vitamin B and automatin action. H. ZWAARDEMAKER. *Verslag Akad. Wetenschappen Amsterdam* 37, 6-8(1928); cf. following abstract.—Automatins from an irradiated heart revived an eel heart after a latent period of 3.5 hrs. The beat rate grew fast and reached a max. after 15 min. The effect lasted 16 hrs. Vitamin B of Donath

and Jensen freed from K by extn. with 96% alc. caused under the same conditions only single intermittent contractions; the effect lasted 2 hrs. After irradiation with soft Ra rays vitamin B caused a vigorous and rapid heart beat after a latent period of 1 hr. A max. was reached after 20 min; the effect lasted 13 hrs. The length of the latent period depended in some instances on the time of washing the heart, but the beat rate was detd. by the concn. of the active substance. The length of irradiation with soft rays from 5 mg. Ra in enamel should be at least 4 hrs., preferably 24 hrs.

MARY JACOBSEN

The nature of the heart injury in beri-beri patients. K. F. WENCKENBACH AND W. C. AALSMER. *Verslag Akad. Wetenschappen Amsterdam* 37, 137-40(1928); cf. Tiemann, *Z. ges. expil. Med.* 58, 821(1928); Zwaardemaker, cf. preceding abstract.—The heart muscle of beriberi patients shows on both sides an increase in vol. and wt. generally called hypertrophy, which is independent of the extent of the degeneration of the nervous system, Stimulation and stimulus conduction are unimpaired. Heart remedies are ineffective. The prompt effect of vitamin B on the size of the heart muscle and the intact automatism suggest that the increase in size is caused by swelling rather than by hypertrophy. It has been pointed out repeatedly that striped muscle loses its contractility through swelling. The swollen and painful skeletal muscles of beriberi patients benefit by vitamin B in the same manner. The injury to the nervous system is possibly also caused by water imbibition or retention and swelling of the nerve tissue. The dehydrating action of vitamin B must be of a sp. nature since thyroid ext., novasurol and salyrgan are incapable of producing the same effect. The automatinic effect of irradiated vitamin B is of interest in this connection. M. J.

Influence of vitamin-fast days on metabolism. W. ARNOLDI, E. FINK AND R. MICHELIN. *Arch. Verdauungs-Krankh.* 41, 239-46(1927).—There is an av. wt. loss of 1.6 kg. with a decrease in rest, and an increase in uric acid of the blood. No difference could be established between cases which received vitamin C directly after the fast and those that did not.

FRANCES KRASNOW

Nitrogen equilibrium and nitrogen reserve dependent on researches with coarse rye bread. AUGUST PÜTTER. *Z. Biol.* 86, 317-44(1927).—The minimal N-exchange under conditions of decreased N reserve may be determined only when there is simultaneously a good glycogen-fat reserve. If this is not adjusted the N values obtained are too high.

FRANCES KRASNOW

Studies in fat metabolism. IX. Formation of acetone bodies. R. MANCKE AND P. SERBESCU. *Z. Biol.* 87, 1-7(1928); cf. *C. A.* 21, 1291.—Hogs (healthy, 35 kg. wt.) were fed 8-17 days on fat. No acetone bodies appeared in the urine. To raise the ketogenic factor, butyric acid was added to the diet and the anti-ketogenic factor (glycerol) diminished. No other effects were noted. With amounts of fatty acid greater than 2 g. mol. very small amounts of acetone bodies were found in the urine.

FRANCES KRASNOW

Soy-bean feeding and blood calcium. A. A. HORVATH. *Japan Med. World* 8, 1-5(1928).—Soy beans, contrary to current belief, are not low in Ca. The av. figures for Ca in the blood serum of normal rabbits were found to be 15.8 mg. per cc. Yellow soy beans contain an excess of fat with respect to the "calcium-fat" ratio required for optimal absorption and metabolism of Ca salts. Raw soaked soy beans can restore a lowered blood Ca caused by bleeding in rabbits.

N. KOPELOFF

Development of paralysis in the suckling young of mothers deprived of vitamin E. HERBERT M. EVANS AND GEORGE O. BURR. *J. Biol. Chem.* 76, 273-97(1928).—A high proportion of the suckling young of mothers receiving a simplified diet (casein, corn starch, lard, salts and vitamins A and B) adequate except for vitamin E develop a day or two before weaning a paralysis characterized by difficulty in regaining their limbs when placed on their backs. The onset is very sudden and may be well advanced in young which are of normal body wt. and still actively growing. About 35% of the affected animals die, about 17% recover perfectly and 48% continue to exhibit paralysis of some limb and body muscle group throughout life. Besides the inability to right themselves most of the animals exhibit a clearly marked spastic condition of the lower limbs and a flexor spasm of the toes somewhat resembling the claw hand. The paralysis is always partial, never complete. Surviving animals in time exhibit every evidence of normality and health except for the paralysis and may give birth to normal litters which at no time develop paralysis, if the mothers receive a sufficient supply of vitamin E. Spontaneous arrest of this deficiency disease is in marked contrast to the picture shown by animals suffering from vitamin B or C deficiencies. All attempts to cure the disease after its manifestation for several days have resulted in failure. That the condition is due entirely to lack of vitamin E is shown by the re-

markable correspondence which has been found in the sterility-curing and paralysis-preventing properties (or lack of these properties) in fractions of wheat germ oil, which could be said to possess or lack vitamin E in accordance with the presence or absence of power to prevent the resorption of embryos in gravid females previously proved to be sterile from vitamin-E deficiency.

A. P. LOTHROP

The fundamental food requirements for the growth of the rat. III. Yeast and yeast fractions as a supplement to synthetic rations. CORNELIA KENNEDY AND LEROY S. PALMER. *J. Biol. Chem.* **76**, 591-606(1928); cf. *C. A.* **22**, 797.—A highly purified ration presumably complete except for vitamin B is made adequate for the growth of rats when each animal receives daily a 0.6 g. pellet of dry starch-free yeast. The same basal ration is not adequate for growth when the source of vitamin B is the Osborne and Wakeman concentrate from pure dry yeast, the residue left from the prepn. of this concentrate, a yeast concentrate supplied by the Harris Labs., or dry yeast which has been autoclaved at 15 lbs. for 2½ hrs. A highly purified diet contg. an adequate amt. of vitamin B in the form of an ext. of wheat embryo which was found to be non-growth-promoting was made adequate by daily doses of 0.2 g. of dry starch-free yeast or of the same yeast after thorough extn. with hot 85-90% alc., or the residue left from the same yeast after removal of the Osborne and Wakeman vitamin fractions, or yeast that had been autoclaved to destroy its recognized growth-promoting and antineuritic properties. Neither the Osborne and Wakeman vitamin B Fraction II prepd. from dry yeast, nor the Harris Lab. prepn. from brewers' yeast, nor an alc. ext. of dried yeast carries adequate amts. of the same growth factor which was found to be present in alc.-extd. yeast, in autoclaved yeast, and in the residue left after removing the Osborne and Wakeman concentrate. This growth factor is extd. from yeast to only a slight extent by alc. or acidulated H₂O and is stable to autoclaving at 15 lbs. for 2½ hrs. It is not bios. The conclusion is reached, therefore, "that yeast contains some factor other than vitamin B or the antineuritic factor, and that this factor is necessary for satisfactory growth. The factor is in some respects similar to but not identical with the yeast growth factor of Smith and Hendrick (*C. A.* **20**, 1433) and the P-P factor of Goldberger and associates (*C. A.* **20**, 1431)." **IV. Coprophagy as a factor in the nutrition of the rat.** *Ibid* 607-22.—Decline in wt. in exptl. rats fed a highly purified presumably complete ration was stopped and fair gains in wt. were made by allowing the rats to consume their feces. The feces of the rats on a mixed diet were no more potent in stimulating growth than the feces of rats on a highly purified synthetic diet. The factor present in feces, which is growth-stimulating, is sol. in alc., and insol. in Et₂O, and is injured by prolonged heating. The employment in the basal diet of com. casein purified merely by leaching with acid H₂O overcomes the necessity of coprophagy made evident by the use of highly purified casein. The conclusion is reached that the feces act beneficially because of some unrecognized dietary factor which they carry.

A. P. LOTHROP

Rickets in dogs. Metabolism of calcium and phosphorus. A. T. SHOHL AND HELEN B. BENNETT. *J. Biol. Chem.* **76**, 633-42(1928); cf. *C. A.* **21**, 3387.—Puppies were fed a diet consisting of 10 g. of dried skim milk powder, 40 g. of Quick Quaker Oats cooked 5 min., 5 cc. of linseed oil and 1 g. of NaCl per kg. of body wt. and in addn. 60 mg. of Harris yeast vitamin concentrate per kg. and 5 cc. of orange juice daily. This diet was relatively rich in Ca and poor in P and had a Ca : P ratio of 0.66. A control received cod-liver oil in place of the linseed oil. Development of severe rickets in puppies is associated not with a negative balance but with a diminished positive balance of both Ca and P. Although the P in the food exceeded the Ca, the P balance was smaller or even negative so that here the element of which the least is consumed was not the limiting factor. The limiting factor was vitamin D which stabilizes the metabolism of Ca and P. Undue emphasis is usually laid upon Ca as compared with P in ossification, a process universally referred to as calcification; the more important defect in rickets lies in the inadequate retention of P. Quant. measurement of the defect in Ca and P metabolism is preferable to an analysis of the bones for the latter may show calcification at the expense of the rest of the body while the former measures this defect in the whole organism.

A. P. LOTHROP

Dietary requirements for fertility and lactation. XIII. Storage of fat-soluble vitamins for lactation, with some observations on the cod-liver oil requirements of nursing young. BARNETT SURE. *J. Biol. Chem.* **76**, 659-71(1928); *C. A.* **21**, 3936.—A sufficient storage of fat-sol. vitamins for normal lactation occurs when females with their litters are transferred from a stock cereal diet contg. 1% cod-liver oil (supplemented by a liberal daily supply of fresh milk) to a purified synthetic fat-sol. vitamin-deficient diet. There is a depletion of the fat-sol. vitamin reserve in the 2nd generation if a similar transfer is made from a stock ¾ whole wheat and ¼ whole milk powder diet

contg. 9% of milk fat. No evidence was obtained of the existence of a specific vitamin essential for lactation other than vitamins A and D and whether or not vitamin E should be divided into 2 specific factors, one essential for fertility and one for lactation, still awaits proof. By drawing out a medicine dropper to a very fine capillary it has been found possible to administer a small drop of cod-liver oil to baby rats at birth; in this way it has been found that a min. curative dose (out of about 30 litters studied) of 12 mg. of cod-liver oil on the 4th day sufficed for the entire lactation period. **XIV. A quantitative biological method for the study of vitamin B requirements for lactation.** *Ibid* 673-83.—Yeasts from various sources vary considerably in their biol. value as a source of vitamin B for lactation. A concd. prepn. obtained by releasing vitamin B adsorbed from yeast on fuller's earth with NaOH has 3 times the potency for normal lactation as Harris yeast. It is necessary to administer as much as 1500 mg. of Harris yeast daily to each nursing female to avoid infant mortality. The animals were kept in cages with raised screens and the yeast was administered daily separately from the ration as soon as the young reached a maintenance curve showing depletion of the vitamin reserves of the mother. **XV. The inefficiency of the lactating mother (*Mus norvegicus albinus*) in secreting vitamin B in the milk, and the relation of this phenomenon to infant mortality (detailed report).** *Ibid* 865-70.—The lactating mother dissipates at least 60%, if not more, of the vitamin B dosage daily apportioned to it in the metabolism of transfer to the milk so that the large requirements of vitamin B for lactation can now be explained as due to the inability of the nursing mother to secrete the vitamin anywhere near quant. in the milk. The growth of nursing young can be greatly accelerated by administering liberal quantities (in H₂O soln. from a medicine dropper) of potent concd. prepn. of vitamin B. It is suggested that a great proportion of infant mortality during the 1st year of life may be due to vitamin-B deficiencies as the av. human nursing mother on the av. American diet is probably on the border line with respect to this vitamin. This is a problem that needs extensive study by pediatricians.

A. P. LOTHROP

The relation of diet to the quality of fat produced in the animal body. W. E. ANDERSON AND L. B. MENDEL. *J. Biol. Chem.* **76**, 729-47(1928).—Male albino rats were fed a diet furnishing 15% of its cal. in the form of protein and supplied by dried skim milk in amts. to furnish 40% of the total cal. intake. The remaining 60% of the energy intake was variously supplied as carbohydrate or fat. The body fat resembled the food fat when soy-bean oil, cottonseed oil or peanut oil was ingested. With butter fat or coconut oil the body fat contained considerably more unsatd. fatty acids than the ingested fat. Substitution of equicaloric amts. of carbohydrates, corn starch, dextrin and dextrin-maltose for fat produced hard body fats with I values of about 60. When proteins such as casein and cottonseed globulin were fed in high concn. amounting to 96% of the total cals., a body fat was produced with an I value approx. the same as that of rats receiving the diets rich in carbohydrates. A soft body fat can be altered to a harder fat by changing to a ration rich in carbohydrate but such alteration occurs only very slowly. If the fat reserves are depleted through brief fasting periods prior to the change in dietary, the change in the type of fat takes place quite rapidly. Observations made on animals receiving a uniform mixt. of whole wheat and whole milk indicate that the body fat tends to become harder as the body wt. increases. The samples of fat used for analysis were obtained by rendering the carcass remaining after removal of the stomach and intestines, which thus excluded any food fat. A. P. L.

The influence of protein, blood, liver, fat, iron and potassium in the diet upon the rate of blood regeneration after hemorrhage in the rat and dog. C. M. McCAY. *Am. J. Physiol.* **84**, 16-35(1928).—White rats and dogs, fed "synthetic" diets with and without various supplements, were repeatedly made anemic by removal of blood by cardiac puncture. The rate of hemoglobin regeneration was calcd. from the total hemoglobin of the blood removed. Dried liver added to the synthetic ration promoted very rapid blood regeneration; ferric citrate was fairly effective in the rat (not tried in the dog); blood was much less effective, particularly in the dog. Blood regeneration was independent of the protein and fat of the diet, provided the diet was adequate in other respects and at least the maintenance supply of protein was furnished. K may exert a marked accelerating influence on hemoglobin formation particularly when the diet is very low in Fe. J. F. LYMAN

The influence of yeast on the alimentary rate. D. W. THORUP AND A. J. CARLSON. *Am. J. Physiol.* **85**, 90-7(1928).—Yeast added to the diets of white rats in amts. up to 25% had no effect on the rate at which small glass beads passed through the digestive tract but there was some increase in the moisture content of the stools during yeast ingestion. In human beings yeast ingestion produced no const. laxative effect. J. F. L.

The index of refraction of blood serum in beriberi. A. BASILICO. *Boll. soc. ital. biol. sper.* 2, 805(1927).—There was an increase in the index of refraction of the blood serum of pigeons kept on a beriberi producing diet. PETER MASUCCI

Histological alterations of the myocardium in experimental avitaminosis scurvy. A. BASILICO. *Boll. soc. ital. biol. sper.* 2, 806-7(1927).—Definite histological changes were noted in the myocardium of guinea pigs affected with exptl. scurvy. Details of the histological picture are given. PETER MASUCCI

The gastric digestion of albumin under the action of x-rays. M. LATTUCA. *Boll. soc. ital. biol. sper.* 2, 820-2(1927).—Gastric fistula was produced in dogs 15-18 kg. wt. Ten days after operation 5 g. coagulated albumin was introduced into the stomach. Samples of gastric contents were tested before and after irradiation. With small doses of x-rays there was an increase in the quantity of albumin digested; with longer irradiation there was a diminution. PETER MASUCCI

Metabolic changes in white rats fed with egg albumin. S. BAGLIONI. *Boll. soc. ital. biol. sper.* 2, 978-82(1927).—White rats were fed exclusively egg albumin in unrestricted amts. and also given daily 0.2 g. butter, 9 drops lemon juice and 0.2 g. yeast. The wt. was taken before and after; the feces and urine were collected and weighed; N, urea and NH_3 detd. The animals survived weeks and months although they showed noticeable disturbances consisting especially of hepatic and renal hyperfunction. P. M.

A comparative study of factor C in bergamot juice and lemon juice. R. DE MARCO. *Boll. soc. ital. biol. sper.* 2, 1023-6(1927).—The antiscorbutic factor C is present in bergamot juice. Compared with lemon juice, its preventive and curative action against scurvy in exptl. animals is not as great. PETER MASUCCI

Antiberiberi vitamin content of sweet potato leaves and shoots. F. O. SANTOS AND E. G. COLLADO. *Philippine Agr.* 16, 513-20(1928).—Expts. with cockerels indicate that sweet potato leaves and shoots are a good source of antineuritic vitamin as well as the growth-promoting H_2O -sol. factor. Twelve references are given. A. I. M.

The influence of active iron on body weight and oxygen utilization of organisms. WALTER ARNOLDI. *Folia Hematol.* 35, 21-9(1927).—Rats were given 0.1 g. of Fe_2O_4 per day for 5 weeks. After 9 to 12 days there was a marked increase in O utilization, but this effect disappeared after 2 or 3 days. The respiratory quotient remained unchanged. In 2 clinical cases the administration of non-magnetic active ferric carbonate increased O utilization and body wt. Active Fe seems to increase oxidative processes. JOHN T. MYERS

Hunting the vitamin. W. H. EDDY. *Am. J. Pub. Health* 18, 313(1928).—A lecture describing investigations on the chem. nature of vitamin B. The question arises and is not solved as to whether the "torulin" fraction described by Peters, the fuller's earth fraction described by Williams and a cryst. antineuritic substance reported by Jansen and Donath have the same biol. properties. It is certain that vitamin B consists of an antineuritic factor and an anti pellagric factor both of which are essential for growth; therefore foods must be described relative to their content of each sep. factor. Expts. indicate the banana and also spinach to be more active in anti pellagric than in the antineuritic factor. Such differentiation must be studied for other foods. α and β Bioses extd. from yeast are described as to method of prepn. and properties. N. M. NAYLOR

Vitamin D and its relation to the irradiation of foodstuffs. I. M. HEILBRON. *Brit. J. Actinotherapy* 2, 210-5(1928).—A review. Studies on irradiation of sterols and of foods contg. these substances, with subsequent spectroscopic examn., have led to the conclusions that selective absorption is shown in cholesterol derivs. of certain chem. structure; that irradiated ergosterol shows absorption bands of the same nature as those of vitamin D; and that further irradiation shows the instability of vitamin D. Reference is made to the irradiation of vegetable oils, margarines and other foodstuffs. N. M. NAYLOR

Activation of cholesterol at liquid oxygen temperature. C. E. BILLS AND FERDINAND BRICKWEDDE. *Nature* 121, 452(1928).—Cholesterol (m. 149° and contg. 1.2/1000 ergosterol) was irradiated at room temp. and a second portion, at liquid-oxygen temp. (-183°) for 105 min. Both samples of cholesterol induced healing of rickets at 0.1% of a diet, but only that irradiated at room temp. induced healing at 0.01% of diet. N. M. NAYLOR

Cholesterol and vitamin D. I. M. HEILBRON, R. A. MORTON AND W. A. SEXTON. *Nature* 121, 452-3(1928).—Absorption bands at 304 to 315 μ , thought to be associated with activation of purified cholesterol, may be due to traces of cholesterolene. N. M. N.

Biological test of the antirachitic value of lipoids carried out on young rats by

means of a new simple rachitogenic diet composed of definite substances. (MRS.) L. RANDOIN AND R. LÉCOQ. *Ann. fals.* 21, 68-74(1928).—After a discussion of the defects of various diets proposed for the biological detn. of vitamin A, the following is proposed: meat peptone 17, powdered dried brewers' yeast 3, butter fat 5, olive oil 5, sucrose 65, salt mixt. Z-84 4, Ca lactate 1. It contains P 0.134, Ca 0.466, Ca: P 3.5. Salt mixt Z-84 contains: KCl 85, anhyd. Na_2CO_3 85, MgCO_3 28.6, Ca lactate 200, ferric citrate 10, KI 0.020, MnSO_4 0.078, NaF 0.240, $\text{KAl}(\text{SO}_4)_2$ 0.024. The advantages of this diet are discussed, and the method of making the tests is described. A. P.-C.

The antiscorbutic vitamin value of some Peking fruits. KANG-LIANG HSÜ. (*Chinese J. Physiol.* 2, 41-4(1928).—Feeding tests with guinea pigs proved that "red fruit," *Crataegus pinnatifida*, contains vitamin C and is about $\frac{1}{3}$ as potent as orange juice. "Haitang," *Pirus spectabilis* and the persimmon, *Diodpyros kaki*, are poor in vitamin C. Subjecting the "red fruit" to sirup at a temp. of 110° to 120° for a few min. and allowing the sirup to dry on its surface did not decrease its vitamin content. L. W. R.

Influence of water diet on urinary excretion of ketonic substances by the dog. F. MAIGNON AND E. KINTHAKIS. *Compt. rend.* 186, 463-5(1928); cf. following abstr. — Ten dogs were fed a bread-soup ration for 2 to 8 days. The same dogs were then kept on a water diet from 8 to 16 days. During the first period the av. daily excretion of acetone and acetoacetic acid was 0.001 g. and that of β -hydroxybutyric acid was 0.077 g. In the second period while on the water diet the corresponding figures were 0.005 and 0.023. Thus a water diet increases the excretion of acetone and acetoacetic acid but causes a pronounced decrease in the excretion of β -hydroxybutyric acid. L. W. R.

Variations of blood p_{H} and alkaline reserve in the course of a water diet in the dog. F. MAIGNON AND E. KINTHAKIS. *Compt. rend.* 186, 600-2(1928); cf. preceding abstr. — In man the acidosis of fasting is almost always compensated. In the dog this is rarely the case as the p_{H} is lowered while the alk. reserve remains about const. On a water diet prolonged beyond about 20 days, inverse oscillations are observed between the p_{H} and the alk. reserve, as well as a raising to the normal of these 2 factors during the final cachexia in case life is sufficiently prolonged. L. W. RIGGS

Quantitative law of the minimum consumption of nitrogen in homeotherms, intra-specific validity. (MME) HÉLÈNE SORG-MATTER. *Compt. rend.* 186, 534-5(1928); cf. C. A. 21, 1835.—Expts. with rats and cocks in which the N consumption per kg. hr. (A) and cal. production per kg. hr. (B) gave a ratio (A)/(B) which, multiplied by 1000, ranged from 2.03 to 2.5 in 9 tests. The law of min. consumption is restated as follows: At the interior of the same species, the consumption of N varies inversely with the size of the individual and is directly proportional to the production of energy. L. W. RIGGS

Activation of fats and lipoids by ultra-violet rays. SIM KI AY. *Compt. rend. soc. biol.* 98, 276 9(1928).—Treatment of rickets in infants by irradiated ergosterol resulted within a month in an increase of 60, 94 and 96% in the serum content of inorg phosphates in 3 cases and an increase of 43 and 60% in the serum Ca in 2 of these cases. Under this treatment the appearance of "chalk lines" was shown by radiograph within 2 weeks. L. W. RIGGS

The chemical nature of vitamins. A. VERDA. *Pharm. Acta Helv.* 2, 168-74, 175-9(1927).—A survey of recent work on vitamins and discussion of the use of Bezsonov's colorimetric reagent (C. A. 17, 3684; 20, 3477) for the detection of vitamin C and the nature of the reaction involved. — S. WALDBOTT

MARCOVICI, EUGENE E.: **Handbook on Diet.** Philadelphia: Davis. 323 pp. \$3.50.

F—PHYSIOLOGY

E. K. MARSHALL, JR.

The female sexual hormone, menformone. IX. Further experiments on its action on the mammary glands; menformone as the hormone causing their normal development. E. LAQUEUR, F. BORCHARDT, E. DINGEMANSE AND S. E. DE JONGH. *Deut. med. Wochschr.* 64, 265-7(1928); cf. C. A. 21, 3059, 3227.—Injection of menformone into castrated or normal male guinea pigs or dogs produced a hyperplasia of the secretory portion of the mammary glands and hypertrophy of the nipples. In castrated undeveloped females, milk production could be induced. A. G.

The metabolism of amino acids. J. M. LUCK. *J. Biol. Chem.* 77, 13-26(1928).—Amino acids administered in equimol. quantities to rats, by mouth, resulted in varying increases in the amino-acid content of the liver, but except in the case of glycine, no change was observed in the content of muscle. Glycine and alanine increased the amino-acid content of the systemic blood to the same degree but the former produced

a great change in the amino N content of the liver, while the latter produced no significant change in this organ. In most cases no appreciable changes were observed in the NH_3 content of liver or muscle.

The specific dynamic action and nitrogen elimination following intravenous administration of various amino acids. C. M. WILHELMJ AND J. L. BOLLMAN. *J. Biol. Chem.* 77, 127-49(1928).—The intravenous injection of alanine, glycocoll or phenylalanine resulted in an immediate rise in heat production and an elevation of the $R. Q.$ The specific dynamic actions of these 3 substances are in the ratio of 1:1.3:2 expressed as calories of extra heat produced per mol. of the amino acid deaminized. When racemic forms were injected, more than 50% of the N appeared in the urine as "extra" urea N, indicating the deamination of all of one component plus a varying fraction of the optical antipode.

A note on the influence of the circulation on the utilization of carbohydrates. R. PEMBERTON AND F. A. CAJORI. *J. Clin. Investigation* 5, 503-9(1928).—An answer to Lennox and Bellinger's criticism (*C. A.* 21, 3390) of the author's work.

Influence of nucleic acids of various origin upon the growth and longevity of the white mouse. T. BRAILSFORD ROBERTSON. *Australian J. Exptl. Biol. Med. Sci.* 5, 47-67(1928).—Thymus nuclei in daily doses corresponding to 0.5 g. of fresh thymus tissue, yeast nucleic acid in daily doses of 25 mg. and spleen nucleic acid in daily doses of 15 mg., on the whole tend to promote post adolescent growth and to enhance longevity. These 2 effects, however, appear to be mutually opposed so that when the growth effect predominates the effect on longevity is at a min. In every instance the administration of nucleic acid increased the variability of the animals. **Influence of thyroid alone and of thyroid administered together with nucleic acids upon the growth and longevity of the white mouse.** *Ibid* 69-83.—Desiccated thyroid alone administered to white mice in daily doses corresponding to 1.9 mg. of fresh thyroid accelerates the early growth of the animals without affecting the max. wt. which they ultimately attain and shortens the life duration by 17%. A daily dose corresponding to 1 in 10000 of the body wt. of desiccated thyroid in conjunction with 15 mg. of spleen nucleic acid was very injurious to adult mice; they died much younger than control animals. Desiccated thymus in daily doses equiv. to 0.5 g. of fresh tissue did not affect the growth of mice, but neutralized the effect of thyroid tissue on longevity. Spleen nucleic acid in daily doses of 15 mg. slightly diminished the effect of the thyroid tissue in abbreviating duration of life but apparently did not modify the effect of thyroid upon growth. The effects of thyroid and nucleic acids upon life duration, when administered together, are additive and are within 5% of the algebraic mean of the life durations of the animals in receipt of these substances separately. The variability of animals is not affected by thyroid.

Action of liver powder on the water content of blood, muscles and certain organs. C. I. PARHON, V. MARZA AND M. KAHANE. *Compt. rend. soc. biol.* 98, 391-3(1928); cf. *C. A.* 22, 98, 636, 820.—The blood, muscles, brain, thyroid, suprarenals, testicles, pancreas, liver and kidneys of guinea pigs which had been fed 0.025 g. of powdered liver per day contained less water than the corresponding organs of control animals, but the differences were slight. The thymus, on the contrary, contained more water.

Glucemia and phosphatemia consecutive with intravenous injection of defibrinated blood. I. I. NITZESCU AND GR. BENETATO. *Compt. rend. soc. biol.* 98, 410-2(1928).—The injection in rabbits of 4 cc. of defibrinated blood from the same animal or animal of the same species was followed in 10 min. by a moderate hyperglucemia which increased for 40 to 60 min., then returned gradually to the normal figure. Defibrinated venous blood injected in doses as large as 5 cc. was followed by a moderate shock. Defibrinated arterial blood was much more toxic, causing a more acute hyperglucemia, and frequently the injected rabbits die within a few min. Injections of defibrinated blood also caused a progressive increase in the content of mineral P in the blood, which increase may reach 35% in 60 to 90 min.

Hyperglucemia action of the blood of the depancreated dog. L. KÉPINOV AND S. PETIT-DUTALLIS. *Compt. rend. soc. biol.* 98, 425-7(1928).—Transfusion of blood from a depancreated to a normal dog was followed by an immediate large increase in the blood sugar of the receiving dog, which generally decreased during the next 3 to 4 hrs. to nearly the normal figure, then usually increased moderately during the 4th to 6th hrs.

Inhibition of ovulation by the yellow body. PIERRE GLEY. *Compt. rend. soc. biol.* 98, 504-5(1928).—Expts. with rats proved that under the influence of the hormone of the yellow body the vaginal phenomenon of estrus (the exterior sign of ovulation)

disappeared. Thus the hormone of the yellow body inhibits the cyclic production of folliculin. L. W. RIGGS

Gaseous metabolism of large wild birds under aviary life. F. G. BENEDICT AND E. L. FOX. *Proc. Am. Phil. Soc.* **66**, 511-34(1927).—At the N. Y. Zool. Park a study was made of 24 full-grown adult birds, ranging from a 17 kg. cassowary to a 0.6 kg. Am. bittern. The measurements were made in a modern respiration calorimeter during muscular repose at 28 or more hrs. after feeding, and at a controlled environmental temp. of 19°. The rectal temp. of the birds was about 40° and the R. Q. was between 0.72 and 0.74. The 24 hr. heat production ranged from 576 cal. with the cassowary to 56 cal. with the Am. bittern. With few exceptions the heat production per kg. of body wt. was inversely proportional to the wt. of the bird. The heat production per sq. m. of body surface per 24 hrs. (computed from the formula $10 w^{2/3}$) ranged from 526 cal. with the Chilian eagle to 1267 cal. with the black-backed pelican. The av. for all of the birds was 874 cal. No explanation was found for these wide differences other than these birds represent 2 entirely different heat-producing organisms in which surface area is without the slightest significance. L. W. RIGGS

KNIPPING, H. W., AND RONA, PETER: *Praktikum der physiologischen Chemie. Teil 3. Stoffwechsel und Energiewechsel.* Berlin: Julius Springer. 268 pp. M. 15. Cf. *C. A.* **21**, 110

G—PATHOLOGY

H. GIDEON WELLS

Anaphylactic shock produced by a soluble specific substance largely carbohydrate in nature. J. TOMCSIK. *Proc. Soc. Exptl. Biol. Med.* **24**, 812-3(1927).—In passively sensitized guinea pigs anaphylactic shock is produced by very high dilns. of a substance that is largely carbohydrate in nature, isolated from *B. lactis aerogenes*. The presence of a trace of N, presumably an impurity, prevents one from concluding that shock may be produced by carbohydrate alone. C. V. B.

Optimal proportions of hapten and immune serum in the precipitation and complement-fixation reactions. J. TOMCSIK. *Proc. Soc. Exptl. Biol. Med.* **24**, 813-6(1927).—Approx. the same ratio of antiserum to antigen, 1:2400, in the indicator tube holds for the precipitin and complement-fixation tests in various dilns. used. A carbohydrate gum obtained from a pathogenic yeast was the hapten. C. V. B.

Blood of animals in hematoporphyrin shock. H. SMETANA. *Proc. Soc. Exptl. Biol. Med.* **24**, 821-2(1927).—Expts. designed to throw light on the state of the blood of animals sensitized by hematoporphyrin and exposed to light were carried out on cats, guinea pigs, rats and mice. Blood pressure, pulse and respiration rates, numbers of red and white blood cells, amts of blood sugar, total non-protein N and creatinine, O₂ content, CO₂-combining power and toxicity of the blood, and effect of light on sensitized blood *in vitro* were studied. C. V. B.

Blood sugar changes in avian polyneuritis. H. E. REDENBAUGH. *Proc. Soc. Exptl. Biol. Med.* **24**, 842-3(1927).—Polyneuritic pigeons showed hyperglucemia; their blood sugar was almost double that of normal pigeons. C. V. B.

Simple experimental anemia and liver extracts. G. H. WHIPPLE AND F. S. ROBSCHT-ROBBINS. *Proc. Soc. Exptl. Biol. Med.* **24**, 860-4(1927).—An aq. ext., an alc. ext. and a liver residue were prepd from freshly ground beef liver as described. All 3 of these fractions contained substances favorable for hemoglobin and red cell regeneration in simple anemia in dogs. C. V. B.

The influence of ultra-violet irradiation of menotoxin and pernicious anemia toxin. D. I. MACHT. *Proc. Soc. Exptl. Biol. Med.* **24**, 966-8(1927); cf. *C. A.* **22**, 265.—Exposure to ultra-violet rays greatly decreased the toxicity for plants of blood serum from pernicious anemia cases, while the toxicity of specimens of menstrual serum was not detoxified by the ultra-violet rays. These findings support the view that menotoxin is chemically related to oxycholesterol. C. V. B.

The seasonal variation of the antirachitic effect of sunshine and its effect on resistance to disease. ALAN BROWN AND F. F. TISDALL. *Can. Med. Assoc. J.* **17**, 1425-9(1927).—The sun's rays in Dec., Jan. and Feb. in the latitude of Toronto produce a slight but definite antirachitic effect on rats fed a rachitogenic diet. A sharp increase in the antirachitic effect occurs early in March, while the effect in April and May is approx. 8 times that in Dec.-Jan. The antirachitic effect of skyshine (reflected rays from sky and clouds) is $1/2$ to $2/3$ that of sunshine. Sunshine which has passed through Corning glass, Vita-glass and Vioryn has from 25 to 50% the antirachitic effect obtained without glass. Sunshine definitely increases the resistance of albino rats to infection

with a sp. organism. It increases the acidity of the intestinal tract of rachitic rats. Reddening of the skin by ultra-violet rays is not a suitable unit for measurement of ultra-violet therapy, but should be considered simply as an accompanying phenomenon which may or may not be a measurement of the rays.

Change in fat content of various organs after splenectomy. L. CANNAVÓ AND F. ARAGONA. *Boll. soc. ital. biol. sper.* 2, 306-7 (1927).—A no. of white rats were operated by splenectomy and after 1 month the fat contents in the liver, kidneys and brains detd. The increases were 0.3 g., 0.4 g., 0.02 g., resp., over controls, which is no more than to be expected in normal growth. It is therefore evident that the functions of the spleen, as well as the other organs, are not related as far as fat metabolism is concerned.

The chemical composition of the active principle of tuberculin. IX. The fractional heat coagulation of the protein of tuberculin. FLORENCE B. SEIBERT. *Am. Rev. Tuberculosis* 17, 394-401 (1928); cf. *C. A.* 21, 767. —A protein-free fraction giving the sp. tuberculin reaction could not be sepd. from the whole protein of tuberculin by fractional heat coagulation. Fractions coagulated at 50°, 70°, 80-90°, 97-99° (boiling) 120° (autoclaving), and even the final non-coagulable fraction, which also definitely contained some whole protein, all gave equally marked tuberculin skin reactions, indicating that the sp. biol. activity is not due to any particular fraction but rather accompanies all fractions where the tuberculin protein is present. All fractions may, therefore, be derivs. of the same protein in varying stages of chem. change. These variations in coagulability are analogous to variations in soly. of different fractions of the same protein. The non-coagulable fraction has more primary toxicity than the coagulable fractions, as indicated by the lethal test, for normal as well as for tuberculous animals, although it gives no more marked sp. skin reaction in tuberculous animals. In considering the tuberculin reaction, therefore, a certain primary toxicity of tuberculin must be recognized in additions to its well-known capacity to elicit the sp. tuberculin reaction in infected animals. X. The isolation in crystalline form and identification of the active principle of tuberculin. *Ibid.* 402-21.—The specifically active substance in tuberculin, responsible for the production of the tuberculin skin reaction, is a water-sol. coagulable protein of the nature of an albumin, staining blue with methylene blue, and contg. the ordinary amino groups, but no carbohydrate, and crystallizable by the Hopkins method at an optimum p_H of 4.9. Even after 14 crystns. the protein gave max. tuberculin skin reactions and caused a typical tuberculin atrophy in the testicle of a tuberculous guinea pig. A test made after ten crystns. showed that less than half as much of the purified protein was required to produce an equally strong reaction as of the original fraction. The unit mol. of this crystd. protein is, however, very unstable and easily becomes denatured. Such denaturation is recognized, first by the facts that the protein will no longer crystallize and that its soly. is changed, and second, by a loss in biol. activity. This instability explains the small yield of crystals obtained and also the great losses in activity during the isolation of the protein.

A note on the cholesterol content of sputum. RUBY G. KELLY AND MAX PINNER. *Am. Rev. Tuberculosis* 17, 430-3 (1928).—The amt. of sputum cholesterol has a rather definite, though not const., relation to the type of lesions. Extensiveness, acuteness and tissue destruction make for larger amts. of cholesterol. If the fact that a qual. diagnosis of tuberculous pulmonary lesions is difficult and uncertain to a degree is taken into account, and that it involves a considerable factor of subjective judgment, the parallelism referred to above must be considered as a fairly close one. It is probably of approx. the same order as that of the so-called "activity tests" (sedimentation reaction, Daranyi and Matéfy reactions, etc.), and of differential blood counts, for all of which rather exaggerated claims have been made. A critical application shows for all these procedures (including the detn. of the sputum cholesterol) that, at the best, they can confirm a well-balanced clinical judgment, but that they are hardly ever likely to secure information beyond that gained by clinical observation, physical exams., x-ray studies and bacteriol. findings.

Relation between concentration and quantity of hemagglutinin to be absorbed by red blood corpuscles. OSAMU ISHIKAWA. *Sei-i-kwai Med. J.* 46, No. 9, 1-3 (1927).—Expts. were carried out with washed red blood cells of goat and sera from rabbits immunized to these cells. It is concluded that hemagglutinin is absorbed in a quant. relationship, the red blood cells absorbing about 4 units.

The sulfuric acid reaction in protein-free serum of uremia. KARL MACROLD. *Wiener klin. Wochschr.* 41, 447-9 (1928).—All cases of uremia gave a positive reaction.

Cholesterol in the cerebrospinal fluid of cancer patients. A. H. ROSSO. *Bel.*

inst. med exp 3, 309 19(1927); *Physiol. Abstracts* 12, 417; *C A* 21, 2734.—Cholesterol is present in cerebrospinal fluid of normal individuals in quantities of less than 0.0025 g. per thousand; in patients with cancer it is present in from 0.10 g. to 0.21 per thousand. H. G.

The glucose tolerance test. W. B. LEWIS. *J. Lab. Clin. Med.* 12, 380-7(1927); *Physiol. Abstracts* 12, 161.—A very definite renal threshold exists for glucose. The relation between the normal sugar in the urine and the blood sugar is discussed. H. G.

Study of the pigment in Addison's disease. C. L. SPOHR AND R. A. MOORE. *J. Lab. Clin. Med.* 12, 438-41(1927); *Physiol. Abstracts* 12, 390.—The pigment was extd. from the lymph glands in a case of Addison's disease, isolated, purified and analyzed. S. and M. regard the pigment as a melanin. H. G.

The Van den Bergh reaction for serum bilirubin with notes on interpretation and technic. W. H. HALL. *J. Lab. Clin. Med.* 12, 529-35(1927); *Physiol. Abstracts* 12, 371.—Serum bilirubin may be studied qual. (direct reaction) and quant. (indirect reaction), the presence of bile salts probably explains the difference of reaction in obstructive and hemolytic jaundice. Details are given of certain variations in technique. H. G.

Blood sugar in infectious diseases. F. ANDERSON AND A. SCHMIDT. *Klin. Wochschr.* 6, 213-4(1927); *Physiol. Abstracts* 12, 231.—The fasting blood sugar was detd. in a series of cases of the commoner infectious diseases. In general, fever causes the blood sugar to rise, but the fever and hyperglycemia do not always run parallel. There was no rise in blood sugar in measles. The greatest hyperglycemia was encountered in typhoid fever. In dysentery there was hyperglycemia without fever. H. G.

Similarity between carcinoma cells and those of exudates. A. BARKER. *Klin. Wochschr.* 6, 252-4(1927); *Physiol. Abstracts* 12, 196.—The exudate cells were obtained by injecting 300 cc. normal saline into the peritoneal cavity of rabbits. The cells were tested by Warburg's method to det. their capacity to produce lactic acid aerobically and anaerobically. The ratio, extra CO_2 consumed, was 13:3. Warburg's figures for human carcinoma cells varied between 1:5 and 11:5. The exudate cells have thus metabolic properties similar to carcinoma cells. H. G.

Diabetics refractory to insulin. H. HAUSSLER AND F. HODER. *Klin. Wochschr.* 6, 511-3(1927); *Physiol. Abstracts* 12, 378-9.—The authors have investigated the "fixation" of glucose by blood corpuscles from normal, diabetic and insulin-refractory diabetic cases when a known amt. of glucose is added to the blood. It is shown that the blood corpuscles of insulin refractory diabetics do not take up glucose under the influence of insulin to the same extent as those from normal persons or ordinary diabetics. The inhibitory substance is removed by washing the corpuscles several times with normal saline. Since the behavior of the body cells may be similar to that of the blood corpuscles, the authors suggest that their expts. support the view that insulin refractory diabetes is not of pancreatic origin. H. G.

Cause of delayed coagulation in diseases of the liver. E. HARTMANN. *Klin. Wochschr.* 6, 1322-4(1927); *Physiol. Abstracts* 12, 186.—The conversion of proserozyme to serozyme in blood from cases of chronic icterus is slower than normal. This is due to the presence of substances in the plasma which inhibit this change. These substances are absorbed by $\text{Ca}_3(\text{PO}_4)_2$. It is presumed that these inhibitory substances are produced in excessive amt. as a result of the abnormal condition of the liver parenchyma, and that they are the cause of delayed coagulation in chronic icterus. H. G.

Basal metabolism in acromegaly. M. R. CASTEX AND M. SCHTEINGART. *Rev. soc. méd. int.* 3, 66-72(1927); *Physiol. Abstracts* 12, 451.—The basal metabolism of 7 cases of acromegaly was studied. It was normal in 4, increased in 3 cases, but after operations for decompression it became normal in the latter. H. G.

The circulating blood volume in diabetic acidosis. H. C. CHANG, G. A. HARROP, JR. AND B. M. SCHAUB. *J. Clin. Investigation* 5, 407-11(1928). ARTHUR GROLLMAN

Hydrogen-ion concentration of the feces of rachitic children. THIRZA REIDMAN. *Biochem. J.* 22, 15-21(1928); *C. A.* 21, 3072.—R. could not obtain a correlation between different stages of rickets and the p_{H} of the feces. (See Jeppeott and Bacharach, *C. A.* 21, 1833.) BENJAMIN HARROW

The cause of Andrewes's diazo test for renal insufficiency. G. A. HARRISON AND R. J. BROMFIELD. *Biochem. J.* 22, 43-5(1928).—The substance responsible for Andrewes's reaction (see *C. A.* 18, 1856) is an indoxyl compd., probably mdican. R. H.

Chlorides and inorganic constituents of the serum and cerebrospinal fluid in meningitis. G. C. LINDER AND E. A. CARMICHAEL. *Biochem. J.* 22, 46-50(1928).—The fall of chloride concn. in the cerebrospinal fluid in meningitis is dependent on a similar fall in the chloride concn. of the serum. The relative concns. in the cerebrospinal fluid

and serum remain the same. There is an increase of the bicarbonate in both fluids and a small decrease in total base in the cerebrospinal fluid. BENJAMIN HARROW

Amino-acid content of the blood of children in health and in disease. S. H. EDGAR. *Biochem. J.* **22**, 168-72(1928).—The amino-acid N is lower in fasting bloods than in non-fasting. In rheumatism and chorea no change is found (as compared with normal healthy children); in nephritis there is a lowering of amino N, and in renal and celiac infantilism this lowering is still more marked. BENJAMIN HARROW

Some contributions of chemistry to diagnosis. JOSEPH CHANDLER. *J. Am. Inst. Homoeopathy* **21**, 292-9(1928).—Review with bibliography. J. S. HEPBURN

Studies in the microchemistry of the cell. I. The chromatin content of normal and malignant cells as demonstrated by Feulgen's "Nuclearreaktion." R. J. LUDFORD. *Proc. Roy. Soc. (London)*, **B102**, 397-406(1928).—The following results were obtained by use of this reaction. In the rat and the mouse, the chromatin content of the nucleus does not increase during oogenesis, and no chromatin is extruded into the cytoplasm when the germinal vesicle breaks down to form the chromosomes. Chromatin is not present in either the oxyphilic or the basophilic nucleoli of the oocyte of the mollusk, *Limnaea stagnalis*. The sperm heads of all 3 species yield a faint reaction when the chromosomes are stretched; but the reaction becomes progressively more marked as condensation occurs in spermatogenesis. The chromosomes apparently contain other substances besides chromatin. Extrusion of chromatin does not occur in the epithelial cells of the epididymis. Shrinkage of the nuclei of gland cells after secretion (e. g., in the adrenal medulla after exposure to cold) is apparently due to the loss of some substance other than chromatin. No relationship is found between the chromatin content of a tumor cell nucleus and the rate of growth of the tumor. In a tar tumor and the surrounding skin, the chromatin content is apparently the same in the normal and the malignant cells. During cellular degeneration of tumors, their nuclei become shrunken and the chromatin runs together. In tumors, the chromosomes stain intensely, and are separate from the nucleolus during the prophase of mitosis. Nuclear extrusions, which are well marked in some tumors, consist of nucleolar material and not chromatin. Nucleolar extrusions are the chief source of keratohyalin during cornification. While the same amt. of chromatin may be present in both large and small nuclei, yet giant nuclei contain large masses of chromatin. JOSEPH S. HEPBURN

Plasma and corpuscular chlorides in peptic ulcer. LEON BLOCH and A. M. SERRY. *Arch. Internal Med.* **41**, 415-9(1928).—There is no relation between blood Cl and gastric acidity. The Cl contents in gastric ulcer do not show marked deviations from normal. The plasma Cl is fairly const. and reaches the highest values. The corpuscular Cl shows greater variations and reaches the lowest level. The changes in the latter suggest that corpuscles play an important part in Cl metabolism. MARY JACOBSEN

Effect of toxemia on tolerance for dextrose and on the action of insulin. J. S. SWEENEY. *Arch. Internal Med.* **41**, 420-7(1928). "Daily tests of the tolerance for dextrose were made on rabbits in which toxemias had been produced with diphtheria toxin. Two units of insulin were injected daily 15 min. after the administration of dextrose. The toxemia appeared to have little if any effect on the injected insulin. On the basis of these and preceding expts., it is suggested that the effect of toxemia is that of a suppression of endogenous production of insulin." MARY JACOBSEN

The icterus index. Spectrophotometric and quantitative study. CLAIRE CUTTEN, EDITH E. EMERSON and WARRNER WOODRUFF. *Arch. Internal Med.* **41**, 428-44(1928).—In CHCl_3 soln. (8-20 mg./l., soly. 25 mg./100 cc.) bilirubin (I) has one max. of absorption at 450μ , the other at 250μ , and a min. at 350μ . The absorption ratio, A_1 for 450μ was 11.14 with a variation of 9.79%. The solns. are unstable, identical readings having been obtained only within 2 weeks. The acetone curve (soly. < 5 mg./100 cc.) resembles the CHCl_3 curve, max. at 450μ , A 0.67. The soly. in abs. EtOH was insufficient to permit detn. Five mg. I dissolved immediately in 100 cc. abs. EtOH contg. 1 cc. 0.1 N NaOH. The soln. (20 mg./l.) had an absorption max. at 450μ , A 1.17, the curve was less steep than the CHCl_3 curve. In alk. EtOH-acetone (3:1, 1 cc. 0.1 N NaOH, 10 mg. I/1.) the curve resembled the alk. EtOH curve. Solns. in alk. water (NaOH, Na_2CO_3 , pH 9.8, 5 mg. I/100 cc.) were colorimetrically very unstable. In the presence of Na_2HPO_4 , pH 9.6, practically no I went into soln. Solns. of quinoline yellow, fast yellow, flavazine and chrysoidine Y could not be used as standards since their spectra differed too much from that of I. Solns. of I in dog serum which in itself is colorless were tested: the stock soln. contained 25 mg. I to 50 cc. serum, 25 cc. 0.01 N NaOH and 25 cc. 0.01 N HCl. The soln. (16 mg./l.) has a max. absorption at 460-470 with a lesser peak at 420-430 and a depression in the bump at around 440. The other max. is at 310μ , a min. at 370μ . A was 10.88 for 450μ . A com-

parison with various $K_2Cr_2O_7$ solus. shows that an icterus index of 100 matches roughly a synthetic jaundiced serum contg. 100 mg. I per l. and that weaker dilns. are nearly proportional. Addn. of alc-acetone for the removal of turbidity causes pptn. of 60-75% I. Light filters must be used in order to eliminate errors caused by even very slight hemolysis. Sp. blue filters will permit a fairly accurate detn. even in the presence of relatively large hemolysis.

MARY JACOBSEN

The effect of toxemia on tolerance for dextrose. J. S. SWEENEY AND R. W. LACKEY. *Arch. Internal Med.* 41, 257-63(1928).—"Rabbits made toxic by diphtheria toxin are shown to have a marked decrease in tolerance to dextrose. The decrease in tolerance becomes more marked during the course of the toxemia. This suggests a quant. relationship between toxemia and tolerance to dextrose. It is suggested that an explanation of the phenomenon lies in a disturbance of insulin action or insulin production. The toxemia did not have a noticeable effect on the gastrointestinal absorption of dextrose."

MARY JACOBSEN

Experimental anemia produced by Clostridium welchii. Chemical analysis of the blood. J. A. KILLIAN, MARJORIE PATTERSON AND EDWIG KAST. *Arch. Internal Med.* 41, 370-84(1928).—Acute intoxication of rabbits with the products of *Clostridium welchii* was associated with the following blood-changes: a marked decrease of hemoglobin, a still greater decrease in red cells, decrease of cholesterol in the early stages followed by an increase with progressing remission, an increase of the icterus index to 1.5-6 times of the normal in proportion to blood destruction. The blood sugar rose slightly, passed a max. on the 3rd day and diminished in spite of repeated inoculations. There was a rise in the non-protein N without a corresponding increase in urea, while the amino acid N remained within the normal limits. The urine urobilin varied from traces to 710 mg./100 cc., increasing in proportion to red cell destruction. Many of the changes resemble those of anemia in man.

MARY JACOBSEN

The non-protein sulfur of the blood in certain pathologic conditions. W. DENIS, G. R. HERRMANN AND LUCILLE REED. *Arch. Internal Med.* 41, 385-402(1928).—In normal persons the inorg. S is limited to the plasma. In nephritis with retention of inorg. S the latter increases in the whole blood more rapidly than it does in the plasma, indicating diffusion into and retention in the cells. There is no apparent direct relation between the retention of non-protein N and inorg. S or between the latter and the neutral S or the Cl.

MARY JACOBSEN

Hemocidal properties of the blood serum. With special reference to pernicious anemia. O. H. HORALL AND F. E. BUCHMAN. *Arch. Internal Med.* 41, 182-98(1928). Normal serum seems to have a protective action on normal red cells. In 78 cases the mean for the beginning hemolysis in salt was 0.40, in own serum 0.45, in normal serum of another person 0.44. The range for NaCl was 0.11, for serum 0.20. The variations from the av. are very small, so that any deviation may be considered as abnormal. A few hrs. after hemorrhage the cells are normal to NaCl; the resistance to own serum is increased. In secondary anemias the av. is normal individual cases show striking variations. In hemolytic jaundice the cells are less resistant to normal and still less to the own serum, while the serum acts normal with normal cells. In pernicious anemia with relapse and in septic anemia the serum contains intermittently a hemolytic and toxic substance. In jaundice and in the remission stage of pernicious anemia the curves are, on an av., normal. Abnormal red cells appear in polycythemia aplastic anemia and secondary anemia. Reticulated cells of normal size are more resistant than non-reticulated ones.

MARY JACOBSEN

Temporary urobilinemia. A. LICHTENSTEIN. *Geneeskund. Tijdschr. Nederland. Indie* 67, 899-906(1927).—Urobilinemia may be produced by the injection of the subject's own laked blood. Whole blood has no such effect. The urobilinemia appears about 5 hrs. after injection and lasts from 24 hrs. to several days. In some normal subjects (Javanese and white) urobilin appeared in the urine periodically in the afternoon or the evening after larger meals and had no pathol. significance. The periodicity was not affected by the injection of the subject's own laked blood. Urobilinemia in the morning may have pathol. significance. The subcutaneous injection of 2 cc. pituitrin which causes the gall bladder to contract and to discharge bile into the intestine produced urobilinemia only in 2 out of 6 subjects. The escape of urobilin into circulation in healthy subjects is ascribed partly to its absorption by the hemorrhoidal veins, partly to the permeability of some normal livers.

MARY JACOBSEN

Surface tension of cerebrospinal fluid in children with normal and diseased meninges. M. GIUFFRÉ. *Pediatrica Arch.* 2, 31-7(1926).—The surface tension of normal cerebrospinal fluid (Traube stalagmometer) is about 5-15% lower than that of water. It keeps within normal limits in chronic diseases (tuberculosis, syphilis) with or without

affections of the nervous system, provided the meninges are not involved. It is also normal in acute diseases (pneumonia, typhoid) assocd. with pronounced meningeal irritation and in the acute stages of encephalitis and infantile paralysis. It is consistently lowered in tuberculous meningitis and markedly diminished in suppurative meningitis of epidemic, staphylococcal, diplococcal or Pfeiffer bacillus origin. It may serve for the differentiation between encephalitis and tuberculous meningitis. M. J.

Glucemia of infancy. MARIO SOLITO. *Pediatria Arch.* 2, 38-48(1926).—The blood sugar (blood from the finger tip) varies in the 1st 2 years of life from 0.08 to 0.12%, av. 0.097%, and is higher in the 1st year than in the 2nd. Gastroenteritis and dyspepsia cause an increase in proportion to the severity of the condition. Lobar and bronchopneumonia have no effect. The literature is reviewed. MARY JACOBSEN

Infantile tetany. STANISLAO FARRIS. *Pediatria Arch.* 2, 231-410(1926).—Exhaustive review with large bibliography. MARY JACOBSEN

The reducing substances of the cerebrospinal fluid in various diseases of children. A. BARBARNI. *Pediatria Arch.* 2, 453-63(1926).—Detns. by the method of Bardisian (reduction of an alk. methylene blue soln.) were made in various diseases with and without involvement of the nervous system; great variations were observed. For details see the original. MARY JACOBSEN

Modification of physicochemical properties of blood in vaccine shock. M. GIUFFRÉ. *Pediatria Rivista* 35, 980-8(1927).—In vaccine shock caused in mchtemis and typhoid patients by the injection of lyzed vaccine the surface tension and Δ are lowered, viscosity and coagulability show a rise after an initial decrease, the p_H is sometimes slightly higher, while the alkali reserve is always diminished. These changes do not occur in patients who have not been sensitized before the disease. The resemblance between vaccine and anaphylactic shock suggests that their mechanisms are identical. M. J.

Taccione's reaction of the cerebrospinal fluid in infancy. F. BARBARNI. *Pediatria Rivista* 35, 989-1007(1927); cf. C. A. 20, 1641. Taccione's reaction is always negative in normal fluids and pretty sensitive for pathological cases. A distinct meningitic reaction is obtained in tuberculous and cerebrospinal meningitis. It may also appear in paralytic and epileptic dementia and cerebral lues. The encephalitic reaction appears in many diseases of the nervous system in which meningeal reactions are scarce, such as infantile paralysis, lethargic encephalitis, Little's disease, epilepsy, etc., further in diseases with transient meningeal disturbances (typhoid, grippe). It may also appear in diseases free from clinical manifestations (congenital lues). MARY JACOBSEN

The actual reaction of blood and urine in the nephropathies of childhood. M. GIUFFRÉ and A. S. PAGLIARO. *Pediatria Rivista* 35, 1035-49(1927).—Kidney diseases with N retention are always assocd. with a corresponding decrease in alkali reserve severe conditions also with a lowered p_H . The changes may also occur in the absence of clinical uremic symptoms. A single p_H detn. is of no value. Series detns. of p_H and d. in connection with the water-drinking test give an idea of the kidney function. MARY JACOBSEN

The acid and alkali test in renal disease. A. PAGANI CESA. *Pediatria Rivista* 35, 1092(1927).— Na_2CO_3 (0.5 g.) was injected; 15 drops HCl was given by mouth. Rehn's finding is confirmed according to which nephritic children eliminate HCl normally but retain almost all alkali, while the reverse is the case for other nephrotic children. MARY JACOBSEN

Creatine-creatinine metabolism in the nephropathies of childhood. M. RASPI. *Pediatria Rivista* 35, 1092(1927).—The creatine and creatinine content of blood and urine is normal; the former is only slightly increased in the blood. The cord blood of fetus from albuminuric mothers also shows a normal creatinine content. M. J.

The potassium dichromate reaction of the cerebrospinal fluid of children, with syphilis of the spinal cord. G. TACCONE. *Pediatria Rivista* 35, 1097(1927).—The reaction is the most sensitive known. It was positive in 92% of children with syphilis of the spinal cord, 45% of whom had no apparent lesions of the nervous system. MARY JACOBSEN

A new immunological reaction of great importance for pediatrics. G. CANDIDO. *Pediatria Rivista* 35, 1103(1927).—The milk of luetic women has a powerful agglutinating action on red cells. MARY JACOBSEN

The fat and cholesterol content of the child's lungs in health and disease. S. GANDOLFO. *Pediatria Rivista* 35, 1105(1927).—G. believes that the "protoplasmic" fats have a sp. respiratory function. In diseases in which the latter is typically deranged the non-cholesterol fat is increased. Conclusions: cholesterol has no direct relation to the sp. function of the lungs. Its presence is a result of cell destruction. M. J.

The p_H and carbon dioxide content of exudates and transudates. M. GIUFFRÉ.

Pediatria Rivista 35, 1106(1927)—A study of 36 fluids of different origin shows that the p_H of exudates is generally low and their CO_2 content usually lower than that of the transudates.

MARY JACOBSEN

The histamine test for gastric secretion in children. M. MANCLOSSI. *Pediatria Rivista* 35, 1106(1927).—The free HCl of normal children especially in the 1st year is considerably lower than that of the adult. Gastrointestinal disturbances cause a further decrease or complete disappearance.

MARY JACOBSEN

The value of determining the creatine substances in the urine. G. SALVIOLI. *Pediatria Rivista* 35, 1106(1927).—In normal children of all ages the urinary creatine-creatinine practically runs parallel with the daily output. In tuberculosis and pulmonary diseases the parallelism is limited to the variations of concn. and output. The reasons for the parallelism are discussed.

MARY JACOBSEN

Cholesterol metabolism in childhood. G. HALPER. *Pediatria Rivista* 35, 1107(1927).—The normal cholesterol content of the serum of children and adolescents varies from 0.058 to 0.160%. It is considerably increased in all nephrotic cases and lowered in tuberculosis. The decrease is pronounced in oligemias. Sympathetic stimulants cause an increase.

MARY JACOBSEN

Blood cholesterol of children in health and disease. L. VARONE. *Pediatria Rivista* 35, 1107(1927).—There are no definite differences between the newborn, the nursing and the older child. The cholesterol content is increased in the florid stages of rickets and spasmophilia. With the progress of clinical improvement cholesterol, Ca and P return to normal at about the same rate. An increase is also present in chronic tuberculosis, a decrease in severe cases of diphtheria with paralysis.

M. J.

Effect of ultra-violet rays on experimental anaphylaxis. G. P. BENTIVOGLIO. *Pediatria Rivista* 35, 1111(1927).—Guinea pigs may be partly or completely desensitized by the inhalation of irradiated air. When irradiated in high diln. with large doses the serum loses its toxic effect, but not its sensitizing properties. The effect on the antitoxin properties is insignificant if any.

MARY JACOBSEN

Behavior of sera irradiated with ultra-violet rays in experimental anaphylaxis. C. GIAUME. *Pediatria Rivista* 35, 1111(1927).—Irradiated normal horse serum does not produce shock in sensitized guinea pigs. Five min. irradiation of the sensitized guinea pig attenuates the shock produced by normal serum. Severe and mostly fatal shock results when both sensitizing and shock releasing serum have been irradiated. The antibody content of diphtheria serum is not noticeably diminished by irradiation.

MARY JACOBSEN

The reducing power of irradiated and non-irradiated neoplastic cells in childhood. R. SIMONINI. *Pediatria Rivista* 35, 1111(1927).—The reducing power is inherent in the cell elements. It is always higher than that of the tissues on which the tumor grows and increases with the activity of the tumor. It is partly but not entirely attributable to a content in oxidizing enzymes and is lowered but not abolished by Röntgen irradiation.

MARY JACOBSEN

Glucemia in the prematurely born. A. MAZZEO. *Pediatria Rivista* 35, 1121(1927).—The values vary between 0.035 and 0.110%.

MARY JACOBSEN

The p_H of normal and pathologic cerebrospinal fluids. C. GUASSARDO. *Pediatria Rivista* 35, 1124(1927).—The normal p_H is 7.55. It was lowered in purulent meningitis, but showed the normal value in all (148) other cases of meningitis, encephalitis, infantile paralysis and hydrocephalus of various origin.

MARY JACOBSEN

Alimentary and adrenaline glucemia in infantile paralysis and in the cerebroplegias of childhood. A. DE CAPITTE. *Pediatria Rivista* 35, 1201-13(1927).—In 20 cases of infantile paralysis (I) the blood sugar was practically normal: 0.058-0.102%, while 42.3% cases of cerebral paralysis (II) showed an increase up to 0.112-0.126%. Administration of glucose caused in I a 20% increase of long duration, in II a considerable increase of much shorter duration. The adrenaline hyperglucemia was in I by far lower than in II, although higher than the alimentary glucemia in I. The exaggerated adrenaline reaction in II is related to endocrine disturbances through stimulation of the presumably diseased sympathetic. The protracted alimentary reaction in I is a result of the neuro-muscular disturbance.

MARY JACOBSEN

The colloid-chemical significance of electrolytes for precipitation. NAQYOSH HAYASHI. *Sei-i-Kwan Med. J.* 46, 3-5(1927).—The presence of salt is necessary for pptn. (agglutination); if salt is absent, the reaction will not necessarily appear. Among the 31 salts employed, all of the univalent cations can be substituted for NaCl in this reaction; also the bivalent cation salts as $CaCl_2$, $MgCl_2$, $SrCl_2$, $BaCl_2$, $CaBr_2$, $MgBr_2$, $SrBr_2$, CaI_2 , $MgSO_4$, $CaSO_4$ can be used instead of NaCl. All these salts are capable of enhancing the reaction in certain concns.; higher concn. inhibits the reaction and

lower concn. has no influence at all. With chloride, iodide and bromide, the area of concn. which intensifies the pptn. and the intensity of the reaction is proportional to the valency of the cation. This would indicate that the cation play the main role in pptn. The above results could not be observed with SO_4 which would indicate that anions also take part in the pptn. Salts which in certain concn (high) inhibit the pptn. dissolve it once it is formed. p_{H} of the pptg. reaction lies between 6.3 and 8.3

J. A. K

Parathyroidectomized dogs, with particular attention to the regional incidence of tetany, and to the blood mineral changes in this condition. C. I. REED, R. W. LACKEY AND J. I. PAYTE. *Am. J. Physiol.* **84**, 176-88(1928)—The tetany level of blood Ca was not const; but tetany always occurred when $\text{Ca}:\text{P} = 1$ or less. The product $\text{Ca} \times \text{P}$ bore no relation to tetany.

J. F. LYMAN

Studies on anaphylaxis. V. Anaphylaxis and avitaminoses. ENRICO SERENI. *Boll. soc. ital. biol. sper.* **2**, 254-9(1927).—The influence of vitamin-free diet on active and passive sensitization was investigated. A group of guinea pigs kept on a vitamin-free diet for 15 days was sensitized with 0.1 cc. horse serum; another group which received normal feed was likewise sensitized. Eleven days later, some animals from each group were re-injected with horse serum with the following results: the animals kept on a normal diet showed few if any symptoms of shock; those kept on a vitamin-free diet showed intense shock, lowering of temp., followed by death in 3 hrs. On the 12th day after sensitization a few animals from each group were re-injected. The normal group presented severe symptoms of anaphylaxis followed in some cases by death; the other group behaved similarly. Animals from both groups injected 20 days after sensitization all died from acute anaphylaxis. The study of passive anaphylaxis demonstrated very clearly that with homologous and heterologous sensitization, animals on a vitamin-free diet become more sensitive to anaphylaxis. A theory of antibody formation is advanced to explain the contradictory results on active anaphylaxis obtained with the normally fed animals re-injected on the 11th and 12th days after sensitization.

PETER MASUCCI

Alimentary glucemia in carcinoma. L. O. CANNARO. *Boll. soc. ital. biol. sper.* **2**, 269-71(1927).—The increased glucemia in carcinoma is always greater than that of normal individuals following the ingestion of sugar; the glucose titer is increased 0.06 to 0.07% after $\frac{1}{2}$ hr. while in the normals the increase is seldom greater than 0.03 to 0.04%. Two hrs. after the ingestion of carbohydrate, the blood sugar becomes normal. Adrenaline does not affect the sugar curve in carcinoma patients any differently than in normal individuals.

PETER MASUCCI

The total fatty acid contents of blood in cancer. L. O. CANNARO. *Boll. soc. ital. biol. sper.* **2**, 272-4(1927).—Fatty acid detns. were made on the anemic blood of cancerous individuals by the Kumagawa-Suto method. The results showed: (1) in all cases examined the lipemic titer was much higher than that of normal blood, 0.3 to 0.35% being taken as the normal; (2) the increase in fatty acids parallels the diminution in the number of red cells.

PETER MASUCCI

The mechanism involved in the production of hyperglucemia with colloidal silver. G. TRIMARCHI. *Boll. soc. ital. biol. sper.* **2**, 274-7(1927).—The histological examn. of the liver, spleen and kidneys of animals previously injected intraperitoneally with colloidal Ag failed to show any evidence of reticulo-endothelial block. T. concludes from these and other results that Demant's hypothesis which attributes hyperglucemia by the injection of colloidal silver to the blocking of the reticulo-endothelial system is untenable.

PETER MASUCCI

The gaseous exchange of inflamed tissues—experimental studies. MARIO GIANOTTI. *Boll. soc. ital. biol. sper.* **2**, 737-42(1927).—The amounts of O_2 consumed and CO_2 eliminated were detd. on normal rabbit ears and on rabbit ears inflamed by means of heat—immersed in water at 50° for 5 min. The results of the respiratory quotient ($R. Q.$) when plotted form a segment of a hyperbola ($y = (a/x) + b$). This shows there is a direct relation between the wt. of the normal ear and the increase of $R. Q.$ of the inflamed ear.

PETER MASUCCI

The formation of tumors by distillates from the asphaltic rocks of Ragusa. E. GIUFFRIDA AND G. SCHILLACI. *Boll. soc. ital. biol. sper.* **2**, 761-3(1927).—No formation of tumors was noted on 4 mice painted with "pure bitumen," a distillate, after 225 days. Small ulcers were noted on the 3 out of 4 mice treated with "heavy oil" after 140-160 days.

PETER MASUCCI

The behavior of the proteolytic, amylolytic and lipolytic power of pancreatic extract in animals treated with typhoid and paratyphoid toxins. MARGIOTTA AND INGRASSIA. *Boll. soc. ital. biol. sper.* **2**, 819-20(1927).—The enzyme activity of the pancreatic se-

cretions of normal dogs with a Pavlov pancreatic fistula remains unaltered until complications arise. After injections of typhoid and paratyphoid toxins, the enzymes are slightly weakened; lipase is the least affected; trypsin and amylase are affected in direct proportion to the general condition of the animal. PETER MASUCCI

Relation of the parathyroids to the healing of fracture as controlled by the Röntgen ray. D. E. ROSS. *Arch. Surg.* **16**, 922-37 (1928).—Removal of 2 parathyroids does not lower the blood Ca or delay the union of fractures. Removal of 3 parathyroids causes a drop of 2 to 3 mg. of Ca per 100 cc. of serum, and delays the union of fractures 4 to 5 weeks. When the serum Ca returns to normal, union of fractures occurs. J. T. M.

The Meinicke flocculation reaction with colored antigen. D. BOROVSKII, *Centr. Bakt. Parasitenk. I Abt.* **105**, 455-9 (1928).—The addn. of 0.1 to 0.2 g. of Victoria blue to 250 cc. of Meinicke antigen will produce a colored ppt. with a luetic serum; hence gradations can be much more easily distinguished. If the serum contains hemoglobin or bile, the end point can be made sharp by extg. with CHCl_3 , which carries down the color only if the reaction is positive. JOHN T. MYERS

Hemoclastic changes in vitro from agents causing anaphylactoid reactions. P. I. HANZLIK, F. DEJDS, L. W. EMPEY AND W. H. FARR. *J. Pharmacol.* **32**, 273-9 (1928).—The authors studied the alterations in surface tension, albumin/globulin ratio, rate of sedimentation and fragility of red blood cells in oxalated blood, plasma and serum of rabbit, guinea pig, cow and dog, produced by the following substances: venal agar, arsphenamine, CaCl_2 , CHCl_3 -plasma, CuSO_4 , kaolin, toxified serum, with 0.5% NaCl as control. The most important change was found in the surface tension which in 50 out of 62 cases was decreased. All the agents caused a change in the albumin/globulin ratio. Generally when the surface tension increased the ratio decreased, and vice versa. Sedimentation rate was increased only by gelatin and acacia. Fragility was increased by CuSO_4 and arsphenamine, and decreased by gelatin and acacia. The other agents were indifferent. The results indicate a disturbance of the blood colloidal equil., this presumably being concerned with the disturbances of anaphylactic and anaphylactoid shock. C. RIGGS

A study of blood serum with reference to diagnosis of precancerous conditions. ROGER DOURIS AND CHARLES MONDAIN. *Bull. sci. pharmacol.* **35**, 145-60 (1928).—A histologic comparison is made between the appearances of the dried residues of drops of serum from normal, syphilitic and cancerous subjects. L. W. RIGGS

Action of inorganic colloids on normal and syphilitic blood serums. P. DOURIS AND J. BECK. *Compt. rend.* **186**, 977-9 (1928); cf. *C. A.* **22**, 1392. In place of the usual colloids, called antigens, an attempt was made to substitute inorg. colloids with the same phys. condition and of const. chem. compn. by adding successively to the serum the necessary reagents. Among the substances thus formed were colloidal S, CdS , $\text{Cu}_2\text{Fe}(\text{CN})_6$, tungstic acid and silicic acid. The concns. of the reagents used to produce these inorg. colloids ranged from $1/10$ down to $1/400$ N. There was a difference in the time of forming or quantity of ppt. or turbidity in normal and syphilitic serums, which, after further study, may prove useful as a basis of serodiagnosis. L. W. R.

Variations of the lipoidal content of the serum in states of shock and under the influence of acidosis or alkalosis. JEAN VAN DE VELD. *Compt. rend. soc. biol.* **97**, 1825-7 (1927).—The variations of the lipoidal content in total blood and serum are parallel, and their differences indicate that the corpuscles absorb but little of the lipoids. Shock by injection which increases the acidity as HCl is followed by an increase of lipoids in the blood, while an injection of NaHCO_3 which increases the alk. is followed by a decrease of lipoids. L. W. RIGGS

Influence of the physical state of the antigens in the sero-diagnosis of syphilis. R. DOURIS, CH. MONDAIN AND J. BECK. *Compt. rend. soc. biol.* **98**, 507-9 (1928).—For 2 antigens of the same concn. in ext. and the same opalescence, the sensitivity varies inversely as the p_H . For the same content of ext. and the same concn. of H ions, the sensitivity of the antigen depends on the mode of diln. and consequently on its opalescence. Accordingly a suspension of antigen is characterized by at least 2 physicochem. data: its p_H and its colloidal state. L. W. RIGGS

The cause of uremia. A. OZORIO DE ALMEIDA. *Compt. rend. soc. biol.* **98**, 510-1 (1928); cf. *C. A.* **21**, 1488-9.—Expts. with dogs indicated that uremia is produced by variations in the relative proportions of the salts in the blood and in the liquids of the organism. L. W. RIGGS

Disorders of renal secretion caused by lack of sodium chloride. L. BLUM AND P. GRABAR. *Compt. rend. soc. biol.* **98**, 527-9 (1928).—See *C. A.* **22**, 1184. L. W. R.

Is there a hyperglucemic substance in diabetic blood? F. HÉDON. *Compt. rend. soc. biol.* **98**, 564-7 (1928).—The question remains unanswered. L. W. RIGGS

Development of a toxic condition in the dog during gestation. W. DE B. MACNIDER. *J. Am. Med. Assocn* **90**, 71-5(1928).—It appears that associated with gestation there is a definite tendency on the part of animals, irrespective of any renal injury, not to maintain a normal acid-base equil. of the blood. L. W. RIGGS

Ambard constant and McLean urea-index in kidney surgery. MASAKI IWAMOTO. *Tôhoku J. Exptl. Med.* **10**, 248-78(1928). L. W. RIGGS

Toxic substances in the blood after extirpation of the adrenals. N. V. PUCHKOV AND A. V. KIBYAKOV. *Arch. ges. Physiol.* (Pflüger's) **218**, 83-8(1927) - Disturbance in the functional activity of the liver as regards lipoids leads to an accumulation of choline in the blood. These changes, at times following adrenalectomy, cause death through a paralysis of the heart G. H. S.

Creatine metabolism in the brain of the pigeon during starvation and in polyneuritis. T. LJUDARSKII. *Arch. ges. Physiol.* (Pflüger's) **218**, 627-34(1928) -Disturbances in the N metabolism of the brain occur in pigeons during starvation or when on a diet deficient in vitamin B; the most marked changes appearing in the paralytic and spastic stages. In the spastic form of polyneuritis there is a reduced total N and an increase in creatine, while in the paralytic form the total N is even more reduced and the increase in creatine is less. In the chronic form and in starvation a slightly increased creatine appears but the total N is unchanged. These disturbed conditions respond very quickly to the administration of yeast. G. H. S.

The physicochemical basis for non-specific hemolysis. RUDOLF MOND. *Proto plasma* **2**, 126-34(1927). - A review in German with 61 references. M. H. SOULE

Lipoids and growth of carcinoma. S. BERNSTEIN AND H. ELIAS. *Z. Krebsforschung* **26**, 112(1927) - Inoculated adenocarcinoma of mice grows much less rapidly when the diet is low in lipoids. This effect is reduced by adding lecithin or cholesterol to the diet. Cholesterol is more effective than lecithin, and there is no evident antagonistic effect between these 2 lipoids. H. G. WELLS

The alteration in cholesterol metabolism by Röntgen rays in cancer patients. F. JACOB AND R. MOTOKIWA. *Z. Krebsforschung* **26**, 51-74(1927) -Röntgenization of patients with cancer but not cachectic is followed by a rise in blood cholesterol. Non-cancerous patients, cancer patients operated upon without recurrence, and cachectic cancer patients, all show a fall in cholesterol. These facts may have some diagnostic and prognostic significance. H. G. WELLS

Microchemical demonstration of bisinuth in experimental animal tumors. L. CALIFANO. *Z. Krebsforschung* **26**, 183-90(1928) - Expts. were conducted with transplanted mouse carcinoma and rat sarcoma, the animals being given colloidal Bi intravenously. The Bi is found only in normal cells and in the stroma of tumors, but not in the tumor cells themselves. H. G. WELLS

The nature and clinical value of the cancer reaction of Roffo. H. HILAROWICZ AND W. JANKOWSKA-HILAROWICZ. *Z. Krebsforschung* **26**, 214-27(1928).—This serum test for cancer depends on an increased globulin content, and hence is not specific for cancer. H. G. WELLS

Growth of cancer cells in relation to hydrogen-ion concentration of the medium. ALBERT FISCHER. *Z. Krebsforschung* **26**, 250-3(1928) - Carcinoma cells are more susceptible to variations in p_H than normal cells. Their growth is inhibited at p_H 5.9, at which reaction connective tissue cells can grow for several days. The optimum p_H for growth of cancer cells is at least not farther towards the acid side than for normal cells; they are more susceptible to higher acid and less to alkali. H. G. WELLS

Refractometric studies of blood serum in cancer patients. F. P. TINOZZI. *Z. Krebsforschung* **26**, 253-9(1928).—Change in refraction of serum depends on its protein contents, as well as on their cleavage products. With cachexia there is a fall in the index, progressing with the downward course of the patient. Under radiation the index rises, perhaps from absorption of decompn products. Refractometric studies have no diagnostic value. H. G. WELLS

Studies in calcium and carbohydrate metabolism. Calcium and glucose tolerance in diabetes mellitus. MAX WISNIOFSKY. *J. Lab. Clin. Med.* **13**, 133-7(1927).—A review is given of the literature on the relation of Ca to carbohydrate metabolism from which it appears definitely established that diabetes mellitus is associated with a negative calcium balance. Contrary to the findings of previous investigators, intravenous administration of $CaCl_2$ does not appear to influence the tolerance of diabetics for glucose as detd. by studying glucose-tolerance curves. ETHEL WICKVARE

BIRK, W.: Untersuchungen über den Stoffwechsel des Kindes in Fieber. Berlin: S. Karger. 104 pp. M. 7. Reviewed in *Biol. Abstracts* **1**, 1100(1927).

H—PHARMACOLOGY

A. N. RICHARDS

Action of apomorphine and santonin on the iris centers. PIETRO MATTEI. *Boll. soc. ital. biol. sper.* 2, 293-7(1927).—Injection of both apomorphine and santonin affects the pupils only by direct stimulation of the iris. There is little dilation of the pupils caused except during convulsion. A. W. CONTIERI

The seat of action of various poisons in the spinal centers. MICHELE MITOLO. *Boll. soc. ital. biol. sper.* 2, 297-302(1927).—Poisons act in two ways on the nervous system. One class, strychnine, caffeine, nicotine, excites reflex action and finally causes symptoms of tetanus. The other class, phenol, camphor, cosin, diminishes reflex action, the final state being complete paralysis. A. W. CONTIERI

The action of saccharin in various doses on hyperglucemia by dextrose. C. CIACCIO AND S. RACCHIUSA. *Boll. soc. ital. biol. sper.* 2, 309-11(1927).—Saccharin when administered together with dextrose inhibits to a great extent the resulting hyperglucemia, even 1 part in 5 being effective. A. W. CONTIERI

Influence of argyrol on experimental hypoglucemia by insulin. G. TRIMARCHI. *Boll. soc. ital. biol. sper.* 2, 323-5(1927).—Dogs were treated by injecting insulin alone; injecting insulin and argyrol mixed; insulin and argyrol at the same time but in different syringes; injection of argyrol, 15, 30 and 90 min. after insulin. The results, although varying in individual cases, show in general that when injected together, the action of insulin is not modified appreciably, whereas, when argyrol is injected after, the hyperglucemic action is both prolonged and intensified. A. W. CONTIERI

The course of glycogen injected in normal and in depancreatized dogs. U. LOMBROSO. *Boll. soc. ital. biol. sper.* 2, 330-2(1927).—Glycogen was introduced into the system of a normal dog and also in a dog with the pancreas removed in the proportion of 1 g. per kg. The sugar content of blood was examd. before and after. The increase in sugar in the blood was twice as much in the dog without the pancreas, and at the same time three times as much was found in the urine. A. N. R.

Reaction of the anterior and posterior epithelial layers of the cornea during autolysis of the corneal tissue. E. GALANTE. *Boll. soc. ital. biol. sper.* 2, 337-9(1927).—Corneas of dogs were treated *in vitro* with equal quantities of physiological soln. and NaF and the autolysis was allowed to go on at 38°. After several days the amts. of amino acids present were detd. by the method of Sørensen. In each case the cornea with the anterior epithelial layer removed produced a lower amount of acids (*i. e.*, equiv. to 4.2 cc. of 0.01 *N* NaOH, *vs.* 10.65 cc. for the normal cornea). With removal of the posterior epithelial layer the acids increase, *i. e.*, from equiv. to 10.65 cc. 0.01 *N* NaOH to 14.40 cc. The effect of antagonistic substances, as atropine and pilocarpine, will be considered in a later paper. A. W. CONTIERI

The injection of amides in circulatory system. II. Effect on depancreatized dogs. G. SUNZERI. *Boll. soc. ital. biol. sper.* 2, 339-41(1927).—Soluble amides were injected in dogs and then various organs, *i. e.*, the liver, muscles, gall bladder, tested for amides. Only glycogen could be found (mahogany color with I₂ soln.). With dogs with pancreas removed the same organs again failed to show traces of amide, but large quantities were found unchanged in the urine. A. W. CONTIERI

Insulin. II. Acetylation of insulin. KARL FREUDENBERG AND WILHELM DIRSCHERL. *Z. physiol. Chem.* 175, 1-17(1928); cf. C. A. 20, 3701.—Insulin preps. were acetylated by treating the suspension in C₆H₆ with pyridine and Ac₂O at 0° for 3 hrs., dilg. with Et₂O and centrifuging. From 1 g. of insulin 0.95 g. of the acetylated product was obtained. The loss is attributed to the H₂O or EtOH content of the original material. The "acetylinsulin" is insol. in H₂O and EtOH, sol. in alkali, and is of much diminished but complex activity. Occasionally it caused even a slight increase in blood sugar and in rare cases a paralysis of the hind legs and death of the rabbit. Perfusion expts. with the isolated frog liver showed the absence of any noteworthy influence on glycogen degradation such as occurs with adrenaline. The preliminary stage of insulin action, *viz.*, the adsorption of glucose on the red corpuscles, was also absent. Under conditions which do not injure insulin itself (0.03 *N* alkali at 1-3° for 24 hrs.) the acetylinsulin is converted into a product which behaves like insulin but exerts only 1/5-1/3 of the insulin activity. Acetylation of this "regenerate" gives an almost inert acetylinsulin which, however, under the same alkali treatment yields a 2nd regenerate with 80% of the activity of the 1st regenerate. The inference is that the insulin is converted into an almost inert acetylinsulin, which on alkali treatment yields an insulin-like, but specifically weaker regenerate, differing from the original insulin in its greater stability. Acetylation may have occurred on OH, NH₂ or NH groups. The simplest explanation

of the phenomena observed is that in regeneration the OAc is saponified, and the NHAc remains intact. This, however, postulates the homogeneity of the insulin factor in the protein mixt. Acetylinsulin contains 3-4% Ac, and the ease with which the Ac is removed suggests the OAc grouping, a view in harmony with the absence of Van Slyke NH_2 from insulin observed by Shonle and Waldo (*C. A.* 18, 2179). The regenerate contains 0.8% Ac. Since the bulk of insulin preps. consists of protein and only a small fraction is actual hormone, the Ac and NH_2 detns. cannot be interpreted in terms of the insulin mol.

A. W. DOX

Experiments with nicotine. W. BURRIDGE. *Arch. intern. pharmacodynamie* 32, 216-24 (1926); *Physiol. Abstracts* 12, 123.—Use was made of addnl. solns. to those employed by Barry, whose exptl. results were confirmed, and it was shown that the effects of nicotine on the frog's heart are divisible into 2 groups: those that come and go with the drug, and those that persist after removing nicotine from the perfusing soln. The action in the first group is ascribed to reduction of the soly. of CaHPO_4 . As an autonomic analyzer it ppts. CaHPO_4 . The second effect is attributed to some firm combination between nicotine and excitable substance. It is suggested that the action of nicotine should not be regarded in terms of stimulative or sedative effects, but in those of increased concn. capacity.

H. G.

Influence of anesthetics on hyperthermia on methylene blue. C. HEYMANS AND P. REGINERS. *Arch. intern. pharmacodynamie* 32, 311-26 (1926); *Physiol. Abstracts* 12, 121-2.—Intravenous injection of methylene blue had been previously shown to cause hyperthermia in the dog. In this the respiratory vol. passes from 0.3 or 0.4 l. per kg. to 3 l. per kg. per min. Ether given to produce deep anesthesia does not prevent this action, but the respiratory vol. is reduced, the CO_2 output, though diminished, being greater than normal. The mixt. chloroform, alc., ether slows the progress of the hyperthermia. There is a diminution of respiratory vol. and of CO_2 output, which approach the normal. Morphine injected before methylene blue prevents hyperthermia, but the fall of temp. and CO_2 is not so marked as that ordinarily found in morphine narcosis. Morphine given after methylene blue does not prevent the effects. The respiratory vol. and CO_2 are decidedly greater than normal. Chloral intravenously inhibits the effects of methylene blue when injected after the pigment.

H. G.

Coramine in chloroform-ether narcosis. P. GUNS. *Arch. intern. pharmacodynamie* 32, 373-99 (1926); *Physiol. Abstracts* 12, 178.—Coramine, a diethylamide, in small dose or large had no other effect than that of depression on the respiration in deep chloroform-ether narcosis in which it was tried. In two cases of very light anesthesia coramine increased respiratory vol., which was normal beforehand. The dose which had this effect varied from 1.5 to 25 mg. per kg. The convulsions which are caused by coramine are masked by chloroform-ether, and are gradually exhibited as the effects of the anesthetic pass off, sometimes ending in death. It is a dangerous drug to use in deep narcosis, though it may be useful in other circumstances.

H. G.

The influence of stereoisomerism on the action of aldoximes. G. LIO. *Arch. intern. pharmacodynamie* 32, 461-88 (1926); *Physiol. Abstracts* 12, 178.—The oximes studied were prepd. by treating aldehydes with NaOH and NH_2OH . Benzaldoximes are more toxic than anisaldoximes, and these latter are more toxic than piperonal-doximes. That the α form is more toxic than the β form is confirmed by expts. on fermentation, on *Paramecium*, on cold- and warm-blooded animals, on the heart, muscles and blood pressure. The oximes studied pass into the urine in part unaltered and in part as aldehydes.

H. G.

Can bromide and iodide of sodium be usefully employed as antidotes of strychnine? G. CAMPO. *Arch. intern. pharmacodynamie* 33, 73-7 (1927); *Physiol. Abstracts* 12, 308.—If NaBr or NaI be injected subcutaneously into an animal within 4 min. after a poisonous injection of strychnine, and at the same point the animal is saved. Part of the strychnine should still remain at the site of injection. If there is a delay of 5 min. after the strychnine injection the animal always dies. A similar result had been obtained by Giribaldi for NaCl. The bromide is preferable to the iodide, which may cause an eschar. Intramuscular injection of bromide has been found useful as an antidote to strychnine poisoning when it has been introduced by the mouth.

H. G.

Studies on quinine and quinidine. II. Their action on the blood vessels. E. E. NELSON. *Arch. intern. pharmacodynamie* 33, 186-96 (1927); *Physiol. Abstracts* 12, 401.—Small doses of quinine or quinidine given intravenously cause a fall of blood pressure. This is due to dilatation of peripheral vessels, and there is no evidence of dilatation of splanchnic vessels. The effect is partly a depression of vaso-motor endings, and in part a direct one on muscle. There is no evidence to show that a vaso-constriction occurs. Quinidine has a stronger effect, passing off more slowly than

quinine. III. The antagonism of quinine and quinidine for the circulatory effects of adrenaline. *Ibid* 197-203.—The antagonism for the pressor effect of adrenaline is vascular, not cardiac. Failure of adrenaline to cause a slowing after either is due to paralysis of the vagus mechanism, which is chiefly peripheral. A minor factor may be that the pressure increase is not great enough to cause reflex slowing. IV. A note on their comparative toxicity. *Ibid* 204-7.—Quinidine given to white rats intraperitoneally or to frogs into the ventral lymph sac is slightly but definitely more toxic than quinine. This is contrary to what is usually found in optical isomers, in which the levorotatory member of a pair is more active, but it agrees with the results of others concerning the relative toxicity of quinine and quinidine on the mammalian circulation. There is no evidence that the fluorescent soln. of sulfate of quinine is more toxic than the non-fluorescent hydrochloride. H. G.

The absorption of mercurials from ointments applied to the skin. R. B. WILD AND I. ROBERTS. *Brit. Med. J.* 1926, I, 1076-9; *Physiol. Abstracts* 12, 125.—All mercurials were absorbed to some extent. Though hydrous wool fat was absorbed in greater quantity than lard when these were used as bases, the absorption of the mercurial itself was greater from the lard basis. A paraffin base was less effective, but the amt. of mercurial absorbed from any ointment was greater proportionally to the amt. present up to 30%. HgO was most readily absorbed; ammoniated Hg, metallic Hg and Hg salicylate were absorbed almost as well; and calomel was least. H. G.

Effect of hypodermic insulin on the fasting blood sugar in normal and diabetic subjects in relation to percentage normal weight. W. M. BARTLETT. *J. Lab. Clin. Med.* 12, 115-8(1926); *Physiol. Abstracts* 12, 165.—Since insulin produces a more marked effect if the initial blood sugar is high, it was thought that the blood-sugar curve after insulin might be a better diagnostic procedure in diabetes than the usual tolerance test. The curve was not found specific enough for this purpose; underweight normal and underweight diabetic subjects were the most sensitive to the blood-sugar lowering effect of insulin, and obese normal subjects the least sensitive. The effect occurs most slowly in obese diabetics and normal weight normal subjects. H. G.

Isopropyl alcohol—an investigation of its physiologic properties. H. C. FULLER AND O. B. HUNTER. *J. Lab. Clin. Med.* 12, 326-49(1927); *Physiol. Abstracts* 12, 181.—The results vary with diff. animals; the intoxication produced is similar to that produced by ethyl alc. and tolerance is usually established quickly. H. G.

Ketonuria due to overdosage with insulin. F. MAINZER. *Klin. Wochschr.* 6, 107-8(1927); *Physiol. Abstracts* 12, 230.—Three cases are described in which a marked hypoglycemia occurred after administration of insulin, this being assocd. with acetoneuria. In two of the cases the alkali reserve of the blood was 86 vol. %, indicating a concurrent alkalemia. H. G.

Thyroid-like action of inorganic iodine. I. ABELIN. *Klin. Wochschr.* 6, 584-6(1927); *Physiol. Abstracts* 12, 387.—Expts. on metamorphosis of the axolotl are described. Intraperitoneal injection of Lugol's soln. (I in KI) caused metamorphosis to take place, but neg. results were obtained when the soln. was merely added to the water in which the axolotl was kept. H. G.

Action of glycine in urticaria. K. GLAESSNER. *Klin. Wochschr.* 6, 597-9(1927); *Physiol. Abstracts* 12, 404.—The author describes several cases of successful treatment of urticaria with glycine. Doses of 5 to 10 g. daily were given. The cases which benefit by this treatment are those in which the urticaria is an anaphylactic manifestation. Cases assocd. with asthma did not respond to the treatment. It is suggested that the glycine exerts its action by forming a non-toxic compd. with the toxic agent. H. G.

Pharmacology of plasmoquin. J. W. LE HEUX AND C. DE L. VAN WYNGAARDEN. *Klin. Wochschr.* 6, 857(1927); *Physiol. Abstracts* 12, 520.—Plasmoquin is a new antimalarial agent. The lethal dose per kg. for rabbits is 3.5 mg. (intravenous), 20 mg. (hypodermic), and 225 mg. (*per os*). In toxic doses the heart beat is irregular and slow; there is marked dyspnea, and the animal lies on its side; convulsions occur. Recovery, if it occurs, is rapid. The substance is soon rendered non-toxic in the body. The lethal dose per kg. for cats is 5 mg. (intravenous), 5 mg. (hypodermic), and 7.5 mg. (*per os*). In these animals it is destroyed much more slowly than in rabbits. In cats a methemoglobinemia is produced, and the drug also produces methemoglobin in the blood of many species *in vitro*. H. G.

Functions of paralyzed muscle. XVI. Action of guanidine. L. CALIFANO. *Riv. patol. sper.* 2, 85-92(1927); *Physiol. Abstracts* 12, 487; cf. *C. A.* 22, 619.—Guanidine is without action on the denervated muscle of the toad after the neuromuscular junction has lost its excitability. H. G.

The problem of the danger of small amounts of mercury. PAUL FLEISCHMANN.

Deut. med. Wochschr. 54, 304-7(1928).—An examn. of a number of patients showed that Hg even in very small amount, (e. g., from amalgam fillings in teeth) may produce considerable harm to the individual. ARTHUR GROLLMAN

Experiments on the therapeutic administration of manganese. F. FALUDI. *Deut. med. Wochschr.* 54, 470-2(1928).—Mn administered orally in combination with proteins had a marked *hematopoietic* action. Alone, and in combination with As, Mn was found of great value in clinical cases of anemia of diverse origin. ARTHUR GROLLMAN

Hypersensitivity towards ethyl acetate. BEINTKER. *Deut. med. Wochschr.* 54, 528(1928). ARTHUR GROLLMAN

The lipid distribution in normal and abnormal liver tissues. II. The effect of insulin on the lipoids of rabbit liver. E. R. THEIS. *J. Biol. Chem.* 77, 75-80(1928); cf. *C. A.* 22, 978.—When administered over a long period of time, insulin caused a decrease in the total lipid content of the liver. Over a very short period the phospholipoid-neutral fat ratio was markedly changed. Less phospholipoid was found in the livers of animals killed at the peak of the insulin action than in those killed several hrs. after this peak. ARTHUR GROLLMAN

Studies in the synthesis of hippuric acid in the animal organism. VII. A comparison of the rate of elimination of hippuric acid after the ingestion of sodium benzoate, benzyl alcohol and benzyl esters of succinic acid. S. L. DIACK AND H. B. LEWIS. *J. Biol. Chem.* 77, 89-95(1928).—After the oral administration of benzyl alc. to rabbits, the velocity of hippuric acid excretion by the kidneys was only slightly less than that obtained after feeding Na benzoate. After the administration of Na benzyl succinate, more hippuric acid was eliminated in the first 6 hrs. than when dibenzyl succinate was fed, but the amt. excreted in 24 hrs. was less in the first case. The results are taken to indicate a rapid oxidation of benzyl alc. and a hydrolysis of the monobenzyl succinate in the body. ARTHUR GROLLMAN

The effect of insulin on the amino acid content of blood. J. M. LUCK, G. MORRISON AND L. F. WILBUR. *J. Biol. Chem.* 77, 151-6(1928).—Subconvulsive doses of insulin lowered the amino acid content of the blood of rabbits, rats and men. The observed decrease when expressed as mol. concn. was at times almost as great as the decrease in blood sugar concn., similarly expressed. ARTHUR GROLLMAN

The effect of anti-rheumatic drugs on the arthritis and immune-body production in serum disease. C. L. DERICK, C. H. HITCHCOCK AND H. F. SWIFT. *J. Clin. Investigation* 5, 427-40(1928).—The administration of neocinchophen or aspirin immediately following the discontinuance of serum therapy, and its continuation throughout the period of the disease, prevented the occurrence of arthritis. ARTHUR GROLLMAN

Low basal metabolism following thyrotoxicosis. I. Temporary type without myxedema, with special reference to the role of iodine therapy. W. O. THOMPSON AND P. K. THOMPSON. *J. Clin. Investigation* 5, 441-69(1928). II. Permanent type without myxedema. *Ibid* 471-501. ARTHUR GROLLMAN

Anticoagulant action of peptone. J. O. W. BARRATT. *Biochem. J.* 22, 230-5(1928).—Peptone acts upon fibrinogen, which, in consequence, becomes diminished in amount. The peptone is without action on thrombin. BENJAMIN HARROW

Effect of phlorhizin and other substances on fermentation by yeast. W. J. DANN AND J. H. QUASTEL. *Biochem. J.* 22, 245-57(1928).—Allyl alc. and acrylic acid bring about an almost complete cessation of the fermentation of glucose by yeast and zymim (cf. *C. A.* 22, 249). Of the glucosides tried one only, phlorhizin, showed a marked retarding action on the fermentation of glucose by zymim. Among the polyhydric alcs. phloroglucinol (the phenol present in phlorhizin) was the most effective in retarding the rate of fermentation by zymim. Phlorhizin had no perceptible action on the fermentation of pyruvic acid by zymim or by live yeast, or on the fermentation of glucose by live yeast. BENJAMIN HARROW

Role and scope of carbon dioxide in general anesthesia. JULIUS WISOFF. *Dental Cosmos* 70, 528-31(1928).—A discussion of the use of CO₂ in gas anesthesia with a bibliography. JOSEPH S. HEPBURN

Changes in the lumen of the capillaries during the action of certain drugs: adrenaline, atropine, pilocarpine. FRANCO CASTELLOTTI. *Biochim. terap. sper.* 14, 359-65(1927).—The subcutaneous injection of 1 cc. 0.1% adrenaline into human subjects causes an increase of heart tone, of the force of heart contractions and of arterial pressure and a decrease of the pulse rate and of the capillary (chiefly arterial, possibly also venous) lumen. Atropine and pilocarpine (1 mg.) have the opposite effect. The effect on the heart and arteries is direct; the contraction and dilatation of the capillaries are detected by the quantity of blood which reaches the capillary barrier through the precapillary arterioles. MARY JACOBSEN

Gold compounds in the therapy of tuberculosis. LINO URIZIO. *Biochim. terap. sper.* 14, 366-7(1927).—U. has detd. the min. inhibiting concns. of sancocrysin (I), krysofolgan (II), trifal (III), aurofos (IV) and neocrisolo (V) for 17 strains of *B. tuberculosis* cultured from sputum or taken from Kral's culture museum in Vienna. All preps. have a peculiar sweet taste increasing with the Au content. The resistance to the same prepn. varies greatly with the strain. Certain strains exhibit a great and const. resistance to all preps. A similar behavior has been observed toward the salts of rare earths. The infections produced in guinea pigs by strains of low resistance to metals are malignant and run a rapid course, while highly resistant strains produce mild and chronic infections. The tolerance of guinea pigs to the preps. increases in the order I to V. For the final expts. the strain *K. Blum* was selected because of its moderate resistance and virulence. Although the doses used were only 0.1 to 0.05 of the tolerated dose death with diffuse hemorrhages occurred in almost every series. Under I only 2 out of 8 animals survived a little longer than the controls. II, III and IV cause febrile reactions; IV is the most effective and least toxic of the 3. Of all preps. V showed the least toxicity. The clinical results confirm the lab. expts., although only V has been used extensively. It was used to advantage especially in asthenic cases with secondary anemia (17). Out of 214 infiltrative pulmonary cases only 32 were cured.

MARY JACOBSEN

Excretion of hydrogen sulfide by the respiratory route following intravenous injections of hypertonic sulfur waters in the rabbit. C. G. GASPERINI. *Biochim. terap. sper.* 14, 388-92(1927).—The water of the thermal spring of Castellamare di Stabia contg. 0.0068 g./l. total S and 0.0020 g./l. S as H_2S was injected into rabbits in doses of 8, 10 and 15 cc./kg. at a rate of 5 cc./min. Mild and transient toxic symptoms appeared 1-4 min. after the injection, increasing with the dose. The expired air smelled slightly of H_2S but stained Pb paper only when the dose was 15 cc./kg., the stain appearing 4 min. after the odor became first perceptible. This 2nd exhalation of H_2S is probably not attributable to a conversion of combined S to H_2S (Sabbatani and the French authors) but has its source rather in the S fixed by protozoa.

M. J.

The effect of insulin on the blood sugar of the pig. H. E. MAGIE and D. HARVEY. *Proc. Physiol. Soc. J. Physiol.* 64, xxxi-xxxii(1927).—Insulin administered to the fasting pig caused a fall in blood sugar, convulsions occurring when the blood sugar was about 75 mg. per 100 cc.

J. F. LYMAN

Experiments with phenylhydrazine. I. Studies on the blood. II. Z. GIFFEN and E. V. ALLEN. *Ann. Internal Med.* 1, 655-76(1928).—Dogs given $PhNHNH_2 \cdot HCl$ for 146 days out of a period of 8 months, and a total dosage equal to that of from 4 to 6 yrs. treatment in man for polycythemia vera, were well at the end. The erythrocytic effects were the same whether given subcutaneously or by stomach tube, or in single or divided doses over a 10-day period. There is an irregular tendency to an increase in leucocytes. Each mg. per kg. of body wt. caused a decrease of 38,000 erythrocytes when given in large doses over periods of a few days. II. Studies on renal and hepatic function and erythropoiesis. E. V. ALLEN and H. Z. GIFFEN. *Ibid.* 677-82.—In 3 dogs treated with $PhNH.NH_2 \cdot HCl$ as above there was an av. reduction of 27% in phenolsulfonephthalein output. Urinalyses were negative, and blood urea was normal. One dog showed a very slight reduction in dye excretion by the liver. The rate of regeneration of erythrocytes was unchanged. Removal of the spleen did not affect the action of hydrazine. III. Pathologic anatomy. E. V. ALLEN and N. W. BARKER. *Ibid.* 683-93.—No pathologic histology could be found except increased deposition of Fe in the liver and spleen when the administration was in therapeutic amts. One dog was given doses which were lethal in 6 days. There was rapid destruction of erythrocytes and hemoglobin, atrophy of liver parenchymal cells, reduction in the number of splenic leucocytes, and over-loading of the cells of the renal convoluted tubules with Fe.

JOHN T. MYERS

The intravenous injection of starch. G. SUNZERI. *Boll. soc. ital. biol. sper.* 2, 213-5(1927).—The intravenous injection of sol. starch (1 g. per kg.) is followed by the elimination of starch in the urine. It disappears very rapidly from the blood and can be detected in the urine only two or three hrs. after injection.

PETER MASUCCI

The behavior of the glucemic titer in castrated rabbits following the injection of diuretin. G. RUGGERI. *Boll. soc. ital. biol. sper.* 2, 277-9(1927).—Following castration (10 cg. per kg.) in female rabbits diuretin gives rise to a moderate hyperglucemia which is not obtained in normal animals.

PETER MASUCCI

Contribution to the treatment of hemorrhagic shock by the use of gum-saline solutions. *Boll. soc. ital. biol. sper.* 2, 965-72(1927).—Dogs were bled until 70% of the total blood was withdrawn; the animals developed a state of shock with an arterial

pressure of 40 mm Hg. The intravenous injection of Ringer soln. failed to save the life of the dog although it momentarily raised the arterial pressure. The intravenous injection of 6% gum-saline soln. equal in vol. to the blood withdrawn not only raised the pressure but saved the life of the dog.

PETER MASUCCI *

Alcohol, saccharose and muscular work. A. GALAMINI. *Boll. soc. ital. biol. sper.* 2, 972-6(1927).—EtOH (95%) and sucrose were administered to healthy men 23-25 yrs. old in the proportion of 0.5 cc. per kg. and 1.5 g. per kg., resp.. The substances were given on an empty stomach before beginning work. The effect of the muscular work on the blood sugar and alc. curve was studied. Samples of blood were taken every 30 min., glucose was detd. by Bang's method, and alc. by the modified Widmark method. The alc. and blood-sugar curves were not affected by each other and indicated that the EtOH was not utilized directly by muscular contraction. P. M.

The effect of alcohols, glycerol and nicotine on the survival of leucocytes. S. BAGLIONI. *Boll. soc. ital. biol. sper.* 2, 976-7(1927).—The effects of alcs (EtOH, MeOH, propyl and benzyl), glycerol and nicotine, on the survival of the leucocytes of *Bufo vulgaris* were studied. Small amts. of EtOH, 0.28 to 0.1%, increase slightly the ameoboid movements, but do not influence time of survival. 1.12 to 2.81% decrease the survival, the latter strength paralyzes animals rapidly within 1.5 hrs. MeOH was less toxic than EtOH. Propyl and benzyl alc. were more toxic. Glycerol in amts. 0.25 to 0.5% had no effect; in 2% there was noticeable damage, but rapid destruction took place only in 20% concn. Nicotine in 0.01% diminished activity and survival; 0.1% destroyed activity completely within a few hrs.

PETER MASUCCI

The stimulating action of alcohols and alkaloids on ameoboid movements. C. FORRI. *Boll. soc. ital. biol. sper.* 2, 985-7(1927).—The effects of methyl, ethyl, propyl and benzyl alcohol, and of strychnine nitrate, caffeine and quinine HCl were studied on the blood of *Bufo vulgaris*. With two methods it was established that the alcs. and the alkaloids increase the ameoboid activity of the white corpuscles before paralyzing them. The stimulating action of the alcs. lasts much longer than that of the alkaloids. P. M.

Physiological reactions induced by α -lobeline. I. Intravenous injections during anesthesia and certain other forms of depression. M. J. KING, HELEN R. HOSMER and M. DRESBACH. *J. Pharmacol.* 32, 241-72(1928).—Ether, morphine, amytal, carbon monoxide, CO, illuminating gas and increased intracranial pressure were used, either separately or in various combinations, to produce respiratory depression in cats, dogs, 1 rabbit and 1 monkey. The effects of intravenous injections of α -lobeline after such depression were studied. In cases of light or moderate depression α -lobeline caused stimulation of respiration, and a rise in blood pressure. In cases of marked depression, there was after α -lobeline little or no effect on respiration and a lowering of blood pressure. Adrenaline and α -lobeline resemble each other in their effects on blood pressure, respiration and blood sugar.

C. RIEGEL

The toxicology of mercurochrome alone and in combination with glucose. D. I. MACHT and W. C. HARDEN. *J. Pharmacol.* 32, 321-40(1928).—The fatal dose of mercurochrome for rabbits, cats and dogs was 25-30 mg. per kg., rather than 10 mg., the figure reported by other workers. This lower toxicity is ascribed to the absence of impurities in the form of other more highly toxic fluorescein derivs. If a glucose soln. is injected at the same time as the mercurochrome, or a freshly prepd. mixt. of mercurochrome and glucose given, the mercurochrome is much less toxic. The mixt. of the two must be freshly prepd. as decompn. of the mercurochrome occurs in the presence of glucose on standing, with pptn. of metallic Hg. Analyses of blood and urine after injection of mercurochrome alone, and after mercurochrome plus glucose, indicate that in the latter case there is a more rapid elimination of Hg from the blood, and a greater excretion in the urine for a given period of time.

C. RIEGEL

The effect of salicylates on the nitrogen metabolism with special reference to the effect of the cation of the salt. G. P. GRABFIELD and EMILY KNAPP. *J. Pharmacol.* 32, 341-50(1928).—See C. A. 21, 3977.

C. RIEGEL

The influence of certain arsenicals upon sulfur excretion. F. P. UNDERHILL and ALICE DIMICK. *J. Pharmacol.* 32, 359-65(1928).—Subcutaneous injection of As_2O_3 in a dog caused increase in the etheral sulfate and neutral S fractions of the urinary S. Doses of As_2O_3 given in gelatin capsules by mouth to 2 dogs were followed by no conclusive changes in the S fractions of the urine. Intravenous injections of neoparsphenamine in a dog caused an increase in the neutral S, and in the S:N ratio. C. R.

Mode of action of synthalin. EDGARD ZUNZ and JEAN LABARRE. *Bull. soc. chim. biol.* 10, 322-6(1928); cf. C. A. 22, 1927.—By pancreatic-jugular anastomosis expts. it was concluded that synthalin excites the secretion of insulin. L. W. RIGGS

Pseudo-inexcitability of the cardiac vagus by uzarin and the extract of uzara.

RAYMOND-HAMET. *Compt. rend.* **186**, 971-3(1928)—Uzarin, which is more sol. than digitalin and much less toxic than ouabain, deserves a place with these glucosides in cardiac therapy. L. W. RIGGS

• Influence of rubidium on the excitability of the frog heart. W. DULIÉRE AND L. DEBORGGRAEF. *Compt. rend. soc. biol.* **98**, 335-6(1928).—The irritability consts. existing after 90 min. of perfusion with normal Ringer soln. are perfectly conserved when the heart is perfused with a soln. contg. Rb, and a mol. equiv. of the K in Rb is not necessary to preserve the irritability. The heart is much less sensitive to variations in the quantity of Rb than to variations in the quantity of K. L. W. RIGGS

Action of nearsphenamine on the formed elements of the blood. HILDING EKERFORS. *Compt. rend. soc. biol.* **98**, 793-5(1928).—Doses of 0.11 to 0.15 g. of nearsphenamine per kg. of body wt. are followed by a thrombocytosis which appears a few hrs. after the injection and persists for about 20 days before the return to normal conditions. The polymorphonuclear and mononuclear leucocytes show no variations. Smaller doses down to 0.021 g. produce similar effects. Doses of 0.01 g. do not appear to change the no. of thrombocytes but cause a mild leucocytosis, the no. of leucocytes increasing from 13,500 to 20,000 per cc. 4 hrs. after the injection. This leucocytosis disappears in the course of the following day. Nearsphenamine causes a strong excitation of the elements of red marrow which produce the thrombocytes. L. W. R.

Action of aconitine on the heart. HILDING EKERFORS. *Compt. rend. soc. biol.* **98**, 795-7(1928).—Aconitine paralyzed the vagus of the heart of *Rana esculenta*, but did not affect the sympathetic. This result is further confirmed by the fact that aconitine does not restrain or modify the motor action on the heart of a dose of adrenaline. Action of aconitine on the autonomic innervation of the intestine and uterus. *Ibid* 797-800.—Aconitine exerts mildly excitant action on parasympathetic nerve terminations of the intestine and uterus; it is a muscular excitant; in relatively large doses it does not paralyze the parasympathetic; and it does not have an affinity for the sympathetic. In large doses it paralyzes smooth muscle fibers. L. W. RIGGS

Action of thyroxine on the autonomic innervation. VICTOR KALNINS. *Compt. rend. soc. biol.* **98**, 800-2(1928).—In the rabbit, thyroxine reinforces the action of adrenaline on the intestine and uterus; it appears to increase the excitability of the sympathetic endings but only with large doses. With small doses it sensitizes the parasympathetic innervation of the intestines; with large doses it paralyzes. Action of thyroxine on the autonomic excitability of the heart. *Ibid* 802-4.—The autonomic excitability of the frog heart was not influenced by thyroxine. The sympathetic motor, as well as the parasympathetic inhibitor, retains its normal excitability in the presence of thyroxine. This substance acts differently in the frog and in the rabbit. In the latter thyroxine in large doses reinforces the action of adrenaline, but weakens or suppresses the intestinal motor effects produced by alkaloids acting on the parasympathetic. On the contrary, small doses increase the irritability of the parasympathetic terminations in the intestine. L. W. RIGGS

Action of certain narcotics on the autonomic excitability of the intestine and uterus of the rabbit. BJORN MORAEUS. *Compt. rend. soc. biol.* **98**, 804-6(1928).—The action of bromoisovalerylcarbamide, ethylurethan, ethylacetylurea-HBr, paraldehyde, chlorethyl, chloralose and amylene-chloral were tested on the parasympathetic excitability of preps. of the intestine and uterus of the rabbit isolated and kept alive in Tyrode soln. after the method of Magnus. Pilocarpine, arecoline and acetylcholine were used as parasympathetic excitants. BaCl₂ served as a muscular excitant. None of these narcotics modified the action of adrenaline in the intestinal tests. None of them had any effect on the uterus tests, except in large doses which caused paralysis. Action of certain narcotics on the parasympathetic innervation of the heart. *Ibid* 807-9.—The same narcotics as above were used in these tests. Paraldehyde, chloralose and amylene-chloral in moderate doses sensitize the parasympathetic elements of the frog heart. The property of amylene-chloral of sensitizing rabbit intestine to motor excitations is attributed to an irritability of the terminal parasympathetic nerve organs. L. W. R.

Action of ephedrine on the intestine and uterus. NICOLAI REINITZ. *Compt. rend. soc. biol.* **98**, 809-11(1928).—Tests on pieces of rabbit intestine kept alive in Tyrode soln. by the method of Magnus gave contradictory results following equal doses of ephedrine, thus indicating that the actions of ephedrine depend on accidental conditions of excitability. Ephedrine has only a slight stimulant action on the intestine through the parasympathetic terminations. Large doses of ephedrine render the intestine less sensitive to adrenaline. Action on the uterus is characterized by increase in tonus and in amplitude of contractions and acceleration of rhythm. Atropine completely blocks these effects. L. W. RIGGS

Action of hepatic extract on the formed elements of the blood. NICOLAI REINITZ. *Compt. rend. soc. biol.* **98**, 811-2(1928).—In normal conditions liver ext. appears to exercise no action on the erythrocytes and hemoglobin. The mononuclear leucocytes show a gradual increase, while there is a pronounced thrombocytosis. Liver ext. appears to be an excitant of the red bone marrow and is of value in the treatment of pernicious anemia. L. W. RIGGS

Action of chlorophyll on the blood pressure and blood vessels. EDUARD RENTZ. *Compt. rend. soc. biol.* **98**, 812-4(1928).—In perfusion tests with frog and rabbit, chlorophyll in concns. of 0.001 to 0.1% caused vasodilatation which was easily and completely reversible. On preps. of rabbit aorta, chlorophyll causes increase in tonus. Intravenous injections of 0.0002 to 0.02 g. per kg. caused a transient slight increase in blood pressure. Chlorophyll acts by sensitizing the sympathetic innervation. **Action of chlorophyll on the blood thrombocytes and leucocytes of the rabbit.** *Ibid* 814-6.—Chlorophyll strongly excites that part of bone marrow which produces the thrombocytes (megacaryocytes) and increases the no. of polymorphonuclear leucocytes. Other leucopoietic organs also appear to be stimulated by chlorophyll. **Action of chlorophyll on organs with autonomic innervation.** *Ibid* 818-20.—Moderate doses of chlorophyll sensitize the sympathetic innervation. L. W. RIGGS

Action of insulin on experimental anemia of the rabbit. Inhibitory substances of the blood in hyperglucemia. EDUARD RENTZ. *Compt. rend. soc. biol.* **98**, 816-8(1928).—Bled animals always show a hyperglucemia. The injection of large doses of insulin in anemic (bled) animals caused a diminution of blood sugar to the normal figure. L. W. RIGGS

Pharmacology of iodine ions. In normal animals and in those deprived of thyroid. W. WADI. *Arch. expl. Path. Pharmacol.* **129**, 1-42(1928).—The influence of the thyroid upon the effects of I was detd. in rabbits. Apparently the thyroid influences the way in which I administered by mouth stimulates erythropoiesis. Two effects upon the leucocytic response are manifest, one, a secondary action operating through a thyroid effect causing a hyperleucocytosis, the other, a primary effect of the I tending toward a leucopenia. As primary effects, wholly or in part, should be included the relative shift between myeloid and lymphoid elements in the blood, damage to the lung after continued administration of large doses of I, the increased thermoregulation to cooling, an increased susceptibility to deprivation of O, augmented respiratory metabolism. Subcutaneously injected I compds. exerted comparable effects. G. H. S.

Intensifying the systolic action of digitalis glucosides by cardiazole. K. FAHRENKAMP. *Arch. expl. Path. Pharmacol.* **129**, 52-71(1928).—See C. A. **22**, 816. G. H. S.

Influence of allyl groups on the pharmacological action of different amines. E. BRAUCHLI AND M. CLOETTA. *Arch. expl. Path. Pharmacol.* **129**, 72-84(1928).—With the 8 amines tested, the introduction of an allyl group reversed the pharmacol. action. Normally, when injected intravenously in dogs they cause an increased blood pressure; after chem. modification they reduce blood pressure. G. H. S.

Velocity of narcosis with homologs and isomers of monohydric alcohols. I. LENDLE. *Arch. expl. Path. Pharmacol.* **129**, 85-92(1928).—Velocity of narcosis increases with the length of the C chain; thus the series is, methyl < ethyl, < propyl, < butyl, < amyl, < heptyl. With amyl alc., the tertiary form acts more slowly than the iso-primary, and secondary isomers. G. H. S.

Mechanism of adrenaline hypoglucemia. F. GEIGER. *Arch. expl. Path. Pharmacol.* **129**, 93-9(1928).—Since adrenaline hypoglucemia during hyperventilation tetany occurs only when the vagi are intact, and since the glucose adsorption is increased, the hypoglucemia must be explained on the basis of a delivery of insulin resulting from a central vagus stimulation. G. H. S.

Inflammation. III. Carbohydrate metabolism of the tissues in the initial stages of inflammation. F. BRICKER AND F. SUPONIZKA. *Arch. expl. Path. Pharmacol.* **129**, 100-7(1928).—The venous blood of the inflamed ear contains more sugar and has a higher amylolytic index than does that of the normal ear. The tissue fluid of the inflamed ear also contains an increased amt. of sugar. **IV. Nitrogen metabolism in the initial stages of inflammation.** F. BRICKER. *Ibid* 122-32.—In inflamed tissue there is an intensified protein break-down, as evidenced by an increased formation of the higher products of protein degradation. G. H. S.

Chemistry and pharmacological action of Banisteria caapi Spr. L. LEWIN. *Arch. expl. Path. Pharmacol.* **129**, 133-49(1928).—The alkaloid banisterine causes an increased motor irritability in all species of animal tested. In frogs the increased reflex irritability is followed by paralysis of the extremities. Doses of 0.05 g. cause a strychnine-like reflex tetanus. Pulse rate is slowed. In mammals respiration is accelerated and

the pupils are dilated. Convulsions appear, and if the dosage is raised to 0.2 g. per kg., given subcutaneously, death occurs in 3 to 6 hrs. With subcutaneous injection, the smallest effective dose for guinea pigs is 0.005 g. per kg., the minimal lethal dose is 0.1 g. per kg. In apes the smallest active dose was 8 mg. per kg. From the results of a few injections in man the possible use of banisterine as a therapeutic agent is discussed.

G. H. S.

Causes of the differences in the pharmacological action of optical isomers. E. KEESER. *Arch. expl. Path. Pharmacol.* 129, 236-55(1928).—Detns. of capillary activity made by means of the stalagmometer failed to show any difference between the *l*- and *d*-forms of a number of substances under various conditions of concn. Viscosity of colloidal solns. is modified by the optical isomers in different ways, quite independently of the pH . The *d*-forms increase the gain in wt. of gelatin through inhibition of water more than do the *l*-comps. No material difference in the adsorptive power of compds. of the two types could be demonstrated. The *l*-forms diffused through a levorotatory gelatin more quickly than did the *d*-forms.

G. H. S.

Effect of strychnine, picrotoxin and samandarine on the vessels. OTTO GESSNER. *Arch. expl. Path. Pharmacol.* 129, 261-70(1928).—Strychnine, picrotoxin and samandarine were inert when tested upon carotid of the calf, but with the Lawen-Trendelenburg frog prepn. a definite vasoconstriction was obtained with concns. of 1×10^{-3} . Unlike the constriction, which is reversible, due to picrotoxin, the constricting effects of strychnine and samandarine are only partially reversible. Ergotamine prevents strychnine constriction but not that induced by picrotoxin.

G. H. S.

Comparative pharmacology of the different skeletal muscles of the frog. TOSHIO KITANO. *Arch. expl. Path. Pharmacol.* 129, 271-84(1928).—Corresponding with known differences in contraction phenomena the different muscles of the frog present differences in response to pharmacol. agents. This is particularly true with regard to the reactions to acetylcholine, veratrine and KCN, with which the gastrocnemius and the rectus respond in one way, the sartorius, gracilis and the semimembranosus in another. With NII, and HCl another and less characteristic grouping is obtained.

G. H. S.

Pharmacology of oriental hashish and Cannabis indica. HERMANN CAYER. *Arch. expl. Path. Pharmacol.* 129, 312-8(1928).—The active substance of Persian hashish causes a definite anesthesia of the cornea of the rabbit, by intravenous injection the corneal unit of the acetone soln. being 0.0056 g. per kg. Artificially grown *Cannabis indica* has the same qual. effects, the corneal unit being at the lower limit of activity for men.

G. H. S.

Effect of hashish on man. FRITZ KANT AND EDUARD KRAPE. *Arch. expl. Path. Pharmacol.* 129, 319-38(1928).—Description of the subjective symptoms.

G. H. S.

The dosage and action of pituitary extract and of the ergot alkaloids on the uterus in labor, with a note on the action of adrenaline. ALBCK BOURNE AND J. H. BURN. *Pharm. J.* 119, 485-90(1927).—A series of elaborate clinical investigations. As to the use of pituitary ext., doses of safe administration are established, based on the legal standard of unit strength in force in Great Britain since August, 1927. As to ergot alkaloids, tyramine has no value in obstetrics; lustamine in a dose of 20 mg., when injected under the skin, produces a powerful but short-lived effect; it appears to exhaust the uterine activity. The sp. alkaloid (ergotamine or ergotoxine) exerts a very prolonged action and appears to be an ideal agent for use after delivery. Extractum ergotae liquidum of the Brit. Pharm. being devoid of the sp. alkaloid has no therapeutic effect (cf. *C. A.* 17, 3749). Adrenaline injected into a vein inhibits uterine contraction before delivery; the administration of H_2O has a similar effect.

S. WALDBOTT

Explanation of a surprising resistance to the toxic action of hydrocyanic acid. L. DE SAINT-RAT. *Presse médicale* 1927, 26. R. W. *Schweiz. Apoth. Ztg.* 65, 139-41(1927).—The results obtained by Violle (*C. A.* 21, 136) seem to be supported by a famous case of attempted poisoning with HCN. In an expt *in vitro*, 5 g. of crystd. KCN was added to 250 g. of Port wine contg. 19% EtOH and 85 g. per l. of reducing sugar, and the soln. was titrated at once. After 35 min., titration of 10 cc. showed that 35% of the KCN had combined, after 2 hrs. 35 min., 70%. After 24 hrs., all the KCN as such had disappeared. The presence of EtOH seems to facilitate the formation of glucoheptonic acid; in the absence of EtOH, the reaction is still rapid, but is not complete in 24 hrs.

I—ZOOLOGY

R. A. GORTNER

Comparison between the dissociation of the hemocyanins of Helix and Crustacea. L. T. HOGBEN AND K. F. PINHEY. *Brit. J. Exptl. Biol.* 4, 203-14(1926); *Physiol. Abstracts* 12, 144.—The dissociation curves for the hemocyanins of *Helix* and *Maia* are compared, with the effects thereon of varying temp., H-ion concn. and salt content, and the marked differences in their behavior, except for temp. changes, are discussed. H. G.

Amebocytes of invertebrates. FAURÉ-FRÉMIET. *Bull. hist. appl. physiol. path.* 4, 33-9(1927); *Physiol. Abstracts* 12, 195; cf. *C. A.* 21, 3982.—A short review of the structure, origin and properties of the amebocytes of invertebrates—i. e., the cells met with in the perivisceral and celomic fluid and in the hemolymph. A biol. and physico-chem. study of the more important modifications of form presented by these elements, of their power of making complexes and of forming pseudopodial layers of extreme thinness. H. G.

The effect of fluorides on the echinoderm egg. M. M. LOUCKS AND A. G. DE GRAFF. *Proc. Soc. Exptl. Biol. Med.* 24, 43-4(1928); *Physiol. Abstracts* 12, 140.—Arbacia eggs were placed in 70 cc. of sea water contg. 1 cc. of an isotonic soln. of NaF, KF, K oxalate and K citrate, resp. An immediate flocculation of the eggs occurred in the sea water to which NaF or KF was added, but this did not occur with K oxalate or K citrate, or when artificial sea water was used in which Ca was absent. The flocculation is, therefore, a direct effect of the F ion. The cells became clumped into large masses enmeshed in a gelatinous bed. Cells to which KF or NaF had been added divided at the same rate as the controls. H. G.

Influence of certain salts upon the hatching and development of salmon fry (Salmo trutta). M. RAMULT. *Bull. intern. acad. Polonaise* 1927B, 45-62.—Solns. of weak concn., 0.05 to 0.1 N NaCl, in which salmon fry can live normally do not influence the growth of hatching fry or at periods up to and later than the end of yolk absorption. Solns. of 0.2 to 0.25 N NaCl, in which young fry perish after a time, do not influence their growth at hatching. Solns. of still higher concn., as 0.15 N NaCl, in which young fry die off speedily, appear to reduce the size of the hatched fry. Cf. following abstr. L. W. RIGGS

Influence of certain salts upon the development of young sticklebacks (Gasterosteus aculeatus). M. RAMULT. *Bull. intern. acad. Polonaise* 1927B, 63-6; cf. preceding abstr.—The object of this study was to learn the resisting power of young stickleback fish to NaCl and to van't Hoff's solns. beginning 24 hrs. after hatching. NaCl and van't Hoff's solns. in a weaker concn. than 0.05 to 0.1 N do not seem to exercise any poisonous action upon young sticklebacks. The same solns. in concns. of 0.2 to 0.25 N poison the fish, the NaCl being more poisonous than van't Hoff's isotonic soln. The fish were tested in solns. of KCl, CaCl₂ and mixts. of KCl—CaCl₂ in varying proportions. All of these solns. were poisonous, KCl or CaCl₂ alone being more poisonous than mixts. of the 2 salts. The most favorable mixt. was 1 of KCl to 2 of CaCl₂. Cane sugar was added to preserve a const. osmotic pressure. L. W. RIGGS

Comparison between different species of vertebrates from the point of view of nucleic phosphorus indices and the phosphorus balance of their organs. M. JAVILLIER, (Mlle.) ALICE CRÉMIEU AND (Mme.) H. HINGLAIS. *Bull. soc. chim. biol.* 10, 327-37 (1928); cf. *C. A.* 21, 750, 951, 3208, 3667.—The total P, nucleic P, lipidic P and P of transition were detd. and calcd. to mg. per 100 g. of fresh material and per 100 g. of dry material in the spleen, liver, kidney, brain, heart and muscle of the horse, guinea pig, rat, pigeon, frog, tench and dog-fish. The analytical figures are assembled in 12 tables and ratios of quantities of different forms of P are calcd. **Nucleic phosphorus balances and phosphorus ratios in certain entire animals, invertebrates in particular.** M. JAVILLIER AND (Mlle.) ALICE CRÉMIEU. *Ibid.* 338-41.—P partitions were made in *Sagartia parasitica* (Coelenterata), *Synapta inchoerens* (Holothuroidea), *Nereis diversicolor* (Chaetopoda), *Tubifex rivulorum* (Chaetopoda), *Hirudo medicinalis* (Hirudinea), *Hydrophilus picens* (Arthropoda), *Cardium edule* (Lamellibranchiata), and for comparison the bronze cyprinus and the mouse. The invertebrates have a much smaller percentage of insol. P and a much larger percentage of lipidal, nucleic and transitional P. L. W. RIGGS

Action of hydroquinone on the electrochemical polarity of Infusoria. PAUL ROTH. *Compt. rend. soc. biol.* 98, 377-9(1928).—The action of hydroquinone is definite but varies in time with several other factors such as the no. and age of the Infusoria, age of culture, and state of the soln. with reference to the stability of hydroquinone. L. W. RIGGS

Oxidation-reduction power of the chondriome of gregarines and the procedure for studying the chondriome. PII. JOYET-LAVERGNE. *Compt. rend. soc. biol.* **98**, 501-2 (1928), cf. *C. A.* **22**, 1792. L. W. RIGGS

Limits of temperature and salinity supported by *Convoluta roscoffensis*. M. GOMPEL AND R. LEGENDRE. *Compt. rend. soc. biol.* **98**, 572-3 (1928).—The fatal temp. for *C. roscoffensis* is about 38° but the worms lose their phototropism at a lower temp. In fresh water their movements instantly cease and the worms swell and burst. The lower limit of salinity is represented by a d. of about 1.005 and the upper limit by d. 1.037. Under the combined action of temp. and salinity the worms at 38° behave normally until the sea water is dild. to d. 1.010. At d. 1.0075 they die rapidly at 35°. Beginning at 1.010 the critical temp. is lowered as the salinity diminishes. L. W. R.

Experimental infection of *Pyrausta nubilais* by entomophytous fungi. S. MÉTALNIKOV AND K. TOUMANOFF. *Compt. rend. soc. biol.* **98**, 583-4 (1928).—The corn borer larvae were readily infected with *Aspergillus flavus*, *Botrytis bassiana*, *Isaria farinosa* and *Sterigmatocystis nigra*. The first named caused death in every case, and the second and third named were markedly virulent. Simple contact with the spores of the fungus without the aid of moisture was sufficient for inoculation of the larvae. L. W. RIGGS

Action of a nucleus of hydroxyaminoquinoline on the gametes and the sporozoites of the *Halteridium* of the pigeon. A. GODOY AND J. G. LACORTE. *Compt. rend. soc. biol.* **98**, 617-9 (1928).—The nucleus of hydroxyaminoquinoline (plasmochine) has a gameticidic action on the *Halteridium* of the pigeon, but does not act on the schizogonic forms of the same species. Plasmochine has a destructive action on the sporozoites of the *Halteridium* of the pigeon. These sporozoites may possess a plasmatic constitution identical to that of the gametes or very similar. The constitution of plasmochine is rapidly modified as 24 hrs. after its ingestion it does not prevent the development of the parasite. L. W. RIGGS

Role of skin and visual excitations in the maintenance of cardiac frequency in the frog. A. A. XAVIER. *Compt. rend. soc. biol.* **98**, 627-8 (1928).—The fall in cardiac frequency produced by ablation of the skin is not due to the action of CO₂ nor to the suppression of the respiratory movements. The suppression of vision reinforces the effect of the ablation of the skin. The cardiac modifications are not produced after section of the vagus nerves. Cf. following abstr. L. W. RIGGS

Effects of ablation of the skin on the respiratory movements in the frog. MIGUEL OZORIO DE ALMEIDA. *Compt. rend. soc. biol.* **98**, 641-2 (1928); cf. preceding abstr.—In the frog in which chem. regulation is much reduced, the activity of the respiratory center depends directly on the excitations coming from the exterior. The skin is the principal source of these excitations. L. W. RIGGS

New findings on the biochemistry of *Centrina vulpecula* Rond. M. KOLLMANN, F. VAN GAVER AND J. TIMON-DAVID. *Compt. rend. soc. biol.* **98**, 776-7 (1928).—The sample of *C. vulpecula* studied weighed 6450 g. Its interior was nearly filled with liver and 16 ovarian eggs, weighing 1535 and 1525 g, resp. Both liver and ovarian eggs furnish oils with the following consts., resp: d at 15° 0.9002, 0.9016; n_D^{14} 1.4689 1.4744; abs. coeff. of dilatation between 18° and 60° 0.00069, 0.000775; iodine index 73.4, 113.9; sapon. index 132.3, 133.7. L. W. RIGGS

Studies on the function of dissolved foodstuffs in the metabolism of aquatic animals. VII. Decrease of the surface tension of the media and growth production. JAROSLAV KRÍŽENECKÝ AND OLGA DUBSKÁ. *Protoplasma* **2**, 17-33 (1927).—Dissolved foodstuff (peptone, sucrose, glycerol) caused growth in tadpoles. Bauer had demonstrated that the surface tension of the media had an effect on the growth of tadpoles. Were the results with foodstuffs due, therefore, to their action on the surface tension? In solns. of lactic acid and ethyl acetate in which no decrease in surface tension took place there was no growth. It was concluded that the action of dissolved foodstuffs is indirect and that the surface tension of the H₂O alters the permeability of the tadpole skin. M. H. SOULE

Heat resistance of sea urchin eggs (*Paracentrotus lividus* Lk). BORIS EPHRUSSI AND ALEXANDRE NEUKOMM. *Protoplasma* **2**, 34-44 (1927).—The sea-water suspensions of the eggs were placed in Borrel tubes and the p_H was varied by the addn. of acids or NaOH. The desired temps. were obtained by placing the tubes in a H₂O bath. The eggs were more resistant to the effects of heat at p_H 7.1 and 10. This resistance was independent of the degree of heat to which the cells were subjected. The nature of the acid (HCl, butyric, etc.) employed seemed not to have much effect. The vol. of the eggs at p_H 7.1 was +5.3%, at p_H 10 —3.1%. It is unlikely that the heat resistance was associated with the intensity of imbibition as was found for the stomata cells of

plants by Weber. It is not possible to account for the heat stability of protoplasm on the basis of imbibition.

Reversible gelatin produced by an increase in the temperature of a freshwater ameba. M. A. VAN HERWERDEN. *Protoplasma* 2, 271-7 (1927).—Two varieties of fresh water ameba (probably *A. vespertilio*) were subjected to slight increases in temp. At first a diminution and then a rise in protoplasmic viscosity took place. Irreversible gelatin occurred at 40°; after this point local reversals continued till 48°. M. H. S.

12—FOODS

F. C. BLANCK AND H. A. LEPPER

Isolation and identification of benzoic acid in food products. GIOVANNI ISSOGLIO. *Atti II congresso naz. chim. pura applicata* 1926, 1381-3.—Comparative tests were made of all methods for the extn. of BzOH from food products to det. which method is the most rapid, economical and reliable. The investigation led to the adoption of a method which is based on that of Lehmann (*C. A.* 2, 3373; 3, 674). Add 200 cc. of water and 20 cc. of 10% H_2SO_4 to 100-200 g. of food product, steam-distill, collect 200 cc., add aq. Na_2CO_3 until distinctly alk., evap. to 20 cc., acidify with dil. H_2SO_4 , ext. twice with 20 cc. of Et_2O , wash the Et_2O ext. with a little water, filter, evap. until crystn. is complete, and if desired sublime this pure BzOH, and identify it by a m.-p. detn. It may also be identified with the following additional tests. Dissolve in NH_4OH , evap. the excess NH_3 , and add dil. $FeCl_3$, which ppts. rose-colored $(BzO)_3Fe$. Dissolve the latter in dil. HCl , ext. with twice the vol. of petr. ether, evap. the ether ext., add to the residue $(BzOH)$, a drop of aq. $FeCl_3$ and a drop of H_2O_2 , which gives a violet color (Ionescu reaction). Acidify this with HCl , ext. with petr. ether, evap., add a few drops of a mixt. of fuming HNO_3 and concd. H_2SO_4 , heat until red fumes are no longer evolved, dil. with water, add a slight excess of NH_4OH and 1 cc. of 10% KCN , which gives a red color. C. C. DAVIS

Dairy bacteriology in Scandinavia. WILFRED SADTLER. *Sci. Agr.* 8, 591-8 (1928).—A well-prepd. and complete report of a year's research spent among the dairy labs. of Sweden and Denmark. C. R. FELLERS

The relative value of potato flours. W. EKHARD. *Z. Spiritusind.* 51, 16 (1928).—Viscosity tests were made according to Lawaczek, and the viscosity of a given concn. of an unknown flour paste compared with the control is used as an index of its relative value. If 2.5 g. of flour requires 68 sec. to discharge, and the unknown giving a reading of 68 has a concn. of 1.97, then $(2.5 \times 100)/1.97 = 1.27\%$. Na and K increase the values and Ca and Mg tend to decrease them. Acids are harmful in the prepn. and should not be permitted to act on the paste. Size of starch grains had no material influence on the viscosity. C. N. FREY

Milk and its adulteration. R. GRASSBERGER. *Wiener med. Wochschr.* 77, 1451-3, 1483-8 (1927). ARTHUR GROLLMAN

Clean milk production. ALLAN SKELTON. *Munic. Eng. Sanit. Record* 80, 291 (1927).—Clean milk should be free from dirt or contamination, reasonably low in bacteria (the non-pathogenic variety, lactic acid bacteria, etc.), absolutely free from tubercle bacilli, *B. coli* absent in 1 cc. and should keep under reasonable conditions for several days. Pasteurized or treated milk tends to make milk producers careless in their methods. Sanitary methods of milking are described. C. H. BADGER

The "alkalinity value" of milk and its electrolytic determination. Z. v. MARIKOVSKY AND E. LINDNER. *Chem.-Ztg.* 52, 283 (1928).—By "alkalinity value" of milk is meant the total cations; for normal milk this is practically const. Upon electrolysis by the Hg-cathode method, 5 cc. of normal milk gives an alky. value equiv. to 5.6 cc. of 0.1 N $NaOH$. This alky. expressed in terms of 1 cc. of milk is known as the alky. factor, it averages about 1.12 for normal samples. RUSSELL C. ERB

Adjustment of composition important. F. J. DOAN. *Butter, Cheese, and Egg J.* (Feb., 1927) 23, 24, 26, 27; *Expt. Sta. Record* 56, 873.—D. describes methods of standardizing mixes for the manuf. of uniform high quality sweetened condensed milk. It is almost invariably necessary to add skim milk or to remove cream to adjust the mix, and examples of both procedures are described. H. G.

Nature of the neutralization precipitate and its effect on the recovery of milk sugar from grain-curd-casein whey. R. W. BELL AND P. N. PETER. *Ind. Eng. Chem.* 20, 510-2 (1928).—When grain-curd-casein whey is neutralized with $NaOH$ or $Ca(OH)_2$, a ppt. of $Ca_3(PO_4)_2$ and protein matter forms, the amt. of ppt. and the ratio of $Ca_3(PO_4)_2$ to protein increasing with pH . When the whey is concd. this ppt. increases the

viscosity to such an extent that development of lactose crystals is hindered. Complete removal of the ppt. at p_H 7, which is difficult, permits a good yield of lactose to be obtained.

F. L. SEYMOUR-JONES

Grading of commercial gelatin and its use in the manufacture of ice cream. II. A. C. DAHLBERG, D. C. CARPENTER AND J. C. HENING. *Ind. Eng. Chem.* **20**, 516-26 (1928).—A studied comparison was made of the Bloom, Hall, Burke and test-tube methods of testing gelatin according to their gel stiffness by means of the MacMichael viscometer. The lowest percentages of different gelatins giving a mix of over 700 centipoises in viscosity were detd. In evaluating the worth of gelatin in ice cream a standard process in manufg. was employed and the melting-down consistency as well as the texture of the resulting ice cream were considered. Differentiations are recognized between gel consistency and gel stiffness. The use of skim milk as a medium in which to dissolve the gelatin for automatic control of p_H is superior to the adjustment of the p_H of gelatin in water soln. The destruction of gelatin by material means and its reformation into a gel upon standing at low temp. is an important property of gelatin as a binder in ice cream.

H. F. ZOLLER

The composition of Canadian Cheddar and process cheese. E. G. HOOD AND A. H. WHITE. *Canada Dept. Agr. Bull.* **79**, (n. ser.), 18 (1927), *Expt. Sta. Record* **57**, 179.—An analysis of 444 samples of Cheddar cheese showed an av. compn. of moisture 34.82, fat 33.75, fat in water-free substance 51.77, and casein and other solids 31.43%. There was no definite relation between the texture and the ratio of the principal constituents.

H. G.

Investigations on maize. B. LAMPE. *Z. Spiritusind.* **51**, 14 (1928).—Analyses of a large number of samples of maize from different countries are given. La Plata maize had the highest starch content.

C. N. FREY

Maize silage. II. H. J. WOODMAN AND A. AMOS. *J. Agr. Sci.* **18**, 194-9 (1928), cf. *C. A.* **18**, 3438.—In regard to compn., digestibility and nutritive value, silage obtained in expts. with a French variety of maize, Jaune Gros, was somewhat superior to American maize silage, the av. results of numerous investigations being taken in that country. Compared on a dry matter basis, its nutritive value was also superior to that of "green fruity" oat and tare silage. Further feeding tests on calves confirmed the results of the digestion trials in respect to the feeding value.

P. R. DAWSON

Ethylene is a ripener of fruits and vegetables. R. B. HARVEY. *Science* **67**, 421-2 (1928); cf. *C. A.* **21**, 2944.—Contrary to the findings of Chace and Church (cf. *C. A.* **21**, 3688), H. insists that C_2H_4 has a ripening effect on fruits and vegetables when applied in concns. of 1 to 1000 of air by vol. and at 65° or higher. In the expts. of Chace and Church a concn. of 1 to 5000 by vol. was used, whereby it was stated that the color of the fruit was changed, but that the compn. of citrus fruits was not appreciably altered.

L. W. RIGGS

The composition of the fruits of Moravia. K. NEORAL AND J. BLAHA. *Mín. Zeměděl., Spr. Vyzkumn. Úst. Zeměděl. (Czechoslovakia)* No. **18**, 26 pp. (1926); *French Abstr.* 22-26; *Expt. Sta. Record* **57**, 138.—Results are given of a study of the chem. compn. of fruits grown in Moravia, including such items as dry matter, insol. substances, sugars, acids, mineral content, etc.

H. G.

Storing of lemons. F. M. READ. *J. Agr. Victoria* **24**, 292-303 (1926); *Physiol. Abstracts* **12**, 466.—The fruit should be picked as it reaches a diam. of 2½ in. while still green. Ripe or nearly ripe fruit will not keep satisfactorily. Lemons improve in keeping quality and chem. compn. during the process of curing.

H. G.

Loss of nutrients in the mechanical removal of water from potatoes. E. PAROW, A. STIRNUS AND W. EKHARD. *Z. Spiritusind.* **50**, 277-8; cf. *C. A.* **21**, 3419.—Analyses of original, potatoes, flakes and juice are given. In general the greatest loss of nutrients occurs in processes involving the greatest removal of the H_2O . One exception was found out of 7 expts. reported. In all cases the losses are great, and to overcome this the concd. juice should be returned to the cake.

C. N. FREY

Chemical composition of some varieties of edible onions. G. RIVIÈRE AND G. PICHARD. *J. Soc. Nut. Hort. France* **26**, 277-8 (1925); *Botan. Abstracts* **15**, 1175.—Analyses of 3 types show considerable differences in dry matter, ash and reducing sugars. A so-called sweet variety possesses much larger sugar content and considerably lower dry matter content than the other varieties.

H. G.

The chloride content of canned sauerkraut. M. E. STARK. *J. Lab. Clin. Med.* **12**, 561-3 (1927); *Expt. Sta. Record* **57**, 193.—Detns. of the content of chlorides, calcd. as NaCl, in canned sauerkraut are reported. The min., max. and av. values for the juice as detd. on 11 samples, including 8 brands, were 1.502, 2.228 and 1.881 g. per 100 cc. and 1.469, 2.167 and 1.83 g. per 100 g., resp. Corresponding values in grams

per 100 g. for solid kraut representing 7 samples from 5 cans and including 4 brands, were 1.605, 1.947 and 1.736 g., resp. H. G.

Pickling olives by the modern Greek process. S. A. KALOYERAS. *Fruit Products, J. and Am. Vinegar Ind.* 7, No. 8, 14-6(1928).—Old methods are briefly considered, in addn. to the modern or salt process. The chem. compns. of olive flesh of olives prepd. by the 3 leading processes are tabulated. The compns. of California and imported Greek process olives are compared. The conclusion seems warranted that the olives treated by the salt process have greater nutritive value, especially those imported from Greece, because of their higher oil content and higher % of other nutritive properties. The green olives, although appetizing, are not very nutritious and are hard to digest. They contain a comparatively small quantity of oil. J. A. KENNEDY

The influence of the stage of lactation and the breed of the cow on the yield and quality of the milk. T. J. DRAKELEY AND M. K. WHITE. *J. Agr. Sci.* 17, 118-39 (1927).—The % of fat decreases to a min. on about the 40th day after calving and then steadily rises again. The yield of milk increases to a max. on about the 45th day and then decreases. The shorter the interval between milking, the lower is the yield of milk as well as the % of solids-not-fat, but the greater is the % of fat. The yield of solids-not-fat increases until approx. the 30th day, after which there is a decline. The Jersey breed yielded milk of the highest fat content. P. R. DAWSON

The "mineral" factor in the feeding of animals. F. E. CORRIE. *Pharm. J.* 119, 667-9(1927).—The importance of the addition of mineral supplements to the food of animals to avoid malnutrition and disease is discussed. Formulas for such mixts. are quoted. S. WALDBOTT

Dried brewers' yeast vs. linseed-oil meal as a protein supplement for dairy cows in milk. H. BARTON, A. R. NESS AND E. W. CRAMPTON. Macdonald Coll., McGill Univ., *Tech. Bull.* 3, 30 pp.(1926); *Expt. Sta. Record* 57, 74.—Dried brewers' yeast may be substituted lb for lb. for linseed-oil meal in rations for milking cows. The suggestion is made that the brewers' yeast be incorporated with the brewers' grains and sold in that form. Such a practice would materially increase the value of the grains. H. G.

Grapefruit refuse as a dairy feed. J. M. SCORR. *Florida Sta. Rept.* 1926, 25, 26; *Expt. Sta. Record* 56, 872.—Two lots of cows were fed by the reversal method for 3 periods. During the first period all cows were fed alike. During the second period grapefruit refuse, analyzing moisture 18%, fat 5.25, protein 5.31, carbohydrates 61.69 and fiber 9.75%, was added to the grain ration of one lot and during the third period the rations were reversed. The grapefruit refuse seemed to have a tendency to increase the milk flow. H. G.

Nutritive value of pasture. III. The influence of the intensity of grazing on the composition and nutritive value of pasture herbage. I. H. E. WOODMAN, D. B. NORMAN AND J. W. BEE. *J. Agr. Sci.* 18, 266-96(1928); cf. *C. A.* 20, 2346; 21, 2522.—The differences in chem. compn., both org. and inorg., between pasture grass cut at intervals of 1 week and 2 weeks are slight. The dry matter of the fortnightly cut grass is extremely high in crude protein and contains a low % of crude fiber, as compared with grass cut at the hay stage of maturity. These characteristics are retained by systematic cutting at intervals of 2 weeks throughout the entire season. The results of digestion tests justify the conclusion that the dry matter of pasture herbage under a system of fortnightly cutting is a protein concentrate equal in digestibility and nutritive value to that obtained by weekly cuttings. The herbage still consists of the same immature, non-lignified tissue as it was at the end of 1 week's growth, with no running-off in respect to compn. and feeding value. It may be inferred that similar results would be obtained with a system of sectional grazing, where pastures eaten down are allowed a fortnightly interval of unchecked growth. In spite of a slight widening of the nutritive ratio in the fortnightly cut grass as compared with that cut weekly, the value is still significantly narrower than the nutrition ratio of milk. As in a system of weekly cutting, it is desirable to employ carbohydrate instead of protein concentrates for supplementing feeding under a more lenient system of grazing. A light-land pasture plot produced increases in dry matter, starch equiv. and digestible protein of 26, 29 and 21%, resp., during 1927, with fortnightly cutting, as compared with 1925 with weekly cutting. However, these differences may be due in part to differences in meteorological conditions in the two seasons. It is concluded that, although intensification of the system of cutting tends to depress productivity, the difference between weekly and fortnightly systems is not sufficient to bring out this effect prominently. Under favorable meteorological conditions the difference is not more than 10%; under less favorable conditions it may be greater. P. R. D.

Apparatus for emulsifying dried milk with water (Brit. pat 275,375) 1. Apparatus for pasteurizing milk (U. S. pat. 1,668,293) 4. Apparatus for producing actinic rays of extremely short wave-lengths for sterilizing foods (Brit. pat 275,596) 1.

WUHLFAHRT, JULIUS E., and BROOKS, ROBERT W.: **A Treatise on Baking**. New York: The Fleischmann Co. 362 pp. \$1. Reviewed in *Cereal Chemistry* 5, 162 (1928).

Beverages. SIEMENS & HALSKE AKT.-GES., H. ENGELHARDT and K. ENGELHARDT. Brit. 275,454, Oct. 21, 1926. Pulverized substances of relatively low sp. gr. such as MgO , $CaCO_3$, pulverized Al or Be or their oxides are mixed with alc. beverages or fruit juices in the process of artificially maturing them with ozone, in order to prevent impairment of flavor.

Preparing foods with kola. A. CHALAS and E. CHALAS. U. S. 1,669,326, May 8. The oxalides of fresh kola are destroyed, *e. g.*, by heat, and a soft ext. is prepd. from the kola thus treated; this ext. is dild. with hot water and lactose is gradually added and stirred into the product until it is almost in the state of dry grains; the product is then crushed.

Differentiating between cooked and uncooked cans of foods. J. HANSON and E. F. LEE. U. S. 1,668,767, May 8. The cans are marked with a compn. comprising a binder, a solvent and a coloring substance, *e. g.*, with a mixt. of shellac, alc. and erythrosin, prior to cooking the filled cans, and the latter are then passed through a cooking zone at a temp. of about 115° which changes the color marking on the can permanently.

Sterilizing and preserving foods. G. A. KRAUSE. Brit. 274,909, July 26, 1926. Foods such as meat, fish, eggs, butter, fruits and vegetables, and anatomical specimens are treated with water or other liquids which have been in contact with metals such as Cu, Ag and Au or alloys capable of destroying microorganisms.

Preserving meat or other foods at low temperatures in an atmosphere containing atomized salt solution. FOOD CHILLERS, LTD. Brit. 275,184, July 30, 1926. An app. is described.

Preserving vegetable food products. A. B. HASLACHER. U. S. 1,668,903, May 8. Corn on the cob, peas or other vegetable material is heated with water to a temp. of about 99° and is afterward frozen while immersed in water.

Drying fruits, vegetables, etc., by circulating superheated steam under partial vacuum. S. T. HOYT. U. S. 1,668,591, May 8.

Apparatus for pasteurizing milk in bulk. R. HORTON. U. S. 1,668,316, May 1.

Apparatus with cooled rollers for kneading ingredients of margarine, etc. B. JIROTKA. Brit. 274,949, April 26, 1926.

Preserving yeast. W. R. JOHNSTON. U. S. 1,667,895, May 1. Compressed moist yeast is formed into a creamy mixt. with an aq. soln. formed from flaxseed and hops, further admixed with an absorbent material such as cornmeal, and the mixt. is dried.

Distributing gases for fumigation, etc. F. A. EUSTIS. U. S. 1,668,496, May 1. In fumigating grapes or other foods with SO_2 , or in similar operations, the reagent used, *e. g.*, liquid SO_2 , is heated sufficiently to effect volatilization and generate a high pressure and a fine stream of the gas is led into one part of the treatment chamber where it is commingled with a stream of air and the mixt. thus produced is further distributed uniformly about the fruit or other substances being treated. An app. is described.

Food for animals. A. E. KIENZLE. Brit. 275,434, Sept. 16, 1926. Ground maize cobs are mixed with wet spent malt or like material, with or without addn. of molasses, or other foods.

13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

Some problems encountered in making fine chemicals. F. H. CARR. *Chemistry & Industry* 47, 384-8(1928); cf. C. A. 21, 971.—In the prepn. of lime permanganate granules for Army respirators, the use of a cast-Fe edge-runner mill contg. an impurity in the Fe, presumably Ni or Co, gave an unstable product. Thorough mixing is of great importance, and may be gained by the use of a high-speed centrifugal pump or a Buhtz reaction machine. Concn. of aq. solns. may be accomplished without heating

by freezing and straining away the ice-crystals. The general details of *isoelectric pptn.* and of *concn.* are discussed.

Synthetic ammonia in refrigeration machines. P. PETIT. *Brasserie et malterie*, 18, 1-5(1928).—Sustained low efficiency is occasionally observed with refrigeration machines using synthetic NH_3 , but does not seem to have been reported with machines using NH_3 from other sources. P. suggests that the trouble is probably due to incomplete elimination of the dissolved N and H which is always present in synthetic NH_3 as manufd., but not in NH_3 from other sources.

Ethylene dichloride as a solvent. K. H. BAUER AND H. LAUTH. *Chem. Umschau Fette, Oele, Wachse Harze* 35, 82-6(1928).—Purified $\text{C}_2\text{H}_4\text{Cl}_2$ has d_{20} 1.250; distn. 82.6-82.8° 10%; 83° 54%; 83.3° 24%; 84-86° 9.5%; loss, 2.5%; flash (Abel-Pensky) 12-13°; inflammability. a flame will ignite $\text{C}_2\text{H}_4\text{Cl}_2$ in an open dish, but dies out on removal of the flame; at 40° and 60° it dies out more slowly and still more slowly when a galvanized-iron dish is used. Evapn. tests with 5 g. of material in a $2\frac{1}{2} \times 7$ cm. weighing glass: 99.98% at room temp. in 276 min.; 100% for $\text{C}_2\text{H}_4\text{Cl}_2$ in 240 min.; and 99.92% for 76-143° benzine after 24.5 hrs. $\text{C}_2\text{H}_4\text{Cl}_2$ is miscible with CH_3OH , $\text{C}_2\text{H}_5\text{OH}$, acetone, AcOEt , C_6H_6 , toluene, petr. ether, ligroin, benzene, pyridine, CCl_4 , trichloroethylene, pentachloroethane, cyclohexanol; CS_2 causes turbidity. Soly. in H_2O : 0.5 cc. at 18-9° in 100 cc. H_2O , and 0.1 cc. H_2O in 100 cc. $\text{C}_2\text{H}_4\text{Cl}_2$; it readily dissolves vegetable oils (12 samples tested) and with difficulty, a no. of resins (table given). Nitrocellulose swells little in $\text{C}_2\text{H}_4\text{Cl}_2$, but dissolves in a mixt. of 80 $\text{C}_2\text{H}_4\text{Cl}_2$, 15 CH_3OH and 5 AcOEt . Acetylcellulose swells strongly in $\text{C}_2\text{H}_4\text{Cl}_2$. Expts. for extg. oil from olive-press residues showed $\text{C}_2\text{H}_4\text{Cl}_2$ to be slightly superior to ether; the solvent can be completely removed from the oil by steam and flavor and odor are unaffected. Boiling $\text{C}_2\text{H}_4\text{Cl}_2$ in the presence of 10% H_2O splits off only traces of HCl and with alk. or acid KMnO_4 it is about as stable as CCl_4 , but surpasses $\text{C}_2\text{H}_5\text{Cl}$ and C_6H_6 . With neutral $\text{K}_2\text{Cr}_2\text{O}_7$ it remains uncompd. but with acid $\text{K}_2\text{Cr}_2\text{O}_7$, it is less stable than CCl_4 and C_6H_6 . $\text{C}_2\text{H}_4\text{Cl}_2$ 0.25-5% by vol. in air causes increased heart activity in white mice and difficulty in breathing; they recover in fresh air.

Compressed and liquefied gases with special reference to the requirements of maritime transport. GIULIO MORPURGO. *Notiz. chim.-ind.* 3, 141-2; cf. C. A. 22, 1637.—A discussion, with illustrations, of the causes of explosions of cylinders.

Chronic benzene poisoning among women industrial workers. A study of the women exposed to benzene fumes in six factories. ADELAIDE R. SMITH. *J. Ind. Hyg.* 10, 73-93(1928).—Blood examn. and physical examn. of 79 women exposed to benzene vapors from rubber cement showed unmistakable evidence of injury in 25 cases. There was a reduction of the white-cell count from the normal of 7500 to 5600 and below; there were purpuric spots and pronounced anemia in some cases; and there were very frequent complaints of headaches, excessive fatigue, dizziness, nausea, anorexia and other characteristic symptoms; there was a large increase in endothelialocytes and abnormal cells were found. There was a distinct odor of benzene in the workrooms, but it was not strong enough to cause immediate discomfort. A substitute for benzene was found, and tests repeated at the end of six weeks showed definite improvement.

Absorption refrigerating apparatus. B. C. VON PLATEN and C. G. MUNTJERS. U. S. 1,669,269, May 8.

Absorption refrigerating apparatus. ELECTROLUX, LTD. Brit. 274,840, July 26, 1926.

Absorption refrigerating apparatus. ELECTROLUX, LTD. Brit. 275,576, Aug. 3, 1926.

Continuous-cycle absorption refrigerating apparatus. ELECTROLUX, LTD. Brit. 275,188, July 31, 1926.

Electrical insulators. J. J. WELDON. Brit. 274,851, July 20, 1926. Insulating rods or studs are formed of cotton or other textile cords held in compressed condition by a binder such as bakelite.

Electric insulation. P. ALLMAN, H. N. MORRIS and L. H. MARJOR. Brit. 275,304, April 30, 1926. Wires and cables are coated by use of a combined soln. of rubber and cellulose and volatile hydrogenated aromatic hydrocarbon products or their hydroxy compds. or esters such as tetrahydronaphthol, tetrahydrophenol, and cyclohexanone. Gutta-percha, balata or other resinous products also may be used.

Heat-insulating sheets. J. WEISS and R. KARG. Brit. 274,471, July 14, 1926. Fibrous vegetable material such as "wood wool," shavings, rushes or straw is used with magnesite and a reactive substance such as an aq. soln. of kieserite, "bitter salt" or Na_2SO_4 and the mass is pressed and dried in perforated molds. Reinforcing or facing materials may also be used on or embedded in the material.

Drying printing inks or other oily substances carried by sheet material. G. L. CLARK. U. S. 1,668,943, May 8. The material is first progressively heated to a relatively high temp. and then, before cooling, is subjected to the action of a confined mixt. of ozone and air.

Hydrogenizing oils. H. MARCHAND. Brit. 275,642, Aug. 5, 1926. Materials such as tar, mazout, or heavy oils are mixed with powd. coal, coke, wood, lignite or the like and the mixt. is distd. at 200–800° and the gaseous products formed are washed, cracked, mixed with products sep'd in the washing operation and the mixt. is treated with H to effect hydrogenation. An app. is described.

Regenerating catalysts used in decomposing steam by phosphorus. M. LARSSON. U. S. 1,668,539, May 1. H is passed over the spent catalyst (which may be formed of metals or metallic oxides) at such a temp. (suitably about 500–700°) that its deleterious coating is converted into a substance of such character that it can be reacted on by steam on the resumption of the decompn. of steam by P.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

What every engineer and water works superintendent should know about chlorination. R. V. DONNELLY. *J. New England Water Works Assocn.* **42**, 79 (1928).—D. describes the equipment generally used, its use, and the common troubles an operator may encounter. New and old uses for Cl are considered. D. K. FRENCH

Relining Payson Park Reservoir: Cambridge Water Works. L. M. HASTINGS. *J. New England Water Works Assocn.* **42**, 47–52 (1928).—An American portland-cement mortar, or, as applied, "re-inforced gunite" was used. The compn. and laying of a two-inch lining to a leaking reservoir are described. D. K. FRENCH

Observations on purification plant reports. J. W. ARMSTRONG. *J. Am. Water Works Assocn.* **19**, 402–7 (1928).—Suggestions are made to make plotted charts more valuable. D. K. FRENCH

Decolorization of soft colored waters. R. S. WESTON. *J. Am. Water Works Assocn.* **19**, 416–27 (1928).—Storage, filtration, and coagulation are considered. Al⁺⁺⁺ ions must combine directly with and ppt. the color particles for best results. Certain industrial colored wastes cannot as yet be economically treated. The mechanics of treatment and mixing are important factors. D. K. FRENCH

Purification and treatment of feedwater. S. T. POWELL. *Power Plant Engineering* **32**, 24–6 (1928).—Innovations within recent years are: (1) continuous blow down

where solids concentrate rapidly and where there is a marked tendency toward priming and foaming, (2) electrolytic scale and corrosion-prevention systems, (3) acid feeding equipment to inhibit embrittlement of metal, (4) deaerators, and (5) deaerating heaters.

S. D. POARCH

Purification of water from rivers polluted by sisal effluent. F. C. KELLY. *Kenya Med. J.* 3, 212-5(1926); *Bull. Hyg.* 2, 651(1927).—Sisal waste markedly increases albuminoid N and decreases absorbed O. The absorbed O test furnishes an excellent indication of sisal pollution because of the marked reducing properties of some unidentified constituent. Fish life but not frogs are destroyed by sisal effluent. Filtration is effective in overcoming pollution by sisal.

C. R. FELLERS

Coagulation processes in the purification of river water. C. P. MOM. *Mededeel. Dienst Volksgezondheid Nederland. Indis* 17, 1-12, 13-9(1928).—Coagulation of the colloidal clay in the water of the Tjilwoni by means of lime was investigated. Removal of the excess lime still present after coagulation and filtration by means of lime-absorbing materials gave unsatisfactory results. Different methods of removing excess lime are discussed, the difficulties experienced in this portion of the purification process are not sufficiently compensated for by the advantage of the sterilizing effect of the lime as a coagulating agent. Coagulation of the colloidal clay by means of $\text{Fe}_2(\text{SO}_4)_3$ and lime also was investigated. $\text{Fe}(\text{OH})_3$, together with the $\text{Ca}(\text{OH})_2$, constitutes the actual coagulating agent in this process. The practical value of $\text{Fe}_2(\text{SO}_4)_3$ -lime coagulation is discussed. Its sterilizing influence when treating water rich in alkali is a great advantage. Its disadvantages are (1) difficulty of neutralizing the alk. reaction after coagulation and (2) the reductive character of the $\text{Fe}_2(\text{SO}_4)_3$ which requires extra O_2 in oxidizing the water.

J. A. KENNEDY

Oxidation processes in the purification of river water. C. P. MOM. *Mededeel. Dienst Volksgezondheid Nederland. Indis* 17, 21-32(1928).—Different methods of oxidizing org. matter which occurs in river water and hinders coagulation were examd. The catalytic influence was shown of sunlight and colloidal clay on the decompn. of KMnO_4 , Cl_2 and Caporite. (This is a Griesheim Electron prepn. of Ca hypochlorite with a content of so-called active Cl_2 of about 70%. It is fairly stable and can be kept for a long time. Chemically and physiologically it is practically as active as liquid Cl_2 and in many cases can replace the latter, cf. *Geneeskundig Tijdschrift voor Nederland. Indis* 63, No. 6(1923).) Sunlight brings about decompn. more quickly and affects these oxidizing agents favorably. It is strongest in the case of KMnO_4 . Filtered river water decomposes less of the oxidizing agent than raw water. Colloidal clay advances the decompn. both of KMnO_4 and of Caporite. In the flocculated form clay does not act as strongly. Cl_2 gas acted practically the same as Caporite. Colloidal kaolin has no influence upon the decompn. of KMnO_4 , but it does influence that of Caporite. In practice, the p_H generally proves to be of little importance. Glazed earthenware jars and glass cylinders were used in the work. Considerable discussion of the above is given by the author.

J. A. KENNEDY

Plants as indicators of ground water. O. E. MEINZER. U. S. Geol. Survey, *Water Supply Paper* 577, 95 pp., 12 plates(1927).—Plants of the arid regions of N. Mex., Ariz. and Nev. are described with reference to the distance to the water table from the surface where the plants are growing. Thus the salt grasses, *Eragrostis obtusiflora* and *Distichlis spicata* and the wild rye *Elymus condensatus*, indicate water within 15 ft. To a slight extent the vegetation indicates the quality of the water. Salt grasses and alkali-resistant plants are apt to be found near highly mineralized water.

L. W. RIGGS

Activities of plankton in the natural purification of polluted water. W. C. PURDY. *Am. J. Pub. Health* 18, 468-75(1928).—The activities of plankton and related organisms constitute a part of the program of natural purification of polluted water. Plankton by their food habits tend to remove a portion of the org. matter. The photosynthetic activities of chlorophyll-bearing organisms operate to produce O_2 . The energy of harmful org. matter consumed as food and released to the water in terms of motion serves to furnish as intimate mixing and microscopic circulation during the critical initial stages of recovery from pollution.

C. R. FELLERS

Chemical character of waters of Florida. W. D. COLLINS AND C. S. HOWARD. U. S. Geol. Survey, *Water-Supply Paper* 596-G, 177-233(1928).—Analyses of 458 waters are tabulated, the constituents detd. being total solids, SiO_2 , Fe, Ca, Mg, Na + K, HCO_3 , SO_4 , Cl, NO_3 and the total hardness as CaCO_3 . These analyses relate to mineral constituents only and do not indicate the sanitary quality except when waters are unfit to drink because of excessive mineral content. Of the 458 samples representing every county in the state, 73 had a hardness less than 50 parts CaCO_3 per million,

36 showed a hardness between 50 and 100, and the remaining 349 samples gave a hardness above 100.

L. W. RIGGS

• **The physicochemical condition of the waters in the Strait of Messina.** MARIO PICOTTI. *Atti II congresso naz. chim. pura applicata* 1926, 1221-31.—A review of work which has been summarized elsewhere (cf. P., C. A. 20, 3275; 21, 881; Vercelli, C. A. 20, 3275) and which is now published in complete detail in book form (cf. *Crociere per lo studio dei fenomeni nello stretto di Messina*: vol. I, by Vercelli, Venezia 1925; Vol. II, by Vercelli and Picotti, about to be published). Corrections. *Ibid* 1946.

C. C. DAVIS

Chlorination of water supplies in Assam. R. T. SEN. *Proc. Assam Branch British Med. Assocn.* 1926, 43-5; *Bull. Hyg.* 2, 649(1927).—Dechlorination of water supplies treated with excess Cl is recommended. Less than 0.1 p. p. m. of Cl will not give a taste *per se* or injure water mains.

C. R. FELLERS

Feed water for world's largest boilers receives zeolite and acid treatment. ALFRED H. WHITE, J. H. WALKER, EVERETT P. PARTRIDGE AND LEO F. COLLINS. *Power* 66, 90-4(1928); cf. C. A. 21, 3096.—The Beacon Street heating plant of Detroit, supplying steam for heating in the business district, contains 12 boilers each of 41,500 sq. ft. of heating surface. The city water used contains free CO_2 , 1.8; SiO_2 , 6.4; Fe_2O_3 , 2.0; Ca, 25.7; Mg, 7.3; HCO_3 , 75.6; CO_2 , 0.0; SO_4 , 31.1; Cl, 7.7 and solids by evapn. 121.0 p. p. m. The high alk. resulting from zeolite treatment is corrected by addn. of 35 p. p. m. of H_2SO_4 . The p_{H} values are recorded in the storage reservoir and as the water leaves the feed-water heater. This amount of acid neutralizes about $\frac{1}{2}$ the total NaHCO_3 present. The p_{H} is 6.5 before deaeration and 8.5 after. Continuous blowdown through a heat exchanger is satisfactory. After 8 months' operation the tubes were clean, there were no tube burnouts and no serious corrosion.

D. B. DILL

Lime and soda treatment of feed water. E. M. PARTRIDGE. *Power* 67, 507-9(1928).—Partial softening with lime and soda may increase corrosive properties and result in the formation of a scale which is harder, though less in amount than is formed from untreated water. Hence complete softening is important.

D. B. DILL

Treatment of filtered water with lime at Harrisburg, Pa. R. H. GOULD. *J. Am. Water Works Assocn.* 19, 358-73(1928).—Harrisburg water is a river supply; it is filtered with alum assisted by lime, when necessary. It was then quite corrosive. Treatment with addnl. lime after filtration was based on free CO_2 present. As a result the drop in dissolved O taken as an index of corrosion was decreased from about 4.45 p. p. m. to about 0.2 p. p. m. A very interesting discussion is included.

D. K. F.

The residual germicidal action of water treated with ultra-violet light. J. F. NORTON. *Am. J. Pub. Health* 18, 476-9(1928).—Water exposed to ultra-violet light retained a slight germicidal power which could be detected by appropriate bacteriol. means. This activity was detected with *Bact. typhosum* and Friedlander's bacillus but not with *Staph. aureus*. No residual germicidal action was noted when certain salt solns. were irradiated. This was likewise true of peptone, phenol and meat extract. Bacterial cells killed by exposure to ultra-violet light appeared to exhibit a residual germicidal action but the data are too incomplete to warrant definite deductions. The work is being continued.

C. R. FELLERS

Deferrization, aeration and filtration of industrial waters. A. LANGUMIER. *Arts et métiers* No. 90, 96-109(March, 1928).—Descriptive.

A. PAPINEAU-COUTURE

Iron removal plant for Amesbury, Massachusetts. G. A. SAMPSON. *J. New England Water Works Assocn.* 42, 43-64(1928).—Aeration is sufficient. There is included a detailed description covering aerators, tricklers, filters, filter basin, etc. A 98.2% removal has been obtained at a cost of about \$3.50 per million gallons of water delivered.

D. K. FRENCH

Clarification of the Catskill water supply of the City of New York by coagulation and sedimentation. WM. W. BRUSH. *J. New England Water Works Assocn.* 42, 65-78(1928); cf. C. A. 21, 1686.—Given plenty of time 1 grain per gallon of alum fed continuously into the aqueduct at Pleasantville for a 100 p. p. m. turbidity reduces it to about 3 p. p. m. at Brooklyn. The p_{H} , however, was lowered to about 6.1; so soda ash was necessary to prevent corrosion; about 0.5 grain per gallon was sufficient. The cost is about one cent a month per person.

D. K. FRENCH

The methods for determining sulfur trioxide in natural waters and soil extracts. B. G. ZAPROMETOV. *Bull. Univ. Asie Centrale* (Tachkent) 1927, 91-5.—The gravimetric pptn. as BaSO_4 , the iodometric titration and the benzidine methods are compared. Raschig's benzidine method (*Z. angew. Chem.* 16, 617(1903)) was found to

be best. Z. simplifies this method by omitting the usual filtration with suction of benzidine sulfate.

RUSSELL C. ERB

Research on the mechanism of the activated-sludge process. A. SEISER. *Gesundh. Ing.* 51, 253-9, 273-6(1928).—The real mechanism of activated sludge is a combination of the properties of the sludge and of the organisms. In the case of bovine serums, peptone, sugar and aspartic acid, as much disappear in the first stages through adsorption as through biol. decompn. Of the N-contg. compds. tested, serum was the most strongly, peptone less strongly and the Na salt of aspartic acid the least adsorbed. The decompn. of albumin was nearly identical with that of globulin. These two show no distinctive difference in regard to the putrescibility test. For the serums it was detd. that the decrease of the permanganate consumption approx. parallels the org. N. The addn. of a good source of energy (sugar) to aspartic acid promotes the fixation of N while the lack of sugar promotes the formation of NH_3 . Nitrification and NO_2 reduction are functions of the intensity of aeration. A lack of air results in a reduction of the oxidized N. The salt content has little effect on the activated-sludge process. Ferrous compds. are quickly oxidized and promote activation during aeration in compounds with protective colloids

WAYNE L. DENMAN

Mansfield (England) sewage-disposal works. Some leading features. W. THOMPSON. *Munic. Eng. Sanit. Record* 80, 157(1927).—The works consist of shallow settling tanks ("grit pans"), detritus chambers, sedimentation, bio-aeration, humus (Dortmund type), settling tanks, etc. A brief description of the purification process is given.

C. H. BADGER

Bedford (England) refuse destructor and sewage-disposal works. N. GREEN-SHIELDS. *Munic. Eng. Sanit. Record* 80, 48(1927).—A brief description of the destructor is given. The sewage pumping station adjoins the destructor. Enough steam is generated by burning house refuse to pump all the screened sewage, about 1,600,000 gal. per day, against a head of 65 ft. to the sewage-disposal works. The sewage screenings are mixed with the destructor flue dust and sold as fertilizer. An underground sewage-pumping station discharging into a high-level sewer and the disposal works are also briefly described. Storm water is treated on 37 acres of land. About 9000 tons of liquid sludge and humus per yr. is put on arable land for 2 to 3 yrs, which is then rented to small holders for 3 yrs.

C. H. BADGER

Warwick (England) and its municipal undertakings. RICHARD WORMELL. *Munic. Eng. Sanit. Record* 80, 96-8(1927).—W. discusses in detail road construction, etc., and describes briefly the sewerage and the means of sewage disposal.

C. H. BADGER

Experimental salvage plant. Results obtained at Nottingham (England). W. C. CULLEY. *Munic. Eng. Sanit. Record* 80, 133-4(1927).—Practical working uncovered a no. of faults which are described. Alterations based on experience showed a reduction in working costs and increased the capacity from 50 to 60 tons of crude refuse per day. Unwashed cinder is sold to an electric power plant. The disposal of screened dust is at present unsatisfactory, most of it being hauled away on contract. The exptl. plant has proved that the destructors cannot compete in economical working with a combined separation and incineration method for the disposal of crude refuse.

C. H. BADGER

Sanitary progress in Plymouth (England). N. RUSE. *Munic. Eng. Sanit. Record* 80, 260-1(1927).—Includes descriptions of water supply and drainage systems.

C. H. BADGER

Apparatus for producing actinic rays of extremely short wave length for sterilizing water (Brit. pat. 275,596) 1. Titration apparatus suitable for determining salinity of brackish water (Brit. pat. 274,623) 1.

JOHNSTONE-TAYLOR, F.: **Modern Waterworks Practice.** London: Ernest Benn, Ltd. Price, approx. 10s. 6d., net.

Artificial mineral water. O. WARBURG. Brit. 274,834, July 22, 1926. Mineral waters prepd. as described in Brit. 259,612 (C. A. 21, 3410) are prepd. by use of Mg K chloride and finely ground CaSO_4 which are assocd. with the bicarbonate and with the bisulfate, resp., in compounding the ingredients.

Filter and water-softening apparatus of the filter type. W. J. HUGHES. U. S. 1,668,206, May 1. U. S. 1,668,207 specifies a system for supplying salt soln. to water-softening app., using base-exchange silicates.

System for heating and deaerating water. G. H. GIBSON. U. S. 1,667,850, May 1.

Apparatus for hot filtration of water, etc. C. G. HAWLEY. U. S. 1,668,807, May 8.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

Agricultural instruction and experimentation in Belgium. Modern institutes of agricultural economy. FRANCESCO SCURT. *Atti. II. congresso naz. chim. pura applicata 1926*, 224-69.—A detailed description, with 61 illustrations, of present lab. and agricultural developments. C. C. DAVIS

An index of soil texture. F. HARDY. *J. Agr. Sci.* **18**, 252-6(1928).—A procedure is described for evaluating an "index of texture" ($I. T.$), based on detns. of moisture contents at the points of stickiness (P), and of sand contents (S) of soil samples. ($I. T. = P - (S/5)$.) The procedure is simple and allows of a rapid lab. examn. of a great no. of spot samples, so that detailed texture maps can readily be constructed. Employed in conjunction with soil-reaction maps, the texture maps form a useful basis for detailed investigations of soil genesis and soil fertility. P. R. DAWSON

Remarks on the mechanical analysis of soils. II. M. KOHN. *Z. Pflanzenernähr. Düngung u. Bodenk.* **10A**, 91-9(1927); cf. *C. A.* **22**, 292.—K. calls attention to numerous errors attending the mech. analysis of the soil. The use of the Stokes and the Oseen formulas for the calcn. of the size of the particles falling in a definite time is recommended instead of the Stokes formula alone. The shape of the particles has an influence on the fall. Formulas for the calcn. of the effective radius of ellipsoid particles are given. Influence of the temp. upon the rate of fall of soil particles is stressed and useful tables for the change in velocity of the fall of soil particles with temp. are given. The advantage of giving the mech. analysis in a distribution curve is emphasized again. The danger of using a const. for the sp. gr. of the different soil fractions and for all soils is stressed. R. M. BARNETTE

The mechanical analysis of heavy ferruginous soils. RUBY C. GROVES. *J. Agr. Sci.* **18**, 200-5(1928).—Certain heavy ferruginous soils do not respond to the usual preliminary treatment with H_2O_2 , for mech. analysis by the pipet method. A method of preliminary treatment is described, involving the use of ammoniacal H_2O_2 , and repeated gentle rubbing with a rubber pestle, which appears to give a satisfactory dispersion with such soils. The results are not affected by mech. shaking, hence the latter may be omitted. P. R. DAWSON

A simple method for the determination of the p_H values of turbid soil and other solutions. C. H. GADD. *J. Agr. Sci.* **18**, 206-8(1928).—A method employed by Atkins (*Notes from Bot. School, Trinity Coll., Dublin* **3**, 178-90(1925)) for the detn. of the p_H of plant juices has been adapted for use with turbid soil solns. To samples of the soil soln, prepd. as usual, is added a sufficient quantity of the desired indicator to make the color clearly visible in the turbid fluid. Equal quantities of this colored sample are then placed in standard comparator tubes or the equiv. Ten drops of distd. water are added to one tube, which is used as a control. To another tube are then added 10 drops of a buffer soln. of known p_H value and the resulting color is compared with that of the control. If no alteration of color occurs the soil soln. and buffer have the same p_H ; if not, other buffer solns. are tried in other tubes until the colors match. If very turbid, the solns. may have to be dild. with water (equal amts. to each tube). P. R. DAWSON

The influence of soil treatment on the assimilability of nutrients in the seedling method of Neubauer. P. HAUSCHILD. *Z. Pflanzenernähr. Düngung u. Bodenk.* **10A**, 37-53(1927).—The assimilability of the K_2O and P_2O_5 of soil increased with the temp. of the drying of the soil from moist soil, air-dried soil, soil dried at 40° , soil dried at 80° and soil dried at 115° . Thus the method of drying the soil must be taken into consideration in interpreting the results of the assimilability of plant nutrients as tested by the Neubauer method. R. M. BARNETTE

An investigation of the method of Page and Williams for the determination of the saturation capacity of soils. P. E. TURNER. *J. Agr. Sci.* **18**, 251-55(1928); cf. Page and Williams, *C. A.* **19**, 1022.—Leaching the mixt. of soil and $CaCO_3$ to 2 l. is insufficient to displace all the exchangeable bases from the soil. It is hence recommended that 3 l. or more of filtrate be obtained, or preferably, that the amt. of soil be reduced to 10 g. The leaching soln. remains in contact with the soil mixt. for a period adequate for the normal $NaCl$ soln. to be satd. with $CaCO_3$. The difference in the amt. of Ca , derived by soln. from the carbonate in the 1st and 2nd liters of filtrate is negligible. The tardiness with which the reaction proceeds to completion is probably due to the difficulty of displacing the final amts. of adsorbed ions, rather than to the presence of Ca ions in the leaching soln. The incompleteness of the reaction renders the method

of Hissink inaccurate for calcn. of the satn. capacity. The variation in the character of the colloidal material of soils is to some extent reflected in the value of the ratio of the Ca passing into soln., through exchange reactions in the 2nd l., to that dissolved in this manner by the total vol. of filtrate.

P. R. DAWSON

Three-year comparison of Neubauer analyses and field experiments. T. RORMER, DIRKS AND WOACK. *Z. Pflanzenernähr. Düngung u. Bodenk.* **6B**, 529-62(1927).—The Neubauer limiting values for root-sol. P_2O_5 varied from 4 to 7 mg. depending upon the crop. Results by the Neubauer method agreed in general with field expts., although there were marked divergences in the case of some crops. In the case of K the agreement was not as good, being best with potatoes. The limiting values ranged from 20 to 42 mg. according to the crop. The Neubauer results generally were higher, when they differed from those of field expts. These differences may in part be attributed to different exptl conditions, such as the prepn. of the soil sample for the lab. tests, differences in temp. and moisture conditions, etc. The pH values of the soil samples may be altered by the Neubauer treatment. The Neubauer method is considered a helpful basis for detg. fertilizer requirements, but it needs further development.

P. R. DAWSON

The soils of Bowie, Denton, Freestone and Red River counties. G. S. FRAPS. Texas Agr. Exp. Sta., *Bull.* **375**, 48 pp (1927).—The forested soils of these counties are usually low in active P_2O_5 and N. They are a little better supplied with active K but some are low. A number are acid. The upland prairie soils are better supplied with plant food and with lime than the forested soils. They contain 2 or 3 times as much active plant food or total N as the forested soils. Most of them are limestone soils but a few are acid. The second-bottom or terrace soils are usually better supplied with plant food than the upland forested soils but are not as well supplied as the prairie soils; some are low in N. The first-bottom soils are better supplied with plant food than the other groups of soils discussed. They contain 4 to 8 times as much active P_2O_5 , 2 to 3 times as much active K, and 2 to 4 times as much total N as the surface soil of the upland forested soils.

J. J. SKINNER

The specific conductivities of soil extracts. C. H. WRIGHT. *J. Agr. Sci.* **18**, 186-93(1928).—Considerable differences were found in the sp. conductivities of different soils at any one time of year; likewise considerable differences appeared in any one soil at different times of the year, the sp. cond. being highest in March and lowest in June and July. Results from different soils are comparable only when samples are taken at the same time of year. A relation was found between the sp. cond. of soil exts. and the mean wts. of lint per plant per row in 2 strains of Llan cotton. Data are presented, showing that the sp. cond. of a 1:5 soil ext. is an index of the fertility. The sp. cond. of a soil decreases under continuous cultivation and there is evidence that the rate of soln. also decreases under the same conditions.

P. R. DAWSON

The effect of dehydration of soils upon their colloid constituents. II. J. L. STEENKAMP. *Soil Sci.* **25**, 239-51(1928); cf. *C. A.* **22**, 2021.—A method is described for detg. neutral salt-forming bases and acid-salt-forming bases in soils. Twenty g. of soil is shaken with 200 cc. 0.1 N HCl, allowed to stand 24 hrs. and filtered. Two aliquots are titrated against standard alkali. In one, phenolphthalein is used as an indicator, and in the other methyl orange is used. The difference between the original titer of acid and that of the soil ext., when phenolphthalein is used, is the amt. of neutral-salt-forming base present in the soil, while the difference between the phenolphthalein figure and that obtained with methyl orange represents the amt. of acid-salt-forming base. Acid-salt-forming bases (Fe_2O_3 and Al_2O_3) are increased by drying, while the neutral-salt-forming bases are decreased. Drying for various periods of time and in atms. of various gases, in most cases, decreases the neutral-salt-forming bases, and increases the acid salt-forming bases. Dehydration decreases the adsorption of CaO from 0.1 N $Ca(NO_3)_2$ and of K_2O from KNO_3 . The adsorption, of P_2O_5 from 0.01 N NaH_2PO_4 is increased by drying in a black clay soil and decreased in a yellow clay soil. Adsorbed bases and adsorption of 0.1 N HNO_3 are plotted at different water values of soil. The varying points of intersection of the curves indicate the beneficial effects of dehydration in increasing plant nutrients. Such beneficial effects will commence earlier in some soils than in others.

M. S. ANDERSON

The movement of water in soils and subsoils. A. F. LEBEDEV. *Z. Pflanzenernähr. Düngung u. Bodenk.* **10A**, 1-36(1927).—A clear and concise discussion of the influence of different phys. factors on the movement and changes of the gaseous water, of the hygroscopic water, of the film water and of the gravitation water in the soils.

R. M. BARNETTE

Acidity, degree of saturation and the lime requirements of soils on the basis of

pot experiments. P. OBST, K. WODARZ AND D. MEYER. *Z. Pflanzenernähr. Düngung u. Bodenk.* 10A, 65-90(1927).—In lab. expts. pptd. CaCO_3 , CaO , ground limestone and K_2CO_3 significantly neutralized the exchange acidity of soils after 4 weeks. The pptd. CaCO_3 was slightly superior to CaO in the rapidity of neutralization of the exchange acidity, while ground limestone was somewhat slower in action. The K_2CO_3 was most active. The lime requirement as calcd. from the detn. of the exchange acidity did not completely neutralize the acidity. The degree of satn. of the soil which gave the highest yields for the different plants varied with the soil type. There seems to be no definite degree of satn. for the effective growing of plants for all soils, despite the fact that it gives a good basis for the detn. of the lime requirement of the soil.

R. M. BARNETTE

The ammoniacal nitrogen of peats and humus soils. II. J. C. B. ILLIS AND C. G. T. MORISON. *J. Agr. Sci.* 18, 346-9(1928).—When a peat, as obtained from a bog, is dried, considerable changes occur in the amt. of ammoniacal N removable by distn. with MgO at reduced pressure. Removal of water causes a relative increase in the quantity of NH_3 extractable by water. This is due to reduction in the adsorptive colloidal properties of the peat. A partial recovery in the adsorptive power takes place on prolonged contact with water.

P. R. DAWSON

The determination of nickel in soils. G. SCHIECKENTHAL. *Z. Pflanzenernähr. Düngung u. Bodenk.* 10A, 104-7(1927).—A method consisting of treating the soil with HCl (1.15 sp. gr.) and removing the Fe and Al with NH_3 , subsequently pptg. Ni in the filtrate with H_2S , dissolving the sulfides of Ni and Co in aqua regia and pptg. Ni as nickel dimethylglyoxime is described. There is believed to exist a relation between the Fe and Ni contents of the soil.

R. M. BARNETTE

Transformations (particularly nitrification) of nitrogen in soil, and the acidity of certain types of soil. W. WOHLBER. *Kuhn Archiv.* 1926, No. 12, 1-37. *Chimie et industrie* 19, 518(1928).—Increase in soil acidity decreases its nitrifying power. The activity of *Azotobacter* ceases entirely at a given acidity, the value of which depends on such factors as soil constitution, aeration, humidity, atm. temp., etc., in light soil horn-N can be nitrified in March, even at a p_{H} value of 4.3, but with lower p_{H} values nitrification is impossible. Nitrification of mineral salts depends on the amt. of Al ion dissolved in the soil, i. e., on the acidity resulting from the complex colloidal exchanges in the soil. Acidity exerts a much less marked action on ammonization, the persistence of which is particularly notable in humiferous soils in consequence of the acidity of the fungi. Ammonization increases slowly with the soil alk., but the phenomenon is obscured by the rapid nitrification of the NH_3 formed. Ammonization is already quite appreciable for very high acidities, and presence of NH_3 in the soil can be detected. In an alk. soil all the N is rapidly nitrified. Nitrites are sometimes found in recently limed soils which are nearly neutral, and they are apparently formed during mineralization of org. N (horn) rather than during nitrification of NH_3 salts. N losses are much higher in alk. than in acid soils. A neutral soil allows of rapid nitrification, avoiding losses of N, and is most favorable to the different transformations of N.

A. PAPINEAU-COUTURE

The reversion of nitrates in the soil under cultural conditions in Mauritius. N. CRAIG AND F. GIRAUD. *Mauritius Dept. Agr., Sci. Ser. Bull.* 11, Eng. ed., 19 pp. (1926), *Expt. Sta. Record* 57, 18.—Under the conditions of the expts. reported, large applications of molasses arrested nitrification and caused the conversion of NH_4 compds. into org. N. Large amts. of org. matter in general caused a reversion of nitrate to org. N, molasses having the greatest effect of the substances tried, with dried green manure second and dried farmyard manure third. Neither molasses nor dried green manures caused loss of N as gas, but farmyard manure caused a large loss of this kind.

H. G.

The sulfur content of Alberta soils. F. A. WYATT AND J. L. DOUGHRY. *Sci. Agr.* 8, 549-55(1928).—In semi-arid soils the S content is often greater than the P content and increases with depth. Because of limited rainfall, concn. zones of sol. salts are formed 3-6 ft. below the surface. Sulfates do not leach out of these soils which contain from 320 to 710 p. p. m. of S in the surface layer and 380 to 1250 p. p. m. of P. The zone of sulfate concn. may or may not be identical with the lime layer; usually it is deeper. The result of leaching in various soil belts is more uniformly and distinctly shown by the depth of the zone of CaCO_3 accumulation, than by the zone of sulfate accumulation, since sulfate is not as uniformly a const. constituent as is carbonate. Sulfates make up the chief salts in alkali soils in Alberta. The alk. of aq. exts. of alkali soils consists mainly of bicarbonate alk. The total alk. seldom

reaches 0.1% and is usually less than 0.05%. Crops did not respond to application of S on 2 types of soil.

C. R. FELLERS

Dye adsorption by hydrous alumina in soils. H. II. CROUCHER. *J. Agr. Sci.* **18**, 350-62(1928).—A critical study of the literature on the dye-adsorption method for measuring the colloidal matter of soils shows that the general failure of the method is due to variations in the chem. compn. of the colloidal material, the presence of previously adsorbed ions, the H-ion concn. of the soil suspension, and the nature of the dye and its concn. in the suspension medium. Special emphasis is placed on the isoelec. theory. A procedure for detection of hydrous alumina in soils is described, involving demonstration of the isoelec. point of the substance by means of preferential dye adsorption in suspensions of various p_H values. Such a method lays the foundation for rapid detection of free hydrous alumina in soils contg. appreciable quantities. The test, however, is not sufficiently precise for all purposes. More efficient dyes than those finally selected could undoubtedly be found. An ideal dye for such studies must be sol. in solns. of p_H 2.0-9.5; must be readily but not excessively adsorbed by hydrous alumina; the 2 dyes and mixts. must have the same depth and shade of color throughout the p_H range, they must be fairly "fast", must have intense and widely contrasting colors; must not be fluorescent; must not be mutually pptd. on mixing, and if possible they should be adsorbed only by hydrous alumina. The 2 dyes should be absorbed in approx. equal amts. at p_H values equidistant from, but on opposite sides of the isoelec. point. The most satisfactory results were obtained with a mixt. of acidic Bielrich Scarlet and basic Iodine Green. The former is adsorbed by hydrous alumina only on the acid side of its isoelec. point and the latter only on the alk. side. The applicability of the mixt. of dyestuffs finally selected is demonstrated for a series of soils of varying basic ratio and including examples of lateritic soils and clays.

P. R. DAWSON

Soil microorganisms and their relation to soil fertility. M. M. ALICANTE. *Sugar News* **7**, 730-5(1926); *Expt. Sta. Record* **57**, 17-8; cf. *C. A.* **21**, 2346.—A sandy soil low in org. matter contained 100,000 bacteria per g. and a sticky, poorly aerated clay showed about the same amt., while good soils under favorable conditions contained from 1,000,000 to 1,000,000,000 organisms per g. Acid, relatively in fertile soils showed low bacterial counts, which increased upon liming and fertilizing the soils. The most important factors limiting the bacterial nitrification of the Philippine Island soils examd. were acidity and excessive clay. A red, sticky soil bearing stunted, yellow cane and contg. 44.9% of clay and an acidity of 0.15% failed to nitrify addns. of $(NH_4)_2SO_4$ during an incubation of 28 days. After liming a 16.7% nitrification was secured. A 4% clay soil of 0.05% acidity was capable of a 14% nitrification of $(NH_4)_2SO_4$. After liming a 94.1% nitrification was obtained, and the soil bore an excellent stand of sugar cane.

H. G.

The study of soil protozoa. M. KOFFMAN. *Acta Zool.* **7**, 277-328(1926); *Expt. Sta. Record* **56**, 809.—An investigation of the protozoa of garden soils about Stockholm is reported, the 93 forms identified and drawn including both forms peculiar to the soil and aquatic forms which appear in soils only under certain conditions. The protozoa were very sensitive to slight changes in such physiol. conditions as p_H , temp., salt concn., nutrients, etc., in the culture media. Protozoa peculiar to soils, commonly small flagellates, together with their cysts, were present in normal soils, but most of the cysts originated from forms not peculiar to soils alone. Results obtained by soil inoculations of culture media hardly give a true picture of the actual protozoan soil fauna, on account of the presence of cysts of protozoa not specifically soil forms and because of the above-noted sensitiveness of the Protista. This applies equally to the identification and to the counting of the protozoa. The effect of the distribution of the protozoa on soil fertility can hardly be detd. without knowledge of the kind and nos. of the forms present. A method applicable to the direct identification and counting of the soil protozoa, at least in certain soils, is given.

H. G.

New concepts of the fertilization of soil. GIUSEPPE TOMMASI. *Atti II. congresso naz. chim. pura applicata* **1926**, 327-35.—Fertilization of soil is now based on the principle of supplying to the plant, in soil, and therefore readily assimilable form, the particular nutrients which are deficient in the soil. It is probable, however, that besides this effect, fertilizers modify the structure and other phys. properties of the soil, so that nutrients which are already present in difficultly sol. and assimilable form are rendered sol. and readily assimilated. In general, fertilizers are beneficial not only in supplying a deficiency of nutrient, but in causing a favorable displacement of certain equilibria in a soil, e. g., its p_H value, in fact fertilization may in some cases owe its chief value to a favorable influence on the H-ion concn. This concept is supported by various exptl.

facts, e. g., the growth of plants is sometimes increased by supplying phosphates when the soil is already rich in phosphates, while the addn. of phosphates to some soils deficient in phosphates does not give beneficial results, phenomena which are also true of N and K fertilization.

Nitrogen fertilizers. ALBERTO DE DOMINICIS. *Atti II congresso naz. chim. pura applicata* 1926, 336-45.—A review and discussion of present developments.

C. C. DAVIS

A new process for the production of fertilizer from spent alcoholic liquors. EMIL BAUER. *Oesterr. Chem.-Ztg.* 31, 39(1928).—This is a brief description of the difficulties overcome by the patented process together with an analysis of the product. The small cost of production by this process is a decided advantage.

E. F. SNYDER

Potash fertilization in Italy. S. DOJMI DI DELUPIS. *Atti II congresso naz. chim. pura applicata* 1926, 368-75.—A crit. review of the requirements of K fertilizers. In Italy leucite is the most economic source of K. The latter is of special importance in the cultivation of wheat on some Italian soils, because it compensates for the high proportion of available Ca with respect to P_2O_5 , and because it corrects unfavorable reactions of the soil, such as too great alk.

C. C. DAVIS

Synthetic pen manure. Use of distillery sludge. V. M. HINCHY. *Trop. Agr. (Trinidad)* 4, 129(1927).—Sludge from the wash vats of a rum distillery produced excellent fermentation of sugar cane trash and grass when mixed with it. The actual degree of humification by the H_2O_2 method was 10-30% in different trials.

A. L. MEHRING

Organic fertilizers from sugar cane. The utilization of field and factory refuse. F. HARDY. *Trop. Agr. (Trinidad)* 4, Sugar supplement 47-8(1927).—A review.

A. L. MEHRING

Analytical investigations on the use of green fertilizers. F. MARTIN. *Kuhn Archv.* 1926, No. 12, 146-204, *Chimie et industrie* 19, 518(1928).—(1) Increase in the yield and improvement in the quality of the harvest through the use of green fertilizers (leguminosae) was observed in all kinds of soils (sandy, clay, mixed clay and calcareous). (2) Green manure increases the org. matter content of the soil (increase of 3000 kg. dry matter per Ha) and the humus content of the surface layers. (3) The variations of the moisture-absorption capacity are similar to those of the humus content. (4) The phys. condition of the soil is unfavorably affected, the proportion of fine material being decreased in the surface layers and increased in the sub-soil. (5) The plots having received green manure had the lowest bacterial activity and N content, the decompn. of org. matter being retarded by the unfavorable phys. condition of the soil, but the losses of N were decreased. (6) Green manure increased the fertility of the soil, as measured by the evolution of CO_2 , which increased 1600 kg. per Ha because of the increased humus content. (7) Green manure increases soil acidity. (8) Plots treated with green manure are more sensitive to modifications in the pH value, the buffer value of the soil being appreciably reduced. (9) Green manure tends to decalcify the surface layers to the benefit of the sub-soil. (10) It increases the P_2O_5 content of the surface layers at the expense of the sub-soil, presumably by reason of the development and acid secretions of the roots of the leguminosae.

A. P.-C.

The solubility of phosphorites in salt solutions saturated with carbon dioxide. K. FLEROW. *Z. Pflanzenernähr. Düngung u. Bodenk.* 10A, 109-14(1927).—Sols. of the alkali metals and alkali earths satd. with CO_2 increased the soly. of Ca phosphate over that in CO_2 -satd. water in the series $SO_4 > NO_3 > Cl$. Ca salts decreased the soly. of the phosphate. Increased concn. of the salts increased the soly. of the phosphates. The possible effects of fertilizer salts on the soly. of soil phosphates are discussed.

R. M. BARNETTE

The evaluation of phosphate-containing fertilizer material from their solubility in citric and nitric acids. Z. *Pflanzenernähr. Düngung u. Bodenk.* 10A, 100-3(1927).—The importance of the control of the H-ion concn. in the evaluation of different phosphates by their soly. in citric and nitric acids is emphasized. With base-contg. phosphates such as Thomas meal, this is particularly important, as the final H-ion concn. of the mixt. of the phosphate and the acid is shown significantly to influence the soly. of the phosphate.

R. M. BARNETTE

Elemental sulfur and phosphate salt mixtures as fertilizer. R. R. MCKIBBIN AND W. H. MOORE. *Sci. Agr.* 8, 579-81(1928).—With Marquis wheat in greenhouse expts., acid phosphate-S mixts. proved toxic on Coastal Plain soils. With other sol. phosphate salts the toxic effect of the S admixt. obtains, though not to the same degree as with $Ca(H_2PO_4)_2 \cdot H_2O$. The explanation is that sol. phosphate salt strongly buffers

the acidity locally produced by S oxidation. The resultant long-maintained intense acidity in pockets is injurious to plant root tissue.

The physiological reaction of "Nitrophoska." R. W. BELINS. *Z. Pflanzenernähr., Düngung Boden.* 6B, 562-7(1927).—When used as a nutrient in water cultures "Nitrophoska" has no effect on the reaction. In soils, however, it shows a definite physiological acidity, increasing both the exchange and hydrolytic acidity and reducing the buffer capacity. On an equiv. N basis this effect is considerably less than that of $(\text{NH}_4)_2\text{SO}_4$.

Superphosphate in Italian agriculture. F. ZAGO., *Atti II congresso naz. chim. pura applicata* 1926, 346-67.—A crit. review of the use of P fertilizers, of the advantages of superphosphate, and of the past and present use of the latter in Italy. Corrections. *Ibid* 1945-6.

The agricultural value of specially prepared blast-furnace slag. J. W. WHITE. Penn. Agr. Expt. Sta., *Bull.* 220, 1-19(1928).—Blast-furnace slag contains 45-50% CaO and MgO and may be used successfully as a substitute for ground limestone or CaO for agricultural purposes. Incomplete data show no distinctive crop increases over ground limestone when both are ground to the same degree of fineness.

The fertilization of agricultural soil for cereals, with special reference to treatment in hot dry climates. EMANUELE DE CILLIS. *Atti II congresso naz. chim. pura applicata* 1926, 303-16.—A crit. discussion of the possibilities of increasing and improving the cultivation of cereals, particularly wheat, in Italy, with the aid of the most advanced knowledge of agricultural chemistry.

The relation between the particle size of phosphorites and their assimilability. G. PIANO. *Atti II congresso naz. chim. pura applicata* 1926, 409-20.—Because of the tremendous saving if pulverized phosphorites could be used directly as fertilizers, the soly. of a typical phosphorite of 2 different degrees of fineness (greater and less than 0.17 mm. diam.) was tested in water contg. (1) org. substances, such as garden mold, manure, fresh and dried blood, legumes, etc., (2) salts, including $(\text{NH}_4)_2\text{SO}_4$, NaNO_3 , NH_4NO_3 and KCl, and (3) citric acid at various concns. (0.2-20%). The quantities of P in soln. after increasing times up to about 1 yr. were detd. Garden mold and legumes had the greatest and manure the least solvent action on the phosphorite. The more finely divided phosphorite dissolved to a greater extent than the coarser grade. The greater part of the phosphorite which became sol. passed into soln. during the first 4 months of contact, after which the solvent action slowly became appreciable. Unlike the org. media, the saline solns. had almost no solvent action, on the coarse or fine phosphorite. Aq. citric acid had a marked solvent action which was far greater than that of any of the preceding substances, and the quantity of phosphorite dissolved was almost directly proportional to the concn. of citric acid. The soly. of the phosphorite in 2% aq. citric acid was only slightly less than that of Thomas slag under the same conditions.

Injection experiments for controlling insects. W. O. HOLLISTER and H. L. JACOBS. *J. Econ. Entomol.* 21, 198-201(1928).—Aloes, aloin, thymol and acid fuchsin were injected into trees infested with borers. The results were negative.

Experiments in the control of the round-headed apple tree borer (*Saperda candida* Fab.) with calcium cyanide. C. E. PERCH. *Sci. Agr.* 8, 560-6(1928).— $\text{Ca}(\text{CN})_2$ killed *Saperda candida* larvae without injury to trees during 2 seasons. The activity of $\text{Ca}(\text{CN})_2$ begins about the 6th hr. and ceases after 24 hrs. A paste using castor oil proved most efficient against young borers. Shellac was of no value KCN when applied to apple trees at the rate of 0.5 oz. per tree killed the trees. One application of $\text{Ca}(\text{CN})_2$ at the rate of 1 teaspoonful per tree and covered with dirt, destroyed about 90% of the old borers.

The domestic production of tobacco for use in nicotine-containing sprays. A simple method for determining the nicotine content of sprays. R. SCHERPE. *Centr. Bakt. Parasitenk. II Abt.* 71, 93-105(1927).—It is desirable that Germany produce her own tobacco and study the methods of increasing the nicotine content by appropriate fertilizers. Nicotine can be detd. as follows: To 6 cc. of fluid in a beaker, add 0.6 cc. of satd. $\text{Pb}(\text{OAc})_2$ and 0.32 g. powd. Na_2SO_4 . Filter into a graduated cylinder. Wash with 1% Na_2SO_4 . Add 3 cc. of 15% silicotungstic acid. Make the vol. 20 cc. Let stand 24 hrs. Shake down any surface ppt. Read after 2 hrs. more. Multiply the height of the column of sediment in cm. by 0.70 to det. the mg. of nicotine. If less than 2 cm., multiply by 0.83.

The content of As, Cu and nicotine in the products from grape vines treated late

in the season for protection against grape worms (VIALA, MARSAIS) 16. The methods for determining SO_2 in natural waters and soil extracts (ZAPROMETOV) 14. Plant distribution as affected by the H-ion concentration of the soil (GUSTAFSON) 11D.

Fertilizer. E. L. PEASE. U. S. 1,668,464, May 1. See Brit. 253,291 (C. A. 21, 2526).

Fungicides. I. G. FARBERMIND. A.-G. Brit. 275,539, Aug. 6, 1926. Fungicides suitable for destroying smut on seed oats contain benzoquinone or other suitable quinone or quinone deriv. or an addn. compd. of a quinone with a phenol, together with a diluent. Comps. of Hg, Cu or As also may be used.

Treating seeds with mercury compounds. SACCHARIN-FABRIK AKT.-GES. VORM. FAHLBERG, I. ST. & CO. AND A. KLAGES. Brit. 274,974, May 1, 1926. In order to protect seeds from fungi and bacteria they are treated with complex Hg salts of aromatic bases such as $p\text{-ClHgC}_6\text{H}_4\text{NH}_2\cdot\text{HCl}$ and $p\text{-ClHgC}_6\text{H}_4\text{NMe}_2\cdot\text{HCl}$. Various solvents and diluents may be used for prepg. solns or powd. mixts.

16—THE FERMENTATION INDUSTRIES

C. N. FREY

The chemism of fermentation in a medium of constant composition. LEFFRONT. *Petit j. brasseur* 34, 1619-29(1926); *Chimie et industrie* 19, 515(1928), cf. C. A. 20, 1885.—Under the ordinary conditions of alc. fermentation yeast has but a low vitality. In a sufficiently dil. (0.2-0.4% sugar) medium of const. compn. yeast does not produce alc., but evolves CO_2 . On keeping the compn. of the medium const. (about 2.5% sugar and 0.16% N) by means of analyses made at hourly intervals, the amt. of yeast produced can reach 75 g. per l. Under these conditions fermentation does not proceed as far as the production of alc., and as tests have shown that yeast cannot assimilate alc., E. considers it is more admissible to consider the aldehyde (which is assimilable by yeast) as the last stage of the transformation, as follows: sugar \rightarrow pyruvic acid \rightarrow CO_2 + aldehyde \rightarrow yeast. According to this hypothesis the whole of the C which is not liberated from the sugar in the form of CO_2 should be found in the yeast: this has been verified exptly. to within 4%. E. explains this loss by supposing that in the early stages of fermentation the evolution of CO_2 is greater than the theoretical evolution due to a total combustion of the sugar at this stage. — A. P.-C.

The importance of hydrogen-ion concentration in brewing. H. T. S. BRITTON. *Ind. Chemist* 4, 150-3(1928).—Emslander in 1913 first used the H electrode in brewing. The p_{H} at which the malting is carried on detcs. the changes in the protein, and eventually the proteins by their buffer action affect the beer. Mashing should be conducted at an optimum p_{H} for the various enzymes to obtain a good yield and good conversion. The optimum p_{H} for polypeptide hydrolysis is 4.4-4.5 at 40°. Peptase has an optimum p_{H} between 3.7 and 4.3, and diastase has an optimum activity at 4.2-5.0. Various authors give values within this range. The break produced by boiling wort with hops is influenced by the p_{H} of the medium; usually a p_{H} of 5 is considered best. Only 6% of the total N of the wort is pptd. by boiling. The control of p_{H} is necessary to promote stability of beer. Treatment of brewing water is facilitated by correcting the p_{H} . — C. N. FREY

Importance in brewing of the ethereal oils from different types of hops. H. LÜERS. *Wochschr. Brau.* 44, 588-90(1927).—Hops vary in the amt. of ethereal ext. yielded by steam distn. At 2 atms. pressure the Kent hops yield a green oil; at normal pressure it is yellow. From Cal. hops the yield is increased under pressure, whereas in Saag and Hallertau it is decreased. The flavors of beers made from various hops

differ in bitterness; that is due possibly to derivs. produced from hop oils by boiling.

C. N. FREY

Material and shape of fermentation vats and storage vessels. H. GEBEL. *Wochschr. Brau.* 44, 109-14(1927).—The type of structure, cost and ease of handling, and cost of repair are considered. Iron, Krupp steel, aluminum, iron with pitch, enamel and ferro-concrete tanks are discussed. No definite conclusions are given regarding any definite type.

C. N. FREY

Fermentation glycerol. TH. KROEBER. *Chem.-Ztg.* 52, 222(1928).—Recent patent developments on production and recovery of glycerol are discussed. In order to make glycerol cheaply and of equal purity to that obtained from fat, a cheap raw material and a high yield are necessary, which have not been achieved at present. Except in war time when fat is scarce, fermentation glycerol is not economical.

C. N. FREY

Industrial absolute alcohol. J. L. GENDRE. *Chimie et industrie* 19, 396-401 (1928), cf. *C. A.* 22, 759.—A brief review of processes actually used commercially.

A. PAPINEAU-COUTURE

Correction of the hardness of brewing water by lactic acid. H. LÜERS. *Wochschr. Brau.* 44, 385-7(1927).—Neutralization of the alk. of brewing H₂O contg. sol. carbonates improved the quality of beer. The acidity produced is favorable to the enzyme action desired, as more maltose is produced as well as more sol. N. The phosphate content is lowered. On boiling the flocculation is improved and a better yield of ext. is obtained. The resulting beer is also more brilliant and has a better flavor.

C. N. FREY

Influence of certain factors on formation of empyreumatic oil by fermentation of molasses. SVETOZAR JANKOVIĆ. *Arhiv. Hemiju Farm.* 1, 218-26(1927).—The yields of empyreumatic oil from the alc. fermentation of molasses increase with temp. and concn. of molasses, and fall with increasing acidity of the culture medium. With dil. solns. the addn. of large quantities of yeast causes increased production of oil, while with concn. solns. the yield of oil is greater when smaller quantities of yeast are used.

B. C. A.

New investigations on the content of arsenic, copper and nicotine in the products from (grape) vines treated late in the season (for protection) against grape worms. P. VIALA AND P. MARSAIS. *Rev. vit.* 68, 233 6(1928); cf. *C. A.* 22, 2024.—As, Cu and nicotine were detd. in samples of musts, lees and wines produced from grapes, the vines of which had been treated with sprays contg. As, Cu and nicotine. Small quantities of As and Cu that appear in the must and raw wines appear to be gradually reduced in concn. by pptn. in the lees. With nicotine, however, appreciable amts. may persist in sol. form in the finished wine.

P. R. DAWSON

The ripeness of barley. W. WINDISCH. *Wochschr. Brau.* 44, 25-9(1927).—If a barley is thoroughly ripe it is most suitable for malting, and beers of 16-18% protein can be prepd. These beers are stable and can be exported. Ripeness depends on the protein being of a high mol. wt.

C. N. FREY

Utilization of beets. E. LÜBER. *Z. Spiritusind.* 51, 7(1928).—The prepn. of beets for fermentation by malting is discussed.

C. N. FREY

The distillation of koumiss by the Mongolian nomads. E. HÜBER. *Z. Spiritusind.* 50, 372-3(1927).—Historical.

C. N. FREY

Phytase of malt. H. LÜERS AND K. SILBREISEN. *Wochschr. Brau.* 44, 263-8, 273-8(1927).—This enzyme hydrolyzes phytin in barley malt. It can be extd. from green malt by means of a weak alc. soln. and then pptd. by means of concd. alc. The optimum temp. for the enzyme is 48° at an optimum p_H 5.2. Inorg. phosphates retard the action of the enzyme. At 0.009 mol. concn. complete inhibition is produced. Inositol does not inhibit the action of the enzyme. Above 50° phytase is destroyed. The reaction of the enzyme is not unimol. The P₂O₅ is apparently removed in stages.

C. N. FREY

Decomposition of starch by the amylase of *Aspergillus oryzae* and of malt with special reference to the limit of decomposition. S. NISHIMURA. *Wochschr. Brau.* 44, 533-5(1927).—A diastase ext. from *Aspergillus oryzae* or from malt when added to starch will hydrolyze 95% of it if the amt. of enzyme added is large. When these conditions prevail the normal limit of decompn., 70-80%, is exceeded, regardless of the action of the complement.

C. N. FREY

Errors in malt analysis due to the want of standardization of the degree of fineness of the malt meal. E. F. ROTHENBACH. *Wochschr. Brau.* 44, 601(1927).—The yield of malt exts. obtained may vary by reason of variation in the fineness of grinding of malt. The screens of the mill may also introduce errors.

C. N. FREY

Characteristics of cider. W. H. BUFTON. *J. Inst. Brewing* 33, 450-8(1927); *Analyst* 52, 649.—The three main groups of vintage cider apples are (1) sweet, (2) bitter-sweet and (3) sour; (1) and (2) contain more sugar and give a juice of higher sp. gr. than (3), while (1) and (3) contain about the same av. amts. of tannin, and (2) a greater proportion. (1) and (2) have less malic acid (0.2-0.3%) than (3) (0.6-0.8%). It is not practicable to inoculate fresh apple juice, natural yeasts almost invariably becoming dominant over even heavy addns. of pure yeasts. Washing of the fruit helps to keep down acetic fermentation, and the *apiculatus* type of yeast appears to be more readily washed off than *S. cerevisiae*. The freshly expressed apple juice has a sp. gr. of 1.044 to 1.056, occasionally even 1.060. The sugars consist of cane sugar (0.25 of the total sugar), dextrose (not over 0.2 of total sugar) and levulose (seldom less than 60%, rising to 90% of the total), the total sugar in apple juice being generally between 10 and 14%. The tannin of apple juice (0.5-0.3% for sweet and sour, and up to 0.3-0.6% for bitter-sweet fruit) differs from gallotannin, and appears to be more closely allied to that of catechu and coffee, giving a reddish brown color with caustic alkalis and pptg. vegetable albumins and gelatin. Clean sound apples only contain an av. of 0.01% of N (Warcollier, *Cidricrie et Pomologie*), and only half is assimilable by yeasts. Fermentation starts about 3-4 days after pressing, and in 14 days the sp. gr. will have fallen to 1.025-1.030, when a first filtration is made to retard the process. The total acetic acid in cider should not exceed 0.075%, and with the best ciders should be between 0.03 and 0.05%. Less than 0.2% of malic acid renders the cider liable to sickness, especially if the sp. gr. is high, and impairs flavor, but if over 0.5 or 0.6% is present long storage will be necessary to prevent a harsh flavor. Total sulfurous acid must not exceed 200 parts per million (*Preservatives in Food Regulations*), and the use of sulfured casks should be avoided, as the sulfurous acid content of the cider may thereby be doubled. H. G.

Sulfuric acid in vinegar. C. LUCKOW. *Deut. Essigind.* 32, 125-6(1928).—Attention is called to the possibility of mistaken identification of H_2SO_4 in vinegar if based on the behavior of $BaCl_2$ as the reagent. Rather should a color test be applied for the presence of free mineral acid, by diln. of the sample to an acid strength of 2%, with addn. thereto of 2 drops of a 0.1% methylviolet soln. In the presence of free mineral acid the color of the liquid becomes blue to green, depending on the amt. of such contamination. This test is to be compared with a control made of a pure sample of vinegar, both being held against a white background. W. O. E.

Examination of brandies. ROBERT COHN. *Pharm. Zentralhalle* 69, 241-6, 261-5(1928).—The methods commonly used in the evaluation of brandies are discussed, as also the foundation for a more uniform procedure. W. O. E.

Rapid approximate determination of volatile acidity in wine. P. BALAVOINE. *Mitt. Lebensm. Hyg.* 19, 66-7(1928). (In French.) Cf. C. A. 21, 623.—Distil 100 cc. wine + 30 cc. H_2O to 75 cc. and titrate 50 cc. of the distillate with 0.1 N NaOH. Volatile acidity (in g. per l.) = 0.24 (cc. NaOH) + 0.2. The results agree within 0.1 g. per l. with those of the Swiss official method. A. PAPINEAU-COUTURE

Detection of fruit wine and grape wine by the Röntgen method. H. WÜSTENFELD. *Deutsche Essigind.* 32, 133-5(1928).—The method depends on the formation of varying color tones according to the resp. content of fruit and grape wines, when the neutralized sample is treated with $Cu(OAc)_2$ soln. The procedure can be made quant. through recourse to an Ostwald colorimeter. The results obtained in the examn. of a series of Ger. and foreign wines are recorded. W. O. E.

The sweetening of beer. W. BELGEONNE. *Bull. assoc. élèves inst. sup. fermentations Gand* 29, 146-56(1928).—Belgian brewers add sucrose or invert sugar at the end of the primary fermentation to improve the mellowness, foaming quality and stability of the beer. A study of the effects of various factors on the rate and degree of fermentation of these sugars showed that they increase with the protein content of the beer at the end of the primary fermentation; filtering after primary fermentation retards the starting up and rate of the secondary fermentation, but increases the ultimate degree of fermentation; reducing the d. of the wort decreases both the N and buffer contents, both of which reduce the degree of secondary fermentation; the degree of fermentation increases with the p_H value of the wort, and decreases with increase in the sugar concn. above 10%; raw grain contains proportionately less N than malt and its addn. (above 10%) reduces the degree of fermentation; increasing the temp. (from 62-4° to 68-70°) activates fermentation slightly. A. PAPINEAU-COUTURE

The effect of p_H value on the clarification of beers. P. VAN CAUWENBERGE. *Petit j. brasseur* 34, 1516-7(1926); *Chimie et industrie* 19, 415(1928).—Clarification depends essentially on the p_H value of the initial wort. In the lab. the p_H of any wort

can be adjusted to give proper clarification; but C. doubts whether this can be done in the brewery.

Turbidity (of beer) due to amorphous nitrogenous compounds. E. BEKAERT. *Petit j. brasseur* 34, 1542-4(1926); *Chimie et industrie* 19, 415(1928).—A brief outline of the various causes of this trouble.

Absorption of odors by beer. A. J. MURPHY AND F. A. MASON. *Bull. Bur. Bio-Tech.* 2, 165-71(1927).—Beers can acquire a flavor by the mere absorption of odor without actual contact with the odoriferous material and without biol. infection. When a small bulk of wort is fermented and racked in an atm. permeated by each odor under consideration, no odor or flavor is communicated to the beer by P, CS₂, H₂S, mineral naphtha and SO₂. On the contrary, free Cl, gas tar, coal-tar disinfectant and mold communicate their characteristic odors and flavors to the beer, while the flavor derived from exposure to turpentine is of a decidedly fruity nature. A metallic-looking film appears upon the surface of the beers in contact with Cl, while those fermented in the presence of H₂S, mineral naphtha and gas tar are inclined to be lazy. B. C. A.

Washing top fermentation yeasts. G. LEFRANCO. *Bull. assoc. élèves inst. sup. fermentations Gand* 29, 136-45(1928).—The tests were carried out on factory scale, by comparing the yields of yeast from 60 hl. fermentations carried out with variously treated yeasts and with untreated yeasts. Washing with pure water had practically neither beneficial nor detrimental effect. Washing with 0.2% tartaric acid soln. had a slight beneficial effect only on yeast which had been working sufficiently long to show signs of exhaustion. Washing with 0.2% phosphoric acid gave somewhat better results than with tartaric acid. Direct addn. of phosphoric acid to the yeast (about 2.5 g. per kg.) increased the amt. of yeast which rose to the surface, provided the addn. was not too frequent, but somewhat reduced the degree of primary fermentation.

A. PAPINEAU-COUTURE

Loss of nutrients in the mechanical removal of water from potatoes (PAROW, *et al.*)

12. Cereals and the agricultural-chemical industries which depend upon them (SCURTT)
12. Synthetic pen manure. Use of distillery sludge (HINCHY) 15.

"Butyl-acetonic" fermentation. D. A. LEEG. U. S. 1,668,814, May 8. An immunized culture of "butyl-acetone bacilli" is produced by repeatedly subcultivating the bacilli in carbohydrate media in the presence of some "sluggishly-fermenting" carbohydrate mash and subjecting the cultures to "heat shock" at each transfer to eliminate attenuated vegetative cells. Cf. C. A. 20, 2045.

Glycerol from vinasse liquors. SOC. DES ETABLISSEMENTS BARBET. Brit. 274,519, July 19, 1926. Petroleum oil, C₆H₆, toluene or the like is added to concd. vinasse liquor and the mixt. is superheated under pressure of 6-8 kg. and the pressure is then released so that evapn. is effected and part of the glycerol is carried over with the hydrocarbon oil. The product seps. into a portion contg. vesicular particles which is returned for retreatment and another portion which is rectified, purified with charcoal, filtered and concd. *in vacuo*. An app. is described.

Wine mixture. M. JORDT (NÉF FREISE). Brit. 274,707, Dec. 11, 1926. A "wine tincture" is formed of raw sugar 3 kg., water 0.67 l., alc. 0.25 l., Maraschino a wineglassfull, cognac 1/2 bottle and ether oils 50 drops; this is mixed with 15 times the quantity of wine and may be bottled, pasteurized and "aerated" in the bottle by a device which is described.

Pasteurizing beer. HANSENA AKT.-GES. and I. NATHAN. Brit. 275,090, April 26, 1926. After heating to 25-30° to drive off CO₂, beer is further heated to 65-75°, cooled to -1°, carbonated, bottled and then again pasteurized at a temp. about 1° below that used for the first pasteurization.

Yeast. DISTILLERS CO., LTD., and E. A. MEYER. Brit. 275,328, May 4, 1926. In yeast propagating processes involving the continuous or periodic addn. of yeast foods to the propagating medium, periodic changes are made in the nature of the yeast foods added; e. g., strong molasses wort may be added to 40 hrs. and grain wort for 6-12 hrs. The use of skim milk or other material to regulate the vitamin content is also mentioned. Brit. 275,329 specifies fully or partially sterilizing the yeast propagating medium before use, by the addn. of a halogen, preferably Cl or I, or of a hypochlorite and an acid.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

The ethereal oil of *Gastrochilus panduratum* Ridl. A. J. ULTÉN. *Verslag. akad. Wetenschappen Amsterdam* **36**, 1262-4(1927).—The root stock of this plant, belonging to the family Zingiberaceae, yields a dextrorotatory yellow oil, d. 0.8636 to 0.8731, b. 200° and higher. Me cinnamate and cineole have been found. Exposure to air gives it the appearance of oxidized terpenes.

M. ACHTERHOF

Rapid test for *Atractylis gummifera* (Masticogna) extract in the juice of the licorice. PIETRO CONDORELLI. *Atti II congresso naz. chim. pura applicata* **1926**, 1353-5.—In Sicily *Atractylis gummifera* ext. is a frequent adulterant of licorice juice, and methods have already been proposed for its detection (cf. Giuffrè, *C. A.* **17**, 179; Bertolo, *C. A.* **17**, 3747). A new method suitable for those with little experience in analysis is described. Add 50 cc. of boiling water contg. a few drops of NH_4OH to 5 g. of licorice ext., cool to 20°, acidify with dil. HCl, let stand, filter and wash. A small portion of the residue, when warmed gently with 2-3 drops of concd. H_2SO_4 emits the odor of valeric acid, according to the reaction of Angelico (cf. *Gazz. chim. ital.* **36**, ii, 636(1906); *C. A.* **5**, 1317). If H_2SO_4 is completely washed out of the residue, the latter may then be oxidized by the method of Bertolo (*loc. cit.*), and the SO_3H group identified.

C. C. DAVIS

The de Myttenaere index for the chemical determination of the toxicity of arsenobenzenes. A. CONTARDI AND U. CAZZANI. *Atti II congresso naz. chim. pura applicata* **1926**, 1384-95.—See *C. A.* **21**, 475.

C. C. DAVIS

Colloidal silver preparations. I. M. KOLTHOFF. *Pharm. Weekblad* **65**, 362-5 (1928).—The test for ionic Ag in colloidal Ag prepns. by pptn. of the colloid with MgSO_4 or alum and then testing the filtrate with HCl is not always conclusive. Often the colloid is incompletely pptd. and the filtrate then gives a negative AgCl test. In general, the smaller the mol. wt. of the protective colloid the more difficult is its removal by pptn. with a salt. The pptn. method cannot supersede the dialysis test. Ultrafiltration is suggested as a promising aid to pharmaceutical research.

A. W. DOX

Essential oil from the timber of rosewood (*Dysoxylon fraseranum*). A. R. PENFOLD. *J. Proc. Royal Soc. N. S. Wales* **61**, 337-46(1927).—Several dists. of the shavings yielded oils varying in color from a pale azure blue to a very intense dark blue, the latter being similar to that of cupric ammonium sulfate. The oils were viscous, and possessed a bacon-like odor, being obtained in a yield of from 1.3 to 2.7% on timber contg. 41 to 46% moisture, equal to 1.6 to 3.42% on air-dried timber contg. 12% moisture. The main constituents identified were mixts. of sesquiterpenes, possibly two, which are apparently hydroazulenes, as on dehydrogenation with S the intensely blue hydrocarbon, azulene, is obtained, a 3rd sesquiterpene yielding an inactive dihydrochloride m. 108-9°, for which the name *dysoxylonene* is suggested. Cadinene was found to be one of the principal sesquiterpenes in the 1st 2 distns. It is not unlikely that copaene is present as well. A sesquiterpene alc. was also detected, but as it would not combine with phthalic anhydride it could not be isolated on account of the large quantity of sesquiterpenes present. The naming of the principal sesquiterpenes is deferred on account of the investigations of Ruzicka at present in progress.

W. O. E.

Determination of acetylizable constituents and of phenols. JOHN ALLAN, *et al.* *Perfumery Essent. Oil Record* **19**, 131-2(1928).—Because of serious differences in the results heretofore obtained by different workers in detg. acetylizable constituents, the following method is suggested as obviating the difficulties previously encountered. To 10 cc. of the oil in a long-necked round-bottomed 200-cc. Kjeldahl flask add 20 cc. of Ac_2O (95 to 100%), 2 g. of freshly fused anhydrous NaOAc and a fragment of broken glass, then boil the mixt. under an air reflux condenser for 2 hrs., supporting the flask on a sheet of asbestos in which has been cut a hole about 1.5 in. in diam. and heating by a small naked flame placed about 1 in. below and not impinging on the bottom of flask. Remove the flame after 2 hrs. and allow to cool. Add 50 cc. of H_2O and heat on a boiling water bath for 15 min with frequent and thorough shaking. After cooling transfer the liquid to a separatory funnel, and reject the lower aq. layer. Wash the acetylated oil successively with (1) 50 cc. of satd. aq. NaCl soln., (2) 50 cc. of brine contg. 1 g. Na_2CO_3 , (3) 50 cc. of brine, (4) 20 cc. of H_2O . Mixts. 1, 2 and 3 should be shaken vigorously, but the final washing with H_2O must be effected gently. The aq. layer from the 2nd washing should be alk. to phenolphthalein (alc. phenolphthalein

must not be added to the mixt. in the separator). On completing the washing remove the aq. layer as completely as possible, pour out the oil and mix with about 3 g. powd. anhydrous Na_2SO_4 , stir 15 min. or until one drop of the oil produces no cloudiness when added to 10 drops of CS_2 in a dry test tube, then pass through a dry filter. For purposes of hydrolysis, weigh out 2 g. of the oil thus dried into a hard-glass flask, add 2 cc. distd. H_2O , then titrate the free acidity with 0.1 *N* aq. KOH, using 1 cc. of 1% soln. of phenolphthalein in 60% alc. as indicator. Add 40 cc. 0.5 *N* alc. KOH and boil under a reflux on a water bath for 1 hr. Cool rapidly, add 20 cc. of H_2O , and titrate the excess of alkali with 0.5 *N* H_2SO_4 . Make a blank detn. of the alc. KOH simultaneously and under like conditions. With regard to the detn. of phenols in essential oils, as shown in expts. with ajowan, bay, cinnamon-leaf, clove, origanum, pimento and thyme, the sample should be shaken with cold aq. KOH soln. and the amt. of unabsorbed oil measured. Uniform results are possible only when standard conditions are maintained. Into a flask (previously cleaned with concd. H_2SO_4 and well rinsed with distd. H_2O) consisting of a 150-cc. bulb and a long neck, of which 10 cc. is graduated in tenths of a cc., the length of the graduated portion being not less than 15 cc., introduce 80 cc. of 5% aq. KOH soln. and 10 cc. of the clear oil, shake thoroughly at 5-min. intervals during 30 min. at room temp. Gradually elevate the unabsorbed portion of the oil into the neck of flask by addn. of more KOH soln., rotating and tapping the flask the while. Let stand not less than 24 hrs. and read off the vol. of unabsorbed oil, taking the lower meniscus in each case. Multiply by 10 the portion absorbed to obtain the % by vol. of the phenolic content. The results obtained in a series of runs indicate that KOH is better than NaOH, that a 5% soln. is the most suitable strength for general purposes, and that for the oils enumerated cold treatment is preferable.

Determination of total geraniol content in citronella oil. A. RECLAIRE AND D. B. SPOELSTRA. *Perfumery Essent. Oil Record* 19, 143 (1928); cf. C. A. 21, 2167.—In calcg. the analytical results, absolutely correct values are obtained by the following formula: $x = n \cdot 154.14 / (50q - 0.15n)$, in which n represents the no. of cc. of 0.2 *N* H_2SO_4 required to neutralize the NH_3 , q the weighed quantity in g. of oxidized oil, and x the citronellal content.

W. O. E.

Eucalyptus oil—should phellandrene be excluded? HORACE FINNEMORE. *Perfumery Essent. Oil Record* 19, 144 (1928).—While pharmacopeial tests should be made as definite as possible, the question arises whether the retention of the phellandrene test in the Pharm. is justified. A discussion of the subject developed the view that there now appears no good reason for including a precise test for the presence of phellandrene in eucalyptus oil of the B. P.

W. O. E.

Purified oil of cassia. HORACE FINNEMORE. *Perfumery Essent. Oil Record* 19, 144–5 (1928).—Expts. are described in repeating the recent work of Dodge on the removal of certain phenolic constituents from cassia oil, and in ascertaining in what way the flavor of com. samples was modified by following his process. Treatment 1st by distn. under reduced pressure to remove resin, followed by extr. with 0.5% NaOH soln. (removal of salicylaldehyde and cinnamic acid), and final fractionation yielded a principal product practically devoid of the curiously unpleasant odor of the 1st fractions. It is suggested that this main fraction be recognized as "purified cassia oil."

Experimental basis and practical application of adsorption therapy. E. HERRMANN. *Pharm. Zentralhalle* 69, 225–8 (1928).—A discussion leading to the conclusion that the exptl. studies of Bechhold and his co-workers, as also clinical practice, show the superiority of metallized adsorbents like adsorgan and silargel over the materials heretofore commonly used.

W. O. E.

Simple method for estimating silver. GREGOR KOGAN. *Pharm. Zentralhalle* 69, 228–9 (1928).—In the evaluation of Ag preps. like collargol, protargol and albagin the following method is suggested: To a weighed portion of the sample in a titration flask add 15 cc. HNO_3 (d. 1.2), place in a boiling water bath and dil. with 30 to 40 cc. of H_2O . Now add a few drops of KMnO_4 soln., sufficient to maintain a red color after the lapse of 1 min. On further standing the color should disappear or if persistent may be discharged by a particle of FeSO_4 . The addn. of KMnO_4 is done to convert the N oxides to HNO_3 . Titrate with standard NH_4CNS . The results obtained in the examn. of some 10 different Ag preps. are recorded.

AND W. PÖRTHEKE. *Pharm. Zentralhalle* 69, 259-61(1928).—An exptl. study of the official Ger. prepn. based on the procedure of Dietz and Margosches. W. O. E.

• Suggestions for an international pharmacopeia. ANON. *Apoth. Ztg.* 43, 491-3 (1928). W. O. E.

Valerian root and its sucrose-yielding capacity. HERMANN KUNZ-KRAUSE. *Apoth. Ztg.* 43, 484-5(1928).—A discussion of the pharmacopeial requirements for the drug, together with further expts. leading to the isolation of large sucrose crystals from an ext. of the root. W. O. E.

Detection of colocynthin in colocynth extract. LUDWIG DAVID. *Pharm. Ztg.* 73, 525-6(1928).—An exptl. study of the color reactions involved in detecting colocynthin according to the methods of Kremels, Keller and Johannson. W. O. E.

Sanchinin. AUFRICHT. *Pharm. Ztg.* 73, 527(1928).—This prepn. consisting of a combination of quinine and gall acids designed for the treatment of malaria; it is sol. in artificial gastric juice to the extent of 18.70, in trypsin soln. 90.42%, and possesses pronounced antiseptic properties, in that the growth of *Streptococcus pyogenes* was checked in 5 and the organisms were killed in 8 min. Growth of colibacillus was checked in 3 and the organisms were killed in 5 min. W. O. E.

A rapid and accurate means of estimating nicotine in tobacco and tobacco extracts. R. R. L. WORSLEY. *Egypt Min. Agr., Tech. and Sci. Service Bull.* 73, 5 pp.(1927); *Expt. Sta. Record* 57, 410 —For the accurate detn. of nicotine in warm climates ether is too volatile. Petroleum ether of a b.-p. range of from 50° to 60° or higher gave accurate results. Any NH_3 present was best removed by drawing a stream of air through the solvent prior to titration. The fixation of the NH_3 by means of gypsum was found useless except with very small quantities of NH_3 . The following method is given: Pipet carefully 100 cc. of nicotine sulfate soln. into a 400-cc. bottle having a well-fitting stopper, add 20 to 25 cc. of 20% NaOH , and further add exactly 100 cc. of petroleum ether. Shake the mixt. well for from 10 to 15 min. and allow it to settle for 10 min., after which decant off 40 cc. and pour into 50 cc. of distd. water. Do not filter the ext., as this is unnecessary and causes loss of solvent by evapn. Add an excess (about 5 cc.) of exactly 0.1 N H_2SO_4 , shake the mixt. gently for a min. and titrate back with exactly 0.01 N NaOH . Should the end point be passed, add 5 cc. of exactly 0.01 N H_2SO_4 and continue the titration. This frequently gives better end point, as the solvent tends to retain a little of the nicotine. H. G.

Novonal as an hypnotic and sedative. E. LEVINGER. *Deut. med. Wochschr.* 54, 271-2(1928). ARTHUR GROLLMAN

Chlorothymol as a disinfectant. K. LAUBENHEIMER. *Deut. med. Wochschr.* 54, 481-2(1928).—A description of the antiseptic action of *lavasan*, a com. prepn. of chlorothymol. ARTHUR GROLLMAN

Medical profession's fight against commercialized therapeutics. A. J. CRAMP. *Dental Cosmos* 70, 537-43(1928).—An account of the work of the Council on Pharmacy and Chemistry of the American Medical Association. JOSEPH S. HEPBURN

Anise-scented oil of bay. F. H. S. WARNEFORD. *Trop.-Agr. (Trinidad)* 4, 128 (1927).—Its sp. gr. is 0.958. Like ordinary bay oil it contains myrcene, chavicol and eugenol, but differs from it in having a high content of estragol (15%), to which the odor of anise is due, and methyleugenol (13%). It contains approx. 25% phenols and 40% tar. A. L. MEHRING

Constants of oil of bergamot from the 1919 to 1926 harvests. ANON. *Boll. uff. r. s. sper. ind. essence* 2, No. 3, 1-5(March, 1927); *Chimie et industrie* 19, 477(1928).—The generally admitted consts. are d_{15} 0.8810-0.8860; α 18-24°; esters (as linalyl acetate) 34-45%; non-volatile residue 4.5-6.0%; sol. in 2 vols. 80% alc. (with turbidity) and in 0.2-0.5 vol. 90% alc. Numerous analyses of samples of known purity gave consts. falling within the following limits: d_{15} 0.8800-0.8870 (exceptionally 0.8890); α 4-28° (exceptionally 30°); esters (as linalyl acetate) 30-45 (exceptionally 48-9%); non-volatile residue 4-6%; sol. in from 1 vol. 82.5% alc. to 0.5 vol. 90% alc.

A. PAPINEAU-COUTURE

Cinchona bark from Uganda. ANON. *Bull. Imp. Inst.* 26, 17-22(1927); cf. *C. A.* 14, 3751.—Bark of *C. succirubra* which was 5 yrs. old and raised in Uganda from seed obtained from the Govt. cinchona plantation, Munson, Kalimpong, Bengal, contained on the dry basis (H_2O 9.4%): total alkaloids 7.56 and quinine 4.11 (equiv. to cryst.

quinine sulfate 5.57%). This is closer to the usual alkaloidal and quinine contents of *C. calisaya* than of *C. succirubra*. Bark of *C. robusta* (?) which was 6 yrs. old and raised at the Bukalasa plantation from seed obtained from the Amani Institute contained on the dry basis (H_2O 10.3%): total alkaloids 7.75 and quinine 3.05 (equiv. to cryst. quinine sulfate 4.15%), which is close to the results previously obtained with bark from the Amani Institute and of the same order as the usual contents found in *C. calisaya*.

A. PAPINEAU-COUTURE

The determination of citronellal. LABORATOIRE "DAUPHIN." *Parfums de France* 6, 77-80(1928). (In French and English.) Cf. Holtappel, *C. A.* 22, 1214.—The original Dauphin method is as follows. weigh 2 g. oil in a 100-cc. flask, add 20 cc. of 5% alc. NH_4OH . HCl previously neutralized to helianthin, immediately titrate the liberated HCl with 0.2 *N* KOH in presence of helianthin. Holtappel's modifications consist essentially in cooling the soln. with ice, use of excess alkali with back titration after 15 min., and use of bromothymol blue instead of helianthin. Investigation of the effects of temp. showed negligible variations (max. 0.5%) from 0° to 35°. Investigation of the causes of the irregularities in results obtained by Holtappel brought out the following facts: (1) citronellal is cyclized by strong acids into isopulegol and its derivs., there being formed chiefly *hydroxy-3-ethoxy-8-p-menthane* in alc. soln., while in hydro-alc. soln. there is formed a mixt. of this compd. with *3,8-p-menthenediol*; (2) neither of these compds. combines with NH_4OH . HCl, and their formation leads to low results; (3) in strongly alc. soln. these reactions are of secondary importance, there being formed *citronellal ethylacetal*, which protects the aliphatic mol. against cyclization; (4) contrary to generally accepted data, this reaction is almost instantaneous, even at -15°; (5) slight acidity catalyzes oximation before cyclization can take place to any appreciable extent. It is concluded that: (1) helianthin should be used as indicator, as the turning point of bromothymol blue is at such a low p_H value of the soln. that appreciable cyclization can occur, while a light red color with helianthin indicates optimum conditions for oximation and absence of cyclization; (2) the alc. KOH should be added sufficiently quickly to avoid production for any appreciable time of the distinct red characteristic of relatively high acidity, and sufficiently slowly to prevent high alkyl. which might slow the reaction and even prevent it from going to completion through formation of the fairly stable acetal. The fact that Holtappel obtained lower results by oximation in alk. soln. than by oximation at low temp. in acid soln. is attributed to the fact that, because of the use of bromothymol blue instead of helianthin, the true effects of acidity could not be detected. The original Dauphin method is more simple and rapid than Holtappel's modification and is as accurate as the latter. The method is being applied in the Dauphin Laboratories to the detn. of ketones in all essential oils (the detn. of citronellal being the most delicate); and where the speed of the reaction is relatively low, by plotting curves the presence of several ketones in the same oil can frequently be brought out very clearly. The method is particularly suitable for detn. of menthone in oil of mint, instead of the usual method of reducing with Na, washing, acetylating and sapon.

A. P.-C.

The supposed influence of polarized light on the deterioration of digitalis. W. R. BOND AND E. W. GRAY. *J. Pharmacol.* 32, 351-8(1928).—Samples of tincture of digitalis were exposed to polarized light for periods of 6 hrs. to 5 yrs. Averages of several expts. showed a somewhat higher toxicity (lower MLD) than tincture of digitalis not so exposed, the difference, however, being within the limits of error of the method of detn. of MLD (cat assay).

C. RIEGEL

The preparation of colloidal lead. S. W. PENNYQUICK AND A. E. SCOTT. *Australian J. Exptl. Biol. Med. Sci.* 5, 95-9(1928); cf. Bell, *C. A.* 20, 2202.—Full details are given for the prepn. of colloidal Pb for use in the treatment of cancer. Very pure samples, prepd. in the presence of N, were less effective in producing the results described by Bell, than those prepd. by the ordinary exposed method. It is concluded that the presence of a certain percentage of the hydroxide in the Pb sol is important. It is claimed that colloidal Pb, prepd. as outlined and bottled out of contact with air, remains stable for several weeks. Such aged samples should be reentrified and re-bottled before use. The results obtained with this prepn. are so far indefinite.

L. W. RIGGS

Reaction of adrenaline with novocaine. HEDWIG LANGECKER. *Arch. exptl. Path. Pharmacol.* 129, 202-35(1928).—When adrenaline-novocaine solns. are allowed to stand, a loss in the adrenaline activity takes place. In the cold the change is gradual; at higher temps. it occurs quickly, and it proceeds in two stages. The initial step, comparable to that taking place in the spontaneous decompn. of adrenaline, is favored by the influence of novocaine in stimulating oxidation of the adrenaline. In the second

phase of the reaction the rose color developed in the first is altered to a yellow shade, and this requires a considerable excess of novocaine. This reaction is but an example of a general reaction between aromatic amines and *o*- and *p*-dihydroxybenzenes.

G. H. S.

The production of medicinal plants in Japan. III. Hibiscus manihot, L. T. KARIYONE. *J. Pharm. Soc. Japan* **48**, 152-4 (1928).—The distribution, the production and the cultivation of the plant are briefly described.

NAO UYER

Tonkin star anise oil. PHILIPPE EBERHARDT. *Bull. agence gén. des colonies*, March, 1927, No. 222; *Chemist and Druggist* **107**, 337 (1927).—The cultivation of the plant and the prepn and properties of the oil are described. A com. and inferior "anise flower oil" is derived not from the flowers, but from the immature fruits of the plant, which are removed to promote the ripening of selected fruits.

S. WALDBOTT

Note on licorice. C. E. SAGE. *Chemist and Druggist* **107**, 340-1 (1927).—Analyses of 21 com. samples of *black licorice* showed loss on drying at 100° 9.4-17.5%, sol. in cold H₂O 56.5-81.4%, insol. in cold H₂O 7.1-28.0%, ash 4.6-12.1%, glycyrrhizin 6.0-14.4%, insol. in 90% cold EtOH 20.0-53.8%, total sugar before inversion 4.5-32%, after inversion 8.4-45.4%. Analyses of 15 com. samples of *stick licorice* gave loss on drying at 100° 7.0-15.5%, sol. in cold H₂O 58.0-80.4%, insol. in cold H₂O 8.6-31.0%, ash 3.9-7.7%, glycyrrhizin 6.6-14.6%. Licorice differs much according to its source and method of manuf.; glycyrrhizin detcs. its flavor; a high % of sugar might indicate sophistication.

Samuel Walter Woolley, Editor of Chemist and Druggist, 1917-27.—EDITORIAL. *Chemist and Druggist* **107**, 707-9, HERBERT SKINNER. *Ibid* 709 (1927).—Obituary, with portrait and tributes of appreciation. Also see *Pharm. J.* **119**, 633 (1927).

S. WALDBOTT

The weighing of standard pituitary powders. J. H. GADDUM. *Pharm. J.* **119**, 580 (1927).—Standard pituitary powders, required to be kept *in vacuo* over P₂O₅, are very hygroscopic; within 3 min. of exposure to air at 19.7° and 73% relative humidity, the powder gained 10% in wt. To minimize this source of error in weighing, rapidly transfer about 10 mg. of the powder into a weighing tube previously tared together with the stopper. Quickly insert the latter, then reweigh at leisure.

S. W.

Notes on some pharmaceutical preparations. J. H. FRANKLIN. *Pharm. J.* **119**, 581-2; JAMES GRIER. *Ibid* 635 (1927).—The prepn. *compd. confectio of guaiacum* of the Brit. Pharm. Codex is not firm enough to hold the powders in suspension; they settle to form a dense mass, making the prepn. appear defective. *Compd. phenacetin tablets*, Brit. Pharm. Codex, being granulated with gum acacia, disintegrate in H₂O only after hrs., hence fail when needed quickly, as in nervous troubles. A green coloration noted in a mixt. of NaHCO₃, *o*-C₆H₄(OH)CO₂Na, tincture of nux vomica, concd. infusion of senega and H₂O, is caused by an *oxidase* contained in the *senega*, acting on the alk. salicylate. When the senega infusion is boiled, or when a little CHCl₃ is added, the formation of the green color is much retarded. The color is prevented by adding to the prepn. a trace of Na₂S₂O₃ (0.5 grain/0.5 pint). *The darkening of phosphoric sirups* is claimed by F. to be caused by caramelization of sugar by H₃PO₄. G. found in a freshly opened bottle contg. Brit. Pharm. H₃PO₄ sufficient Fe to account for the formation of a highly colored Fe saccharophosphate noted by Timmis and Evers (*C. A.* **21**, 156).

S. WALDBOTT

Barium sulfate. HENRY BODSWORTH. *Pharm. J.* **119**, 639-40 (1927).—The mode of the use of BaSO₄ in diagnostic x-ray work is described, and its action compared with that of bismuth carbonate. Particular stress is laid on the necessity of purity of the BaSO₄ to be used. A scheme of systematic examn. of BaSO₄ is presented, including tests for sulfides, sol. Ba salts, salts of Ag, Hg, other heavy metals, limit test for As (Brit. Pharm.), a special control test for Pb (with Na₂S), tests for phosphates, chlorides, etc., free acid and alkali. At the London Hospital where 644 lbs. BaSO₄ were used in 1 year, the BaSO₄ contained < 3 p. m. of As and Pb, and a trace of Na₂SO₄. Rarely, a trace of free H₂SO₄ was found, but never any other impurity.

S. WALDBOTT

Notes on some Brit. Pharm. Codex preparations. W. A. KNIGHT. *Pharm. J.* **119**, 641 (1927).—As *liquor quinae et strychninae* rapidly develops fungus growths and crystallizes in cold weather, K. suggests replacing it by a sirup of quinine and strychnine, made by dilig. the liquor with sirup (1.5 in 7 vols.). By mixing 7 parts of this sirup with 1 part of liquor ferri phosphatis, *Easton's sirup*, Brit. Pharm. Codex is obtained. The use of liquid ext. of squill in prepg. oxymel, sirup and vinegar of squill, Brit. Pharm., as recommended in the Codex, leads to a product contg. AcOEt and differing in AcOH content. An *AcOH ext. of squill* should be used for this purpose.

The "0.1% strength" of *aqua amygdalae amarae*, *Pharm. Ind.* given in the Codex, refers to HCN, not to BzH. *Emulsio chloroformi* is "a cheap substitute for spiritus chloroformi at the expense of accuracy," since the frothy liquid cannot be measured reliably. In the prepn. of *compd. sirup of hypophosphites*, which darkens in incompletely filled bottles, K. preps. a stock soln. $5 \times$ the strength of the sirup, storing it in 4-ounce bottles kept filled. For a simpler method of prep. *mistura magnesi hydroxidi*, mix 5 drachms of freshly calcined light MgO with 12 ounces of boiled then cooled H₂O; a thick cream results upon shaking the mixt. when it begins to jelly. To facilitate rapid disintegration of tablets contg. *phenacetin* or *acetylsalicylic acid*, compress with 15% of dried neutral potato starch.

S. WALDBOTT

Liquid extract of ipecacuanha, *Brit. Pharm. J. H. FRANKLIN. Pharm. J. 119*, 662; H. D. RICHMOND. *Ibid* 685(1927).—A recent com. sample contained only 64% EtOH instead of 78% which is contained in the official prepn. R. records similar cases.

S. WALDBOTT

Dried sulfate of iron. A. C. ABRAHAM. *Pharm. J. 119*, 666(1927), cf. Liverseege, *C. A. 21*, 1521.—For dried ferrous sulfate the *Brit. Pharm.* 1885 and 1898 adopted the standard FeSO₄·H₂O, which A. had recommended. In *Brit. Pharm.* 1914, the standard was changed to "77% Fe" (equiv. to FeSO₄ 2.5H₂O). A. deprecates this change, as the old standard gives a well-defined end product and is easily obtained, e. g., by drying FeSO₄·7H₂O in thin layers on a flat enameled dish over steam pipes. The new standard is not easily prepd., probably not stable, and for the prepn. of Bland's pills (cf. following abstr.) involves a special detn. of the H₂O content.

S. W.

Bland's pills. A. C. ABRAHAM AND J. RAE. *Pharm. J. 119*, 666-7(1927); cf. Liverseege, *C. A. 21*, 1521, and preceding abstr.—Genuine Bland's pills were prepd., according to an authoritative formula (cf. Humphreys, *Pharm. J. 70*, 643(1903)). FeSO₄·H₂O 60, K₂CO₃ 60; powd. gum arabic 10; distd. H₂O 60; sirup 30. Analyses of freshly made pills and of others, resp. 3 and 30 years old, showed their extreme stability. Total Fe, resp. 14.61, 14.64, 15.11%; Fe⁺⁺ 14.61, 14.02, 13.22%; Fe⁺⁺⁺ trace, 0.62, 1.89%; FeCO₃ 16.97, 11.2% (in 3 year sample). FeO (causing the black color of the pills). 7.19, 11.12%; Fe(OH)₃ trace, 1.97%; K₂CO₃ 0, 0.646%. A freshly prepd. sample of *Pil. ferri*, *Brit. Pharm.* contained CO₂ equiv. to 20% FeCO₃, confirming L.'s conclusions. Bland's pill and *Pil. ferri*, *Brit. Pharm.* are essentially different medicines.

S. WALDBOTT

Notes on the constituents of Artemisia brevifolia, Wallich. T. AND H. SMITH, *Ltd. Pharm. J. 119*, 688, 701; *Chemist and Druggist 107*, 785(1927), cf. Greenish and Pearson, *C. A. 15*, 924.—*Camphor* of *A. brevifolia* m. 177°, [α]_D -44°; i. e., it is the exact *l*-isomer of the *Brit. Pharm.* camphor. The monobromo compd., m. 76°, identical with that of the *d*-camphor; but by mixing the 2, the m. p. is lowered. *Essential oil* is difficult to sep. completely from the camphor; b. 110-180°; d. 0.950. It is a terpene, contg. neither phenol nor aldehyde. The characteristic odor of the herb resides in a minute quantity of a very volatile oil. *Brevifolin* (A) occurs in the herb to the extent of 0.01%; it is extd. from the mother liquors in the prepn. of santonin; unlike this it can be extd. from alk. soln. with CHCl₃. Recrystd. from 60% alc. it forms short glistening needles, m. 80°, is little sol. in cold H₂O, sol. in C₆H₆, CHCl₃, Et₂O and EtOH, also in dil. NaOH. Concd. H₂SO₄ forms a yellow soln; on diln., A is re-pptd. Concd. HNO₃ forms at once an intense blue color, which on warming changes to violet, purple, then red. Like santonin, A is N-free, but differs from it by not being affected by light. It also differs from Merck's *artemisin* (m 200°) from *A. maritima*. A forms a monobromo compd., but no Ac compd.

S. WALDBOTT

Some analytical notes on pharmacopeia revision. E. J. SCHORN. *Pharm. J. 119*, 688-91, 701-2; *Chemist and Druggist 107*, 785-6(1927).—General and sp. suggestions anent the revision of the *Brit. Pharm.*; a plea for definiteness as an analytical guide.

S. WALDBOTT

Notes on pharmacopeia revision, with special reference to tests and alkaloidal solutions. D. B. DORR. *Pharm. J. 119*, 691-2, 701-2; *Chemist and Druggist 107*, 828-9(1927).—Solubilities should be established rather than the dispensing point of view than from that of strict accuracy. Similarly, certain tests are too exacting, e. g., for reduced Fe, and the limit tests for As and Pb; substances should be "physiologically pure." Recommendations are made as to alkaloidal solns. and assay processes. The following identity test for *salicin* is suggested: To the aq. soln. add 0.2 \times its vol. of HCl and warm. The soln. develops an aromatic odor and ppts. saliretin. Ext. this with Et₂O, and evap. to dryness; the amorphous residue gives a red color with H₂SO₄.

S. WALDBOTT

Solubilities and standard temperatures. J. R. HILL. *Pharm. J. 119*, 692-3,

701-2; *Chemist and Druggist* 107, 828-9(1927).—Solubilities detd. at higher temps. are not as safe in dispensing practice as those detd. at lower temps.; detn. of sp. gr. can safely be made at a higher standard temp. The temps. adopted by the Brit. Pharm. (15.5°) and the U. S. P. (25°) are selected arbitrarily, and are not based on av. prevailing temps. The U. S. and Great Britain should unite on a common standard of temp for soly. and sp. gr. S. WALDBOTT

Removal of peroxides from anesthetic ether. J. RAE. *Pharm. J.* 119, 693-4 (1927); F. A. HOCKING. *Ibid* 120, 26(1928).—Samples of Et₂O were shaken with 1.1% of animal charcoal, then, together with untreated samples set aside. Applying Hocking's test (C. A. 21, 4020), R. finds the intensity of the reaction unchanged in 2 days, half as strong in 14 days, faint in 28, a slight trace in 48 and no reaction in 54 days. The same value of p_H (6.5) was found in the H₂O ext. of the untreated as of the treated Et₂O, showing that the charcoal added neither acid nor alkali. H. states that with proper storage and frequent renewals of the stock, no peroxides are formed; but each fresh lot of Et₂O should be tested. Cf. C. A. 18, 3452; 21, 3103. S. WALDBOTT

Pharmaceutical notes. WILLIAM DUNCAN. *Pharm. J.* 119, 694-5(1927).—*Unguentum hydrargyri nitrat* is best prepd. by heating together the HNO₃, lard and oil (Brit. Pharm.) with const. stirring until the reaction is complete and frothing ceases, then add the equiv. of yellow HgO (10.8 g.), stirring the mass till combination of the HgO is complete. A more direct way of prepg. *liquor hydrargyri nitrat* acidus (Brit. Pharm.) is to dissolve the equiv. of HgO in the HNO₃ and adjust with H₂O to the required wt. *Sulfurated potash* is now chiefly used as a fungicide. For its quick prepn., put KOH 2, sublimed S 1, H₂O 2 parts into a bottle, and shake. In 2 hrs. the reaction is complete. Use 1-1.5 ounces per gallon of H₂O, e. g., as a spray for apple trees. D. finds the sp. gr. of camphor in small crystals $d_{15.5}$ 0.996; $d_{15.5}$ "about 0.995" (Brit. Pharm.); d_{10} for camphor is about that of H₂O, slightly above or below 10° camphor expands and contracts more than H₂O. To avoid clotting of quinine (caused by rise of temp) in prepg. the mixt: quinine sulfate 1, aromatic spirit of ammonia 3, H₂O to make 24 parts, diffuse the sulfate in half the H₂O and the volatile salt in the remainder, chill both by means of ice, then mix, a readily diffusible ppt. is obtained. S. WALDBOTT

Zamia floridana and Florida arrowroot. T. E. WALLIS. *Pharm. J.* 120, 50(1928); cf. C. A. 17, 2170.—Florida arrowroot is obtained from *Zamia floridana*, A. DC., a species distinct from both *Zamia integrifolia*, Aiton and from *Z. angustifolia*, Jacquin. Florida arrowroot contains H₂O varying from 12 to 15%, and CaC₂O₄ 0.38% (max.), i. e., 27 grains of anhyd. CaC₂O₄ per pound. S. WALDBOTT

The tincture of iodine question. P. C. *Schweiz. Apoth. Ztg.* 65, 277-8; THOMANN. *Ibid* 301-2; V., *Ibid* 325-6(1927).—P. C. refers to a discussion by A. Jentzer, W. Odermatt and R. Baumann in *Schweiz. med. Wochschr.* 1927, on the irritating effect of vapors of old tincture of I, and methods of avoidance. Tincture of I prepd. with alc. denatured with 2% Me₂CO had bad effects in 96%, prepd. with pure alc. in 28% of all clinical cases reported; a 10% I soln. caused trouble in 52%, a 5% soln. in 22% of all cases (J.). The products of decompn. are discussed. A soln. of 5% I in 80% EtOH with 4-5% KI is recommended, since a 5% soln. has been found sufficiently strong as a disinfectant (Brunner, v. Gonzenbach and Ritter) (O.)† B. recommends as a disinfectant in operations alc. denatured with gas tar, in the place of tincture of I (digest 5 parts liquid tar with 100 of 95% alc., decant and filter the yellow turbid liquid, add 80 g. of the filtrate to 100 kg. of 70% alc.). T. recalls the improved army method of ready prepn. of 5% I soln. contg. 2% KI. 2 tablets sealed in a glass tube contain 0.5 g. I and 0.2 g. KI. When needed, dissolve these in 80-90% EtOH (sol. also in 70%) in a glass graduated to 10 cc. V. condemns the use of 10% I soln. also of alc. denatured with Me₂CO. Cf. C. A. 16, 2385, 2387, and V., *Schweiz. Apoth. Ztg.* 1922, 202-4. S. WALDBOTT

Warning against the use of santonin. ANON. *Schweiz. Apoth. Ztg.* 65, 453 (1927).—The case of a 5-year-old child affected by tetany with coma after it had been given 0.05 g. santonin, is cited by Lesné. Santonin on aging may undergo changes causing it to become more toxic. S. WALDBOTT

Formula AL-14. ANON. *J. Am. Med. Assocn.* 89, 1394(1928).—AL-14 is sold as "an insurance against Colds, Flu and Pneumonia." The package contained 12 powders (A) with directions printed in red and 12 (B) with directions printed in blue. A consisted of CaCO₃ 0.6, KHCO₃ 39.2 and NaHCO₃ 60.1%. B consisted essentially of citric acid. L. E. WARREN

The constants of chloroform liniment? L. E. WARREN. *J. Am. Pharm. Assocn.* 16, 1029-33(1927).—Soap liniment was prepd. from materials of known constns. Several

specimens of CHCl_3 liniment were then prep'd. from soap liniment and CHCl_3 , some of which were purposely not according to standard. The phys. properties of the several specimens were then observed. The d. varied most with variation in CHCl_3 content. The d_{20} should be 1.050–1.060; α_D 1.14–1.6°; solids 3.9 to 4.5 g. per 100 cc.; EtOH 43–45%. No standard for CHCl_3 is suggested. L. E. WARREN

The ephedrine assay of Chinese Ephedra. C. T. FENG AND B. E. READ. *J. Am. Pharm. Assocn.* 16, 1034–9(1927).—Various methods for the assay of *Ephedra* were tried. Hot extn. and the use of strong bases like NaOH to liberate the alkaloid are most satisfactory. The total yields of alkaloid may exceed 1%. The $\text{NH}_4\text{OH}-\text{CHCl}_3$ process has been critically studied and it was found that a large excess of NH_4OH was necessary to liberate the alkaloids. A physiol. assay is suggested to confirm the chem. assay. L. E. WARREN

The quantity of alkaloid in Hyoscyamus and a new method for its evaluation. H. R. WATKINS AND S. PALKIN. *J. Am. Pharm. Assocn.* 16, 1039–44(1927).—The essentials of the new method consist in (1) liberation of the alkaloid in a continuous extn. app. (C. A. 19, 2106), with Et_2O chiefly as solvent, (2) purification of the alkaloid by treatment with dil. acid to ppt. chlorophyll and ether extractives, (3) re-extraction of alkaloid from the aq. soln. after making alk. with NH_4OH and (4) subsequent titration. All procedures were carried out in such a manner as to insure the stability of the alkaloid. Place 15 g. of the drug (no. 60 powder) in a type B extractor and pour sufficient Et_2O through the center delivery tube to render the tube moist. Add a mixt. consisting of 5 cc. of 28% NH_4OH , 10 cc. of EtOH and 20 cc. of Et_2O . Stir the drug with a glass rod. Attach the delivery tube to a 300-cc. Erlenmeyer flask, stopper the app. securely and allow to macerate overnight. Stir the drug again with the glass rod and wash the rod with Et_2O . Insert the filtering gauze and place the funnel in the upper end of the center delivery tube. Pour Et_2O into the funnel in the tube until the liquid flows over into the Erlenmeyer flask to the extent of about 75 cc. Connect the extractor with a reflux condenser, allowing the Erlenmeyer flask to rest on a steam bath. Boil briskly for 2 hrs. (If any channeling in the powdered mass is observed during the process of extn., the extractor should be removed and the mass again stirred with the glass rod to break up the channels.) Remove the extractor and pour the solvent remaining in the jacket into the Erlenmeyer flask. Evap. the ext. to about $\frac{1}{3}$ its vol., using a current of air. Add 10 cc. of 0.05 N H_2SO_4 and 5 cc. of H_2O and evap. until the odor of Et_2O is entirely gone. Pour the acidified liquid into a 50-cc. volumetric flask and rinse the Erlenmeyer flask with 5 cc. of water. Take up the residue remaining in the Erlenmeyer flask with a small quantity of CHCl_3 . Pour the acidified liquid into the volumetric flask; cool the contents to room temp and make up to the mark with water. Mix thoroughly and filter through paper, rejecting the first few cc. of the filtrate. Use an aliquot of 40 cc. of the filtrate for extn. Place the soln. in a type C extractor, make alk. with NH_4OH and ext. with CHCl_3 until the soln. is exhausted of alkaloid. Evap. the ext. on the steam bath to about 5 cc. Add a measured excess of 0.05 N H_2SO_4 and continue the evapn. until the CHCl_3 has disappeared. Cool the soln. and titrate back with 0.05 N NaOH, using 1 drop of methyl red soln. as indicator. Extended trials show that the new method yields more than 3 times the quantity of alkaloid obtainable by the U. S. P. IX or the U. S. P. X procedure. L. E. W.

The biological assay of aconite. M. G. JAUREGUI. *J. Am. Pharm. Assocn.* 16, 1045–52(1927).—Aconitine of approved m. p. was used. Each day a soln. of 0.100 g. in 100 cc. of 2% AcOH was prep'd. The guinea-pig method was used and the standard was found to be within the U. S. P. X requirements. The m. i. d. for cats and dogs was nearly the same as that for guinea pigs. The intravenous method for dogs is unsatisfactory. Cutting the vagus does not improve the accuracy of the method. In cats the intravenous method of administration is wholly unreliable. The method was more reliable if the depressing effect of the anesthetic on the heart could be eliminated by insufflation of the Et_2O into the bronchi with maintenance of artificial respiration. L. E. WARREN

Phenols from distillates obtained in oil cracking [as disinfecants] (Brit. pat. 275,313) 22.

THOMS, HERMANN: *Handbuch der praktischen und wissenschaftlichen Pharmazie*. In 6 vols. Berlin and Wien: Urban & Schwarzenberg.

Antidiabetic medicine. H. W. DUDLEY. U. S. 1,669,328, May 8. Material such as a crude product from pancreas which contains a crude specific diabetic principle is treated with picric acid to form an insol. compd. and the latter is treated with an inorg. acid such as HCl to obtain a sol. salt of the diabetic principle.

Base for ointments. C. SCHROEDER and A. KEIL. U. S. 1,668,382, May 1. Finely divided ZnO is mixed with a sirupy product obtained by concg. sepd. or skim milk and glycerol also is added.

Hormones from animal organs. G. EICHELBAUM and J. ALTENBURG. Brit. 275,183, July 28, 1926. The material used or exts. obtained are treated with ultra-violet rays, preferably *in vacuo* or in an inert atm.

Mixtures of vegetable foods with medicinal substances. O. STINER and B. DIETHELM. Brit. 274,915, July 26, 1926. Medicines such as K1, As₂O₃, strychnine and K₂CO₃ are mixed with bran or other vegetable substances.

Iodo derivatives of cyanophenol ethers. CHEMISCHE FABRIK AUF AKTIEN, FORM. E. SCHERING. Brit. 275,213, Aug. 2, 1926. Intermediates for use in producing pharmaceutical compds. are obtained by condensing iodophenol ether with metallic salts of iodo-hydroxybenzonitriles or metallic salts of iodophenol ethers with iodobenzonitriles. An iodonitrobenzene or iodonitrohydroxybenzene may be used also and the condensation product in that case reduced and treated after diazotization with Cu cyanide. To effect the condensation the materials may be heated to 210–240° in the presence of a catalyst such as Cu.

Nitropyridinearsonic acids. A. BINZ and C. RATH. Brit. 275,590, Aug. 5, 1926. 2-Hydroxy- and 2-halogen-pyridine-5-arsonic acids or other substituted pyridinearsonic acids are treated with strong nitrating agents. The products, and the amino compds which can be formed from them by reduction, may be used as *therapeutic agents*.

Quinoline derivatives. I. G. FARBENIND. A.-G. Brit. 275,277, Feb. 4, 1926. 6-Alkoxy-8-aminoquinolines are made either by reducing the 8-nitro or 8-azo derivs of 6-alkoxyquinolines or by alkylation of the O of the OH group of a 6-hydroxy-8-acylaminoquinoline or 6-hydroxy-8-arylidencaminoquinoline and subsequently splitting off the acyl or arylidene such as benzyldene group or by direct alkylation of 6-hydroxy-8-aminoquinoline. The products may be used as *therapeutic agents* or as intermediates for the prepn. of other pharmaceutical compds. Several examples are given.

Surgical ligatures. P. BOSR. Brit. 274,493, July 15, 1926. Ligatures are formed of spun or woven animal fibers such as those of muscle, which may first be washed, sterilized and hardened with CH₂O, chromic acid or I soln. and may also be degreased and tanned, vulcanized or twisted.

Deodorant. E. H. O'NEIL. U. S. 1,669,016, May 8. A compn. adapted for application to the body is prepd. by melting together spermaceti 2 and petrolatum 1 part, adding ZnO 1 and H₃BO₃ 1 part, cooling the compn. and molding it into stick form.

Composition for "permanent waving" of hair. E. O. SCHNEILL. U. S. 1,668,608, May 8. An emulsion is formed of a non-drying oil such as olive or castor oil, colloidal clay, water and an alk. salt such as Na₂HPO₄ or NaHCO₃.

Composition for softening the beard for shaving. W. E. POOLE. Brit. 274,659, Aug. 17, 1926. Sugar, borax and turpentine are dissolved in boiling water and this mixt. may be added to shaving creams.

18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

High-pressure ammonia synthesis. F. MÜLLER. *Arch. Eisenhüttenwesen* 1, 517–23(1927); *Stahl u. Eisen* 48, 405–6(1928).—Description of the Haber-Bosch, Claude, Casale and Mont-Cenis processes.

Synthetic ammonia and the Casale process. A. MIOLATI. *Notiz. chim.-ind.* 3, 138–41, 201–10(1928).—Following a general description of the chemistry of the fixation of N and the various processes which have become of industrial importance, the Casale process is discussed, with diagrams and illustrations, including chem. and engineering problems and results attained at various plants.

A technical method of the preparation of sodium nitrate and hydrochloric acid by the action of nitric acid on sodium chloride. V. I. NIKOLAEV. *J. Russ. Phys.-Chem. Soc.* 59, 685–8(1927).—A study of the system Na₂O–N₂O₅–H₂Cl₂–H₂O has shown that increasing acidity displaces the equil. in favor of HNO₃ in the liquid phase, the phenomenon being more marked at higher temps. By adding to a soln. of 10.17 parts

NaCl in 47.2 parts water at 45°, 46.62 parts Na_2O_3 , a satd. soln. is obtained from which 14.8 parts of pure NaNO_3 deposit on evapn. The distillate (contg. HNO_3 and HCl in the ratio 5:1) is satd. at 100° with NaCl and cooled to room temp. whereupon crude NaNO_3 (contg. 27.4% NaCl) seps; the residual liquor leaves a mixt. of 90.2% NaNO_3 and 9.8% NaCl. The second distillate contains HNO_3 and HCl in the ratio of 1.09:1, i. e., about 60% of the original HNO_3 has reacted to form NaNO_3 . The acid mixt. is slowly added to concd. H_2SO_4 and the HCl liberated dissolved in water. The remaining HNO_3 is distd. off with repeated addns. of water, 90% being recovered. NaNO_3 from the second distn. is purified by dissolving in water at 100°, the soly. of NaNO_3 being 58.25% and that of NaCl 5.54%.

BASIL C. SOYENKOFF

The colloidal behavior of lime. K. W. RAY AND F. C. MATHERS. *Ind. Eng. Chem.* 20, 475-7(1928).—The properties of hydrated lime are explained by assuming it to be a non-reversible colloid. Plastic lime putties show cataphoresis to a limited extent. The differences between putties are attributed to the difference in their colloid content, since the amt. of cataphoresis varies with diff. samples and is related in a rough way to the relative plasticities. The extent of cataphoresis is greatest for plastic putties and least for non-plastic putties. By the application of the Donnan membrane equil. equation to the charged particles of lime in a putty, a theory is developed in which the plasticity of a lime putty depends on a water-film held around each particle by a force depending upon the charge held by the particle.

J. H. PERRY

Some interesting experiments with gypsum. P. P. BUDNIKOFF. *Pit and Quarry* 16, No. 1, 72-6(1928).—The effects of heating gypsum to temps. from 100° to over 750° are outlined and the various theories advanced for the mechanism of the effect of catalysts on the acceleration or retardation of the setting of gypsum are discussed. Exptl. results show the effects of normal and molar acid solns. of their Na salts, of salts of univalent, bivalent, or tervalent metals, of complex salts, and bases on the speed of setting of plaster of Paris. H_2SO_4 , HNO_3 , HCl and HF are accelerators, while H_3PO_4 , lactic acid, boric acid, formic acid, acetic and citric acids are retarders. Expts. on M , N and 0.1 N solns. of the carboxylic acids showed such negative action on the setting of plaster of Paris that even the 0.1 N solns. of the salts give no second increase in temp. Samples thus secured possessed greater strength than those prepd. with the aid of positive catalysts or with pure water. Salts of the univalent metals are strongly positive catalysts. Bivalent metals with sulfate anion differ but slightly in catalytic properties. The effects of Ba, Ca, Sr and the tervalent metals are noted. Most salts aid in the hydration and setting of anhydrite.

W. H. BOYNTON

The system: potassium, sodium, and calcium nitrates and water. FR. FROWEN. *Z. anorg. allgem. Chem.* 169, 336-44(1928), cf. *C. A.* 21, 850.—The object of this study is to find methods based upon the phase rule to convert synthetic $\text{Ca}(\text{NO}_3)_2$ to KNO_3 . The soly. curves at 0° and 20° were detd. for those systems not yet studied. Great difficulties were met with $\text{Ca}(\text{NO}_3)_2$ solns. due to supersatn., high viscosities, and d. often over 1.76. They were overcome by long stirring (7-8 hrs.), settling and careful pipetting of the solns. The binary systems KNO_3 - $\text{Ca}(\text{NO}_3)_2$ and NaNO_3 - $\text{Ca}(\text{NO}_3)_2$ and the non-variant point of the ternary system were detd. KNO_3 raises the soly. of $\text{Ca}(\text{NO}_3)_2$, while the latter raises the soly. of the KNO_3 . The hydrated Ca nitrate causes a curvature in the soly. of the non-hydrated Na and K nitrates. Contrary to the results of Barbaudy (*C. A.* 18, 191) at 30° $\text{Ca}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$ was the only hydrated Ca nitrate found and no mixed crystals occurred in any system.

A. F.

Treatment of leucite with alkali. FELIX JOURDAN. *Atti II congresso naz. chim. pura applicata* 1926, 1194-8.—See *C. A.* 21, 989.

C. C. DAVIS

Decomposition of clays. L. WASILEWSKI. *Przemysl Chem.* 12, 40-8(1928).—The decompn. of clays and kaolins by means of $(\text{NH}_4)_2\text{SO}_4$ and the individual factors involved were studied. The decompn. proceeds as if first $(\text{NH}_4)\text{HSO}_4$ and ammonium alum were produced, which reaction would go up to 357°, and next NH_3 and $(\text{NH}_4)_2\text{SO}_4$ were driven off from the alum, which reaction would begin at 420-30°, and end above 450°. The temp. of decompn. affects the losses of NH_3 , since up to 360° about 0.5% NH_3 used in the reaction is oxidized and ammonium alum is leached out of the products, while at 450° about 9% NH_3 is oxidized and at the same time $\text{Al}_2(\text{SO}_4)_3$ is obtained. A curve showing the relationship between the temp. and % NH_3 oxidized is given. Clays of varying chem. compn. decompose at different times and in different ways, i. e. g., clays with a higher Fe_2O_3 content release NH_3 more easily and quickly than those of lower Fe_2O_3 content, and those free from Fe_2O_3 resist conversion to $\text{Al}_2(\text{SO}_4)_3$.

A. C. ZACHARIN

Oxychloride and other dental cements. WALTER S. CROWELL. *Trans. Am. Inst. Chem. Eng.* 19, 19-25(1927).—Dental cements are placed in 3 classes: oxychloride

cements, heavy metal phosphate cements and silicate cements. Zn oxychloride cements have been largely superseded by those of the second group, while Zn phosphate cements, as filling agents, have been superseded by the silicate cements. Most recent developments are the substitution of acid-sol. silicates contg. Al for Zn or Cu compds. previously used. All dental cements consist of basic powder and an acid liquid mixed immediately before use. At 37° , 4 phosphates of Zn are formed. The range of stability of each is given. Silicate cements resemble industrial porcelain. The necessity of slow setting, the mechanism of setting, and the limited industrial uses of dental cements are outlined, also a means of testing them. Other things being equal, the cement with the lowest shrinkage and highest strength is the best. W. H. B.

The microscopic pictures of a few decolorizing carbons. FERDINAND KRYŽ. *Z. Zucker ind. Czecho-Slov. Rep.* 52, 98-9 (1927).—Microscopic analysis permits definite differentiation between animal and vegetable carbons. Further studies should lead to recognition of different brands of the latter. F. R. BACILER

Fumigation of stored-products insects with certain alkyl and alkylene formates. R. T. COTTON and R. C. ROARK. *Ind. Eng. Chem.* 20, 380-2 (1928).—The vapors of methyl, ethyl, secondary butyl, isobutyl, isoamyl, and allyl formates are toxic to insects infesting stored products, such as rice weevils, clothes moths, carpet beetles and furniture beetles. About 70% CCl_4 is added to remove the fire hazard. C. M. S.

BISCHOFF, J.: Handelswichtige anorganische Chemikalien. LEIPZIG: Max Jänecke. 331 pp. Paper, R. M. 12; bound, R. M. 13.50.

KEGHEL, DE: Manuel du fabricant d'encre, cirages et colles. PARIS: J. B. Baillière et fils. 384 pp. F. 22.

Hydrocyanic acid. G. H. BUCHANAN. U. S. 1,667,838, May 1. $\text{Ca}(\text{CN})_2$ or other crude cyanide contg. an alk. earth metal compd. is treated with water and HCN is removed from the zone of reaction before any objectionable quantities of azulmic compds. are formed. An app. is described.

Sulfuric acid. C. W. FIELDING. Brit. 274,918, Jan. 29, 1926. In producing H_2SO_4 directly from SO_2 and nitrous vitriol, gases contg. SO_2 and free O with or without oxides of N and water vapor are introduced into the bottom of a mixing column or similar app. and brought into intimate contact with nitrous vitriol which is circulated and cooled. Brit. 274,919 specifies a similar process in which the gas is forced into nitrous vitriol and raises the latter on the air-lift principle to effect intimate contact partly as a foam and partly as a spray. An app. is described.

Caustic alkalies. R. E. WILBY and C. E. MENSING. Brit. 275,044, Oct. 11, 1926. Caustic alkalies are converted into granular form by centrifuging the fused material, subjecting it to the action of an air blast, and directing addnl. cold air upon the material. An app. is described.

Ammonia synthesis and reductions by hydrogen. SOC. INTERNATIONALE DES PROCÉDÉS PRUDHOMME HOUDRY (formerly SOC. INTERNATIONALE DES PROCÉDÉS PRUDHOMME). Brit. 274,846, July 23, 1926. The H used is preliminarily passed through a material such as metallic Ni or a suitable oxide which converts the H into nascent condition. An app. is described.

Burning alkaline earth carbonates. DWIGHT & LLOYD METALLURGICAL CO. Brit. 275,463, Nov. 26, 1926. In burning carbonates such as limestone, dolomite and magnesite, the material is spread in a layer on a pervious support and heating gases are passed through it. An app. is described.

Ammonium carbonate. RHEINANIA-KUNHEIM VEREIN CHEMISCHER FABRIKEN AKT.-GES. Brit. 275,459, Nov. 20, 1926. In carrying out the process described in Brit. 262,408 (C. A. 21, 3716), the temp. is maintained so that it does not substantially exceed 60° when atm. pressure is used. When higher pressures are used, the temp. may be 60 – 90° .

Carbon monoxide and hydrogen from hydrocarbons. L. CASALÉ. Brit. 274,610, June 2, 1926. Reaction is effected at about 1000° in an excess of steam and at a pressure less than atm. pressure. H and CO free from CH_4 are obtained and if air is used a gas may be produced suitable for use in NH_3 synthesis.

Chlorides of calcium, strontium, magnesium, zinc, etc. I. G. FARBENIND. A.-G. and K. STAIB. Brit. 275,116, March 5, 1927. In converting oxides into anhyd. fused chlorides, the finely divided oxide, suspended in a mixt. of Cl and CO, is introduced into a heated chamber where conversion takes place. By using the oxide with Cl and finely divided C, the CO may be omitted.

Potassium ferrocyanide. G. H. BUCHANAN and C. M. HULINGS. U. S. 1,667,839,

May 1. A ferrocyanide mother liquor such as that obtained by use of crude cyanide material is treated with Ca ferrocyanide in excess, com. KCl is added, insol. substances are sepd. from the soln. and the insol. constituents are treated with sufficient K_2CO_3 to decomp. any double salt of K and Ca ferrocyanide present but insufficient to react with any $CaSO_4$ present; the soln. is filtered and $K_4FeC_6N_4$ is recovered from it.

Concentrating or purifying caustic soda, etc. C. F. HAMMOND. U. S. 1,668,504, May 1. Material such as NaOH is conducted over the surface of a hot liquid mass, *e. g.*, molten Pb, heated directly by the flame or gases of a submerged flame burner and the products of combustion are withdrawn at a portion of the surface which is not covered by the material under treatment. An app. is described.

Purifying solutions containing sodium arsenate and stannate, etc. H. HARRIS. Brit. 275,344, May 7, 1926. Solns. contg. Na arsenate and stannate are freed from Sb by treating them with a reducing agent, *e. g.*, by heating in contact with Sn plates, filings or turnings for 1-2 hrs. Na antimonate may be obtained as a by-product. Cf. C. A. 22, 2036.

Zinc oxide catalysts. G. BLOOMFIELD. U. S. 1,668,838, May 8. In prepg. a catalyst suitable for use in MeOH synthesis or other processes, ZnO is combined with a soln. of NH_4NO_3 and the mass is ignited.

Separating compounds of aluminum and potassium. H. J. FALCK. U. S. 1,667,968, May 1. Al and K compds. such as those of leucite are converted into nitrates, the latter are treated with concd. HNO_3 and the soln. of KNO_3 in HNO_3 thus obtained is used for producing a mixt. of KNO_3 and $Al(NO_3)_3$ from fresh raw material.

Separating metalloids from their compounds, etc. H. WITTEK. Brit. 275,145, July 27, 1926. Extn. of metalloids from their compds. such as those of P, As and Sb is carried on in connection with nitrogenation of Ca, Ba or other carbide and the metalloid is obtained in the free state or as another compd. such as CS_2 . Various details and modifications are described.

Treating titanium-bearing materials. TITAN CO. AKTIESELSKABET. Brit. 275,578, Aug. 3, 1926. An aq. liquid, preferably an aq. soln. of an acid or a salt such as $FeSO_4$, is added to the H_2SO_4 or other acid used for treating materials such as ilmenite or titanite, to restrict hydrolysis or crystn. of the compds. dissolved. The process of soln. may be conducted at progressively decreasing temps., *e. g.*, 170-130° and may be carried out under pressure. Brit. 275,579 specifies the use of acid such as H_2SO_4 for treating ilmenite, rutile or titanite together with a reducing agent such as pyrites or various metals or H_2S . Brit. 275,580 specifies the treatment of the Ti-bearing material, preliminarily, with various reducing agents, with or without Mg, to effect selective reduction of the Fe present without reducing the Ti, and then dissolving the Ti with an acid solvent such as H_2SO_4 . If desired, an excess of reducing agent may be used in the presence of N to obtain N compds. of Ti, in which case $(NH_4)_2SO_4$ is obtained from the soln. produced in the acid treatment.

Hydrogen. F. GÜLKER. Brit. 275,273, July 30, 1926. CO or water gas or other gas contg. CO is treated with steam in the presence of a catalyst in the presence of substances which under the conditions of the process will absorb CO_2 , *e. g.*, lime (which may be prepd. *in situ* from marble). Mineral substances such as spathic Fe ore and bauxite may be used as catalysts without preliminary activation. An app. is described.

Carbon black. CANADA CARBIDE CO., LTD. Brit. 274,573, April 24, 1926. In dissocn. of a hydrocarbon gas such as C_2H_2 or natural gas, by passing the gas into a heated chamber, the gas is maintained at a temp. sufficiently low to prevent polymerization up to the time of its entry into the reaction chamber and it is then suddenly heated to dissocn. temp. The entering stream of gas may be kept cool by an enveloping stream of another gas such as air, CO_2 or N. An app. and various details and modifications of procedure are described.

Active carbon and other products. K. S. C. BONE and WILSON BROS. BOBBIN CO., LTD. Brit. 274,538, March 19, 1926. Finely divided wood impregnated with Ca acetate is continuously fed in a layer through a retort and gradually and uniformly heated to 1000° or higher; creosote oils are recovered at temp. below 450° and a bath of Pb may be used at the end of the retort from which the vapors are withdrawn or two retorts in series may be used. Acetone, Me Et ketone, higher ketones, HOAc and creosote oils are recovered. The active C formed is removed from the retort, its oxidation being avoided and is extd. with HOAc or HCl to remove ash and $CaCO_3$. App. is described.

Apparatus for continuous hydration of lime, etc. J. C. SCHAFFER. U. S. 1,668,839, May 1.

Apparatus for hydrating lime. J. C. SCHAFFER. U. S. 1,668,924, May 8.

Destructive hydrogenations and other catalytic reactions. I. G. FARBENIND. A.-G. Brit. 274,904, July 24, 1926. The catalyst is brought into a state of suspension throughout the reaction space and whirled by a current of gas, *e. g.*, in destructive hydrogenation of a heavy oil with a Mo-Cr catalyst at 460° under 20 atm. pressure, or in synthesizing NH_3 or MeOH.

Heat exchange system for catalytic processes. SOC. L'AIR LIQUIDE, SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS G. CLAUDE. Brit. 275,592, Aug. 9, 1926. Processes such as the NH_3 synthesis described in Brit. 268,722 (C. A. 22, 1444) may be modified by passing the reaction products through the reaction chamber in such a way that they absorb heat from the hottest zone of the catalyst. An app. and other modifications are described.

Adhesives. G. HONSCHE. Brit. 274,490, July 16, 1926. Glue powders suitable for use by adding cold H_2O are formed from animal glue with the addn. of oxalic acid, H_2BO_3 , salicylic acid, phthalic acid, Na salicylate, NaCl, Zn NH_4 chloride, $\text{Ca}(\text{NO}_3)_2$ or similar substances and quartz powder, MgCO_3 , alum, aldehydes or their condensation products or substances of like action.

Molded products from amphibole. L. H. HARTUNG and F. FOLBERT. U. S. 1,668,768, May 8. In forming articles such as panels or furniture, amphibole is used with ZnCl_2 and soap, the material is initially molded under pressure, heated and dried and the surface of the molded product is then further treated with a soap soln.

Plastic molding composition. M. SASAKAWA. U. S. 1,668,172, May 1. A compn. suitable for use instead of clay for modeling is formed by adding powd. CaCO_3 and flower of S to a soft fat-like substance produced by kneading a mixt. of lime soap and mineral grease and further kneading the complete mixt.

Plastic condensation product. E. L. AIKEN. U. S. 1,668,444, May 1. Phenol and glycerol are caused to react in the presence of a dehydrating agent such as CuSO_4 and the dehydrating agent and assocd. water are removed from the reaction product. The reaction product thus obtained is suitable for reacting further in the presence of $(\text{NH}_4)_2\text{CO}_3$ with a reactive CH_2 -contg. substance such as a CH_2O polymer to obtain a viscous condensation product. U. S. 1,668,445 specifies forming flexible articles by condensing a phenylglyceryl compd. with available CH_2 such as may be supplied by a CH_2O polymer to form an intermediate product, and shaping the intermediate product without pressure and heating the shaped article to cure it.

Uniting vitreous surfaces. B. LONG. U. S. 1,668,853, May 8. Surfaces to be joined, after accurate fitting and grinding to a smoothness such as is obtainable with fine emery, are coated with a thin film of a synthetic resin and joined by heat and pressure.

Absorbent materials. A. ROSENHEIM. Brit. 275,203, July 30, 1926. The basic content of natural or artificial zeolites, glauconite, tuffs, natural glasses and like materials is at least partially extd. with acids or acid salts; the product may be used as an adsorbent for gases or vapors or for decolorizing liquids such as oils or sugar solns. If the oil or other substance treated contains acid, this may serve for extg. the bases from the decolorizing material. Numerous examples are given.

"Antifriction" material for bearings, etc. SOC. ANON. FRANÇAISE DU FÉRODO. Brit. 275,648, Aug. 7, 1926. Artificial resin may be mixed with textile fabrics, flakes, waste of fibrous material, graphite, etc., for making bearings, piston packing, valves and other sliding parts of machinery.

Metal for "self-lubricating" bearings. C. CLAUS. Brit. 275,444, Oct. 13, 1926. See U. S. 1,648,722 (C. A. 22, 485).

Composition for polishing metals. W. BREITZKE. U. S. 1,669,281, May 8. A pasty mixt. is formed from confectioner's sugar 68, camphor 26, ether 6 parts and water.

Preventing and removing incrustations from radiators and water jackets of engines, etc. H. MENZ and H. VOM BRUCK. Brit. 274,718, Dec. 22, 1926. A device is arranged to hold a mass of tannin (with or without addn. of 5% Na_2CO_3) in the top of the radiator.

Rope rendered waterproof and floatable by paraffin and occluded air. C. A. O. BERNER. Brit. 275,327, May 4, 1926.

Pictures on metal plates. F. D. LIVERMORE. U. S. 1,668,686, May 8. A "key print" is formed from a gelatin plate; a transfer from this "key print" is made to the surface of a metal plate which may be formed of Zn or Al, portions of the transferred image on the metal plate are blocked in and the metal plate is treated, *e. g.*, etched with acid, to remove portions of the image not covered by the blocking in operation.

Fire-extinguishing compositions. EXCELSIOR FEUERLÖSCHGERÄTE AKT.-GES. and C. WAGNER. Brit. 274,567, April 23, 1926. In producing foam, at least one ma-

terial is used which is insol. in water such as carbonate or bicarbonate of Ca or Mg which may be made into a paste and mixed with an acid and water.

Fire-extinguishing compositions. W. GRAAFF. Brit. 274,574, April 24, 1926. A foam is used together with CCl_4 or similar substances.

Generating foam for extinguishing fires or for other purposes. R. SCHNABEL. U. S. 1,669,213, May 8. A saponin soln. is oversatd. with a gas such as CO_2 in a container under pressure, so that on relieving the pressure the gas escapes and foam is produced.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

Some recent improvements in the manufacture of flat glass. H. K. HITCHCOCK. *Mech. Eng.* 50, 368-72(1928). E. H.

Glass, resistant to drastic temperature changes, mechanical influence, and chemical attack. Its manufacture and properties. HUGO KÜHL. *Glashütte* 56, 743 et seq. (1926); 57, 3 et seq. (1927); *J. Soc. Glass Tech.* 11, 233A.—For the manuf. of chem. app., cooking ware, lamp cylinders, centrifuge glasses, as well as for containers for certain foods, drink, acids and alkalies, a batch must be used which should give a eutectic soln. of silicates in one another and should not show any alteration with time. The value of different oxides in producing resistant glass was discussed. Phonolith was recommended as a very suitable source of Al_2O_3 in cases where the green color due to iron oxide impurity was no serious disadvantage. H. G.

Magnesia glass. HUGO KÜHL. *Glashütte* 57, 123(1927); *J. Soc. Glass Tech.* 11, 233A.—A glass which showed an extraordinary resistance to temp. change could be obtained by using a German dolomite of the compn CaCO_3 55.39%, MgCO_3 41.90, SiO_2 1.65, Al_2O_3 0.90, Fe_2O_3 trace. Plasks made from such a glass contg 4.5% MgO withstood very drastic temp. changes without breaking. H. G.

Practical instructions in annealing of hollow glassware. OSCAR KNAPP. *Sprechsaal* 61, 42-3, 62-3, 83-6(1928).—The temp. at the beginning of annealing should be high, preferably near the deformation temp. When a variety of large glasses of different wall thickness are annealed at the same time the initial temp. should be governed by the ware of smallest wall thickness. The greater the rate of cooling, the shorter the time of annealing. In this case the largest glasses with the greatest wall thickness must be the controlling factor. The annealing operation should be continuously controlled. R. A. HEINDL

Some effects of carefully annealing optical glass. L. W. TILTON, A. N. FINN AND A. Q. TOOL. *J. Am. Ceram. Soc.* 11, 292-5(1928).—Small differences in annealing temp. may be eliminated by careful furnace control. There need be no change in the av. n if the "thermo-optical" const. of the glass are detd. C. H. KERR

The ring test for casing glasses. L. SPRINGER. *Sprechsaal* 59, 806(1926); *J. Soc. Glass Tech.* 11, 135A.—S was in agreement with the results of Gehlhoff and Thomas on the subject of the ring test (see *Ibid* 59, 697(1926)) and quoted several earlier

	Cobalt blue glass	Cadmium yellow glass	Crystal glass
	1	2	3
SiO_2	45.7%	46.5%	77.15%
PbO	32.7	31.5	—
Al_2O_3	0.5	0.5	—
CaO	Trace	Trace	6.05
K_2O	9.0	9.8	10.05
Na_2O	Trace	Trace	6.75
B_2O_3	11.0	11.0	—
CoO	About 0.5	—	—
CdS	—	About 0.5	—
Expansion coeff.	21.8×10^{-6}	21.9×10^{-6}	24.5×10^{-6}

communications by various authors. Tests had proved that a colored casing made from the parent batch with large addns. of coloring oxide (Fe and Mn) could often be combined successfully with the parent crystal glass, even though its expansion coeff. was appreciably altered. Other properties, such as elasticity and relative thickness of the base and the casing glasses, also came into play. Casing glasses 1 and 2 in the

table were used in conjunction with Bohemian crystal glass 3, although the calcd. expansions were somewhat different. H. G.

Fluorspar, cryolite and artificial cryolite as opacifiers in the glass industry. HUGO KÜHL. *Keram. Rundschau* 35, 823-4(1927).—Small quantities of fluorspar, NaF, Na fluosilicate and cryolite act always as fluxes. Opacity is produced as soon as a certain upper limit, which is different for each opacifier and very high for fluorspar, is exceeded. With an opacifier present glass which is usually clear becomes milky-white when it is re-heated and slowly cooled. Cryolite is considered a better opacifier than fluorspar because of the smaller quantity required. Since Greenland is the only com source of cryolite synthetic cryolite is suggested as a satisfactory substitute. H. I.

The requirements for a pure red lead for glass-making and methods of analysis. RUDOLF SCHMIDT. *Keram. Rundschau* 35, 840-3(1927).—Although pure red lead contains 65.11% PbO and 34.89% PbO₂, com. red lead also contains varying amts. of Pb₃O₄ and Pb₂O₃, and often as little as 24 to 26% PbO₂. Red lead with low PbO₂ content used in glass batches makes the glass difficult to melt and to refine. "Scarlet-red" lead (cryst. red lead) is more satisfactory for glass making than "brick-red" lead which is more pulverulent. The oxides of Sb and Sn and PbSO₄ are the principal impurities in red lead which has not been deliberately adulterated. Other impurities are Fe, Cu and Co. For glass-making purposes Fe₂O₃ should not exceed 0.005%, CuO 0.002% and Sb₂O₃ 0.006%. A chem. method for detg. the purity of the red lead and for detg. qualitatively the nature of the impurities is given as well as the detailed method for quant. chem. analysis. H. I.

Influence of porosity and compactness on refractory materials used in glass-making. A. THURET. *Céram. Ver.* 46, 493(1926); *J. Soc. Glass Tech.* 11, 277-8A.—Porous materials dried more uniformly and so had less tendency to crack and more resistance to sudden temp. changes. More compact materials had better resistance to attack by the glass and its constituents and did not disengage gas bubbles into the glass in contact with them to so great an extent, nor did they adsorb coloring matters from the glass so much and thus cause variations in the tints of glass melted in pots of such materials. Pots in which optical glass was to be melted should, therefore, be of materials as non-porous as possible, while pots for ordinary glass should be less compact, as they had to withstand changes of temp. between the working and the founding temp. Siege blocks for pot-furnaces should be of similar material to these latter, while tank blocks should be as dense as possible, as they were in contact with glass at a uniform temp. Silica bricks of low expansion were used for furnace arches, but porous aluminous bricks might be used. Movable refractories such as stoppers should be very porous. Suggested compns. for refractory materials were:

	Raw clay %	Grog % of sieve mesh			
		45	26	16	14
Optical glass pot	49	37	—	14	—
Ordinary glass pot	50	25	—	—	25
Tank blocks	44	38	—	18	—
Siege blocks (pot-furnaces)	40	—	35	—	25

To obtain the advantages of both types of material, pots might be lined with a more compact type of material of the same compn. on the inside. Trials had been made with pots lined with a finely ground siliceous material—or rather less aluminous than the body of the pot—so that the outer layer, having a higher expansion coeff., contracted on to the inner layer, making it dense and durable. H. G.

Plasticity of clay. L. E. JENKS. *J. Am. Ceram. Soc.* 11, 317-22(1928).—The cause of plasticity is the formation in the moistened clay of a continuous external phase through the action of water in making gelatinous the material that forms the enveloping surface around the non-gelatinous particles and aggregates present in the clay. C. H. KERR

Acidity of Japanese acid clay (Japanese fuller's earth). K. KOBAYASHI. *Mem. Faculty Sci. Eng. Tokyo* 4, 1-2(1927); *Analyst* 52, 559.—Analyses of the chief Japanese acid clays suggest that the clay is a mixt. of colloidal hydrated Al silicates and an amorphous anhyd. compd. of orthosilicic acid, and may be expressed as Al₂O₃·6SiO₂·xH₂O, x being greater than 6. The clay is not a true acid, the acid reaction being due to free acid liberated by the adsorption of the clay to the indicator and the reaction is similar in nature to that with silk and wool fibers. H. G.

The specific heats and heat variations of clays. W. M. COHN. *Ber. deut. keram. Ges.* 7, 149(1926); *J. Soc. Glass Tech.* 11, 285A; cf. C. A. 21, 2773.—The methods

for the detn. of the sp. heat of ceramic materials and the heat absorbed by them during firing were discussed. C.'s results (C. A. 18, 3259) were then compared in detail with those of MacGee (C. A. 20, 2233). H. G.

A study of the calcium-sodium ratio of certain waters. R. A. HART. *J. Am. Ceram. Soc.* 11, 314-6(1928).—Clays deposited by water in an arid section should have a greater d. than similar clays deposited by waters in a humid section. Tempering clays with water having a relatively low Ca-Na ratio should produce a body of greater d. C. H. KERR

A continuous kiln for the firing of pottery and other clay products. J. WILLIAMSON. *Brit. Clayworker* 37, 18-22(1928); *Pottery Gaz.* 53, 111.—This kiln is of the tunnel type; it may be fired by gas, oil or coal, and is of the combined direct flame and muffle type. Instead of traveling in a longitudinal direction as in present practice, the flame takes a transverse course, which may be either up draft or down draft. The flame may also alternate from one side of the kiln to the other, resulting in uniformity of temp. R. A. HEINDL

The influence of titanium on the coloring of clay ware. E. KLEVER. *Keram. Rundschau* 36, 101-2(1928).—The presence of Ti may cause a bluish to purplish color in burned clay ware. The color is most frequently produced when (1) the ware is burned to the sintering point and (2) a reducing fire is used. Fe_2O_3 may mask the coloring effect of Ti. H. INSLEY

The history of ceramics. C. F. BONINI. *Giorn. bibl. tech. intern.* 3, 763-74(1927). C. C. DAVIS

Some factors influencing the thermal properties of minerals and products of the ceramic industry. W. M. COHN. *J. Am. Ceram. Soc.* 11, 296-306(1928).—A survey is given of factors influencing sp. heat, thermal reaction, thermal cond., thermal expansion, thermal radiation, etc. A bibliography is added. C. H. KERR

Bibliography of plasticity. P. J. SLEGEL. *Bull. Am. Ceram. Soc.* 7, 130-6(1928). C. H. KERR

English porcelain. W. B. HONEY. *Pottery Gaz.* 53, 644-50(1928).—Starting with Chelsea porcelain of 1745, H. discusses various porcelains down to modern type of English ware. R. A. HEINDL

Methods for testing crazing of glazes caused by increases in size of ceramic bodies. H. G. SCHURECHT. *J. Am. Ceram. Soc.* 11, 271-7(1928).—The autoclave test (subjecting the sample to a steam pressure of 150-175 lbs. per sq. in. for 1 hr.) proved reliable in detecting bodies which would craze in 1 or more yrs. of storage. The more vitreous bodies are less apt to develop the type of crazing caused by increase in size of body. Bodies having a low soly. in H_2SO_4 are less apt to craze than bodies of high soly. Bodies having a low ignition loss above 110° after 3 or more years' storage in general show the least crazing. The expansion of the body, which causes this crazing, is probably due to combination of H_2O with the body. C. H. KERR

Acid-resisting overglaze colors. R. V. TILBY. *J. Am. Ceram. Soc.* 11, 307-9(1928).—Requirements, difficulties and testing are discussed. C. H. KERR

The prevention of disintegration of blast-furnace linings. H. K. MITRA AND A. SILVERMAN. *J. Ceram. Soc.* 11, 278-91(1928).—The spots of Fe_2O_3 in a fire brick are the points where disintegration starts. Fe_2O_3 is reduced to FeO by CO at 500° and FeO is the catalyst which hastens the reaction $2\text{CO} \rightarrow \text{CO}_2 + \text{C}$, depositing C, the absorption of which by the linings is the cause of failure. The oxide Fe_3O_4 is immune to such action. Converting the Fe_2O_3 to Fe_3O_4 will, therefore, prevent disintegration. This is commercially difficult and requires further exptl. work. C. H. KERR

Use of the simulative-test furnace as a means of making comparative tests of fire brick. G. L. ROGERS. *J. Am. Ceram. Soc.* 11, 323-9(1928).—The U. S. Navy Simulative Service Test is described. C. H. KERR

Brick machine, bucket elevator and hammer mill power determinations. D. P. OGDEN. *J. Am. Ceram. Soc.* 11, 310-3(1928). C. H. KERR

Refractories for the electric steel furnace. E. KOTHNY. *Feuerfest* 3, 157-64(1927).—The characteristics of 14 different refractories are described and their actual or possible application in elec. furnace construction is indicated. The relative costs per cu. m. of brickwork are tabulated for 6 different types of refractory bricks. Silica bricks may be used in all parts of radiation furnaces and above the slag line in basic furnaces. By reason of their comparatively low price, they constitute one of the chief materials for elec. furnace construction. Magnesite bricks are sensitive to abrupt changes of temp.; they are only applied where their slag-resisting property can be utilized. Calcined magnesite and calcined dolomite are suitable for basic furnaces.

Chromite bricks may be used to form a neutral layer between acid and basic brickwork. Carborundum bricks are destroyed by the action of slags, and can therefore only be used in the roofs of furnaces. Corundum bricks are very refractory and resistant to temp. changes. Magnesia spinel brick are very refractory and highly resistant to basic slags and changes of temp. Sillimanite bricks are attacked by acid slags. Fused magnesite is suitable for low-frequency induction furnaces. Zirconia bricks have a very high m. p. (3000°), high refractoriness under load (2500°), and are very resistant to basic slag and to temp. changes. The disadvantage of the last-mentioned seven materials (chromite-zirconia) is their high cost as compared with silica. Zirconia, however, may possibly find permanent application in the construction of high-frequency induction furnaces.

Practical aids to wet-process cast-iron enameling. J. E. HANSEN. *Bull. Am. Ceram. Soc.* 7, 122-7 (1928). B. C. A.

Discussion on "acid-resistant enamels." C. MUSIOL. *Bull. Am. Ceram. Soc.* 7, 127-30 (1928); cf. C. A. 22, 1023.—Malinovsky's statements are criticized. C. H. K.

Glasses from NaPO_3 and oxides of Pb, Cd and Mn (DE CARLI) 6. The crystallization of PbO-SiO_2 glasses (DE CARLI) 6.

Glass articles. G. CHANRL. *Brit.* 275,141, July 31, 1926. Ornamental articles are formed from quartz or from low-expansion glass by welding the parts together with an O-H blow-pipe and then annealing the welded spots with a gas blow-pipe. *Brit.* 275,142 relates to a similar method of forming artificial flowers from "Pyrex" or similar glass.

Apparatus for forming glass sheets reinforced with wire. N. FRANZEN. U. S. 1,668,200, May 1.

Apparatus for making sheet glass by rolling. H. S. HEICHERT. *Brit.* 275,169, July 29, 1926.

Tank furnace for melting glass. P. G. WILLETTTS. *Brit.* 275,555, Aug. 3, 1926. The inner walls and bottom of the furnace preferably are formed of blocks of combined SiO_2 and Al_2O_3 vitrified at a temp. above 1500° united by a luting into a monolithic structure.

Regenerative glass melting and refining tank. G. E. STICKLER. U. S. 1,668,700. May 8.

Rotary glass pot or tank. S. J. SELLAR. *Brit.* 275,138, Jan. 28, 1926.

Laminated glass. F. FRASER. U. S. 1,669,044, May 8. Two sheets of glass are united by an intervening sheet of non-brittle material such as a cellulose deriv. or compn. which is impregnated with castor oil.

Laminated sheet material of glass and celluloid or like materials. P. H. HEAD and SAFETY GLASS AND METAL PRODUCTS, LTD. *Brit.* 275,279, Feb. 10, 1926. Sheets of glass of different thicknesses are joined by intervening sheets of celluloid, gelatin or the like.

Heating ceramic articles in tunnel furnaces. BARTON FOREIGN PATENTS, LTD. *Brit.* 275,104, Feb. 19, 1927. In the manuf. of vitrified paving bricks or other ceramic articles, the ware is first heated to vitrifying temp. and then passed to a cooling zone maintained at a considerably lower temp. than that of the vitrifying zone, is then reheated, and allowed to cool first slowly and then rapidly.

Gas-fired tunnel-kiln for burning tiles, pottery, etc. J. MARLOW. *Brit.* 275,048, Oct. 18, 1926.

Highly porous silica product. H. L. WATSON. U. S. 1,669,363, May 8. Cryst. SiO_2 is heated to about 1700°, cooled to below about 230°, impregnated with a decomposable binder such as shellac and reheated rapidly to about 1750°. The product may be used for heat insulation.

Abrasive articles. W. B. WESCOTT. U. S. 1,668,476, May 1. Granular abrasive material such as SiC or emery is formed into wheels or other articles with a composite binder carrying fibers disposed at random and including a continuous bond of rubber.

Abrasive articles. W. B. WESCOTT. U. S. 1,668,439, May 1. In forming abrasive wheels or other abrasive articles, granules of SiC , emery or other abrasive material are bonded by films of gelled latex rubber contg. a small proportion of asbestos fiber.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

The action of pure water on quick-setting cements. MOURRAL. *Génie civil* 92, 121-2(1928).—Contrary to popular opinion pure water does not readily break down quick-setting cements such as are used in water mains. If pure ingredients are used and the mix is made rich good results may be expected. At least 7 installations over 20 years old were still found to be in good condition. C. R. FELLERS

Recording instrument for determining the time of setting of cement. L. LIAUTHAUD. *Arts et métiers* No. 91, 146-50(April, 1928).—A brief description of an instrument for making and recording periodical (every 10 min.) Vicat-needle tests under controlled humidity and temp conditions. Examples are given of the type of diagrams obtained, showing that in every case setting starts in some time (varying with different cements) after the cement has been mixed with water. A. PAPINEAU-COUTURE

A method of interpreting an analysis (of portland cement) by a system of triangular coordinates. WM. A. ERNST, E. S. ERNST AND W. S. ERNST. *Rock Products* 31, No. 9, 54-7(1928). RAYMOND WILSON

Rate of absorption of limestone. H. F. KRIEGER. *Rock Products* 31, No. 9, 62 (1928).—Stones having high 24-hr. absorption generally absorb water at a high rate during the early part of the test. Absorption from a concrete mix is slower than that from free water, the difference depending on the size of the stone. RAYMOND WILSON

Variation in adsorption of asphalt by different mineral aggregates. A. W. DOW. *Pit & Quarry* 16, No. 1, 88-90(1928).—The method employed for detg. the relative adsorption of asphalt by sand grains is outlined. Brief consideration is given to the effect variations in the adsorption of the mineral aggregate will have on asphalt paving mixes. Other things being equal, the mixt. with the mineral aggregate having the highest adsorptive power should hold the most asphalt cement. The adsorption of asphalt cement from a CS_2 soln. is used as a basis of test in the case of fillers and sands. W. H. BOYNTON

Effect of decay on the chemical composition of wood. L. F. HAWLEY, L. C. FLECK AND C. A. RICHARDS. *Ind. Eng. Chem.* 20, 504-7(1928).—The comparative effects of decay on the chem. compn. of wood have been studied. Analysis was made of several species of wood before and after decay with both a white-rot and a brown-rot fungus. Detn. was made of pentosans in cellulose and of the hydrolysis no. of cellulose. "The loss of wt. due to decay in a lab. sample of wood cannot be taken as an exact measure of the usual effect of the fungus on that particular species of wood." Pentosans in cellulose are among the first constituents attacked by decay. They are, in proportion to the amount present, more rapidly removed than the hexosans in the cellulose. Both the stable and the readily hydrolyzed portions of the cellulose were always attacked, but in most cases there was a preferential attack on the readily hydrolyzed portion. *Polystictus hirsutus*, a white rot, is like the brown rot during the first stages of decay in its preferential attack on the cellulose. The two softwoods studied had a larger amount of stable cellulose than the hardwoods, while the two hardwoods had more pentosans in their stable cellulose than did the softwoods. W. H. BOYNTON

MALCHOW, W., AND MALLISON, HEINRICH: *Die Industrie der Dachpappe*. Halle (Saale): W. Knapp. Monograph of the Chemisch-technische Fabrikationsmethoden. Vol. 43. 113 pp. M. 7.50; bound, M. 9.30.

WARNES, ARTHUR R.: *Building Stones. The Causes of Their Decay and Their Preservation*. London: Ernst Benn, Ltd. Price, approx. 16s., net.

Rotary cooling drum for cement clinker, etc. E. ALLEN & Co., LTD., AND W. J. COLES. *Brit.* 274,656, Aug. 10, 1926.

Cementitious material suitable for stucco plasters. H. E. BROOKBY AND C. K. ROOS. U. S. 1,668,548, May 8. Natural ground anhydrite without calcination is mixed with less than 1% of $Na_2S_2O_3$ and the mixt. is formed into a mortar with water when desired for use. $ZnSO_4$, clay and calcined gypsum also may be added.

Bituminous concrete. L. S. VAN WESTRUM. *Brit.* 275,364, May 31, 1926. Dry mineral aggregate is mixed with either (a) a cementitious material such as lime, portland cement or plaster of Paris, or (b) a mixt. of such cementitious material with stone or slag flour, with or without Fe oxide, is then mixed with a bituminous soap other than that described in *Brit.* 269,975 (*C. A.* 22, 1454), e. g., with a bituminous soap

prepd. by mixing hot 30-50 parts of bitumen and 2-5 parts of vegetable oil, with or without resin, and saponifying with 20-40 parts of weak alk. lye.

* **Artificial marble.** G. BIA and J. E. D. DE GRANVILLE DE BIELIZE. Brit. 275,448, Oct. 26, 1926. Calcined magnesite is used with $ZnSO_4$ soln., $MgSO_4$ soln. and a mineral or resinous oil or agar-agar jelly or a soln. of a phenol-aldehyde condensation product. Fillers such as $BaSO_4$ and a small quantity of H_2SO_4 also may be added.

Molding bakelite dentures. C. H. WARDELL. Brit. 275,541, Aug. 4, 1926. Portions of the mold may be formed of a yielding material such as a mixt. of plaster of Paris 62, hard rubber 35 and bronze powder 3 parts. Other similar compns. also are described.

Pavement. A. JANIN. Brit. 275,280, Feb. 27, 1926. For a top dressing on macadam roads, aggregate of sand size is coated with a film formed from a light oil and a small quantity of bituminous material to cause the fragments to be tacky to the touch but capable of being handled without matting. The light oil is preferably applied first followed by application of less than 2.5% of a heavy bituminous material. Lime also may be added.

Thermoplastic material adapted for making sheets or boards. A. L. CLAPP. U. S. 1,668,760, May 8. Na silicate soln. is formed into a pulp together with material such as wood flour, Montan wax, resin and asphalt.

Plastic composition containing paper mill sludge. A. E. HANSEN and A. C. RUGER. U. S. 1,668,961, May 8. Paper mill sludge is used with rubber, plaster of Paris, etc. for making building boards or other products.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

Notes on recent developments in fuel technology. R. WIGGINTON. *Fuel in Science & Practice* 6, 529-31 (1927).—Brief reviews of the following subjects. new pulverized fuel burner; bituminous sands of Alberta; oil transport. D. A. R.

Notes on recent developments in fuel technology. R. WIGGINTON. *Fuel in Science & Practice* 7, 1-3, 49-51 (1928).—Brief reviews of the following subjects: the Pittsburgh explosion, the Bergius method, calorific values of H and C, chamber ovens for gas manufacture, synthetic gasoline, natural steam power, submerged combustion, the Benson boiler, pulverized fuel on ships, Smith tar extractor, water gas from vertical retorts. D. A. REYNOLDS

The action of bacteria on coal. W. FUCHS. *Fuel in Science & Practice* 7, 28-30 (1928).—See C. A. 22, 1840. D. A. REYNOLDS

Notes on coal cleaning and its relation to the cost and quality of coke. G. W. J. BRADLEY. *Fuel in Science & Practice* 7, 31-6 (1928). D. A. REYNOLDS

The cleaning of coal. XXI. W. R. CHAPMAN and R. A. MOTT. *Fuel in Science & Practice* 6, 552-69 (1927); cf. C. A. 22, 493.—The economic advantages of coal cleaning are discussed. D. A. REYNOLDS

The dry cleaning of coal. H. WINKHAU. *Glückauf* 64, 1-13 (1928).—A description and discussion. ALDEN H. EMERY

Industrial chemistry of coal, its possibilities and its present needs. A. GILLET. *Rev. univ. mines* 15, 15-27 (1927). C. W. OWINGS

Recent developments in coal burning. F. S. COLLINGS. *Power* 65, 476-9 (1927).—Pulverized fuel plants of the unit type with water-cooled furnaces give best results in burning coal of low heat value, high H_2O , ash and S contents and undesirable ash characteristics. A polemic followed the presentation of the paper. D. B. DILL

The combustion of solid carbon. R. T. HASLAM. *Proc. Inst. Fuel Tech.* 1927, 8; *J. Soc. Glass Tech.* 11, 153A.—In tests by the U. S. Bur. of Mines (1917) on the combustion of coal in hand-fired furnaces, results indicated that the primary reaction $C + O_2 = CO_2$ (brought about through an intermediate complex C_2O_2) was limited by the rate of diffusion of O_2 through the stationary gas film on the solid only, the chem. reaction being practically instantaneous. The rate of diffusion was nearly proportional to the gas velocity, and the compn. of the gas at a fixed distance above the grate was const. whatever the velocity. Since the CO was produced at a rate proportional to the CO_2 , it was evidently formed by reduction therefrom. The O was always consumed completely at 3-4 1/2 in. above the top of the ash zone. Later work from the same source, by Haslam and also by Weyman and others, served to confirm the diffusion theory of reaction. The capacity of a furnace was limited only by the draft obtainable and if this was forced, by the velocity required to blow the fuel from the grate. Since

the oxidation zone was quite thin whatever the gas velocity, the fuel-bed should be kept as thin as possible, to allow of heat radiation from the oxidation zone and reduce clinking. Volatile matter should be distd. off in an oxidizing atm. Greater capacity per unit vol. of combustion space was obtained by the use of finer coal particles and by furnace design such as to give increased turbulence of the gas. H. G.

Combustion in the open-hearth furnace. W. TRINKS. *Fuels and Furnaces* 5, 477(1927); *J. Soc. Glass Tech.* 11, 270-1.—In a slow-working 60-ton steel furnace making 25 lb. per sq. ft. per hr., heat losses from walls and ports were approx. 1,750,000 B. t. u. per ton, so that with a regenerator efficiency of 40%, 4,400,000 B. t. u. were needed per ton made. Since at most 880,000 B. t. u. were required for actual working it was evident that relative wall losses could be appreciably lessened by increased rate of production. Speeding up was possible by the use of a sharp, hot, radiating flame, the hot spot of which was adjustable. With oil-fired furnaces, it was necessary, in order to maintain const. ratio of fuel to air, to keep the pressure and temp. of the fuel const., and to keep const. also the pressure of the steam for atomizing in lines near the furnace. Much could be accomplished by employing pressure-reducing valves, thermostats, return-flow systems for the fuel, and sufficiently large pipe lines to allow reducing valves to work. A trap on the steam line close to the furnace was desirable. Flame length was adjusted by variation of the ratio of pressure of fuel to steam. The direction of the flame was detd. by the slope of gas and air ports and could only be altered by rebuilding. To adjust the length of flame to suit furnace length, air ports were inclined to gas ports more steeply in shorter furnaces. Quick mixing of gas and air to give a short flame was obtained by (1) forcing gas and air through a comparatively small opening in which they mix, (2) forcing gas at a high velocity to induce air, (3) sloping ports, side walls, and roof so as to direct the air stream into the gas stream, (4) premixing some air with the gas in the gas ports, (5) by external aids such as fan draft or jets of steam or air. H. G.

Oxidation of different coals at different temperatures. II. D. J. W. KREULEN. *Brennstoff-Chem.* 8, 241-4(1927).—A flaming gas coal, a gas coal, a fat coal and a lean coal were heated in air for 6 hrs. at 125°, 150°, 175° and 225°. The resulting oxidation caused an increase in the combined water content, which runs parallel to an increase in the humic acid content, the effect being greater with increased temp. The coking properties of a coal are reduced by oxidation. The coking properties are even reduced by heating for some hrs. in a drying oven at 100-105°. The coking properties were not affected by heating a coal for 3 hrs. at 175° in an atm. of CO₂. By heating a flaming gas coal for 56 hrs. and repeated extn. of the humic acid, only 5% of the coal was not changed into humic acid. E. G. MEYER

The absorption of oxygen by preheated coal. G. COLES AND J. I. GRAHAM. *Fuel in Science & Practice* 7, 21-30(1928), cf. C. A. 19, 569.—The effect of preheating coal *in vacuo* at 300° upon its oxidation over a period of 180 hrs. at 50° and 100° was detd. for 8 coals ranging from anthracite to lignite. At 50°, bituminous coals all showed a large increase in oxidation, this increase being greater during the first 48 hrs. Lignite showed a reduction in oxidation of nearly 20%. Anthracite oxidized more during the first 48 hrs. but less during the 48-180-hr. period. At 100°, the preheated coals oxidized in the same order as at 50°. With bituminous and lignitic coals the percent increase in oxidation, due to preheating, varied inversely with the O content of the fresh coal. When oxidized at 100° there was less increase in the oxidation of the preheated coal (percentage basis), than when oxidized at 50°; this is attributed to the greatly increased absorption of O by the untreated coal at 100°. Three bituminous coals were preheated at 200°, 300°, 400° and 500°, and then oxidized at 100°; the most effective temp. was found to differ for each coal and varied from less than 300° to 400°. Preheating at 500° caused a decrease in oxidation with each coal. Preheating in N at 300° under 30 to 33 atm. pressure did not cause as large an increase in the subsequent oxidation as when the preheating was carried out *in vacuo*. D. A. REYNOLDS

Modification of the Thomson mixture for the determination of the calorific power of coals. MAURIZIO COUTURE. *Atti Il congresso naz. chim. pura applicata* 1926, 1374-5.—With the usual mixt. of 2 g. of coal and 18 g. of KNO₃-KClO₃, combustion is so rapid (17-20 min.) that serious losses occur. A greater quantity of KNO₃-KClO₃ does not prevent all loss, and with a smaller quantity of coal combustion is incomplete and irregular. Excellent results are, however, obtained if 1 g. of coal, 1 g. of NH₄NO₃ and 18 g. of KNO₃-KClO₃ mixt. are used, combustion being complete in 30-35 min. (an ideal length of time) and the results agreeing closely with those by the Mahler method. As in the ordinary 2-g. method, 10% is added in the calcs. The factor 0.54 corresponding to the NH₄NO₃ is then subtracted according to the directions of Salvadori (cf. *Gazz. chim. ital.* 36(1906)). C. C. DAVIS

Coal heat value from ash. A. W. COLE. *Power Plant Engineering* 32, 289-90 (1928).—B. t. u. for dry coal were detd. graphically from the ash content. S. D. P.

Further data on the determination of ash melting points of coal. D. J. W. KRUELEN. *Chem. Weekblad* 25, 192-4 (1928).—A more detailed description is given of the technic of detn. of the ash m. p. previously given (*C. A.* 22, 1027). B. J. C. v. d. H.

Siberian boghead coals. G. STADNIKOFF. *Brennstoff-Chem.* 8, 244-5 (1927).—An analysis of three Siberian boghead coals showed the following: moisture 1.26-3.98% (moisture-free basis) ash 5.93-14.79, and volatile matter 70.4-80.0% (ash-free basis) C 76.5-81.1, H 8.34-10.41 and N 0.56-1.12%. The gross calorific value varied from 7584 to 8325 cal. On low-temp. carbonization they yielded 39.1-48.8% tar and 10.0-39.4% semi-coke. The low-temp. tars are remarkable for their low content of phenols and org. bases. E. G. MEITER

The K. S. G. low-temperature process. J. N. HAZELDON. *Fuel in Science & Practice* 7, 155-60 (1928).—The process of low-temp. carbonization operated continuously at Karnap, Germany, since 1924 is described and illustrated. The chief feature of the process is the construction of the retort, which comprises 2 inclined concentric drums which rotate as one. The coal is fed into the lower end of the inner drum and is carried upwards by a screw conveyor to the upper end, where it falls into the outer drum and moves downward as the drum rotates to the lower end, where it is discharged. Heat is supplied externally by the combustion of producer gas and internally by steam superheated by the hot flue gases. Preheating the coal in the inner drum limits the overheating of the tar vapors and renders the entire length of the outer drum available for carbonization. The range of blends or straight coals adaptable to this process is extended by: (1) change in rate of feed of coal; (2) change in rate of revolution of the drum, affecting the depth of fuel in the retort, and the time of contact; (3) variation in temp.; (4) variation in quantity and temp of superheated steam. Cokes made at 750° contain 10-12% volatile matter and are about as hard and dense as by-product coke; they ignite readily and serve well as domestic fuel. Plant and assay yields of coke, tar, gas and light spirit are given. D. A. REYNOLDS

Three smoke abatement reports. J. B. C. KERSHAW. *Engineer* 145, 149-51 (1928).—A review of reports of (1) Hamburg Smoke Abatement for the Year 1926, (2) of the medical officer of health for Salford and (3) of the meteorological department of the County Borough of Southport for 1927. D. B. DILL

Discoveries on alcohol motor fuel in Schlesien. H. NEUMANN. *Z. Spiritusind* 50, 376 (1927).—Expts with monopolin, a motor fuel, are discussed. More power is obtained and less motor trouble is experienced with its use than with benzene mixts. C. N. FREY

Synthetic liquid fuels: the problem of the rational utilization of mineral fuels. R. BRUNSCHWEIG. *Chaleur et industrie* 9, 143-51 (1928).—An address. A. P.-C

Utilization of mineral fuels. M. BOHM, A. PONTREMOLI AND S. SALES. *Notiz chim.-ind.* 3, 143-6, 216-9 (1928).—Various German plants were inspected with a view to the application of successful processes to the utilization of low-grade fuels in Italy. These German plants and processes are described individually, and from their crit. study a general scheme is recommended for the most economical utilization of the Italian lignites and other similar natural fuels. C. C. DAVIS

Report of test on the Crozier retort installed by Mineral Oils Extraction, Ltd., at Wembley. C. H. LANDER, et al. *Dept. Sci. Ind. Res. (Brit.) Rept.* 1927, 21 pp.—The retort consists of two cast-Fe walls, 15 ft. high and 5 ft. in max. width, with semicircular ends. Temp. control is maintained by adjustable dampers on 5 inclined cross-flues passing through the retort. Coal is charged in a hopper at the top; coke is discharged by a screw at the bottom, while the retort is heated externally and through the flues by gases from a furnace burning solid or gaseous fuel. A 5-day test run indicated a throughput of 4 tons of Scottish splint coal per day yielding per ton: coke 15.4 cwt., gas (6555 cu. ft.) 23.9 therms, tar 16.4 gal., crude spirit 0.8 gal., (NH₄)₂SO₄ 9.1 lb. The temp. is 800° to 280° from the bottom to the top of the retort. A diagram of plant and detailed tables and curves of products and working conditions are included.

Vertical retort installation at Edinburgh. H. W. STRONG. *Chem. Eng. Mining Rev.* 20, 191-2 (1928).—A description of the works at Granton, near Edinburgh, Scotland. T. S. CARSWELL

Studies and investigations on the lignites of Valdarno. M. G. LEVI AND C. PADOVANI. *Atti II congresso naz. chim. pura applicata* 1926, 558-600; cf. *C. A.* 19, 2265.—The object of the expts. was to det. the suitability of the white and brown lignites as fuel, in view of which detns. were made of the calorific power, moisture, ash, C, H, S, N and

O, as well as low-temp. distn. in a Fischer rotatory furnace at 500°, with similar analysis of the solid, liquid and gaseous products. The original lignites, the tars and the semicokes were then subjected to hydrogenation under pressure (Bergius method) and the products analyzed as before. The technic is described in detail and the equipment is illustrated. The results are tabulated in full detail with an extensive discussion of their significance and value. It is considered that the lignites can be profitably distd. at low temps., under which conditions the semicoke is of special economic value as a source of elec. power and for industrial fuel. Hydrogenation is of no economic utility.

C. C. DAVIS

Chemical and technical study of a xyloid lignite of the Castellina basin at Chianti. C. PADOVANI AND A. AMATI. *Atti II congresso naz. chim. pura applicata* 1926, 601-8.—The expts. included detns. of the chief chem. and thermal properties of the lignite, its behavior on distn. at low temp. in a Fischer rotatory furnace, including the yields and analyses of the solid liquid and gaseous distn. products, and a comparison of the tars from the Fischer furnace, from the Pieters furnace and from redistn. The results, given in detail, show the lignite to be a normal xyloid lignite. It has a low ash and high calorific power, and yields a semicoke (50-60% of the dry lignite) which is of promise industrially. The tar is of good quality compared with those from other lignites, but the gas is of almost no value. The Pieters furnace is particularly adaptable to the production of a primary tar of good quality. The yield of phenols is also high enough to warrant further research.

C. C. DAVIS

Burning pulverized lignite in a Texas power plant. L. H. MORRISON. *Power* 67, 410-3(1928).—The compn. of Texas lignite used is fixed C 35.93, volatile matter 21.10, S 0.48, ash 9.16 and H₂O 33.39%. The heat value is 7069 B. t. u. per lb. Stack CO₂ is about 15%. Not more than 1% of the ash is combustible and very little ash is carried out of the stacks. The account of the plant is illustrated.

D. B. DILL

Producers for the gasification of high- and low-quality fuels and of waste products. H. BARTH. *Ker. Rundschau* 34, 494(1926); *J. Soc. Glass Tech.* 11, 269-70A.—After a discussion on the economic factors relative to the use of coal, slack, lignite briquets and peat as fuel for industrial purposes, B. described a patented producer that could be adapted with slight alterations for the gasification of all grades of fuel from rough coal to waste sludge. The grate (the most important part of the producer) could be arranged without rebuilding, either as a step grate, flat grate or combination of the two. A special feeding device allowed of the producer being used for the gasifying of fine coal or sludge, these being fed into sloping shafts at the sides of the producer. A central feeding hopper allowed of the simultaneous feeding in of other fuel—peat, briquets or coal. It was possible with such a generator to produce gaseous fuel adequate to the heat requirements of a furnace at a much less cost than when fuel of good quality was used, since the fine coal and washer sludge was in the nature of a waste product at the pit head and was obtainable at a very cheap rate.

H. G.

The gas industry. G. ARRIGO OLIVIERI. *Atti II congresso naz. chim. pura applicata* 1926, 526-9.—A crit. review of the industry in Italy.

C. C. DAVIS

Gas pressure. D. STAVORINUS. *Het Gas* 48, 163-7(1928).—The most favorable pressure for domestic gas consumption is discussed (around 75 mm.). Details and drawings are given of the "Progas" pressure reducer.

B. J. C. VAN DER HOEVEN

Corrosion of pipe lines and dehydration of gas. D. STAVORINUS. *Het Gas* 48, 110-3(1928).—A review of the Taunton CaCl₂ dehydration process (cf. Harris, C. A. 22, 311) as used in 12 English gas plants of up to 280,000 cu. m. per day production; the cost per day per 1000 cu. m. is about \$0.165. For the glycerol process (Kirkham, Hulett and Chandler) is calcd. a cost of (Radford plant) \$0.114 per day per 1000 cu. m. by assuming a glycerol price of \$0.40 per l. and a consumption of 240 l. per day per 1000 cu. m.

B. J. C. VAN DER HOEVEN

The spiral-guided gas holder at Delft. F. J. SWARTWOUT DE HOOG. *Het Gas* 48, 156-63(1928).—Description of a 14,000-cu. m. three-lift spiral-guided gas holder of 27.2 × 38.9 m. size, total twist 125°, 150, 250 and 350 mm. water pressure.

B. J. C. VAN DER HOEVEN

The influence of preheating hot gas and secondary air on the temperature of combustion and the fuel consumption. W. BRASS. *Sprechsaal* 59, 763(1926); *J. Soc. Glass Tech.* 11, 1567A.—The relationship between calorific value and theoretical combustion temp. for a preheated gas was represented by the equation $\Sigma Q_v + \Sigma C_{v_1} v_1 h_1 = \Sigma C_v v t$, where Q_v = calorific value of the gas, v_1 = vol. of preheated gas, v = vol. of products of combustion, h_1 = temp. of preheating, t = theoretical temp. of combustion, C_v = sp. heat per vol. unit of gas and C_v = that of residual gas. By use of the above equation, the effect of preheating on the combustion temp. was calcd. in 2 pro-

ducer gases. Gas of the compn. CO_2 7, CO 26, CH_4 1, H_2 14 and N_2 52% would normally give a temp. (with 10% of excess air) of 1500° when dry or 1420° with 10% of water vapor. A theoretical combustion temp. of 1800° could be reached by preheating the gas alone to 1100° , the air alone to 1350° or both to 650° . The saving of fuel by preheating was pointed out. H. G.

The constituents of low-temperature tar. E. BÖRNSTEIN. *Nature* 121, 356-7 (1928).—The presence of β -methylanthracene is confirmed in low-temp. tars from three geologically-old Westphalian coals. The yellow hydrocarbon, "Crackene," was also observed. J. H. PERRY

The constituents of low-temperature tar. G. T. MORGAN AND D. D. PRATT. *Nature* 121, 357 (1928).—Other anthracene derivs. besides β -methylanthracene have been extd. from low-temp. tars as well as complex hydrocarbons. J. H. P.

Combustibility of coke. C. HOLTBAUS. *Mitt. Dortmunder Union* 1, 194-236 (1926); *J. Inst. Metals* 38, 657-8.—The causes of the varying combustibility of coke were investigated by chem. and phys. methods. The combustibility and the ignition temp. depend mainly upon duration of coking. Gas content and ignition temp. may sometimes be taken as a criterion of combustibility. Content of metallic ore has no influence. H. G.

Evaluation and testing of foundry coke. L. ZERZOG. *Giesserei-Ztg.* 22, 477-85, 528-39 (1925); *J. Inst. Metals* 36, 657.—The influence of the nature of the coal and the temp. of conversion into coke on the suitability of the coke for foundry purposes is discussed at some length and illustrations of suitable and unsuitable foundry cokes are included, together with analyses of samples of Ger. coke of different origins and of the ash obtained from them. The combustibility of coke in the foundry is discussed chiefly with reference to the economical production of iron castings. H. G.

Coke for crucible steel melting. R. V. WHEELER. *Fuel in Science & Practice* 7, 148-51 (1928).—Beehive coke only meets the requirements of crucible steel melters. By-product cokes do not break readily into pieces desirable for good feeding of the fuel bed, are less uniform in physical characteristics, and do not afford the high temps. required. D. A. REYNOLDS

The reactivity of coke and a new method of determining it. R. A. DENGGE. *Fuel in Science & Practice* 7, 152-4 (1928).—An app. for detn. of coke reactivity is described and illustrated. Air passes over the 0.2 g. sample contained in a boat placed in a tube furnace. The dried effluent gas passes through a soln. of $\text{Ba}(\text{OH})_2$ whose cond. is known accurately, and to which is connected a Wheatstone bridge with a telephone. Rate of CO_2 formation is calcd. from cond. measurements. D. A. REYNOLDS

The coking industry in Japan. TADAJI SHIMMURA. *Fuel in Science & Practice* 7, 186-9 (1928).—The principal developments of coke-oven construction are described and statistics are given to show the present position of the coking industry. D. A. R.

The application of low-temperature carbonization to gas-producer practice. S. UCHIDA. *Fuel in Science & Practice* 7, 179-85 (1928).—A gas producer with a carbonization retort designed for using a carbonization process for Japanese coals prior to gasification is described and illustrated. Data concerning the conditions in the producer and properties of the products are given. D. A. REYNOLDS

Coke-oven operation. VACHEROT. *Gas u. Wasserfach* 71, 317-8 (1928).—Data are given for the Bielefeld Gas Works as to daily gas production, coal used and analysis of gas for each day during Feb., 1928. R. W. RYAN

Coke-oven gas properties. C. W. STEVENS. *Chem. Met. Eng.* 35, 243 (1928).—Curves based upon a 6 months' record of daily analyses show that the calorific value of coke-oven gas decreases from 585 to 540 B. t. u./cu. ft., its H content decreases from 56.7 to 45.4%, and its N content increases from 2.4 to 11.1% as its sp. gr. (air = 1) increases from 0.34 to 0.46. RAYMOND E. SCHAAD

Phenol-recovery plant avoids waste pollution of streams. H. E. JONES. *Chem. Met. Eng.* 35, 215-8 (1928).—Phenol is extd. continuously with an efficiency of 96% from the crude ammonia liquor of the coke plant by motor benzene, which is then stripped of phenol by washing with 23% NaOH soln. The Na phenolate thus produced upon acidification with 60° Bc. H_2SO_4 yields a crude phenol of the volumetric compn.: phenol 54, cresols 23, water 16 and tarry matter 7%. RAYMOND E. SCHAAD

Bituminous limestones as a source of fuels (MANUELLI) 22. Saving \$28,000 annually in paper-mill coal cost (BERGER) 23. Apparatus for charging gas producers (U. S. pat. 1,668,968) 1.

THAU, A.: *Die Schwelung von Braun- und Steinkohle*. Halle (Saale): Wilhelm Knapp. 722 pp. Bound, M. 52. Reviewed in *Ind. Eng. Chem.* 20, 557 (1928).

Fuel. A. B. LOW. U. S. 1,669,341, May 8. A relatively slow-burning fuel is formed from finely divided Fe pyrites 5, a finely divided nitrate such as NaNO_3 3 and a finely divided carbohydrate, e. g., dextrin 0.5 part. Na_2CO_3 1 part may be added.

Carbonized fuel. W. W. STRAFFORD. U. S. 1,667,906, May 1. An aq. colloidal suspension is formed from pulverized coking coal, this suspension is mixed with pulverized non-coking coal and the mixt. is molded and carbonized.

Powdered fuels for Diesel engines, etc. I. G. FARBENIND. A.-G. Brit. 274,462, July 13, 1926. Mineral coal 80 and a coaly material of more recent origin such as lignite 20% are used together.

Synthetic liquid fuels. SOC. INTERNATIONALE DES PROCÉDÉS PRUDHOMME HOUDRY. Brit. 275,585, Aug. 3, 1926. Gaseous products obtained in the combustion of tars, heavy oils and the like are brought into contact with H or a H-bearing gas such as water gas which have been passed through a metallic filter, so that hydrogenation is effected in the absence of a catalyst. An app. is described.

Fuel briquets. A. M. HART. U. S. 1,668,643, May 8. Na silicate is used as a binder with carbonized vegetable matter such as grasses, weeds, leaves, "tropical waste" and sea weeds.

Fuel and ore briquets. KOKS- UND HALBKOKS-BRIKETTIERUNGS GES. Brit. 274,876, July 24, 1926. The material is briquetted with 3-6% of very finely ground clay and sulfite waste liquor may also be added to strengthen the briquets formed. Waterproofing materials also may be added and the briquets may be roasted or kiln-dried.

Drying and destructive hydrogenation of fuels. I. G. FARBENIND. A.-G. Brit. 274,858, July 21, 1926. Moist fuels such as brown coal, peat, wood, tars or mineral oils are heated under pressure to above 200° and the sepd. water is removed. The operation is facilitated by stirring, centrifuging, action of an elec. field or addn. of reagents such as PhNH_2 or alkyl sulfonates. The fuels so treated are suitable for subsequent destructive hydrogenation.

Apparatus for low-temperature distillation and carbonization of fuels. J. PLASSMANN. Brit. 275,546, Aug. 5, 1926. Modifications are specified in the app. described in Brit. 240,800 (C. A. 20, 2243).

Carbonizing coal. W. RUNGE. U. S. 1,669,023, May 8. Pulverized coal having agglutinating properties is preliminarily suspended in hot air until it loses its agglutinating properties and a small proportion only of its volatile content; the coal, still retaining its finely divided state, is then subjected to carbonization in hot gases which are inert to it, forming a finely divided carbonized residue. An app. is described. U. S. 1,669,024 relates to a similar process and app.

Carbonizing coal. C. B. WISNER. Brit. 275,602, Aug. 7, 1926. In the first stage of a 2-stage process of coal distn. the coal is heated with access of air to retain a sufficient hydrocarbon content to allow the charge to take the form of balls, and in the second stage the material is carbonized at a temp. sufficient only to remove condensable hydrocarbons. An app. comprising rotatable retorts is described.

Low-temperature distillation of coal or lignite. E. PIRON. Brit. 275,178, July 27, 1926. Particles of coal or lignite not larger than 0.25 in. are heated in a layer 0.25-0.75 in. in thickness on a stationary hot surface at a temp. of about $590-730^\circ$.

Low-temperature distillation and hydrogenation of coal. R. FRIGG. Brit. 274,465, July 16, 1926. Coal is dried in a drum heated by exhaust gases from a turbine and sifted. The fine material is used for heating a boiler and the coarser particles are passed into retorts through which gases and vapors from a condenser may be passed. Part of the coke formed is used in a gas generator which also may be supplied with dust

from the grinding mill. O from electrolytic decompn. of water is supplied to the gas generator and distn products from the coal are hydrogenated by the H formed by the electrolysis of the water. An app. is described.

Distilling and carbonizing coal and oil or similar materials. W. E. TRENT. U. S. 1,668,132, May 1. A heat storage element such as a cast Fe cover is placed over charge units to be treated as these are passed through the treating chamber and these serve for transmitting heat to the charge. Vapors and gases evolved are discharged below the fuel charges. An app. is described. Cf. C. A. 21, 3449.

Use of ethylene as a fuel for airship engines. HOLZVERKOHLEND-INDUSTRIE AKT.-GES. Brit. 274,811, July 20, 1926.

Oil gas. C. A. PHELPS. U. S. 1,669,172, May 8. A portion of the oil used is completely burned with air and the heat thus generated is used to heat a checker-work to a temp. above the reaction temp. of the products of combustion with volatilized and cracked products of the oil; a remaining portion of the oil is volatilized and cracked with heat from the combustion but out of direct contact with the combustion products; the volatilized and cracked products are then mixed with products of combustion and the mixt. is passed into contact with the heated checker-work to produce a uniform combustible gas. An app. is described.

Pulverized wood for fuel. S. SHIMAMOTO. U. S. 1,668, 660, May 8. Sawdust is softened by treatment with a hot milk of lime soln., mixed with powd. coal and formed into briquets which are pressed and dried.

Recovery of benzene, etc., from gases. GES. FÜR LINDR'S EISMASCHINEN AKT.-GES. AND SOC. ANON. METALLURGIQUE DE SAMBRE ET MOSELLE. Brit. 275,633, Aug. 4, 1926. Gas such as that produced by coal distn., freed from tar and preferably also from NH_3 , is passed through a compressor to a cooler which is fed with water at such a temp. and in such a quantity that C_6H_6 , oil from the compressor and water are deposited as an emulsion in a separator to which the cooler is connected; the gas passes thence to additional coolers for condensation of C_6H_6 . An app. is described.

Water-bottom gas producer. T. R. WOLLASTON. Brit. 275,411, Aug. 3, 1926

Water-gas plant. R. & J. DEMPSTER, LTD., and C. ANDREWS. Brit. 275,490, Jan 22, 1927.

Automatic electric control system for operating the valves of gas-making apparatus. J. S. KENNEDY. U. S. 1,668,319, May 1.

Distilling tar. SOC. DES ETABLISSEMENTS BARRET. Brit. 274,513, July 17, 1926. Gas and coke-oven tars are distd. by heating under pressure to 150-170° and then reducing the pressure and permitting ammoniacal liquors and light oils to distil and sepg. these by decantation. An app. is described.

Batch distilling apparatus for producing coke and generating gas. W. E. TRENT. U. S. 1,668,131, May 1.

Coke-oven battery construction. H. H. KOPPERS. U. S. 1,669,168, May 8.

Coke-oven construction and pressure-regulating device for same. DR. C. OTTO & Co., GES. Brit. 275,139, July 30, 1926.

Regenerative coke-oven construction. SIMONCARVES, LTD., and J. H. BROWN. Brit. 274,653, Aug. 6, 1926.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

F. M. ROGERS

The present and future of the Italian petroleum industry. STEFANO FACHINI. *Atti II congresso naz. chim. pura applicata 1926*, 518-22.—A crit. review of the present economic situation in Italy and the influence of foreign industries on the future of the Italian industry. It is considered that by proper application of cracking processes to heavy oils and residues a large expansion can be attained. C. C. DAVIS

Tabulated analyses of representative crude petroleum of the United States. N. A. C. SMITH AND E. C. LANE. *Bur. Mines, Bull.* 291, 69 pp.(1928); cf. C. A. 21, 2183. E. H.

Separation of the components of petroleum. VI. **The action of glacial acetic acid.** P. F. GORDON AND J. MERRY. *J. Soc. Chem. Ind.* 46, 429-32T(1927); 47, 30T(1928); cf. C. A. 21, 2979.—Untopped Persian petroleum was divided into two parts by extg. with glacial AcOH and the acid-sol. portion fractionated by adding successive portions of H_2O . Large amts. of the volatile components were lost in dehydrating. All fractions, acid-sol. and -insol., flashed at about 50°. The acid-insol. portion yield-

ed about 5.1 g. of asphaltic residue per 100 cc. of crude, a larger % than with AmOH, abs. alc., abs. alc. added to Et₂O soln., CHCl₃, or Et₂O as the solvent, or by filtering after topping with open steam. These residues were all similar and were probably dropped out of suspension after the solvent had removed the protecting membrane of oil. The asphalt when refined was shown to consist of wax crystals and a brown oil, probably a fine and stable emulsion. The acid-insol. oil dissolved in Et₂O was fractionated by successive additions of abs. alc., and then of water. The abs. alc. threw out the heaviest fractions first. Crude oil was similarly fractionated from Et₂O soln. The acetic acid solns. contained the heaviest and the lightest fractions of the oil. The portion of the crude oil insol. in AcOH was intermediate in sp. gr. probably because of the presence of wax, since it contained all the wax in the crude oil except that in the asphalt.

E. E. CRANDAL

Studies and researches to obtain fuels from bituminous rocks and from heavy petroleum of Italy. M. G. LEVI, C. PADOVANI AND A. AMATI. *Atti II congresso naz. chim. pura applicata* 1926, 530-55; cf. L. and P., *C. A.*, 19, 2265.—The expts. dealt with petroleum from S. Giovanni Incarico, 2 bituminous ores from Sicily, Serradifalco schist and bituminous or asphaltic limestone from Ragusa and consisted essentially in cracking and in heating with H under pressure (Bergius process) of the distd. oils. The cracked and hydrogenated oils were compared with the corresponding oils by detns. of calorific power, d., S, I no., viscosity, inflammability, ash, etc., and the gaseous products were analyzed. The extensive data are tabulated in complete detail. The Serradifalco schist was exceptionally rich in bituminous substances and gave on distn. a very high yield of oil. The gas contained 25% H₂S and had such a calorific power and was of such quantity that it would furnish most of the heat for distn. on an industrial scale. In simple cracking, the difference between the final pressure and the initial pressure (atm. pressure) of the charge is always a positive value, whereas in hydrogenating cracking (Bergius) this difference is always a negative value. This shows that, during hydrogenation, the contraction from absorption of H (1-3% absorption based on the original oil) compensates and even exceeds the ultimate increase of vol. by evolution of non-condensable gases. The temp.-pressure curves tend to confirm the recent supposition of Kling and Florentin (*C. A.* 20, 1587, 1791). A comparison of the compn. of the gases obtained by simple cracking and by hydrogenation under pressure does not show any notable differences in the % of unsatd. components. On the other hand the % of satd. hydrocarbons, CII₄ and C₂H₆, is far greater in the gases from simple cracking, indicating that the antidissociating action of H on the gaseous phase predominates over the true chem. satn. action. The favorable influence of H under pressure on the pyrogenic disson. is also evident in the relatively low % S and I no. of the oils produced with H, the higher the pressure of H the lower these values. The results show that at elevated temps. with H under pressure and with a single compd., there is an optimum temp. and pressure at which the resistance of hydrogenated products is diminished sufficiently, without however causing so extensive disson., that the pressure of H fails to predominate. The expts. also show that it is possible to control the pyrogenic decompn. of heavy oils by the use of H under suitable pressure, and thus to obtain a very high yield of light oils. Particularly noteworthy is the tendency for these light oils to have a very low S content, the S being in part eliminated in the gases, in part fixed by the Fe oxide and most of the remainder appearing in the heavy oils. C. C. D.

A comparison of the results obtained with the oxygen-bomb and Carius methods in determining sulfur in the heavier petroleum oils. J. M. DEVINE AND F. W. LANE. *Bur. Mines, Repts. Investigations* No. 2866, 3 pp. (1928).—For oils of 2.5 to 0.15% S content the O-bomb method gives consistently lower results than the Carius method. The variation amounts to 3.1% for a sample of 2.47% S content and increases with decrease of S content to 7.3% for oil contg. 0.15% S. Presence of NH₄NO₃ in the bomb did not materially influence the results with the oils studied. Conclusion: The Carius method is necessary only when results of the highest accuracy are essential.

D. F. BROWN

The manufacture of fuel oil. HECTOR PAULEUR. *Rev. univ. mines* 15, 234-45 (1927).

C. W. OWINGS

Desirable qualities of a motor fuel for internal-combustion engines. E. DAVIN. *Génie civil* 92, 140-2 (1928).—An app. for testing homogeneity of gasolines is described. Volatility, homogeneity and anti-knock properties are the 3 most important factors in evaluating motor fuels.

CARL R. FELLERS

Motor fuel anti-detonants. Their history and development. H. S. TEGNER. *Chem. Trade J.* 82, 427-9; *Chem. Age* 18, 388-9 (1928).

E. H.

Cleaning Diesel oil by a centrifuge. L. S. CHEATHAM. *Power* 67, 471 (1928).—

About 1.1% H_2O and 0.024% solids are removed from California residuum oil of 19% B \acute{e} . by centrifuging in a DeLaval app. at 170° F. D. B. DILL

• **Designing equipment for chemical treatment of oil distillates.** J. C. MORRELL AND D. J. BERGMAN. *Chem. Met. Eng.* 35, 210-4(1928).—Designs are given of columns for mixing petroleum distillates with H_2SO_4 , NaOH or plumbite soln. The efficiency of contact between oil and reagent, with the different mixing devices designed, decreases in the order: orifice, packed (Raschig rings preferred) and baffle-plate column. Jet, mechanical and pump mixers are also discussed and blow-cases for introduction of treating reagents are described. RAYMOND S. SCHAAD

A rapid corrosion test for gasoline. H. P. RUE. *Bur. Mines, Repts. of Investigations* No. 2862, 5 pp.(1928).—A Hg corrosion test developed by the Barnsdall Refineries, Inc., comprises shaking 1 cc. of metallic mercury with 100 cc. of the sample in a 4-oz. bottle for two min. The gasoline is then decanted off and filtered at once and the filter paper dried. The intensity of the black ppt. on the paper is the measure of the corrosiveness of the gasoline. The test seems to offer possibilities, especially in the control of continuous sweetening plants using doctor soln., and in testing the corrosion of very volatile gasolines. D. F. BROWN

Gasoline stripping plant. V. DENISEVICH. *Azerbeydj. Neft. Khoz.* 1928, No 1, 59-64.—A plant is described and very complete drawings are supplied. The slightly preheated crude oil is pumped through a tube still, which is connected to an evaporator; both are heated from the same fire box. The evaporator is placed in the stack and is heated by open fire and flue gases. The gasoline, ligroin (Russian) and partly the light kerosene are evapd.; the oil left is heated in the battery in the customary way. The evapd. fraction consisted of 3.73% of benzine, 2.32% of ligroin, 4% of light kerosene. The crude oil contained originally 5.5% of gasoline. The crude oil had a temp. of 75° when it entered this still and 175° on leaving. The heat recovery of this equipment is given as about 75%; fuel consumption 0.7%. A. A. BOEHLINGK

Some new developments in the utilization of mineral oil. FELICE EPSTEIN. *Atti II congresso naz. chim. pura applicata* 1926, 451-67.—A crit review and discussion of recent developments. C. C. DAVIS

Observations on insulating mineral oils and methods of control. STEFANO FACHINI. *Atti II congresso naz. chim. pura applicata* 1926, 523-5.—A crit. review of the desirable properties of transformer oils, with special reference to the work of Snyder (cf. C. A. 18, 1193; 20, 1513). Exception is taken to the opinion that the Italian method of testing is unreliable. Tests of numerous oils during 2 yrs., using the Italian testing procedure, indicate that the method is satisfactory for distinguishing the relative quality of different oils. C. C. DAVIS

Use of the formolite reaction for testing mineral oils. M. BORODULIN. *Neft-yanoye Khoz.* 14, 363-4(1928).—When the formolite ppt. is washed with water, the first part of the water is clear but gradually it becomes brown. This is attributed to the presence of $(NH_4)_2SO_4$, which is gradually washed out and the formolite is dissolved. B. recommends the use of methylal, the methylal residue being sol. in $CHCl_3$. A. A. BOEHLINGK

Deterioration of mineral oils. II. Mechanism of oxidation and action of negative catalysts as determined by static methods. BRIAN MEAD AND COLLABORATORS. *Ind. Eng. Chem.* 19, 1240-5(1927); cf. C. A. 21, 1345.—The subject was studied statically by (A) exposing closed tubes of oil to the action of O for a period of time at 130°; (B) leaving the tubes open to the air at 150°; (C) testing a large number of substances for their antioxidant action. (A) Effects of varying temp., time, area of oil surfaces, and chem. unsatn. were noted; the catalytic effect of initial acidity upon sludge formation appeared as a possibility. (B) This possibility was strengthened by the results with open tubes. (C) $MeC_6H_4NO_2$, $PhNO_2$ and S showed very marked antioxidant action. E. E. CRANDAL

Insulating oils. C. O. HARVEY. *Chemistry and Industry* 46, 904-6(1927).—According to Rodman 3 types of sludge are found in transformer oils: asphaltic sludge, which consists of oxygenated compds. of high mol. wt. and which is a good insulator but interferes with the transference of heat away from the windings of the transformers; soap sludge, produced by the formation of salts of org. acids in the oil and having poor insulating properties; and carbon sludge, the result of arcking or the corona discharge; this is less common than the others and is easily removed by filtering or centrifuging. The Michie sludge test by which the oil, held at 150°, is blown with air for 45 hrs. is tedious, difficult to control, and takes no account of acid compds. formed which do not constitute any part of the sludge. Kissling's tar test takes account only of the acidic compds. produced. The Brown-Boveri test attempts to measure sludge, acidity and

peroxide development. Olefins if present in the oil may polymerize or may be oxidized to ozonides or peroxides, to be followed by the formation of aldehydes, ketones and acids. Diolefins may undergo similar reactions. Naphthenes may form naphthylenes, which may polymerize or may yield asphaltenes. If S and N compounds exist in the oil they may serve to accelerate polymerization as in the vulcanization of rubber hydrocarbons, especially as combined S is found in asphaltenes from natural asphalt. If phenols are formed during the oxidation they may combine with ketones and aldehydes to give resinoid substances. Van der Heyden and Typke have recently shown that exposure to light may aid in the development of sludge and acidity; and Becker has found that the silent discharge causes mol. condensation, loss of H, and increased viscosity.

E. E. CRANDAL

Tube still for distillation of crude oil. I. N. ACKERMAN. *Neftyanoye Khoz.* 14, 193-212(1928).—Very complete calcns. are given for the construction of tube stills, including whole equipment such as evaporators, condensers, heat exchangers, etc.

A. A. BOEHLINGK

Separation of fractions and the size and shape of rectification columns. K. V. KOSTRIN. *Neftyanoye Khoz.* 13, 180-7(1927).—Higher columns increase the fuel consumption of stills. By increasing the cross section of the column the fuel consumption is not always increased. Very high columns connected to open-fire stills improve the sepn. of heavy fractions; those for steam distn. improve the sepn. of light fractions. A high narrow column works better than a wide low one with the same capacity.

A. A. BOEHLINGK

Changes in construction of present-time stills. S. VUSHETRAVSKII. *Azerbeydj. Neft. Khoz.* 1928, No. 3, 58-69.—Diff. still equipments used by American oil concerns are described together with two Russian constructions which have never been made known. The still constructed by Krupoves for the Shibaev Company in Baku is a combination of 3 stills in cascade form. Each still has a dephlegmator. The preheated gasoline enters the top dephlegmator; the uncondensed vapors enter the top still; from the top still the evapd. gasoline is led into the second dephlegmator, then second still, etc. The still constructed by Pokrovskii for the A. I. Mantashev Company in Baku, is based on the same principle, but in construction details is slightly different. A. A. B.

Crude oils from the district of the Kruinskaya settlement (Kuban, Black Sea District). A. O. YURKOV. *Neftyanoye Khoz.* 14, 217-9(1928).—Some of the wells have a high percentage of gasoline, 6.6%, b. 100°, and 28.8%, b. 200°; but the sp. gr. is high and the amount distg. below 100° is not satisfactory. As the wells are rich in gas it might be possible to improve the gasoline fraction. The kerosene fraction gives a satisfactory yield but the sp. gr. is high, which indicates a high content of aromatics or of S. The mazout is similar to Kaluga crude oil but it contains less tarry substances. It is possible to obtain an appreciable amount of lubricating oils. The high sp. gr. prohibits its use for fuel. The Kruinskaya crude oil has less aromatics than the crude oil from Maikop. Consts. are given for the oils.

A. A. BOEHLINGK

New method for improving the viscosines (cylinder stocks). L. GUKHMAN. *Azerbeydj. Neft. Khoz.* 1928, No. 2, 61-3.—Cylinder stocks obtained from Balakhanui crude oil are called viscosines; those from Emba crude oil, vapors. Vapors have a better color (green) and are lower in carbon, 2.1-3.1% against 3.0-7.0%. The viscosine was obtained after acid and caustic treatment of bottoms ("Nigrol"). The washing of this cylinder stock was very complicated because of high viscosity. Gurvich suggested the use of steam, which improved the quality and eliminated the treatment with caustic. The ash content dropped considerably. To obtain viscosines of higher viscosity it was necessary to distil off the lighter parts, still increasing the ash content. Pengu suggested mixing bottoms with flash 300° with 1/3 of fuel oil to ppt. the acid sludge. To obtain heavier viscosines less distn. was necessary, cheapening the production considerably. The bottoms from Emba are treated in a soln. of Solar oils. This method was used for Balakhanui bottoms on a lab. scale. It produced a good color and lower C content and much less H₂SO₄ was required. The proportion used was 2 parts by wt. of bottoms with flash 305° and 1 part of black Solar oil with sp. gr. 0.880-0.882. Viscosity of the mixt. was E₁₀₀ 2.7. Twelve % of acid was required for treatment (on the amount of bottoms). Treatment was carried out in two steps with 3 and 9% of acid. The temp. during the process was 20-25°. Loss through treatment was 36-37%. For a cylinder stock of higher viscosity this product was partly distd. off. The distillates could be used for different lubricating oils after one or two treatments with caustic. The satisfactory results are due in great part to the low temp. used in treating the bottoms.

A. A. BOEHLINGK

Cracking or hydrogenation? M. NAPHTALI. *Chem. Umschau Fette Oele Wachse*

Harze 35, 100-3(1928).—A general review of present methods of cracking the heavier petroleum oils and of hydrogenating hydrocarbons and coal with and without catalysts.

P. ESCHER

Cracking of mazouts from heavy crude oils. A. N. SAKHANOV and M. D. TILICHEV. *Neftyanoye Khoz.* 14, 328-53(1928).—An investigation was made of the methods of cracking for obtaining (1) a better fuel-oil (lowering of cold test and viscosity), (2) gasoline and fuel-oil, (3) gasoline and coke. A method was developed for testing oils for cracking at 425°, a pressure of 10-60 atm., depending on the product used and the kind of cracking desired, and during periods of 10 min. to many hrs. The speed at which gasoline and kerosene are formed is practically the same for all mazouts and heavy crude oils. At 425° are formed in 30 min. 8-10% gasoline and 12-15% kerosene; in 60 min. 18-20% gasoline and 18-22% kerosene. For higher temps. the rate of cracking is doubled every 10°. The speed of formation of gasoline and kerosene is dependent only on time and temp., not on the pressure. The rate of formation of coke depends to a great extent on the nature of oil used. The following oils have been investigated: Mazout from Surakhanui; heavy crude from Voznesenskii, from Binagadii, from Kaluga; paraffin, mazout from Groznui; oil tar from Groznui. Surakhanui mazout formed the lowest % of coke; oil tar from Groznui the highest. A certain amount of cracked gasoline corresponds to a certain amount of coke for each oil. This relation is independent of the temp. The calcn. of a cracking unit depends on the gasoline and on the amount of coke expected. The following exptl. data have been obtained for Groznui paraffin mazout: When cracked according to (1) the cold test is decreased from plus 34° to plus 11°. According to (2) 35% of cracked gasoline and 1% of coke are formed. (3) With heavy cracking, up to 57% of gasoline and 15% coke could be obtained. Mazout from Surakhanui yields 50% gasoline at 1% of coke. By applying the first method of cracking to Kaluga crude oil the viscosity could be lowered sufficiently to make it very suitable for fuel oil. The cracking of oil tar and paraffin tar from Groznui could not be carried out on a commercial scale because of excessive formation of coke. These expts. were carried out in an autoclave with release for vapors.

A. A. BOEHLINGK

Acid sludge from oil fractions from Emba crude oil. S. OBRVADCHIKOV. *Neftyanoye Khoz.* 14, 360-2(1928).—The acid sludge was washed with water, the residue heated in an oil bath to 130-150°. At this temp. the coke sepd. from the tar. The sepd. tar was treated with air at 300° and asphalts m. 80°, 60° and 30° were obtained. At 130° there were formed water and gas 2.15%, asphalt 53.6%, coke 44.25%; at 150° water and gas 6.03%, asphalt 51.82%, coke 42.15%; at 170° water and gas 13.94%, asphalt 50.87%, coke 35.19%. The coke mixed with some cheap oil could be used as fuel. This coke contains up to 2% of ash and could not be used for electrodes.

A. A. BOEHLINGK

Lubricating oils and their rational use. STEFANO FACHINI. *Atti II congresso naz. chim. pura applicata* 1926, 514-17.—A crit. discussion, with special reference to the advantages of "Vollol" oils.

C. C. DAVIS

Bituminous limestones as a source of lubricants and of fuels. CAMILLO MANUELLE. *Atti II congresso naz. chim. pura applicata* 1926, 423-50.—Expts. are described to illustrate the manner in which asphalt oils can be transformed into light oils and benzine, which are quite suitable as lubricants and as fuels. In principle, the asphalts are steam-distd. *in vacuo* by a continuous system where the hot asphalt oil falls through towers and is met by ascending superheated steam. By proper control of the temps. of oil and steam and with several towers in series, benzine, light, medium and heavy oils and bituminous residues are sepd. Detailed tabulated data show the properties of the various fractionation products obtained in representative runs. The lubricating oils are yellow or red, solidify only at temps. far below 0° and are practically neutral. Expts. on the cracking of asphalt oils in the vapor and in the liquid form are also described, with tabulation in detail of the data. The results show that when properly treated, asphalt oils are a valuable source of benzine. A review is included of earlier attempts at the utilization of bituminous rocks and the possibilities of an Italian industry. C. C. D.

The utilization of bituminous rocks, with special reference to Sicily. MARIA BAKUNIN. *Atti II congresso naz. chim. pura applicata* 1926, 468-513.—A crit. review and discussion, the subjects including the historical aspects, the character of the bituminous rocks of Sicily, their org. components, distn. and cracking processes, treatment of the oils and the economic status of the industry. C. C. DAVIS

Comparison of Foreign and Soviet lubricating oils. G. ANDREYEV. *Neftyanoye Khoz.* 14, 354-9(1928).—Usual tests are run on 4 American spindle oils and 4 Russian oils. The Russian oils have a lower flash point. The cold test is in favor of Russian

oils, being below -20° ; also the resin content. American spindle oils are paraffin-base oils; the Emba (Russian) oil seems to be of the same nature. A. A. BOEHLINGK

Lubricating oils from Surakhanui crude oil. A. SAKHANOV. *Azerbejdj. Nefti. Khoz.* 1928, No. 1, 50-2.—The light fractions of this oil consist of naphthenes, the heavy of paraffins. The crude was worked up for lubricating oils after distn. of the gasoline and kerosene. The fractions left for lubricating oil amounted to about 54.2%. This mazout was distd. under a vacuum varying between 8 and 13 mm. The diff. fractions had d. 0.858-0.932, E_{100} 1.3-10.0, b. $122-322^{\circ}$, cold test -17.5 to plus 35° , flash (Brenken) $143-341^{\circ}$. About 72% of mazout was recovered as oil. Approx. 28% of residue left was taken up with ligroin and treated with fuller's earth (50%). The paraffin wax was frozen out at -15° and filtered. The filtrate after evapn. of the ligroin consisted of cylinder stock, free from paraffin. d_{15} 0.920, flash 323° , cold test 19° , E_{100} 7.0, color dark red. The treatment of the residue is carried out without difficulty as no asphaltenes are present. Lighter cylinder stock could be obtained, providing the lubricating oil fractionation is not carried out that far. This stock compares very favorably with American cylinder oils. About 10% of the residue consisted of crude paraffin wax with melting point 60° , 75% of which is a high-grade, slightly yellow ceresin m. 65° .

A. A. BOEHLINGK

Some modern methods of recovery of lubricating oil. A. J. BROUGHALL. *Chemistry and Industry* 46, 1096-9, 1112-7 (1927).—About half of the lubricating oil used could probably be reclaimed. Ten per cent of the cost of electricity produced by Diesel engines is accounted for by the cost of the lubricating oil. The impurities usually found in lubricating oils include (1) H_2O , (2) metallic particles produced by wear, (3) C particles formed by heating the oil to a high temp. and (4) particles of grit. Oil from internal-combustion engines will also contain heavy fuel ends. The impurities are removed by settling, centrifuging or filtering. By a process used with a settling tank made by Industrial Waste Eliminators, Ltd., the 80-gal. tankful of oil is heated to boiling point and held there 15-20 min., dropped to $170-180^{\circ} F.$ and allowed to stand at that temp. for 2 weeks for water and sediment to settle out. The temp. for light oils is $150^{\circ} F.$ and the time 1 wk. The Stream-Line filter, made by the Stream Line Filter Co., Ltd., filters by passing the liquid between the leaves of packed columns of papers. The pressure on the column controls the fineness of the particles which will be carried through. The colloidal C in a used lubricating oil can be filtered out completely. The paper must be so prep'd. that the solid particles do not penetrate between the fibers; otherwise the edges would thicken. In the commercial stream-line filter the solid residue from the oil remains outside the oil, only the clean oil passing between the papers into the center holes which lead to the outlet. Heating arrangements and a small vacuum pump are provided to vaporize and draw off the light oil and H_2O and these are then readily absorbed in the paper. The vacuum pump can be converted to an air compressor for forcing off the cake of solid particles. Tables of data show the results obtained by settling, centrifuging and the stream-line filter. E. E. CRANDAL

Treatment of bottoms from the lubricating-oil fraction of Emba crude oil. N. CHERNOZHUKOV. *Neftyanoye Khoz.* 13, 188 (1927).—The heavy bottoms were treated with a mixt. of 2 parts of H_2SO_4 and 1 part of naphthenic acids left from treatment of engine oils. Forty-five % of oil could be sepd. this way. A. A. BOEHLINGK

Pyro-benzine from mazout from Surakhanui paraffin oils and from residue from heavy gas tars. N. NOVIKOV-VAKULENKO. *Azerbejdj. Neft. Khoz.* 1928, No. 1, 55-9.—Heavy residues were atomized and blown against a heated surface of fire bricks of a gas-producing equipment. The temps. of vapors leaving the brick surface were $617-774^{\circ}$, depending on the nature of residue. After passing a hydraulic seal and scrubbers they were ready for use. In this way was obtained about 33.5-54% of gas; the rest was tar. This tar was heated to 175° and the distillate re-distd. according to Engler. The following oils and residues were used. (1) Solar oil, d. 0.889; temp. of gas leaving the brick surface 617° , leaving the producer 551° ; tar (hydraulic) condensed, d_{15} 0.9006 63.5%; gas yield 33.5%, distn. of tar up to 175° 3.08%, $175-240^{\circ}$ 6.82%, $240-260^{\circ}$ 5.77%; residue left 82.94%. (2) Concd. paraffin mazout, d. 0.9172; temp. of gas leaving the heated brick surface 737° , leaving the producer 646° ; tar (hydraulic) condensed, d_{15} 0.9208 61%; gas yield 36%; distn. of tar up to 175° 11.45%, $175-240^{\circ}$ 13.9%, $240-260^{\circ}$ 6.07%; residue left 63.8%. (3) Mazout from Surakhanui paraffin crude oil d. 0.8939; temp. of gas leaving the heated brick surface 774° , leaving the producer 623° ; tar (hydraulic) condensed, d_{15} 0.9580 43%; gas yield 54%; distn. of tar up to 175° 9.43%, $175-240^{\circ}$ 9.59%, $240-260^{\circ}$ 6.29%; residue left 74.09%. (4) A mixt. of heavy gas tar and mazout from Balakhanui paraffin crude oil in equal parts; temp. of gas leaving the heated brick surface 790° , leaving the producer 650° ;

tar (hydraulic) condensed, d_{20}^{20} 0.9780 (11.4%), light tar 17.8%; gas 67.8%; distn. of tar up to 175° 6.83%, 175-240° 16.53%, 240-260° 4.17%. All tars contained naphthalene. The compns. of gases obtained from these tars for Solar oil and for mazout from paraffin crude oil were, resp., CO_2 0.7-1.3, 0.8; CO 0.7-0.5, 1.0; O_2 1.1-1.6, 1.8; H_2 9.2-25.4, 16.79; CH_4 46.7-36.5, 36.14; heavy hydrocarbons 38.8-27.6, 20.8; N_2 2.8-7.1, 22.67%.

A. A. BOEHLINGK

Methods of dealing with paraffin troubles encountered in producing crude oil. C. E. REISTLE, JR. *Bur. Mines, Tech. Paper* 414, 39 pp.(1928).—Paraffin accumulation in wells and flow lines is affected by temp., loss of volatile constituents in the oil and suspended inorg. material. By proper control of these factors, paraffin deposits can be reduced or eliminated. Control methods are discussed with respect to flowing wells, wells flowed by compressed air or gas, pumping wells during the transition period, settled pumpers, paraffin in the sand, flow lines and tanks. Methods of removing deposits from casing and tubing are described with respect to the use of standard tools and elec. hoist and paraffin hook. Removal of paraffin from the tubing of pumping wells is discussed with respect to pulling rods and use of the paraffin hook, knife or auger, the use of rod guards or protectors, the use of solvents, elec. heaters, steam and chemicals. Methods of removing paraffin deposited on or in the sand are: raising the fluid level, use of solvents, circulation of hot oil, and use of compressed air or gas, steam, flame at the bottom of the well, chemicals, sand reamers and explosives. Advantages and disadvantages together with the cost of each method are pointed out. D. F. B.

Determination of sulfur and sulfur derivatives of hydrocarbons in naphtha solutions and in petroleum distillates. W. F. FARAGHER, J. C. MORRELL AND G. S. MONROE. *Ind. Eng. Chem.* 19, 1281-4(1927).— H_2S is pptd. as CdS , free S is removed by shaking with Hg and the loss detd. Mercaptan S is estd. by removing as Pb mercaptide. Disulfides are reduced to mercaptans and detd. as mercaptides. Sulfides are pptd. from the residual oil with HgNO_3 and residual S is detd. in the sample by the lamp method. Sulfide S is found by difference.

J. E. CRANDAL

Action of refining agents on pure sulfur compounds. M. A. YOUTZ AND P. P. PERKINS. *Ind. Eng. Chem.* 19, 1247-50(1927).—Solns. of pure hydrocarbon sulfides, disulfides and thiophenes in straight-run naphtha were made up of such concn. as to contain about 0.5% of S. These solns. were treated with 95% H_2SO_4 , AlCl_3 , SiO_2 gel and fuller's earth, and the loss of S was detd. H_2SO_4 has mainly a solvent action, AlCl_3 affects all the S compds.; SiO_2 gel removes all the forms of S partially but has the least effect upon thiophenes; fuller's earth is not effectual for secondary sulfides, disulfides or thiophenes.

E. E. CRANDAL

Ultramicroscopic study on asphalt. F. J. NELLENSTEIJN AND J. P. KUIPERS. *Chem. Weekblad* 25, 190 2(1928).—It is shown from tables of observations of the ultramicroscopic picture of asphalts, natural (Trinidad and Neufchatel) and artificial, dissolved in various solvents that all of them show ultramicroscopic particles, the natural species more readily than the artificial. By admixt. of finely ground mineral powder (e. g., cement powder) to the artificial asphalt solns. as many particles appear in these as in natural asphalt. Probably the finest cement particles are taken up in the asphalt micelle. For petroleum asphalt the ultramicros appear most readily in CS_2 soln. ($\sigma = 30.9$); in liquids with higher surface tension σ the observation is more difficult (particles too small); for surface tensions lower than 25 coagulation is apparent. Coal-tar asphalt, which has a σ larger than that of petroleum, shows an optimal σ for observation of 40 to 44 (quinoline, furfurole, aniline, nitrobenzene, o-nitrotoluene); CS_2 causes coagulation. This peculiarity will have to be taken into account for a detn. of free C in coal-tar products based on that for petroleum products. B. J. C. v. d. H.

Carbonization of soft-wood sawdust in the Pacific Northwest. W. L. BEUSCHLEIN. *Trans. Am. Inst. Chem. Eng.* 19, 93-106(1927).—Complete details are given of an entire carbonization process, using a rotating kiln.

T. S. CARSWELL

Distilling and carbonizing coal (U. S. pat 1,668,132) 21.

Apparatus for heating crude petroleum. F. GARDNER. U. S. 1,668,766, May 8. A settling tank for effecting a primary sepn. of oil from water is connected with app. for filtration and chem. treatment.

Apparatus for distilling and cracking hydrocarbon oils. F. TINKER. *Brit.* 274,959, April 28, 1926. Crude oil is preheated by the residuum and also by the vapors and condensates and the various streams of preheated oil or mixts. of vapor and oil are passed into a mixing vessel prior to passage into a vapor-sepg. chamber. Various other features are described.

Cracking hydrocarbon oils. V. W. NORTHRUP. Brit. 275,120, March 21, 1927. A mixt. of the vapors of heavier hydrocarbon oils and gas contg. available H is passed through an electrified zone and afterward through an independent catalyzing zone which may contain catalysts such as Ni, Co, Pd, Al, Fe or their mixts. An app. is described.

Distilling and cracking hydrocarbon oils. W. M. CROSS. U. S. 1,667,883, May 1. An oil such as crude petroleum is distd. and different fractions are condensed and collected; the tarry residual products are withdrawn, and the gasoline-like fractions are refined and redistd. to produce gasoline; the more refractory fractions and selected portions of the residual material are subjected to cracking under a pressure above 500 lbs. per sq. in. so that conversion is effected substantially in the liquid phase; the synthetic product contg. a substantial proportion of material of low b. p. is drawn off and cooled, and is recycled through the fractional distn. stage; a portion of the heavy oils is diverted from the system.

Distilling petroleum oil. A. E. PEW, JR., and H. THOMAS. U. S. 1,668,602, May 8. Oil such as crude petroleum after being preliminarily heated is partially vaporized and the vapors are fractionated in one part of a described app.; another body of oil is partially vaporized in another part of the app. and its vapors are fractionated in a third portion of the app.; residual oil and condensed oil from the first evapn. and fractionation and also condensed oil from the last fractionation are conveyed to the "body of oil" mentioned and distributed over an extended surface and brought into contact with the vapors from this body of oil. Cf. C. A. 22, 2053.

Refining petroleum oils. C. R. WAGNER. U. S. 1,669,180, May 8. In order to sep. petrolatum from steam-refined stocks, the stock is dild. with a mixt. of a Bu alc. and naphtha, contg. over 25% of the Bu alc., and gravity sepn. is effected after chilling the dild. oil.

Purifying mineral oils, petrolatum or paraffin. I. G. FARBERNIND. A.-G. Brit. 274,828, July 21, 1926. After refining with acid and alkali, bleaching is effected with hypochlorite in the presence of auxiliary agents such as Ni sulfate or other salts of Ni, Cu or Co, or a bicarbonate which serve to remove caustic alkali and may also produce HOCl.

Refining mineral oil. H. T. MAITLAND. U. S. 1,668,920, May 8. Particles of sand or other material affording a large superficial area are coated with a film of H_2SO_4 and lubricating oil distillate or other oil is passed through a body of this material.

Phenols from distillates obtained in oil cracking. R. CROSS. Brit. 275,313, May 3, 1926. Mixts. of phenols, cresols, etc., which may be used as *disinfectants* are obtained by extg., with NaOH, distillates obtained in the cracking of coal tar, or its distillates or of shale oil, asphaltic-base crude oils, cracked oils, etc. If the oils initially used do not contain O compds., the cracking is carried out after adding substances such as glycols, glycerol or alcs. An app. is described.

Plant for distilling oil from shale. W. RHOADES. U. S. 1,668,820, May 8.

Hydrocarbons from bituminous shale-like material. W. H. HAMPTON. U. S. 1,668,898, May 8. Bituminous shale or similar material is digested at a temp. above 260° with a liquid oil, while the materials are agitated, and the solid residue is sepd. by centrifuging. An app. is described.

Treating hydrocarbons with sulfur dioxide. W. HESS. U. S. 1,668,275, May 1. Hydrocarbon material is treated with gaseous SO_2 and then with liquid SO_2 , to avoid losses of liquid SO_2 .

Removing sulfur and sulfur compounds from hydrocarbon oils. G. L. WENDT. U. S. 1,668,225, May 1. Lower mercaptan compds. such as Na mercaptides with less than 10 C atoms are added to the oil and it is then treated with "doctor soln." The added mercaptan compds. serve to prevent souring on distn. Cf. C. A. 22, 1233.

Removing wax from oil. G. D. GRAVES. U. S. 1,668,239, May 1. In order to remove, from oil distillates contg. principally paraffin wax and other waxes which hinder filtration or sweating of ordinary paraffin, the latter class of waxes, the oil is filter-pressed at a temp. (suitably about $22-30^\circ$) at which the paraffin remains in soln. in the oil but at which the interfering waxes crystallize.

Cast metal return bend for oil stills. F. E. KAY. U. S. 1,668,680, May 8.

Apparatus for pressure cracking of petroleum residuums, etc. STANDARD DEVELOPMENT Co. Brit. 274,763, March 14, 1927.

Apparatus for treating hydrocarbon distillates and gases by various blending operations, etc. N. H. COLWELL. U. S. 1,668,104, May 1.

Sulfuric acid recovery from acid sludges. J. D. RUYS. U. S. 1,669,102, May 8.

Acid sludge produced in petroleum refining is treated with acid oils derived from cracked petroleum oils, to facilitate concn. and recovery of acid.

• **Emulsions.** C. A. AGTHE. U. S. 1,668,136, May 1. A substance to be dispersed, *e. g.*, a mineral oil, is atomized with steam or other suitable atomizing agent in the form of a hollow fluid jet with the interior and exterior of which the material treated is caused to come into contact; the atomized material is incorporated in a dispersion medium such as an aq. soln. in which the atomizing agent condenses and within which the atomization is effected. An app. is described.

Breaking emulsions of hydrocarbon oils. L. BURGESS. U. S. 1,668,941, May 8. Emulsions such as those of oil and water are broken by the addn. of a sulfonic acid obtained from sludge of hydrocarbons refined with strong H_2SO_4 .

Treating emulsions of hydrocarbon oils and water. C. F. PESTER. U. S. 1,669,379, May 8. The emulsion is subjected to the action of an unneutralized sludge obtained from refining hydrocarbon lubricating oils with strong H_2SO_4 , in order to break the emulsion. A temp. of about 75° is suitable.

Wetting and emulsifying agents. BRITISH DYESTUFFS CORPORATION, LTD., J. BADDILEY AND E. CHAPMAN. Brit. 274,611, June 3, 1926. A mineral oil fraction, *e. g.*, that obtained by extg. *Boone* petroleum with liquid SO_2 , is sulfonated and the product is condensed with an alc., *e. g.*, with isopropyl alc. or benzyl alc. in the presence of H_2SO_4 . The products are suitable for use in various treatments of textile materials or in prepng. emulsions of oils and solvents for treating leather or other purposes. Several examples are given.

Apparatus for gaging temperature of gasoline in tank cars. H. B. HICKMAN. U. S. 1,668,149, May 1.

Fuel for internal-combustion engines. H. F. PARKER. Brit. 275,334, May 5, 1926. "Knocking" of kerosene or like fuels is reduced by adding cyclic compds. extd. from kerosene by liquid SO_2 . Fifty % or more of these compds. may be used.

Fuel for internal-combustion engines. C. A. WALTER and F. B. MUHLENBERG. U. S. 1,669,181, May 8. A compn. for addn. to fuels such as gasoline is prepd. by agitating gasoline or similar material with NH_4Cl and adding small quantities of $CuSO_4$ and $ZnSO_4$ which serve to reduce knocking and otherwise improve the effect of the fuel.

Motor fuel. T. MIDGLEY, JR. U. S. 1,668,022, May 1. A hydrocarbon fuel such as kerosene and gasoline is mixed with a volatile metal compd. such as Et_4Pb and with a halogenated lubricating oil, contg., *e. g.*, C_2H_5Br or $C_{10}H_7Cl$, which serves to prevent deposits on the valve stems or other engine parts.

Lubricating oil. F. W. HALL. U. S. 1,668,313, May 1. Cylinder stock is treated with H_2SO_4 , mixed with a lighter petroleum oil and the acid sludge materials are allowed to settle out from the mixt.

Decolorizing and purifying lubricating oils. P. W. PRUTZMAN. U. S. 1,667,984, May 1. A stream composed solely of oil under treatment mixed with an adsorbent such as fuller's earth is passed through a pipe coil in which it is heated to a temp. above the vaporizing point of the oil and the vapors are retained within the flowing stream by subsequently cooling it below the vaporization point. An app. is described. Cf. C. A. 22, 865.

Apparatus (with a mercury heater) for reclaiming used lubricating oil by distilling off gasoline, etc. O. WERNER. U. S. 1,669,182, May 8.

Oxidizing paraffin. J. R. SCANLIN. U. S. 1,668,871, May 8. An oxidized paraffin product, free from gummy substances, suitable for use in lubricants is obtained by exposing the paraffin to the action of an oxidizing gas such as air and to heat (suitably at a temp. of about $150-165^\circ$), and discontinuing the oxidation when an acid value not exceeding 40 has been reached.

Treating asphalts. N. TESTRUP, T. BOBERG and TECHNOCHEMICAL LABORATORIES, LTD. Brit. 274,540, March 20, 1926. In order to facilitate transportation and storage of bituminous material such as Trinidad asphalt, it is melted and freed from water, treated with about an equal quantity of a vaporizable solvent, insol. substances are allowed to settle out and the solvent is then recovered and its residue is removed by steam distn. An app. is described.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Erroneous determination of the cellulose space lattice. O. L. SPONSLER. *Naturwissenschaften* 16, 263(1928).—S. claims that Herzog's interpretation of the cellulose lattice is false for several reasons (cf. C. A. 22, 1679). Reply. M. POLANYI. *Ibid* 263-4. B. J. C. VAN DER HOEVEN

The hygroscopicity of cellulose esters. ABEL CAILLÉ. *Chimie et industrie* 19, 402-6 (1928); cf. C. A. 20, 1719; 21, 2062, 4065.—The retention of hygroscopic H_2O by nitrocellulose and by vegetable parchment increases with the total H_2SO_4 content, as in the case of fixation of methylene blue. In the case of acetylcellulose: (1) the Me_2CO -insol. residue has an appreciably lower H_2SO_4 content than the sol. portion; (2) of 2 acetates having the same total H_2SO_4 content, the one with the higher combined H_2SO_4 is more sol. and more viscous; (3) the Me_2CO soly. of a given acetate decreases with the combined H_2SO_4 content; (4) fractional pptn. of Me_2CO solns. with H_2O shows that the acetate can be sepd. into fractions of decreasing H_2SO_4 contents, of which C. gives the following interpretation: H_2SO_4 , which is a depolymerizing agent, has reacted differently with acetylcelluloses of different degrees of polymerization and on dispersion of the acetate in Me_2CO there are different-sized micellas with varying combined H_2SO_4 contents. A. PAPINEAU-COUTURE

Correct calculation of costs. G. M. JOHANSSON. *Svensk. Pappers-Tid.* 31, 209-16 (1928).—Production costs in cellulose plants are analyzed. Several of the 28 tables give proportions of chemicals involved in the process. W. SEGERBLOM

Viscosity of nitrocellulose. OTTO MERZ. *Färbem-Ztg.* 32, 2768-71, 2886-7 (1927).—The viscosity of nitrocellulose solns. depends on the size of the nitrocellulose particles and, to some extent, on the solvents. Nitrocellulose of a low viscosity is mfd. by maintaining the following conditions: high nitration temp., prolonged reaction time, increase of the H_2O and decrease of the HNO_3 content of the mixed acid, lessening the amt. of the mixed acid, boiling and bleaching of the nitrocellulose and the addn. of free acid to the latter. With an increasing mol. weight of the solvent, cotton solns. of higher viscosity are obtained. Small quantities of water lower the viscosity of the soln. but the solvent power of the solvent is raised. 3.55 parts of water to 100 parts of Am ester increase the soly. of nitrocellulose 34.3%. Adding alc., heating and allowing to rest for a certain period lowers the viscosity of the cotton soln. The temp. at which the nitrocellulose is dried scarcely influences the viscosity of the final soln. M. gives a review of the various viscometers applied in the lacquer industry, discusses the usefulness of Engler's app. and gives directions for its use. With this app. the time it takes for a certain amt. of lacquer to pass through a given opening is measured. J. S.

The manufacture and industrial development of rayon. M. G. LUFT. *Kunstseide* 9, 387, 430(1927).—Various factors in the manuf. and use of rayon are reviewed and discussed. FREDERICK C. HAHN

Theory of spinning and structure of rayon. KÄMPFF. *Kunstseide* 9, 361-5, 409-15(1927).—A theoretical discussion of the spinning of rayon is given, based on the micelle theory. K. discusses from a mathematical standpoint the effects of variations in the quantity of spinning soln. pumped, the concn. of the spinning soln., the size of the opening of the nozzle, and the change of the velocity of pulling (take-up speed). A spinning soln. contains a mass of disordered micelles, which are rod-shaped particles and which are pictured as fine-tooth combs or as scaling ladders. The teeth or rungs represent mechanical forces to which are due "friction" or "ability to aggregate." The capability of a soln. to be spun presupposes that the micelles are sufficiently close together to prevent their free-floating. The soln., therefore, must have a certain concn., certain viscosity, and a min. inner friction. The larger the individual micelles, the more intense is their intramol. imbibition, and the lower can be the concn. If the means of dispersion is removed from such a dispersion of micelles, a clotting and finally a coagulation of the micelles occur while they shrink together. The moment the spinning soln. leaves the nozzle, attenuation occurs, and simultaneously by the action of the pptg. bath the spinning mass is covered with a thin film caused by the dense accumulation of micelles. These micelles by a combing action accumulate the still freely moving micelles within the soln. and orient them in the direction of flow of the soln. The velocities of flow and aggregation are what det. the arrangement of the micelles in the rayon filament. If the ratio of the take-up speed to the speed of flow at the nozzle is increased, the degree of orientation of the micelles is greater, they are closer together, and the mutual effect of their forces directed at right angles to the longitudinal axis results

in increased strength of filaments. K. discusses permanent extension and elasticity, and explains as follows the observation by Weltzian that a stretching of the fiber in the dry state may be reproduced in the same way when the stretched fiber is subjected to swelling in caustic soda soln. As a result of stretching, such an intensive mutual interference occurs in the close stratification of the micelles in the dried gel that a rigid strain is set up. By swelling, the formation of the micelles becomes looser, the tensions swing back to normal position, so the process is reproducible after drying. On the basis of the foregoing picture, the effects of the quantity of soln. pumped, change in concn. of the spinning soln., changes in the size of openings in the nozzle, and changes in the exit velocity are discussed from the standpoints of elasticity, strength, etc., of the rayon.

FREDERICK C. HAHN

Measurement of the fluidity of cotton in cuprammonium solution. D. A. CLIBBENS AND ARTHUR GRAKE. *J. Textile Inst.* 19, 77-82T (1928).—A soln. contg. 15 g. Cu, 240 g. NH_3 and less than 0.5 g. HNO_3 per l. is prepd. and standardized. In a capillary viscometer contg. an Fe cylinder as stirrer the cotton is dissolved in the absence of air. Unless the HNO_3 is low, bleached cotton will not dissolve completely. By use of a 0.5% soln. of cotton the extreme range of change is 60-fold and can be measured with a single instrument. The time of flow is standardized against 64.4% $\text{C}_3\text{H}_5(\text{OH})$ (d_{20} 1.1681), which has the max. rate of flow permissible for bleached cotton. The ratio to the glycerol standard may be used but it is more satisfactory to express results as abs. fluidity (reciprocal of viscosity in poises). If cotton is highly tendered a correction for the kinetic energy of the liquid which may amount to 30% must be applied. Detns. with solns. which are not clear are of doubtful significance. Unbleached cotton without chem. treatment contains at least 7% of non-cellulose and will not give a clear soln. Overnight mechanical agitation to produce soln. is necessary; excess does no harm. A temp. variation of 2° from 20° is permissible. A 0.5% soln. of lightly scoured cotton has a viscosity of about 1 poise; vigorous scouring reduces this to 0.2 without detracting from the quality; a further reduction to 0.05 is accompanied by 20-30% loss in tensile strength. Changes of fluidity have roughly the same significance in any part of the scale. Values are of theoretical significance only when the soln. follows the law of true viscous flow. Cotton solns. approach this more closely the higher their fluidity. A detailed method for detn. of the extent to which they follow this law is given. For fluidities above 8 this is approached closely enough for control work. Chemically modified cotton shows a correction different from that of normally bleached cotton. This chemically modified cotton may be studied in 2% soln. and calcd. to 0.5%. Cloth high in oxy- and hydrocelluloses shows a soly. of about 60-70% in cuprammonium contg. 2-3 g. HNO_3 per l., the residues being fragments of normal hairs showing little swelling. Cloth may be sepd. as yarns and boiled in 1% NaOH at 20 lbs. excess pressure to render it more sol. in this soln. These effects are not observed with the soln. low in HNO_3 . The effect of the mechanical form of the fabric and of HNO_3 content of the soln. is clearly indicated.

FOSTER DEE SNELL

Libyan esparto. CAMILLO LEVI. *Atti II congresso naz. chim. pura applicata* 1926, 270-99; cf. *C. A.* 21, 3742.—The botanical characteristics of *Stipa tenacissima* L. (I) and *Lygeum spartum* L. (II) and agricultural and economic problems connected with its cultivation and its utilization for cellulose are described, with illustrations and with new data. The chem. compn. differed according to the source of the esparto and the nature of the soil. The cellulose was 45-50%, the ash of I was 3.4% and of II was 3.9%. About 65% of the ash was SiO_2 . A crit. examn. of the English (NaOH) process for the production of cellulose showed the high cost of fuel and indicated the possibility of developing a more economical process. A method using Cl was considered most promising, particularly for Italy where Cl from the electrolytic NaOH process is available in great quantities. A comparison of the de Vains and the Cataldi Cl processes led to the choice of the latter as a basis for the development of a process for esparto. After numerous expts., particularly attempts to minimize the harmful action of HCl, it was found best to treat the esparto with 2-2.5% aq. NaOH at 90° for a max. of 2 hrs. with agitation and circulation of the liquors, wash, press, treat with Cl gas, wash with dil. NaOH, sort, bleach and dry. The more NaOH in the initial treatment the less the Cl usually required, but for economic reasons it is best to minimize the NaOH and use a relatively large quantity of Cl. Excellent results are obtainable with 16 parts of NaOH and 38-40 parts of Cl per 100 parts of dry I, with a 40% yield. Comparative analyses of cellulose from I made by this process and by the English NaOH process gave the following results: ash 1.81, 3.0; fats + waxes + resins 1.07, 0.73, aq. ext. 3.82, 6.49; α -cellulose 78.8, 72.74; β -cellulose 13.9, 21.48; γ -cellulose 7.3, 5.78; pentosans 20.04, 14.57; Cu no. 2.16, 3.74; cellulose no. 0.57, 0.70. The Cu nos. indicate less altera-

tion of the cellulose in the Cl process. Analyses of papers made from cellulose prep'd. by the NaOH, Cl, de Vains and Schlacht processes are compared. Paper from cellulose of the Cl process is lighter and softer than that from other processes. Photomicrographs of cellulose from the Cl and the NaOH processes are shown. The cellulose from the Cl process had a fiber approx. 1.2 mm. long and 11 μ diam. Microscopic differences in the cellulose from I and from II are described. The Cl process had been shown by large-scale expts. at the Pomilio electrochem. plants to give an excellent cellulose and to be of great promise industrially. C. C. DAVIS

The bleaching of sulfite pulp. L. RYS. *Paper Trade J.* 85, No. 18, 61-7 (1927); cf. C. A. 21, 1711.—During the bleaching of sulfite pulp with hypochlorite soln. chlorination takes place, the end products of the reaction going into soln.; whether insol. chlorination products are first formed was not detd. The amt. of organically combined Cl is higher the higher the lignin content of the unbleached pulp. The expts. described indicate that the chem. equil. during bleaching can be expressed by the reversible equation $2\text{NaOH} + \text{Cl}_2 \rightleftharpoons \text{NaOCl} + \text{NaCl} + \text{H}_2\text{O}$, the left side representing chlorination and the right side oxidizing conditions. The proportion between oxidation and chlorination reaches and maintains a practically const. value under similar conditions, which supports the theoretical explanation already given. The time necessary for a given consumption of available Cl increases as the chlorination decreases. Although the acidity or alkyl. was not closely followed during the expts., it appeared that under the conditions used there was a tendency to approach and maintain a condition of, or nearly approaching, neutrality. Though the color relations of the pulps were not detd., it was easy to see that the color was degraded by the action of free Cl and also by the addn. of chloride ion. It may be considered that increasing the intensity of chlorination without a corresponding increase in oxidation results in a resinification of the lignin, which makes the H- or OH-ion concn. important. Contrary to the results of Schwalbe and Wenzl, chlorates were found to take no part in the bleaching of sulfite pulp. The presence of chlorates in the bleach liquors has no appreciable effect on the chem. equil. during the bleaching reaction, and neither the phys. conditions of bleaching nor the chem. compn. of the bleached pulp is altered by its presence. Contrary to the results of Wenzl, the presence of acetates was not found to influence the bleaching action materially, so far as the bleaching time, color of the waste liquor, and color and chem. properties of the bleached pulp were concerned. With increasing amts. of acetate, a very slight increase in chlorination and an increased acidity of the waste liquor were found. The amt. of ash decreased as the acidity of the waste liquor increased. The amt. of acetates which were used did not appear to cause any salting-out effect such as was suggested by Wenzl. The action of carbonates, bicarbonates and air upon bleach is due only to the changes which they cause in the H-ion concn., since no changes were observed when the concns. of carbonate and bicarbonate ions in the bleach were increased. A. PAPINEAU-COUTURE

The typical action of wax sizing in pulp. WIEGER. *Wochbl. Papierfabr.* 59, 11-8 (1928).—The proper use of Montan wax gives a soft, flexible, waterproof material capable of a high finish, and with good coloring qualities. Many problems of application are still to be solved, however. R. H. DOUGHTY

The solubility of cellulose esters. I. G. KITA, I. SAKURADA AND T. NAKASHIMA. *Cellulosechemie* 9, 13-7 (1928). II. Acetone solubility of cellulose acetate. *Ibid* 27-9; cf. C. A. 22, 499, 1472. R. H. DOUGHTY

Alpina nutans for paper making. ANON. *Bull. Imp. Inst.* 25, 122-6 (1927).—The dried, fibrous stems of *A. nutans*, contg. a large amt. of pithy matter, have the following compn.: H₂O 90, ash 6.25, cellulose 49.9% (54.8% on dry basis), av. fiber length 2.62 mm., av. fiber diameter 0.0162 mm. Pulping tests showed the material can be converted into paper of satisfactory quality in good yield and without excessive NaOH consumption. A. PAPINEAU-COUTURE

Saving \$28,000 annually in paper-mill coal cost. J. G. BERGER. *Power* 67, 456-8 (1928).—Test runs and various plant improvements are described. D. B. D.

Paper sizing. FR. ARLEDTER. *Papier-Fabr.* 26, 33-6 (1928).—Address. R. H. DOUGHTY

Parchment paper. ROBERT FRITSCH. *Wochbl. Papierfabr.* 59, 63-7 (1928).—Descriptive of the development and present status of the industry. R. H. DOUGHTY

The passage of air through paper. BRUNO SCHULZE. *Papier-Fabr.* 26, 198 (1928).—The vol. of air in l. per min. passing through 100 sq. cm. of paper, under a pressure difference of 10 cm. of H₂O, are reported for 103 samples handled in routine testing. Tests were made at 65% relative humidity. Values varied from 0.09 to 7.58

for bag paper, less widely for other materials. Since no other data on the paper were available, no conclusions can be drawn.

R. H. DOUGHTY

• **Measurement of the light-fastness of colored papers by illumination with the quartz mercury lamp.** G. DALÉN AND P. WILKE. *Papier-Fabr.* 26, 199-202; *Wochbl. Papierfabr.* 59, 345-49 (1928).—From qual. tests it is concluded that this lamp should furnish a satisfactory substitute for sunlight in making fading tests on papers. One hr. of lamplight is equiv. to 3 hrs. direct sunlight, or to 10 days north daylight, under the conditions used. Temp. and moisture content of the sample affect the results; activation of the air by the lamp apparently does not. Aging of the lamp is not a serious factor after it has been operated a few hours.

R. H. DOUGHTY

WANDROWSKY, HERMANN: **Wasserdicht-Machen von Papier.** 2nd ed. Berlin: Verlag der Papier-Zeitung, Carl Hofmann, G. m. b. H. 53 pp. Paper, M. 1.50. Reviewed in *Ind. Eng. Chem.* 20, 558 (1928).

Cellulose acetate. SOC. CHIMIQUE DES USINES DU RHONE. Brit. 274,814, July 26, 1926. An app. is described for continuous operation in the manuf. of cellulose acetate.

Cellulose acetate. H. L. B. GRAY and C. J. STAUD. U. S. 1,668,959, May 8. Cellulose acetate substantially free from haze and graininess is made by treating cellulosic material such as cotton dust with an aq. bath contg. 35-75% H_2SO_4 , stopping the action of the bath before the cellulose is degraded, removing the acid from the material to render the latter at least neutral to litmus, and then acetylating in a bath contg. ZnCl_2 or other catalyst which is weaker than H_2SO_4 .

Acetylcellulose. H. L. BARTHELEMY. U. S. 1,668,482, May 1. In the manuf. of acetylcelluloses or other mixed acetic esters of cellulose, in which acetylation is effected in the presence of a catalyzer, sapon. in the "primitive acetic sol" is effected by the addn. of a dil. acetic medium contg. HCl and HF . U. S. 1,668,483 specifies softening cellulose fibers such as cotton to facilitate their esterification by subjecting the mass of fibers to the combined action of the vapors of glacial HOAc and Cl or other suitable intensifying agent selected from the halogen group. U. S. 1,668,484 specifies subjecting a mass of cellulose to a series of at least 4 successive partial acetylations, each of which is deferred until the preceding partial acetylation has terminated. U. S. 1,668,485 specifies first subjecting cellulose material such as cotton linters to the action of an alk. soln. contg. peroxides and a soap to diminish the superficial contact tension and facilitate diffusion of nascent O , then treating the mass, to soften it, with a halogen such as Cl and vapor of HOAc , then acetylating in successive stages; the quantity of HOAc and catalyst contg. H_2SO_4 used in the bath is detd. by the no. of acetyl groups which must be present at the end of each addn. and the sapon. is effected in the presence of HCl to ensure elimination of sulfates.

Reacetylating cellulose acetate. H. T. CLARKE and C. J. MALM. U. S. 1,668,946, May 8. Cellulose acetate from which acetyl groups have been removed until its soly. is impaired is treated with HOAc as the sole reacetylating agent.

Cellulose esters of acetic or other fatty acids. H. T. CLARKE and C. J. MALM. U. S. 1,668,944, May 8. Esters are formed contg. 1 mol. proportion of the fatty acid component for approx. 24 C atoms of the cellulose component; the fatty acid is one contg. less than 8 C atoms, e. g., HOAc or propionic or butyric acid. These esters may be further esterified.

Moldable material from cellulose acetate, etc. SOC. CHIMIQUE DES USINES DU RHONE. Brit. 275,558, Aug. 3, 1926. A soln. of cellulose acetate or other cellulose ester or ether is mixed with fillers, coloring agents if desired and plastifying substances, e. g., with ultramarine and *p*-toluolsulfonamide, and water or other pptg. agent is added to ppt. the cellulose deriv. in the form of a fine powder suitable for molding.

Cellulose ester compositions for impregnating fabric for use as shoe stiffening. M. MOREL. Brit. 275,575, Aug. 3, 1926. Examples are given of solns. of cellulose

nitrate and cellulose acetate with admixts. such as camphor, acetone, benzene, alc., ether, copal, ocher, benzyl alc., tricresyl phosphate, abietic acid and ZnO.

Coating threads, fabrics, films, etc., with cellulose esters or ethers. G. SCHNEIDER and C. DREYFUS. Brit. 274,841, July 23, 1926. Two layers of cellulose ester or ether are formed one upon the other by employing for the second layer a soln. of cellulose acetate or other cellulose ester or ether in which the solvent used is not a solvent for the ester or ether of the underlying ether. A large variety of examples are given.

Esterifying hydrated cellulose with lower fatty acids. H. T. CLARKE and C. J. MALM. U. S. 1,668,945, May 8. Hydrated cellulose is heated to 100–170° with HOAc, propionic acid, butyric acid or other fatty acid with 2–7 C atoms, without use of any catalyst, until 4 mol. proportions of the acid combine for each 24 C atoms in the hydrated cellulose. In some cases a mild catalyst such as $ZnCl_2$ or Mg perchlorate trihydrate may be used. In using heptylic acid, a temp. of 145–165° is suitable. Numerous details are given.

Cellulose formate. E. ELÖD. Brit. 275,641, Aug. 9, 1926. Cellulose is esterified with concd. formic acid, *e. g.*, 98–100% acid, in the presence of swelling agents such as $ZnCl_2$ or $CaBr_2$; catalysts such as HCl or P_2O_5 may be used and the cellulose may be preliminarily slightly nitrated. Various details of procedure are given.

Artificial silk, etc. L. LILIENTHAL. Brit. 274,521, Jan. 11, 1926. Artificial silk, ribbons and like products of good dry and wet tensile strength and resistance to aq. alkalies and soap are made from viscose by use of a setting bath which contains not less than 55% H_2SO_4 (suitably 65–85%). Other inorg. acids, sulfates, sulfitcs, nitrite, H_3BO_3 , glycerol, glucose, alc., salts of bases such as $PhNH_2$ and org. acids such as acetic formic, lactic and oxalic also may be added. The setting bath may be operated at room temp. or at lower temps. down to -10° . The strength of the acid which gives best results depends somewhat upon the degree of maturation of the alkali cellulose, the time of ripening of the viscose and other details. Numerous details of procedure are described.

Artificial silk from viscose. L. LILIENTHAL. Brit. 274,690, Jan. 11, 1926. Artificial threads of high dry tenacity are made from viscose by use of a setting bath in which the H_2SO_4 used as described in Brit. 274,521 (preceding abstr.) is substituted, in whole or in part, by another inorg. acid such as 25–40% HCl, 60–90% HNO_3 , H_3PO_4 of 1.5–1.86 sp. gr. or 60–90% arsenic acid.

Artificial silk, films, etc. H. DREYFUS. Brit. 275,286, March 26, 1926. In the manuf. of filaments, films or other products from cellulose acetates or other cellulose esters of high-viscosity characteristics, the ripening or secondary treatment is prolonged beyond the normal stage to give products which may serve to form solns. of lower viscosity than products at earlier stages of ripening. Water may be added to an acetylating mixt. to destroy the acetylating agent and the mixt. may then be allowed to stand until a product sol. in acetone contg. 3–10% of water is produced.

Apparatus for making artificial silk filaments. COURTAULDS, LTD., F. SHEDDEN, A. E. DELPH and N. G. BAGULEY. Brit. 275,042, Oct. 4, 1926. A gas-testing app. is provided to facilitate maintaining a const. proportion of solvent vapor in the atm. of a spinning chamber.
